加拿大医学检验教育经验与借鉴

刘征
桂林医学院

目的 作者于 2014 年至 2017 年在加拿大医学检验技术专业学习，回国后从事医学检验教学工作。本文从课程设置和教学方法两个方面分析加拿大医学检验教育的经验和对国内医学检验教育的借鉴。
方法 选取加拿大 10 所和国内 6 所开设医学检验技术专业的大学，通过对比专业课程设置，分析加拿大医学检验技术专业课程设置的不同和优缺点。通过作者在加拿大医学检验技术专业学习的体会，对比与国内医学检验技术教学方法的异同。
结果 加拿大医学检验技术专业的专业课设置以医院检验科工作为导向，分为临床生物化学检验技术、临床微生物检验技术、临床血液检验技术、输血技术、组织技术 5 门课，上课内容、教具、材料、化验单直接取自医院检验科。国内院校没有开设组织技术课，但是将一部分临床生化和血液检验技术融合成了一门临床检验基础课程，同时微生物、血液、输血技术 3 门课内容过于陈旧，注重大而全，以讲述基础理论和经典检测方法为主，对当前检验科开展的项目讲述含糊不全。加拿大医学检验技术专业严格遵循宽进严出的毕业政策，所以在教学方法上注重知识点的理解和拓展，死记硬背教材内容很难达到毕业要求。
结论 与国内相比，加拿大医学检验技术专业课程设置与当前检验科开展项目密切关联，值得国内学习。由于录取的学生基本都已经完成了 4 年的大学课程，所以在基础知识讲述方面较为省略，这也使得教学工作虽较为实用，但是过于技术化。

OR-002

检验医学科住院医师规范化培训临床教学模式的研究与探讨

李林璋、曹永彤
中日友好医院

住院医师规范化培训是医学生毕业后再教育的重要组成部分，在医学教育体系中起着承前（医学院校教育）启后（继续医学教育）的作用。检验医学科住院医师规范化培训推进了检验医学的发展，在住院医师规范化培训中，临床实践对于提高住院医师的临床能力有着重要作用，这种临床实践和临床思维的培养对检验医学住培学员也非常重要。因检验医学科由于未设立床位，不需要管理住院患者，检验科住培的临床教学就要与临床科室医师住培有所不同。临床科室的培训内容侧重于临床工作方法，规范体格检查、常见疾病的诊疗常规和临床路径，而检验医学培训则侧重于在具备临床知识和实验室检验技术能力的基础上，能够将实验室检验与临床相结合，为临床疾病的诊断、预防等提供建议和咨询。根据检验医学培训细则要求，检验医师在培训期间需要进行病例讨论、教学查房和临床巡诊等。检验医学的临床教学内容主要有：①以检验结果为切入点式病例讨论，通过检验报告寻找此患者所有的病例资料，分析其检验结果可能的影响因素，从标本检验报告单入手，提高检验医师实际工作运用能力和建设临床思维；②改革临床医学教学查房的基本模式，在临床带教老师的组织下进行教学查房，突出检验学科内容式教学查房，通过教学查房对检验医师言传身教，培养检验医师正确解读分析检验结果的能力，同时加强检验医师临床思维的训练和与临床信息关联的能力；③到相关临床科室进行临床巡诊，比如在血液组轮转的学员可以安排到血液科进行临床巡诊。检验医学科的住培工作是一项新的挑战，也是检验医学发展的必由之路。检验医学科现在已成为与临床内、外科等并列、平行的学科，目前国内已有少量检验科可出具检验诊断性报告，可指导临床医师合理申请检验项目，帮助临床医师深入挖掘检验报告的详细信息，拓展报告的作用，并参与临床的某些决策。这种进步与检验医学住培的临床教学息息相关，希望检验医学科专业住培能够得到更多的关注与重视，使检验医学得到更好的发展。

网络平台建设在医学检验形态学人才培养中的应用研究

周玉利[1]、吴茅[2]、龚道元[3]、茹进伟[4]
1. 杭州市第一人民医院
2. 浙江省人民医院
3. 佛山科学技术学院检验学院
4. 广东省乐昌人民医院

目的 通过医学检验细胞形态学网络平台建设，促进形态学人才培养。
方法 通过企业微信、微信群、视频号、公众号、抖音、小程序等多种互联网形式开展细胞形态学教学，邀请更多的国内形态学专家录制视频课、微课、慕课，为学生免费开放，可重复试听。按照血液、骨髓形态学，体液形态学，寄生虫学，微生物学等分类，创建电子形态学图文资源库和试题库，系统、全面收集图片和案例，方便实时检索学习；设形态识别和病例分析等多种题型，学生可以自测训练，也可以运用于教学效果评定。举办形态学线上比赛，调动学生学习积极性，巩固教学质量，使学生更好掌握形态学的难点和重点。
结果 1.交流平台的建立，初步建立全国性的形态学医学检验交流群 3-5 个，每个微信群满员可容纳学员 500 名，定期有老师分享病例，或者转发分享其他微信群里较有学习价值的图片和病例；每周的周一、周三和周五，分别安排血液学病例、体液学病例和基础形态教学分享，动员群成员积极参与病例讨论和学习。2.资料库建设和公众号推送，成立病例资料整理组和公众号编辑组，病例整理组人员对图片和病例进行筛选和整理，选择高清典型的形态学图片收录资料库。公众号编辑组将精美图片和完善病例编辑成文，邀请专家审核后以公众号推文推送，供学生学习。3.专家库建设，吸引更多的临床检验专家和大专院校教授加盟，录制视频课、微课，丰富平台微课堂。4.形态学专家共识的推广，由国内知名形态学专家起草浆膜腔积液、肺泡灌洗液和脑脊液形态学检验专家共识，突出形态学教学的标准化、正规化的重要性。形态检验学生在校期间应该接受严格的规范化训练，为今后的临床工作打下坚实的理论和实践基础。
结论 多模态网络形态学教学大大推动形态学人才培养，值得大力推广和普及。

Association of CDK6 and its upstream miRNAs with tuberculosis susceptibility in a Chinese population

Hao Bai、Binwu Ying
Department of Laboratory Medicine, West China Hospital, Sichuan University

Background Tuberculosis remains a serious global health threat. Recent studies revealed that cyclin-dependent kinase 6 (CDK6) participated in the regulation of inflammation. We aimed to investigate the association between CDK6 and upstream miRNAs with tuberculosis susceptibility in a Chinese population.
Methods We included 436 tuberculosis patients and 566 healthy individuals from West China Hospital. We first selected and genotyped 5 single nucleotide polymorphisms of CDK6 (rs4272, rs42032, rs42045, rs10254840, and rs6975474). And then the expression levels of CDK6 mRNA and its upstream regulatory microRNAs (miR-26a, miR26b, miR-29a, and miR-29b) were measured.
Results We found rs6975474 and rs10254840 were associated with tuberculosis susceptibility. And the expression of CDK6 mRNA was significantly down-regulated in tuberculosis patients. Further analysis revealed that CDK6 expression level was negatively correlated to the serum C-reactive protein level and the erythrocyte sedimentation rate. In addition, the expression levels of miR-26a and miR-26b were significantly increased, while miR-29a and miR-29b were decreased in tuberculosis patients.

Conclusion Our study roughly provided a comprehensive association of CDK6 and its upstream miRNAs with tuberculosis susceptibility in a Chinese population. More studies with functional verification will refine our understanding of the role of CDK6 in tuberculosis.

基于 TCGA/GEO 数据库识别 GNG2 基因在乳腺癌中的作用与机制研究

赵安江[1]、李伶[2]、张玫[1]
1. 四川大学华西医院
2. 重庆医科大学

目的 G 蛋白 γ 亚基 2 (GNG2)参与多种细胞信号通路，对细胞增殖和血管生成至关重要。然而，GNG2 在乳腺癌(BC)发生发展中的作用尚不清楚。本研究旨在基于 TCGA/GEO 数据库探究 GNG2 在乳腺癌发生发展及临床诊治中的作用。
方法 利用 GEO 和 TCGA 数据库筛选出乳腺癌组织中的所有差异表达基因，利用 KEGG 富集分析探究所有差异基因可能参与的信号通路，利用 STRING 构建所有差异基因的相互作用网络，并筛选出对乳腺癌发生发展具有重要作用的候选差异基因。采用 Cox 回归分析 GNG2 与乳腺癌患者总体生存率的相关性。采用受试者工作曲线探究 GNG2 在乳腺癌中的诊断价值。通过体外和体内实验观察 GNG2 对细胞周期、增殖和凋亡的影响。通过共定位试验和免疫共沉淀技术揭示 GNG2 和 MRAS 之间的相互作用。
结果 我们从前 5 个差异基因中筛选出了 GNG2，其在乳腺癌组织中的表达明显减少。GNG2 与乳腺癌患者的总生存率独立相关，且在乳腺癌中具有较好的诊断价值（灵敏度 79.6%，特异度 85.8%）。过表达 GNG2 可显著抑制乳腺癌细胞增殖和肿瘤生长。此外，我们发现 GNG2 以 MRAS 依赖性的方式显著抑制 ERK 和 AKT 的活性。重要的是，GNG2 和 MRAS 在细胞膜上存在共定位并相互作用。
结论 GNG2 可能作为一种潜在的肿瘤标志物，为乳腺癌的诊断提供重要价值。机制上，GNG2 与 MRAS 的相互作用可能抑制 Akt 和 ERK 活性，从而促进乳腺癌细胞凋亡和抑制增殖。因此，在体内增加 GNG2 表达或破坏 GNG2-MRAS 的相互作用可能是治疗乳腺癌的一种潜在策略。

Long-read sequencing enables the detecting of complex HBV integrated genome structures in hepatocellular carcinoma patients

Zhongling Zhuo、Fei Xiao
Beijing Hospital

Objective The integration of HBV into the human genome is a crucial mechanism of Hepatocellular carcinoma (HCC), but the intricate HBV integration pattern is still unclear. In this study, we evaluated the feasibility of identifying complex HBV integrated genome structures by Nanopore and PacBio platforms.
Methods The DNA library was sequenced using the long-read sequencing on GridION and PacBio Sequel II, respectively. Simultaneously the DNA and mRNA were sequenced using next-generation sequencing on Illumina NextSeq. We established a workflow, analyzed HBV integration patterns using BLAST and local scripts, and verified the accuracy of this workflow.
Results In this study, we evaluated the feasibility of identifying complex HBV integrated genome structures through Nanopore and PacBio platforms and established an analytical strategy. Based

on the long-read sequences of the Nanopore and PacBio platforms, we can not only identify the breakpoints of HBV integration but also obtain complex HBV integrated genome structures. We obtained the entire HBV integration patterns in sequences, not based on algorithm predicting for the first time. The HBV integration pattern was extremely complicated, HBV was not integrated with a complete genome, but the genome was fragmented and integrated into the human genome in different orientations.

Conclusion Our results proved that long-read sequencing enables detecting complex HBV integrated genome structures in HCC patients. It provides evidence to support the potential application of long-read sequencing in virus integration identification and helps people fully elucidated the role of HBV integration in carcinogenesis.

Exploration of Microvascular Invasion Biomarkers for Hepatocellular Carcinoma Based on Cancer Genome Mutations

Zhaodan Xin、Juan Zhou、Liting You、Yi Zhou、Xingbo Song、Xiaojun Lu、Binwu Ying
West China Hospital, Sichuan University

Objective Microvascular invasion (MVI), has increasingly been recognized to be one of the most significant risk factors for hepatocellular carcinoma (HCC) recurrence and metastasis after hepatectomy, which is probably caused by tumor gene mutations. While it is tough to detect tumor tissue mutation before hepatectomy, non-invasive circulating tumor DNA (ctDNA) detection for HCC mutation is feasible. In this study, we focus on cancer genome mutations to explore new MVI markers and provide clues to the mechanisms of invasion and metastasis.

Methods 36 patients with initially suspected HCC who were undergoing hepatectomy at West China Hospital of Sichuan University in 2019 were prospectively recruited. Peripheral blood samples were collected preoperatively, and fresh tumor tissues were resected during the operation. High-throughput sequencing using hybrid capture library was performed on the Gene+2000 platform, for tumor tissues and ctDNA. The hybrid probes targeted 1021 genes related with tumorigenesis. Fisher's exact test was performed in MVI/non-MVI groups to find the differentially mutated genes and Wilcoxon test was utilized to compare VAF between groups. In all analyses, $P < 0.05$ indicated statistical significance.

Results 36 individuals including 11 MVI and 25 non-MVI samples underwent gene mutation analysis of tumor tissues, and mutations were detected in all samples; 33 individuals underwent ctDNA gene mutation analysis, and 26 samples (78.8%) were detected mutations. The HCC gene mutation profile was widely distributed and genes with the highest frequency of ctDNA mutations were similar to tumor tissues such as TP53, LRP1B and CTNNB1. We found the incidence of several gene mutations such as ACIN1 and CSF1R was higher in MVI group than non-MVI group both in tumor tissues and ctDNA analysis, although there was no statistical difference ($P>0.05$). Moreover, ctDNA variant allele frequency (VAF) was further compared between MVI group and non-MVI group, and VAF maximum value of MVI group was higher than non-MVI group (0.037 vs 0.015, P=0.0092). A total of 32 HCC patients had both tumor tissue and ctDNA sequencing results, among these patients, 7 samples (7/8, 87.5%) in MVI group and 16 samples (16/24, 66.7%) in non-MVI group were detected tissue consistent mutation in ctDNA, indicating great potential of ctDNA in HCC, especially in HCC patients with MVI. Remarkably, 13 samples (40.6%) detected undetected mutations of tissues in ctDNA, indicating great heterogeneity in HCC, and ctDNA might be a good choice by overcoming tumor heterogeneity.

Conclusion Genes with higher mutation rate in MVI patients deserve our further attention for HCC invasion. VAF of ctDNA, especially the maximum value of VAF, can be used as a new biomarker to distinguish MVI patients from non-MVI ones. Designing a panel of specific gene mutations and using the VAF maximum value of ctDNA to predict MVI might be a potential choice.

数字 PCR 检测血流感染常见病原菌的临床应用研究

刘芳瑞、吕琳婷
上海交通大学医学院附属仁济医院(东院)

背景 血流感染是指细菌、真菌等病原微生物入侵血循环，在血液中繁殖,释放毒素和代谢产物,并诱导细胞因子释放,引起全身感染性疾病。目前血流感染的主流病原菌有大肠埃希菌、肺炎克雷伯菌、鲍曼不动杆菌、铜绿假单胞菌以及各类葡萄球菌。大多入侵为呼吸道感染、泌尿系统感染以及腹腔感染。近些年由于抗生素和介入治疗的使用，血流感染的发病率呈持续增高趋势。目前检测血流感染最重要的检查手段是血培养。但血培养周期时间长、用血量大、且无法定量，早期诊断及准确的抗菌治疗对降低疾病死亡率至关重要。
目的 运用领航数字 PCR 系统检测临床血浆样本中的病原菌，以测评该技术的临床应用价值。
方法 采用领航基因五色荧光数字 PCR 系统检测 169 份临床血浆样本，并与传统血培养方法进行比较，计算数字 PCR 技术检测血流感染的敏感度、特异性和符合率。
结果 本次实验检测的 169 份样本中，血培养阳性 27 例，阴性 142 例，阳性率 16%；数字 PCR 阳性 15 例，阴性 154 例，阳性率 8.9%。与传统血培养鉴定技术相比，领航五色荧光数字 PCR 系统检测血流感染样本的敏感度为 24%，特异性为 97.2%，阳性预测值为 60%，阴性预测值为 88%，总体符合率为 88.8%。数字 PCR 系统鉴定阳性的病原菌包括绿假单胞菌（1 例）、大肠埃希菌（5 例）、肺炎克雷伯菌（4 例）、鲍曼不动杆菌（2 例）、屎肠球菌（3 例）、粪肠球菌、嗜麦芽窄食单胞菌（5 例）、表皮葡萄球菌（3 例）。但由于血培养阴性而数字 PCR 检测阳性的病原菌主要集中在嗜麦芽假单胞菌和表面葡萄球菌，所以不能排除污染的可能性。
结论 数字 PCR 技术是一种新型血流感染的检测技术，检测时间短，具有较好的特异性，但敏感性还有待提高，未来或许可以成为临床早期诊断与优化感染治疗的新方法。

Development and Validation of a Novel Glycolysis-Related Risk Signature for Predicting Survival in Pancreatic Adenocarcinoma

Ang Li[1]、Sinan Hou[2]、Jian Chen[3]、Yanfang Jiang[1]
1. The First Hospital of Jilin University
2. 连云港市中医院
3. 东南大学附属中大医院

Background Pancreatic adenocarcinoma (PAAD) is one of the leading causes of cancer-related deaths worldwide. Through data mining, anincreasing number of biomarkers have been identified to predict the survival of patients with PAAD. However, the ability of single gene biomarkers to predict patient survival is still insufficient. This study aimed to develop a novel risk signature for predicting the survival of patients with PAAD.
Methods mRNA expression profiling was performed for a large PAAD cohort (n =177) identified using The Cancer Genome Atlas database (TCGA). Geneset enrichment analysis (GSEA) was performed to detect whether the gene sets showed significant differences between PAAD and adjacent normal tissues. Univariate Cox regression was used to analyze and identify genes related to overall survival (OS). Multivariate Cox regression was subsequently used to confirm the prognostic genes and obtain the coefficients. By analyzing the expression level of selected genes weighted by their coefficients through linearly combining, we constructed a risk score formula for prognostic prediction. The three-mRNA signature for survival prediction was validated using the Kaplan–Meier method.

Results We demonstrated that a set of three genes (KIF20A, CHST2, and MET) were significantly associated with OS. Based on this three-gene signature, 177 PAADpatients were classified into high-risk and low-risk groups using the median risk score as the cut-off value. We also validated the reliability of this three-gene signature in the GSE28735 dataset from the Gene Expression Omnibus (GEO) database. Additionally, multivariate Cox regression analysis revealed that the three-gene signature had an independent prognostic value.
Conclusion To the best of our knowledge, this is the first study to develop a glycolysis-related risk signature for predicting the survival of patients with pancreatic adenocarcinoma. Our findings provide insight into the identification of PAAD patients with poor prognosis. We also identified novel therapeutic targets for this disease.

Rapid electrochemical biosensor for sensitive profiling of exosomal microRNA based on multifunctional DNA tetrahedron assisted catalytic hairpin assembly

Xiaohe Zhang、Ye Zhang、Bo Situ、Yuan Wu、Shihua Luo、Lei Zheng、Yurong Qiu
Southern medical university Nanfang hospital

Profiling of exosomal microRNA (exo-miRNA) is very important for cancer diagnosis and treatment. However, rapid and sensitive determination the trace of exo-miRNA in clinical samples has not been developed. Herein, a robust electrochemical biosensor was proposed using multifunctional DNA tetrahedrons assisted catalytic hairpin assembly (MDTs-CHA) for exo-miRNA analysis. The MDTs-CHA, contained two multifunctional tetrahedrons (T1 and T2), leverage localized reaction and cascade amplification to enable rapid and ultrasensitive exo-miRNA analysis. Employing the MDTs-CHA, the electrochemical platform allowed quantitative measurement of exo-miRNA down to 7.2 aM in 30 min with good specificity. Furthermore, by profiling four tumor-associated exo-miRNAs (miR-1246, miR-221, miR-375, and miR-21) in a breast cancer cohort, this platform showed high efficiency (AUC: 0.989) and high sensitivity of 90.5% for breast tumors diagnoses, with 80% sensitivity for early diagnoses (stage I-IIa). Therefore, this platform has great potential in bioanalysis and clinical diagnostics.

The establishment of neuron-specific enolase reference interval for the healthy population in southwest China

Qiang Miao、Bei Cai、Xuedan Gao、Zhenzhen Su、Junlong Zhang
West China Hospital, Sichuan University

Aim To investigate and establish a reference interval (RI) of neuron-specific enolase (NSE) in southwest China's healthy population by using the laboratory information system database.
Method A total of 86957 periodic health examination individuals of the medical examination center in West China Hospital from 2016 to 2018 were included in the study. We used the Box-Cox conversion combined with the Tukey method to normalize the data and eliminate the outliers, and the normal distribution method and the nonparametric method to estimate the 95% distribution RI.
Results The NSE 95% distribution RI we established in healthy populations in southwest China through normal distribution and nonparametric method were 0-19.64 ng/ml and 0-20.46 ng/ml, respectively. The obtained RIs verification conformed to the standard and was significantly different from the reagent instruction($P < 0.05$). The RI established by the nonparametric method was superior to the RI of the normal distribution method and reagent instruction($P < 0.05$).

Conclusion We initially established an NSE RI that was suitable for the healthy southwest China population. The Box-Cox conversion combined with the Tukey method and nonparametric method is a reliable and straightforward indirect method for reference interval acquisition, which is suitable for the promotion and application of clinical laboratory.

上海市临床生物化学实验室诊断项目成本核算

邵文琦[1]、王海银[2]、赵瀛[1]、王蓓丽[1]、郭玮[1]、潘柏申[1]
1. 复旦大学附属中山医院
2. 上海市医学科学技术情报研究所

目的 实验室诊断是医疗服务项目规范的重要板块之一，价格构成不同于其他技术劳务为主的诊疗项目。政策要求创建“以成本和收入结构变化为基础”的价格动态调整机制，医疗服务价格调整箭在弦上，却由于缺乏科学的成本测算标准悬而未发。
方法 医院检验科临床生化室作为技术较为成熟的组室之一，日均标本量高，开展项目多。本文以检验科临床生化室的诊断项目成本作为切入点，通过客观、公正、科学、合理的数据分析兼顾各方利益，建立标准化实验室模型，构建价值分析框架，分版块，分类测算临床生化室诊断项目成本。
结果 大部分临床生化检验项目检测成本略高于收费价格，仅有少数方法较新的项目成本低于收费价格。
结论 临床生化检验项目价格制定按照 2012 年出台的成本价格进行计算，而没有考虑十余年间的通货膨胀，物价上涨和技术进步等因素，收费标准中也没有将人力成本和物耗成本等核算在内。需要在政府物价和医疗保险支付部门、病人、医院检验科间建立桥梁，提出完善实验室临床生化检验项目诊断价格制定和支付的政策建议。

时间就是生命：探索心血管病医院急诊检验能力建设之道

于金星、崔凯、冯子秋、高小晶、周洲
中国医学科学院阜外医院

目的 中国心血管病患病率、死亡率持续上升，已成为重大公共卫生问题。尤其急性胸痛相关的致死性心血管疾病，如急性心肌梗死、主动脉夹层、肺栓塞等的救治，更需准确与快速，时间就是生命。而急诊检验的检测结果影响着 70%-85%的临床决策。阜外医院是心血管病专科医院，作为抢救的“最前线”的急诊检验承担着包括急诊室、ICU、CCU、HFCU、小儿 PICU、成人术后恢复室等急重症患者的检测服务，工作中涉及临床基础检验、临床血液学检验、临床生物化学检验、临床免疫学检验、临床微生物学检验、临床分子生物学检验等各检验专业学科，探索急诊检验能力建设对于提高心血管病急危重症患者救治能力具有重要意义。
方法 中国医学科学院阜外医院作为心血管专科医院，急诊检验通过信息化与自动化系统的运用升级流水线设备、丰富急诊检测项目、精益管理的实施：5S 精益改善、利用人工智能等一些列措施。
结果 通过精益的改善项目，急诊检验的流程得到了进一步的优化，对能力建设前与建设后进行数据分析，结果发现急诊检验内周转时间（标本签收与报告审核发送之间的时间）平均缩短了 34.2%。
结论 急诊检验通过升级流水线设备、丰富急诊检测项目、5S 精益改善、利用人工智能等一些列措施，提升了运营效率和服务水平，大大缩短了检测时间，为临床端及患者端提供准确及时的检测报告，提高了患者救治率。急诊检验的工作任务就是开展必要的检验项目以满足临床的急需，提供准确、及时的检验结果是临床对急诊检验的基本要求。心血管疾病的救治需要多学科医务人员协作，规范、及时的急诊检验尤为重要。急诊检验是检验科中综合性强、报告要求及时性高、工作量多、挑战性大的实验室。本项研究的探索，希望通过心血管病医院急诊检验的能力建设，对于提高心血

管病医院急危重症患者的救治能力、合理利用医疗资源、以及促进未来交叉学科的发展等方面提供一些参考数据和实践依据。

检验过程的生物安全风险管理和实践体会

公衍文
山东大学第二医院

目的 总结实验室检验过程生物安全风险管理的实践体会，以期能够提供可以落地有效的风险管理办法。
方法 风险管理是质量管理的根本落脚点，但在实施过程中，多数实验室未能将静态评估和动态监测结果结合起来，一味地依靠所谓的头脑风暴，导致风险管理流于形式，没能识别出真正可能存在的风险，相应的风险控制措施也就没有效果，无法实现持续改进。我们将静态风险评估（基于工作流程和操作，明确每个岗位和操作在实验室环境、生物安全柜、个人防护措施等方面选择，并在此基础上评估存在的风险，以及风险的严重程度和可识别能力）和动态监测（安全管理组定期检查监测安全措施执行情况、风险管控措施执行情况，以及生物安全实验室良好工作行为遵守情况，统计风险可能发生的频次）相结合，计算 RPN 指数，进行客观的风险评估。
结果 共识别出高风险 5 项，中风险 11 项，低风险 25 项。对高风险立即实施针对性的纠正措施，并作为后续监测的重点，评估措施的有效性；对中风险项目，评估其可能的发展趋势，必要时采取预防措施，并监测措施的有效性；对低风险项目，继续列入日常监测项目，持续关注。
结论 检验过程风险管理必须将静态评估和动态监测结合起来，才能真正有效。

OR-015

检验科员工满意度与需求的多维度分析

牛书敏、姜宏兵、刘春燕、刘艳雯、张新、邓朝晖
新疆生产建设兵团医院

目的 采用多维度问卷了解检验科员工工作满意度与需求，并分析其主要影响因素，为科室管理提供决策依据。
方法 通过问卷调查法分析新疆生产建设兵团医院检验科 34 名员工的工作满意度，以明尼苏达满意度量表为雏形，马斯洛“需求层次理论”为基础，结合中国检验科实践工作设计相关评价指标。满意度调查分为 5 个维度，共 20 个项目，采用净推荐值(NPS)打分系统(1-6 分)及排序量化记分，评价科室不同专业组、不同年资员工对工作环境、收入和机遇、尊重与归属感、员工管理、组织承诺与结构 5 个维度的满意度。
结果 34 名员工平均满意度为 5.0 分，感到满意的员工达到 98%；其中，工作不满 5 年的员工满意度最高，微生物组、样本前处理组员工满意度最高，临检组满意度较低。满意度调查的 5 个维度中，收入和机遇维度满意度最低，平均满意度为 4.6 分；组织承诺与结构维度满意度最高，平均满意度高达 5.4 分；其他三个维度满意度居中。在收入和机遇维度满意度调查中，工作大于 10 年和临检组的员工满意度较低，平均满意度为 4.4 分、4.2 分，其中分别有 54%和 60%的员工持中性甚至负面态度。
结论 检验科员工对工作总体较为满意，收入和机遇是影响科室员工满意度的主要因素，科室有的放矢地采取改进措施，提高员工满意度。

特殊蛋白检测项目基于患者风险的室内质量控制程序的设计

刘佳丽[1]、郭拥军[2]、刘向祎[2]、王薇[1]、王治国[1]
1. 北京医院 国家老年医学中心 国家卫生健康委临床检验中心/北京市临床检验工程技术研究中心
2. 首都医科大学附属北京同仁医院检验科

目的 用具有批长度的 Westgard 西格玛规则为九项特殊蛋白项目设计基于风险的统计质量控制（SQC）程序。
方法 收集北京同仁医院检验科 IgG、IgM、IgA、C3、C4、类风湿因子（RF）、抗链球菌溶素 O（ASO）、转铁蛋白（TRF）和前清蛋白（PA）半年（2018 年 12 月-2019 年 5 月）的累积在控变异系数（CV）作为不精密度的估计值，将该实验室参加室间质量评价（EQA）计划中的百分差值绝对值的均值作为偏倚（Bias）的估计值，采用国家卫生健康委临床检验中心 EQA 的评价标准作为允许总误差(TEa)，计算各项目的西格玛度量值（σ），采用具有批长度的 Westgard 西格玛规则为各项目设计合适的 SQC 程序。
结果 IgG、IgA、IgM、C4 和 TRF（σ>6）采用 13s 规则（N=2，R=1），批长度为 1000 个患者样品的 SQC 程序；C3（σ=5.86）采用 13s/22s/R4s 规则（N=2，R=1），批长度为 450 的 SQC 程序；RF、ASO、PA（3<σ<4）采用 13s/22s/R4s/41s/6X 规则（N=6，R=1），批长度为 45 的 SQC 程序。
结论 具有批长度的 Westgard 西格玛规则可帮助实验室设计基于风险的 SQC 程序，保证检验结果的质量和患者安全。

基于生化免疫流水线的全流程智能化探索

尹利民、孟国艳、徐宏忍、白敏凤
昆明市第一人民医院

目的 为提高临床检验的工作效率，减轻工作人员劳动强度，依托生化免疫流水线系统，通过不断流程优化，进行全流程智能化探索。
方法 收集昆明市第一人民医院检验科 2015 年 6 月至 2021 年 5 月生化免疫检测项目的运行数据，开展回顾性研究。
结果 标本转运、标本接收、标本分拣、编号、离心、录入 LIS 系统、仪器上输入检测项目、去盖、分杯、转移到样品架，仪器检测、查看结果，稀释、复检审核、打印报告、报告发放、标本入库等多环节均实现自动化。
结论 自动化极大地提高了实验室的工作效率，优化了流程。

一项回顾性观察研究：血清白蛋白水平升高与重症监护病房急性肾损伤 2 年死亡率降低相关

唐琪、王佳佳、夏鹏程、王榕榕、李明、白晓卉、王勇、卢志明
山东第一医科大学附属省立医院临床医学检验部

背景 血清白蛋白浓度与多种危重疾病的预后有关。急性肾损伤是一种严重的临床疾病，可能增加重症监护病房患者的死亡率。然而，在重症监护病房中血清白蛋白浓度与急性肾损伤 2 年死亡率之

间的关系尚未被探讨。本研究旨在调查重症监护病房的患者血清白蛋白与急性肾损伤 2 年全因死亡率之间的关系。
方法 我们对 2016 年 1 月至 2018 年 11 月在山东第一医科大学附属省立医院内科和外科重症监护室招募的患者进行回顾性观察分析。我们采用多元回归模型研究血清白蛋白与急性肾损伤 2 年全因死亡率之间的关系。我们还使用了分层分析来验证我们的研究在不同的患者亚组中的稳定性。
结果 本研究共纳入 392 例患者(男性 254 例，女性 138 例)。血清白蛋白与急性肾损伤两年全因死亡率呈负相关和非线性相关。校正模型 I 调整了两个变量(性别和年龄)，校正模型 II 调整了 8 个变量，包括性别、年龄、血尿素氮、C 反应蛋白、氯离子、钠、基础肌酐和葡萄糖。此外，在许多亚组中，包括男性患者、无糖尿病患者、手术 4 级、急性肾损伤 I 期、血尿素氮< 5.7 mmol/L、甘油三酯< 1.05 mmol/L、血容≥ 40.1 vol%、血红蛋白≥ 136 g/L、红细胞 ≥ 4.5×10^{12}/L、白细胞 < 6.15×10^{9}/L 等亚组中，血清白蛋白与急性肾损伤两年全因死亡风险显著相关。
结论 血清白蛋白与重症监护病房中急性肾损伤患者的 2 年全因死亡率呈非线性负相关。我们的发现需要进一步的研究来验证。

运用 PDCA 循环法在三级医院检验科三年质量管理上的研究

周慧聪
南京大学医学院附属泰康仙林鼓楼医院

目的 运用 PDCA 循环法管理检验科检验前、检验后质量指标，探索检验科质量管理方法，提高检验科的工作质量，更好的服务患者。
方法 1、由科主任确定检验科“年度重点质量管理项目”，制定“质量目标”，包括“体液标本采集时间缺失率<10%”、“血液标本采集时间缺失率<10%”、“不合格标本比例<1%”、“门诊患者实验室内周转时间超时率<5%”。2、将上述数据“快捷统计功能”维护到检验科 LIS 系统里，可以按照“时间”、“标本来源”等检索条件获取每月数据。3、每月 5 号前由专人统计并分析上述质量指标涉及的数据，形成图表，清晰可见，内容包含以上四项质量管理项目在上月的数据。4、召开“检验科月度质量小组会议”，分析导致质量目标不佳的原因，由专人根据会议内容撰写“质量小组活动记录”，内容包括“针对本月的质量分析及改进项目”、“针对下月的改进目标和措施”、“对上月质控活动改进措施的落实和成效评价”。5、从人、机、料、法、环五方面进行根因分析，针对不同问题积极整改并与临床沟通，增强培训及考核力度。6、每月按照上述方法进行质量管理，循环往复，计算三年来质量管理成效。
结果 2020 年全年较 2018 年全年体液标本采集时间缺失率下降 31.24%；血液标本采集时间缺失率下降 82.59%；不合格标本率下降 40%；门诊患者实验室内周转时间超时率下降 54.14%。2019 年及 2020 年全年质量目标均在目的范围内。
结论 PDCA 循环法运用到检验科质量管理中可以起到很好的作用，可以大大提高检验科的质量目标，此方法可以运用到更多的检验科质量管理项目中，使检验质量不断进步。

应用室间质评变异系数评价和推进检验结果互认的可行性研究

张娟、李红燕、蒋黎
电子科技大学附属医院·四川省人民医院

目的 回顾性分析四川省 2016-2020 年全省各级医院参加四川省临床检验中心举办的血细胞分析和临床化学检验项目室间质评结果变异系数 (Coeficient of Variation，CV)，分析近 5 年各项目 CV

值变化趋势，探讨依据 CV 值变化趋势判断和指导全省各级医院之间逐步推进临床检验项目结果互认的可行性。
方法 回顾性分析四川省临床检验中心 2016-2020 年连续 5 年临床血细胞分析共 8 个项目以及临床化学检验项目共 33 个项目，总共 41 个检验项目，每年 2 次，每次 5 个质评物的室间质评 CV 值，分析各项目各等级医院各浓度近 5 年 CV 值的变化趋势。由于项目较多，生化项目仅选取 11 个互认项目进行详尽分析。以 1 年为单位，将参与单位分为三个组，分别是三级医院组、二级医院组和其它检测机构组，对数据进行分组、分年进行分析，正态分布数据采用方差分析，非正态分布数据采用 Kruskal-Wallis 检验，$P<0.05$ 为差异有统计学意义。
结果 1. 参加血细胞分析和生化项目室间质评的实验室分别由 2016 年第一次 696 家增加到 2020 年 1014 家，生化为 682 家增加到 2020 年 989 家，总体合格率在逐年上升。2. 以医院等级进行分组，汇总近 5 年 CV 值结果分析，不同等级医院全血检测项目在低浓度和中浓度之间，CV 值均有差异，P 分别为 0.0039 和 0.0015，在高浓度间未见明显差异。生化项目根据各自参考范围分为低浓度和高浓度两个水平，除 TG 和 Mg 以外，其余项目 CV 均有显著性差异，且在三级医院的 CV 值均最低。3. 近 5 年各项目变化趋势为总体趋势均是各项目 CV 值中位数逐年递减，提示在推动全省检验项目结果互认基础上，总体检验结果一致性在逐年提高。
结论 室间质评项目 CV 值可以较好地客观反映全省各级医疗机构检验结果的差异和变化趋势，为全面推进检验项目的结果互认提供可靠的实验室参考依据。

Sample pooling of COVID-19 RT-qPCR without sacrificing sensitivity

Dong Zhang、Juan Du、Guanhua Wang、Yu Chen、Xuesong Shang、yingying Ding、Ziyi Wang、Jie Wu、Jie Yi、Qiwen Yang、Yingchun Xu
PUMCH

A more efficient and costly method for COVID-19 testing has attracted much interest in recent times. Given the limited testing capacity available in the world, several studies have proposed sample pooling to increase testing capacity. However, the high rate of false negatives for sample pooling may undermine efficient tracking and good policymaking. We provide a detailed analysis and validation of the original sample pooling strategy and extracted RNA sample pooling strategy. The original samples and the extracted RNA samples were mixed in parallel to get a range of 2-specimen pool to 16-specimen pool size. For the pooled samples, we scaled up the PCR reaction volume to 50 ul, 75 ul, and 100 ul. No false-negative results were observed in Case 3 (Ct < 30), while a total of 43 (17.9%) false-negative results were acquired in 240 pooling samples containing Case 1 or Case 2 (Ct > 35). By scaling up the reaction volume, all the weak positive samples with low viral load could only be detected in RNA pools at dilutions of 1:1, 1:2, and 1:3, while the repeatability was unsatisfactory in other pooling strategies. Overall, the sensitivity of pooling RNA samples with scaling up reaction volume had about the same sensitivity as individual testing.

泛癌分析显示同源重组缺乏评分可作为免疫治疗反应者的预测指标

杨璨[2,3]、唐雪梅[1]、张心菊[2]、吴之源[1,2,3]、关明[1,2,3,4]
1. 复旦大学附属华山北院中心实验室
2. 复旦大学附属华山医院中心实验室
3. 复旦大学附属华山医院检验科
4. 复旦大学附属华山北院检验科

背景和目标 肿瘤微环境(TME)的免疫背景是免疫学干预成功的决定性因素，但对免疫敏感性 TME 和免疫治疗反应者识别的 DNA 水平的生物标志物的探索较少。同源重组缺陷(HRD)疤痕是肿瘤基因组不稳定的一个新兴特征，可以触发免疫反应。本研究旨在全面研究主要癌症类型的 HRD 疤痕（评分），并揭示它们与肿瘤微环境和免疫治疗反应的联系。
材料和方法 使用来自癌症基因组图谱(TCGA)的 9088 个肿瘤的基因组学、转录基因组学和免疫表型数据对 HRD 评分进行了功能分析。与 HRD 相关的癌症类型由 HRD 评分累积频率分类来定义。对 HRD 高或低基因型的肿瘤突变负荷(TMB)和新抗原进行比较。肿瘤微环境(TME)用 CIBERSORT、xCell、MCP-counter、EPIC 和 quanTIseq 这五种算法进行了数字分析。微卫星不稳定性(MSI)、TMB 和 HRD 的敏感性和特异性。
结果 来自 TCGA 的 32 种癌症的 9088 名肿瘤患者的 HRD 评分分析显示，7 种主要癌之间的广泛关联，包括膀胱癌、乳腺癌、头颈鳞癌、肺腺癌、肺鳞细胞癌、卵巢癌和肉瘤。HRD 评分高的肿瘤有白细胞浸润和淋巴细胞分数增加，并表现出免疫敏感的 TME。最后，通过 TIDE 模型，我们证实了 HRD 评分的高基因型是 TCGA 乳腺癌队列中免疫反应的潜在预测因子。
结论 HRD 评分高的肿瘤具有免疫敏感的 TME。HRD-高基因型是乳腺癌患者免疫治疗反应的重要指标。

Tfr-Tfh index: a new predicator for recurrence of hepatocellular carcinoma patients with HBV infection after curative resection

Beili Wang、JIE ZHU、BAI-SHEN PAN、JIAN ZHOU、JIA FAN、XIN-RONG YANG、WEI GUO
Department of Laboratory Medicine, Zhongshan Hospital, Fudan University

Background T follicular helper (Tfh) cells and T follicular regulatory (Tfr) cells were newly identified as the subsets of cluster of CD4+ T cells. As major components of human immune system, they were found in tumor microenvironment and reported to play vital roles in the progression of cancer. But their clinical significance in Hepatocellular carcinoma (HCC) was not elucidated. Thus, this research aimed to investigate their prognostic value in HCC.
Materials and Methods A total of 210 subjects (including 110 HCC patients, 50 chronic hepatitis patients and 50 healthy individuals) were enrolled in the research. Tfh, Tfr cells and Treg cells from peripheral blood were measured by flow cytometry. Receiver operating characteristic (ROC) curves were used to evaluate the diagnostic performance of Tfr-Tfh Index (TTI) in early HCC and relapse status. Its further prognostic valve was assessed by Kaplan-Meier survival estimate and log rank tests.
Results Tfh cells, Tfr cells, Treg cells and TTI were all higher in HCC patients than in chronic hepatitis patients and healthy control. TTI was found to have positive correlation with the load of HBV. The AUC of TTI for early HCC and relapse status was better than other clinical indices in HBV positive patients. An optimal cutoff point for the TTI stratified the HCC patients into high

(>21.96) and low index (≤21.96) groups. High TTI was significantly correlated with recurrence. Univariate and multivariate analyses revealed TTI could be a predictor for recurrence. Moreover, it retained prognostic performance for patients with lower recurrence risk.
Conclusion Our research showed that TTI could be a promising indicator for early recurrence in HCC patients with HBV infection.

Establishment of Coamplification at Lower Denaturation Temperature PCR/Fluorescence Melting Curve Analysis for Quantitative Detection of Hepatitis B Virus DNA, Genotype, and Reverse Transcriptase Mutation and Its Application in Diagnosis of Chronic Hepatitis B.

Can Liu、Qishui Ou
The First Affiliated Hospital of Fujian Medical University

Dynamic and real-time hepatitis B virus (HBV) DNA, genotype, and reverse transcriptase mutation analysis plays an important role in diagnosing and monitoring chronic hepatitis B (CHB) and in assessing the therapeutic response. We established a highly sensitive coamplification at lower denaturation temperature PCR (COLD-PCR) coupled with probe-based fluorescence melting curve analysis (FMCA) for precision diagnosis of CHB patients. The imprecision with %CV and detection limit of HBV DNA detected by COLD-PCR/FMCA were 2.58% to 4.42% and 500 IU/mL, respectively. For mutation, the imprecision and detection limit were 3.35% to 6.49% and 1%, respectively. Compared with Sanger sequencing, the coincidence rates of genotype and mutation were 96.0% and 82.5%, respectively, whereas the inconsistent data resulted from a low proportion (<20%) of mixed genotypes or mixed mutations. The mutation ratio in HBV infection patients was as follows: hepatitis B e antigen (HBeAg)-positive infection (0/0.0%) < HBeAg-negative infection (16/4.5%) < HBeAg-positive hepatitis (30/5.5%) < HBeAg-negative hepatitis (36/6.5%). In patients with entecavir therapy, the proportion of mutation at baseline or week 4 in virologic response (VR) group was <4%, whereas in the partial VR group, it was mostly ≥4%. COLD-PCR/FMCA provides a novel tool with high sensitivity, convenience, and practicability for the simultaneous quantification of HBV DNA, genotype, and mutation. It might be used for distinguishing the different phases of HBV infection and predicting VR of CHB patients.

Peripheral blood mononuclear cell DNA methylation markers enables early non-invasive detection for breast cancer

tiantian wang[2]、chuanxin wang[1]
1. The Second Hospital of Shandong University
2. The Second Hospital of Shandong University

Background The immune system can monitor the development of tumors, while DNA methylation is involved in the body's immune response to tumors. Peripheral blood mononuclear cell (PBMC) DNA carrying cancer-specific epigenetic aberrations may become a non-invasive approach for early detection of breast cancer (BC).
Methods we examined the genome-wide methylation profile of PBMCs from 50 BC patients and 30 normal controls using Infinium 850K BeadChips and identified BC-specific methylation

markers. The BC prediction diagnostic model was built in a training cohort (n = 100) using pyrosequencing and validated in a validation cohort (n = 200) using MethylTarget sequencing. Compared with mammogram and ultrasound, the performance of this diagnostic model was analyzed.
Results We discovered a total of 282 differentially methylated CpG positions (DMPs) between BC patients and match normal controls, of which 10 significant DMP markers were selected further pyrophosphate validation. We built and validated a BC diagnostic model based on four markers, which had high accuracy (90.0%,92.0%) sensitivity (85.7%,84.6%) and specificity (94.3%,86.6%) in both the training and validation cohort. More importantly, compared with mammogram and ultrasound, this diagnostic model achieved a great improvement in sensitivity in the detection of early-stage tumors(stage I-II 81.0% vs. 78.1%, 69.3%).
Conclusions DNA methylation markers in PBMC can provide a noninvasive, accurate, rapid and high-throughput method for early diagnosis of BC, and are more sensitive than traditional imaging examination for early-stage and minimal tumors.

CD83+CCR7+ NK cells induced by interleukin 18 promote experimental autoimmune uveitis

Xin Wang[1]、Wei Lin[2]、Yi Zhang[1]
1. Qilu Hospital of Shandong University
2. 山东第一医科大学基础医学院基础研究所

Objective Uveitis, an inflammatory disease involving the uvea, retina, retinal vessels and/or vitreous body, can result in visual impairment and blindness. A disorder of the immune system represents an essential pathogenesis for autoimmunity uveitis. In specific, the large number of lymphocytes, including mature dendritic cells (DCs), T cells and natural killer (NK) cells infiltrating the eye may be a critical factor which drives this disorder of the immune system to result in tissue damage. Natural killer (NK) cells have been reported to play a pathological role in autoimmune uveitis. However, the underlying mechanisms of NK cells in uveitis remain unclear.
Methods Experimental autoimmune uveitis (EAU) mice were established by immunizing human interphotoreceptor retinoid-binding protein peptide (IRBP)1–20 and pertussis toxin (PTX) intraperitoneally. To analyze the role of CD83+CCR7+NK cells in EAU, CD83+CCR7+NK or CD83-CCR7-NK cells were isolated from the inflamed spleen on days 12-16 post-immunization by flow sorting instrument. These cells were then adoptively transferred into EAU mice that had been immunized 4 days prior. The cells from eyes, lymph nodes and spleens were analyzed by flow cytometry The severity of retinal tissue damage was assessed by H&E staining. DCs were isolated from spleens or ocular cells from EAU mice using a CD11c+isolation kit. For anti-IL-18R treatment, NK cells were isolated from the eyes of EAU mice and were pretreated with anti-IL-18R for 24h, and then were added to the DCs, T cells or combination of DCs and T cells.
Results We found CD83+CCR7+ NK cells were increased within the eyes in the EAU mice. Both clinical and histopathological scores of eyes from mice receiving CD83+CCR7+ NK cell-transfers were greater higher than those of mice without cells transfer or those receiving CD83-CCR7- NK cell-transfers. The number of lymphocyte subsets generated, including CD4+IFN-γ+ T cells, CD4+IL-17+ T cells, CD4+GM-SCF+ T cells, CD11c+ MHC-II+ DCs and CD3-NK1.1+ cells within the eyes of mice receiving CD83+CCR7+ NK cell-transfers were greater than that in mice without a CD83+CCR7+ NK cell transfer or those with a CD83-CCR7- NK cell-transfer. Furthermore, we found CD83+CCR7+ NK cells promote maturation of DCs when CD83+CCR7+ NK cells co-cultured with immature DCs in vitro. Since it has been found that CD83+CCR7+NK cells could secrete IFN-γ to influence the statues of DCs, we used anti-IFN-γR antibody to block IFN-γR on DCs, then we found the expression levels of CD80, CD86 and CD54 in above DC were lower than non-blockage when co-cultured with CD83+CCR7+ NK cells. As IL-18 has been reported to be an important factor involved in inducing subsets of CD83+CCR7+ NK cells, we examined IL-

18 in this EAU model. IL-18, as well as IFN-γ, were significantly increased both in the aqueous humor of inflamed eyes and serum of EAU mice. When IL-18 Binding Protein (IL-18 BP) was injected into EAU mice to neutralize IL-18, the symptoms of EAU and percent of CD83+CCR7+NK cells within the eyes were decreased. Furthermore, we found Anti-IL-18R antibody treatment relieved EAU symptoms and decreasd NK cell infiltration within inflamed eyes.
Discussion Our current data provide further evidence that the increasing CD3-NK.1.1+CD83+CCR7+cells in EAU play a pathological role in the development of EAU by promoting the activation of DCs and T cells. IL-18 is a cytokine that belongs to the IL-1 super-family and is an inflammatory factor in many diseases. However, the mechanisms of IL-18 as related to uveitis remain unknown. In our study, we now provide evidence indicating that IL-18 is a pathogenic factor in EAU and provide a description for some possible mechanisms of IL-18 in uveitis. IL-18 can induce NK cell activation to secrete IFN-γ and increase expression levels of CCR7, CD83, NKG2D and CD69 on NK cells. Thus, IL-18 has the capacity to promote NK cell activity and migration to inflammatory sites, where it may then function as a critical factor in EAU through induction of CD83+CCR7+ NK cells. IL-18 is mainly produced by macrophages, neutrophils and DCs. In our experiments, we found that macrophages, neutrophils and DCs were all increased in EAU and secreted IL-18. But macrophages and neutrophils were not primary increasing cells in inflamed eyes of EAU. DCs as an important pathogenic factor for EAU, might participate in producing IL-18 to promote pathogenic CD83+CCR7+NK cell activation in the eyes of EAU. And then, these NK cells migrate into lymph nodes to promote DC maturation and T-cell activation. Thus, IL-18 might play a key role in inducing the cycle of DC maturation and NK activation. An axis may exist between DC-NK interactions to regulate Th1 responses in this EAU model. Furthermore, anti-IL-18R antibody might serve as a possible therapeutic candidate for the treatment of autoimmune uveitis.

血清自噬相关蛋白 7 在 HBV 相关肝癌中的诊断价值

卓传尚、冯惠娟、叶治、林英、陈力、彭菲、柳丽娟
福建医科大学孟超肝胆医院

目的 探讨自噬相关蛋白 7（ATG7）对乙型肝炎病毒相关肝癌（HBV-HCC）的诊断价值。
方法 采用 ELISA 技术检测 67 例 HBV-HCC、22 例非 HBV 相关肝癌（nonHBV-HCC）、50 例慢性乙型肝炎（CHB）和 20 例健康对照者（HC）血清中 ATG7 表达水平，分析各组 ATG7 及 AFP 的表达，比较 ATG7、AFP 及二者联合检测的诊断效率。
结果 HBV-HCC 组血清 ATG7 表达水平为 22.88(19.79,23.04)ng/m，显著高于 nonHBV-HCC 组（17.06 (14.45, 19.40) ng/mL）、CHB 组（19.21 (16.65, 20.82) ng/mL ）和健康对照组（13.82 (8.70, 17.82) ng/mL）；ATG7 诊断 HBV-HCC 的 AUC 为 0.818（95%CI：0.743～0.879），略高于 AFP（AUC=0.777, 95%CI：0.698~0.843）差异无统计学意义(P=0.3941)；ATG7 和 AFP 联合检测诊断 HBV 相关肝癌的 AUC 为 0.859（95%CI：0.790～0.913），显著高于 ATG7(P=0.0284）和 AFP（P=0.0379）。
结论 ATG7 是诊断 HBV 相关肝癌的良好标志物，ATG7 和 AFP 联合检测可显著提高 HBV 相关肝癌的诊断率。

OR-028

Four potential broad-spectrum neutralizing epitopes in the spike protein of SARS-CoV-2 were predicted by bioinformatics

Yunyi He[1]、Ning Zhang[1]、Ying Qu[1]、Hanyu Zhu[2]、Qiliang Liu[2]、Hongbo Liu[1]
1. The Second Affiliated Hospital of Guilin Medical University
2. College of Bio-technology, Guilin Medical University

Objectives To date, seven human coronaviruses (HCoVs) have been discovered. SARS-CoV-2 is a newly emerged HCoV, which can induce fatal pneumonia infection, and thus seriously threatens human health and life safety. Coronavirus is a single-stranded RNA virus that is susceptible to mutation, making it difficult to develop vaccines. Broad-spectrum vaccines based on conserved neutralizing epitopes can not only prevent epidemic strains, but also have broad-spectrum antiviral property. In this study, bioinformatics was used to predict broad-spectrum neutralizing epitopes of HCoVs.

Methods The spike (S) protein amino acid sequence of SARS-CoV-2 Wuhan-Hu-1 strain (GenBank ID: YP_009724390.1) was used as the template for epitope prediction. Four linear B-cell epitope prediction online servers with different algorithms, namely, ABCpred2006 (threshold: 0.51), BepiPred2.0 (threshold: 0.5), COBEpro (threshold: 0.5) and SVMTriP (default threshold), were employed to preliminarily predict the linear B-cell epitopes, and the peptide fragments were selected according to their common prediction results. To increase prediction accuracy, VaxiJen2.0 (threshold: 1.0), the online server with another different algorithm and a higher prediction accuracy rate (70%~89%), was used for further screening, shortening the peptide fragments scope by deleting the amino acid one by one, and the top three highest-scoring peptides in each scope were chosen as the candidate epitopes. The spatial position of candidate epitopes in S protein was analyzed by the PyMOL software, and the conservation of candidate epitopes was analyzed by Clustal X2 software.

Results Four potential broad-spectrum linear B cell neutralizing epitopes were predicted, which include P6(aa496-501), P12 (aa811-816), P14 (aa1163-1168) and P15 (aa1196-1201). These epitopes were all in the loop structures of SARS-CoV-2 S protein, which is the dominant structure recognized by functional antibodies. P6 was a potential cross-neutralizing epitope against SARS-CoV-2 and SARS-CoV in the RBD domain, containing four amino acids related to RBD/ACE2 binding, and its amino acid and spatial structure were highly conserved in SARS-CoV. P12 was a potential broad-spectrum neutralizing epitope against SARS-CoV-2, SARS-CoV and HCoV-OC43, located in the second cleavage site S2' of the S protein, and its amino acid was highly conserved in SARS-CoV and HCoV-OC43. P14 and P15 were located in the HR2 domain, and both contain the important amino acids related to HR2 and HR1 binding. P14 was the potential cross-neutralizing epitope against SARS-CoV-2 and SARS-CoV, and its amino acid was completely conserved in SARS-CoV. P15 might be a potential broad-spectrum neutralizing epitope against SARS-CoV-2, SARS-CoV and MERS-CoV, and its amino acid was completely conserved in SARS-CoV and highly conserved in MERS-CoV.

Conclusions In this study, bioinformatics methods were employed to predict the epitopes, and four potential broad-spectrum linear B cell neutralizing epitopes in the S protein of SARS-CoV-2 were predicted, laying a foundation for the development of HCoVs broad-spectrum vaccines.

The potential value of serum chemerin in patients with breast cancer

Xianjin Zhu、yingping cao
Fujian Medical University Union Hospital

Breast cancer (BC) is one of the most dangerous malignant diseases in females. However, the reliable serum biomarkers of BC still need to be explored. Chemerin levels have been found to be associated with different types of cancer. This study aimed to evaluate the role of serum chemerin as a biomarker of BC diagnosis, as well as the correlation between serum chemerin levels and clinicopathological features. The serum from 248 BC patients, 30 breast benign tumor patients, and 103 healthy controls were collected and serum chemerin levels were determined with enzyme-linked immunosorbent assay. We found that serum levels of chemerin in BC patients were higher than those in healthy control individuals ($P<0.05$). The area under the ROC curve (AUC) for chemerin, CA15-3 and CEA was 0.704, 0.662 and 0.581, respectively, in distinguishing between breast cancer patients from healthy individuals, and the chemerin cutoff value was 100.327 ng/ml with a sensitivity of 56.60% and a specificity of 98.10%. The AUC for chemerin + CA15-3 was 0.822, which was higher than that for chemerin + CEA and CEA + CA15-3. Moreover, serum levels of chemerin were significantly associated with histologic grade, Ki67 expression, and menopausal status. However, no significant association was found between serum levels of chemerin and age, tumor size, metastase, ER status, PR status, and HER-2 status. Overall, our study suggested that the combination of chemerin with CA15-3 achieves relatively better diagnostic performance in the breast cancer. Elevated serum chemerin is associated with Ki67 expression levels and histologic grade.

2,5-dimethylcelecoxib improves immune microenvironment of hepatocellular carcinoma by promoting ubiquitination of HBx-induced PD-L1

Zhanfei Chen[2]、Haijian Tu[1]、Liumin Yu[1]、Nanhong Tang[3]
1. The Affiliated Hospital of Putian University
2. The Affiliated Hospital of Putian University, Putian Univeristy
3. Department of Hepatobiliary Surgery and Fujian Institute of Hepatobiliary Surgery, Fujian Medical University Union Hospital

Background 2,5-dimethylcelecoxib (DMC) is a targeted inhibitor of microsomal prostaglandin E synthase-1 (mPGES-1), a key enzyme in the PGE2 synthesis pathway of inflammatory mediators. Previous studies have confrmed that DMC can inhibit the growth of hepatitis B virus (HBV)-related hepatocellular carcinoma (HCC). However, it is not known whether DMC is involved in the changes of tumor immune microenvironment.
Methods In this study, we explored the effects of DMC on HBV-related HCC immune microenvironment, and deeply analyzed its unique effect and mechanism on programmed death receptor 1 (PD-1)/and its ligand 1 (PD-L1) pathway.
Results Clinical hepatoma tissues detection showed that compared with non-virus-related HCC, the level of CD8 of HBV-related HCC was signifcantly lower, while the levels of PD-L1 and CD163 were higher. In vivo experiments indicated that DMC could increase the level of tumor infltrating CD8+ T cells in hepatitis B virus X (HBx) (+) hepatoma cells implanted mouse models, and inhibit the expression of PD-L1 and CD163 in tumor tissues. DMC combined with atezolizumab had more signifcant antitumor effect and stronger blocking effect on PD-1/PD-L1 pathway. Mechanism studies have shown that DMC can promote ubiquitin degradation of HBx-

induced PD-L1 protein in HCC cells by activating adenosine 5′-monophosphate-activated protein kinase pathway. Further experiments confrmed that this process was mainly mediated by E3 ligase RBX1.
Conclusions Our results uncover a role for DMC in promoting HBV-related HCC immune microenvironment, which not only enrich the relationship between inflammatory factors (mPGES-1/PGE2 pathway) and immunosuppression (PD-L1), but also provide an important strategic reference for multitarget or combined immunotherapy of HBV-related HCC.

Exosomal circPACRGL promotes progression of colorectal cancer via the miR-142-3p/miR-506-3p- TGF-β1 axis

Anquan Shang 、Dong Li
Tongji Hospital of Tongji University

Background Colorectal cancer (CRC) is the leading cause of cancer-related death worldwide. Exosome shave emerged as crucial regulators of intercellular communication and that abundant Circular RNAs (circRNAs) are enriched within exosomes. CircRNAs are novel members of noncoding RNAs regulating cancer proliferation and progression. However, the function and regulatory mechanism of cancer-derived exosomal circRNAs in CRC remains unclear.
Methods CRC cells-derived exosomes were characterized using transmission electron microscopy, nanoparticle tracking analysis (NTA) and western blot. CCK-8, wound healing and transwell assays, and flow cytometry assays were conducted to assess whether exosomes would affect the proliferation, metastasis, and apoptosis of CRC cells, respectively. Moreover, we performed the RNA sequencing and RT-qPCR to identify circRNAs in exosome-stimulated CRC cells. Fluorescence in situ hybridization (FISH) assay was used to detect the cellular distribution of circPACRGL. Bioinformatic analyses (StarBase 2.0) were used to pool the miRNA targets of circPACRGL. Luciferase assays were performed to verify the direct interaction. Finally, flow cytometry was used to detect the differentiation of N1-N2 neutrophils.
Results Our study identified a novel CRC-derived exosomal circRNA, circPACRGL. We found circPACRGL was significantly upregulated in CRC cells after tumor-derived exosomes addition. Moreover, circPACRGL serves as a sponge for miR-142-3p/miR-506-3p to facilitate the transforming growth factor-β1 (TGF-β1) expression. As a result, circPACRGL promoted CRC cell proliferation, migration and invasion, as well as differentiation of N1 to N2 neutrophils via miR-142-3p/miR-506-3p-TGF-β1 axis.
Conclusion Our study, the first to reveal that cancer-derived exosomal circPACRGL plays an oncogenic role in CRC proliferation and metastasis, providing mechanistic insights into the roles of circRNAs in CRC progression and a valuable marker for CRC treatment.

Genetic testing and clinical relevance of patients with thoracic aortic aneurysm and dissection in northwestern China

Liu Yang、jinjie li、yanjun diao、lei zhou、yijuan xin、rui li、juan wang、jiayun liu
Air force medical uiversity xijing hospital

Thoracic aortic aneurysm and dissection (TAAD) is a life-threatening pathology that remains a challenge worldwide. Up to 40% of TAAD cases are hereditary with complex heterogeneous genetic backgrounds. The purposes of this study were to determine the diagnostic rate of patients with TAAD, investigate the molecular pathological spectrum of TAAD by next-generation

sequencing (NGS), and explore the future preclinical prospects of genetic diagnosis in patients at high-risk of study.
METHODS NGS was used to screen 15 genes associated withgenetic TAAD in 212 patients from northwestern China. Clinical data of patients were gathered by Electrocardiography, transthoracic echocardiography and computed tomography.
RESULTS Of the 212 patients, 67 (31.60%) tested positive for a (likely) pathogenic variant, 42 (19.81%) had a variant of uncertain significance (VUS), and 103 (48.58%) had no variant (likely benign/benign/negative). A total of 135reportable variants were detected in our test, among which 77(57.04%) are first reported in this paper.

ddPCR 检测循环肿瘤 DNA 甲基化水平在肝细胞性肝癌诊断中的应用

王娟[1]、杨柳[1]、刘家云[1]、刁艳君[1]、郑良宏[2]、张康[3]、马越云[4]、郝晓柯[1]
1. 空军军医大学西京医院
2. 广州优泽生物技术有限公司
3. 澳门科技大学医学院
4. 解放军空军总医院检验科

近年来，一些新型蛋白质生物标志物、基因突变位点和表观遗传修饰常用于分子诊断癌症。作为一种非侵入性液体活检分析新策略，循环肿瘤 DNA(circulating tumor DNA，ctDNA)甲基化异常的分析在多种癌症的早期诊断中已有大量研究，其中也包括原发性肝细胞性肝癌(hepatocellular carcinoma,HCC)。本研究旨在通过基于数字微滴聚合酶链反应(digital droplet PCR, ddPCR)的检测方法，评价甲基化探针 cg23612220 在肝癌早期诊断中的应用。方 法 采集原发性肝癌患者 97 例，健康人 80 例，慢性肝炎 46 例。提取 ctDNA 并进行亚硫酸氢盐转化，利用 ddPCR 方法定量 DNA 甲基化水平。结 果 我们分析了不同健康状况下 cfDNA 含量的变化。肝细胞癌组 cfDNA 含量明显高于健康对照组。随后，我们研究了与肝癌病情进展相对应的外周游离 DNA 甲基化比率的动态变化。在晚期(BCLC C)和晚期(BCLC D)也检测到较高的游离 DNA 甲基化状态和 DNA 含量。另外，我们还探讨了甲基化标签 cg23612220 对肝癌诊断的价值。在肝癌的诊断中，结合 AFP 水平和 cfDNA 含量，采用 15.70%的 DNA 甲基化为 cutoff 值检测 HCC、慢性肝炎和健康个体之间的甲基化状态差异，敏感性为 78.57%，特异性为 89.38%，诊断正确率为 89.27% 。

Serum GFAP, NfL, and UCHL1 as potential biomarkers of disease activity in AQP4-IgG+NMOSD

Jinyang Wang[1,2]、Jianan Wang[3]、Ruibing Li*[1]、Chengbin Wang*[1,2,3]
1. 中国人民解放军总医院第一医学中心检验科
2. 潍坊医学院医学检验学院
3. 解放军医学院

Objective Neuromyelitis optica spectrum disorder(NMOSD) is a frequently disabling neuroinflammatory syndrome with a relapsing course. Blood tests to monitor disease activity in NMOSD have not been developed. Here, we investigated the potential of serum glial fibrillary acidic protein(GFAP), neurofilament light chain(NfL), Tau protein and Ubiquitin C-terminal hydrolase L1(UCHL1) levels in NMOSD with aquaporin-4 antibody-positve(AQP4-IgG+NMOSD), myelin oligodendrocyte glycoprotein-antibody-associated disease(MOGAD) and multiple sclerosis(MS).

Methods Using ultra sensitive single molecule array(simoa), levels of sGFAP, sNfL, sTau and sUCHL1 were measured in a prospective cohort of 29 AQP4-IgG+ NMOSD, 13 MOGAD, 20 MS and 9 healthy controls(HCs). Serum biomarker levels were compared between patients in relapse and remission stages, and the correlation with clinical parameters in the AQP4-IgG+NMOSD group was further determined using multiple linear-regression.
Results The median levels of sGFAP[155.11pg/ml, p<0.0001], sNfL[10.71pg/ml, p=0.0001] and sUCHL1[14.34pg/ml, p=0.001] were significantly higher in the AQP4-IgG+NMOSD group than those in HCs group[sGFAP, 61.89pg/ml; sNfL, 5.28pg/ml; sUCHL1, 4.90pg/ml]. sUCHL1 levels in the AQP4-IgG+NMOSD group[14.34pg/ml] were higher compared to those in MOGAD groups[6.48pg/ml, p=0.02] and MS groups[8.51pg/ml, p=0.038]. For AQP4-IgG+NMOSD subgroups, sGFAP [233.29pg/ml, p=0.001], sNfL[18.35pg/ml, p=0.002] and sUCHL1[16.76pg/ml, p=0.004] levels remarkably increased during relapse. Meanwhile, patients in MOGAD relapse stage displayed higher sGFAP[144.27pg/ml] and sNfL[10.46pg/ml] levels than those in the remission stage[59.28pg/ml, 4.75pg/ml, all p<0.05], but only sNfL[21.29pg/ml, p=0.017] levels distinguished patients with MS in relapse from those in remission. During relapse in these disease groups, both sGFAP[233.29pg/ml, p=0.044] and sUCHL1[16.76pg/ml, p=0.007] levels were significantly higher in the AQP4-IgG+NMOSD group than those in MS group[136.72pg/ml, 9.00pg/ml, respectively], while only elevated sUCHL1 levels can discriminate the relapse stage of AQP4-IgG+NMOSD group from that of MOGAD group[6.48pg/ml, p=0.004]. Univariate and multiple analysis indicated that sGFAP and sNfL levels were higher in patients with brain lesions and sUCHL1 levels was higher in those with spinal cord lesions during a recent relapse. Additionally, combination with sGFAP, sNfL and sUCHL1 can significantly improved the diagnosis of AQP4-IgG+NMOSD[AUC=0.771, sensitivity:58.62%, specificity:90.24%, p<0.001].
Conclusions These findings suggest that sGFAP, sNfL and sUCHL1 can monitor AQP4-IgG+NMOSD disease activity, and were associated with phenotype of the recent relapse. Besides, sUCHL1 levels can exhibit good discrimination between these disease, and the combiation with sGFAP, sNfL and sUCHL1 can significantly improve AQP4-IgG+NMOSD diagnostic efficacy.

OR-035

Prognostic and immunological role of inhibin B receptor in lung adenocarcinoma: A study based on bioinformatics analysis

Guoying Zou、Ying Wu
The Second People's Hospital of Hunan Province

Objective Inhibin B (INHBB) is one of the transforming growth factor β (TGF-β) superfamily, consisting of α (INHA) and βB (INHBB) subunits. INHB is mainly secreted by germ cells, and acts as a negative feedback regulator of Follicle-stimulating hormone (FSH).The β subunit combines specifically with the activin receptor type-2 (ACVR2)， performs biological functions by competitively inhibiting the pathway of Activin (ACT). The study found that transforming growth factor β recetor 3 (TGFBR3) binds to a convex α subunit on the surface of INHB, and enhances the binding affinity of ACVR2A/B to INHβ subunit. So INH-ACVR2A/B-TGFBR3 can form a high affinity ternary complex that antagonizes ACT signal transduction. The research of INHB in oncology is largely limited to reproductive system tumors. Our previous research has found INH βB inhibited invasion and metastasis of nasopharyngeal carcinoma cells thought TGF-β/Smads signaling pathway. This study aimed to visualize the prognostic landscape of INHB subunit and its receptors in lung adenocarcinoma (LUAD) and investigate the relationship between INHB subunit and its receptors expression and immune infifiltration.
Methods INHB subunit and its receptors(INHA, ACVR2A, ACVR2B, INHBB, TGFBR3) expression were primarily screened in LUAD tissues and normal tissues from

Oncomine, UALCAN and GEPIA databases, and further analyzed the correlation between the expression of INHB and its receptors and the prognosis of LUAD patients using Kaplan–Meier plots database. Then, we investigated the functional relevance of INHB and its receptors in LUAD across CancerSEA database, and further validated the differential expression and co-expression of INHB in metastasis samples of LUAD from HCMDB database. And the proteins network with TGFBR3 and co-expression proteins were also built using the online STRING website, functional annotation and enrichment analysis of genes were performed. Meanwhile, we investigated the relationships between TGFBR3 expression and infiltrated immune cells and their corresponding gene marker sets with TIMER databases.
Results INHB subunit and its receptors(INHA, ACVR2A, ACVR2B, INHBB, TGFBR3) expression were differential in LUAD tissues and normal tissues ($P < 0.01$). The expression of INHA, ACVR2A, ACVR2B, INHBB were up-regulated while the expression of TGFBR3 was down-regulated in LUAD tissues. Only INHA, ACVR2A, and TGFBR3 expression levels were closely associated with high-grade malignancy and advanced TNM stage ($P < 0.05$). High INHA expression levels were significantly associated with poor overall survival (OS) and the expression of ACVR2A and TGFBR3 were the opposite in LUAD patients. The expression of TGFBR3 was negatively correlated with the metastasis of LUAD probably mainly through the regulation of lipolysis in adipocytes and PI3K-Akt signaling pathway.Univariate and multivariate analysis indicated the overall survival of LUAD cases with low TGFBR3 level is shorter than those of patients with high TGFBR3 expression ($P < 0.05$). LUAD with TGFBR3 deficiency presented the paucity of infiltrated immune cells and their matching marker sets.
Conclusion The expression of TGFBR3 was down-regulated and negatively correlated with the metastasis in LUAD. Deficient TGFBR3 expression was related to disease progression and poor prognosis, as well as impaired infiltration of immune cells in LUAD.

OR-036

Thrombin-activated platelets induce vascular endothelial leakage by a PECAM-1-dependent mechanism

Liqin Ling、Jing Zhou
West China Hospital, Sichuan University

Objective Acute lung injury (ALI) has a high mortality as it causes pulmonary vascular endothelial leakage leading to acute lung edema. It has been known that platelets can contribute to vascular endothelial leakage during ALI, therefore in this study, we aimed to figure out the mechanism involved in this process.
Methods Mice were injected intraperitoneally with lipopolysaccharide (0.1 mg/kg), followed 24 h later by intravenous injection of anti-H2d antibody (1 mg/kg), to creat ALI models. A custom-designed intravital confocal microscopy system was developed to study the pulmonary vasculature in vivo. Platelet, or its agonist (thrombin) or antagonist (anti-Pselectin, anti-PECAM1 or anti-GPIIbIIIa) was injected intravenously.
Results Thrombin injection could aggravate ALI endothelial leakage, blocking its activation on platelets (protease-activated receptor-4 antagonist) could interrupt this reaction. In vitro assay showed that thrombin-activated platelets could adhered to the lumen surface of pulmonary vascular endothelial cells, leading to intercellular junction breakage and cellular contraction, forming endothelial leakage, while thrombin or platelets alone didn't have this effect. Furthermore, by utilizing a self-developed device, which supported direct visual observation and/or video recording of cell-cell interactions in the pulmonary microvasculature under confocal intravital microscopy, we found that the number of adhesion platelets on pulmonary vascular endothelium was associated with the severity of endothelial leakage. While PECAM-1 antagonist could block this adhesion and reduce endothelial leakage, P-selectin antagonist or GPIIbIIIa antagonist did not have this effect. Moreover, by immunofluorescence techniques, only PECAM-1 was found to be localized at the edge of activated platelets, mainly at where the platelet-endothelium

adherence existed. P-selectin was found to be evenly distributed on activated platelets, mainly protruded towards the vascular lumen of the vessel, supporting its role in mediating the interaction between activated platelets and neutrophils in the vessels. GPIIbIIIa was found at where platelet aggegation existed, demonstrating its well-known role in hemostasis.
Conclusions With all the results above, we concluded that thrombin-activated platelets might induce vascular endothelial leakage by a PECAM-1-dependent mechanism in ALI mice, although we have yet to figure out the mechanism of how PECAM-1 signal mediates endothelial leakage.

Risk predictive value of antiphosphatidyserine-prothrombin complex antibodies in lupus anticoagulant-positive patients

Yaxin Chu、Rui Qiao
Peking University Third Hospital

Objective To investigate the risk prediction value of antiphosphatidylserine/prothrombin complex antibodies(aPS/PT) in the clinical events of the patients with positive lupus anticoagulant(LA).
Methods A total of 167 patients with LA positive tested for two or more times at intervals of 12 weeks or more were enrolled in the study from Peking University Third Hospital from January 2018 to September 2019. The patients were divided into the group with clinical events(n=115) and group without clinical events(LA carrier group, n=52), and the former were divided into the thromboembolism(TE)group (n=18), adverse pregnancy outcome(APO) group(n=91) and TE+APO group(n=6). The anticardiolipin antibody(aCL), anti-β2glycoprotein I antibody(anti-β2 GPI) and aPS/PT of the patients were detected by the chemiluminescence immunoassay, and the results among different groups were compared.
Results The aPS/PT IgG positive rate(37.4% vs 9.6%, P<0.001) and the concurrence of aPS/PT IgG and IgM positive rate(31.3% vs 5.8%, P<0.001) in the clinical event group were significantly higher than in the LA carrier group. Besides, the titres of aPS/PT IgG in clinical event group was significantly higher than LA carrier group[16.050（5.100～73.083）units] vs[16.914（14.736～24.646）units], P=0.881). The clinical event group can be further divided into thromboembolism group(TE, n=18), adverse pregnancy outcomes group(APO, n=91) and the concurrence of two events group(TE+APO, n=6). Compared with LA carrier group(9.6%), the positive rate of aPS/PT IgG in TE+APO (100.0%), TE (55.6%) and APO (29.7%) were significantly higher, P<0.05. And the titres of aPS/PT IgG in TE+APO[150.000（89.305～150.000）units], TE [54.654（12.093～135.943）units] were significantly higher than LA carrier group [(16.359（14.737～24.473）units], P<0.05. The positive rate of aPS/PT IgM was only significantly higher in TE+APO (100.0%) than in the LA carrier group(38.5%), P<0.05, the titres of it was significantly higher in TE+APO than in LA carrier group[116.395（82.663～150.000）units] vs [40.871（15.925～127.643） units, P<0.05]. The positive rate of the concurrence of aPS/PT IgG and IgM were significantly higher in TE+APO(100.0%), TE(44.4%) and APO(24.2%) than in LA carrier group(5.8%), P<0.05. Positivity of aPS/PT showed good consistency with triple positive group of antiphospholipid antibodies profiles(aCL, aβ2GPI and LA), Kappa=0.114，P=0.012. And the titres of aPS/PT IgG and IgM in triple positive group [30.617（5.100～150.000）units], [76.212（33.420～150.000） units] were significantly higher than in only LA positive group[15.143（14.690～17.004）units], [13.458（9.598～20.611） units], P<0.05.
Conclusions The risk of clinical events of APS patients is increased in the cases of aPS/PT and LA positive, aPS/PT has the value of risk stratification for LA positive patients.

血浆中 D-二聚体和 IL-6 与抗 PD-1 治疗晚期 NSCLC 的疗效和 PFS 相关性研究

陈冲
天津医科大学肿瘤医院

目的 寻找预测抗 PD-1 治疗晚期 NSCLC 患者的疗效和 PFS（无进展生存期）的外周血生物标志物，用来指导抗 PD-1 治疗方案调整，为 NSCLC 患者带来更大的临床获益；
方法 系统回顾 2018 年 1 月至 2021 年 4 月期间在天津医科大学肿瘤医院住院接受抗 PD-1 治疗（纳武利尤单抗（O 药）、帕博丽珠单抗（K 药）信迪利单抗和卡瑞丽珠单抗）的 103 名晚期或复发性 NSCLC 患者。记录患者的临床病理特征：包括开始治疗时的年龄、性别、ECOG PS、治疗线、吸烟史、放疗史、临床分期（根据国际肺癌研究协会指南第七版）、驱动肿瘤基因突变状态、组织学、BM、血清 Alb、血清 LDH、肺部肿瘤标志物（CEA、CYFR21-1 和 SCC 等）、血清炎症标志物-NLR、dNLR、 PLR、IL-6 和血浆中纤溶指标：D-dimer，利用 SPSS16.0 分析患者的临床病理特征与抗 PD-1 治疗晚期 NSCLC 患者的疗效和 PFS 相关性。
结果 仅有 85 名患者（82.5%）进行驱动肿瘤基因突变（EGFR 或 ALK）检测。仅有 86 名患者（83.5%）进行 PD-L1 肿瘤表达检测。IL-6 和 D-dimer 可以预测抗 PD-1 治疗 6-8 周的治疗效果临床价值，AUC 面积对应 0.765 和 0.804。利用新的 cut-off 值建立抗 PD-1 治疗 NSCLC 的 PFS 预测模型：利用 IL-6 ≥ 8.03 pg/mL 为“1”分，IL-6 ＜ 8.03 pg/mL 为“0”分；DD ≥ 917.2 ng/dL 为“1”分，DD ＜917.2 ng/dL 为“0”分；将 103 例研究对象分为：0 分、1 分和 2 分三组，比较三组抗 PD-1 治疗的 PFS。结果表明联合 IL-6 和 D-dimer 评分，评分越高，PFS 时间越短。
结论 联合应用炎症指标（IL-6）和纤溶指标（D-dimer）评分可以预测抗 PD-1 治疗 NSCLC 患者的疗效。

急性中毒患者血栓弹力图和常规凝血指标检测的相关性及应用分析

闫彬、翟素平、胡天喜
南阳市中心医院

目的 探讨急性中毒患者血栓弹力图（TEG）和常规凝血指标检测之间的一致性。**方法** 回顾性分析 102 例急性中毒患者的 TEG 和常规凝血指标参数。
结果 （1）中毒后继发肝功能损害组的 R 值显著高于非肝功能损害组，而继发心肌损伤组的 MA 值和 G 值均显著高于非心肌损伤组；（2）PLT 值与 MA 值、CI 值和 G 值之间均呈正相关（r 分别为 0.397、0.234、0.401，P 均<0.05）；APTT 值与 R 值呈正相关（r=0.323，P=0.001），与 CI 值呈负相关（r=-0.201，P=0.043）；TT 值与 Angle 值、MA 值、CI 值和 G 值之间均呈负相关（r 分别为-0.197、-0.246、-0.232、-0.242，P 均<0.05）；FIB 值与 MA 值和 G 值之间均呈正相关（r 分别为 0.335、0.332，P=0.001）；（3）在评估患者低凝状态时，PLT 值和 MA 值、PLT 值与 CI 值之间具有一致性（κ 分别为 0.243、0.203，P 均<0.05）；TT 值和 CI 值之间具有一致性（κ=0.224，P=0.020）；FIB 值与 K 值、FIB 值与 MA 值之间具有一致性（κ 分别为 0.193、0.213，P 均<0.05）。FIB 值与 Angle 值、FIB 值和 MA 值之间在评估患者高凝状态时具有一致性（κ 分别为 0.214、0.274，P 均<0.05）；（4）PLT 值判断 MA 值<50mm 的敏感度和特异度分别为 99.0%、81.5%，AUC 为 0.933；FIB 值判断 MA 值<50mm 的敏感度和特异度分别为 70.0%、70.7%，AUC 为 0.678。

结论 TEG 和常规凝血指标检测在急性中毒患者中的相关性较弱，两者在评估患者低凝状态时的一致性较好。常规凝血指标对预测 TEG 检测的低凝结果价值较大，但不能取代 TEG 检测，两者联合应用将有助于更好地评估急诊中毒患者的凝血状态，预防出血事件。

一例复合杂合突变导致的遗传性凝血因子 XII 缺陷症家系分析

陈静
成都市新都区人民医院

目的 分析 1 例遗传性凝血因子Ⅻ（FⅫ）缺陷症家系的临床表型及基因突变情况，探讨其分子致病机制。
方法 检测先证者及其家系成员（共 3 代 5 人）血浆凝血酶原时间（PT）、活化部分凝血活酶时间（APTT）、纤维蛋白原含量（FIB）、D-D 二聚体（D-D）、凝血因子 XII 促凝活性（FXII:C）和凝血因子 FXII 抗原（FXII:Ag）等凝血指标。采用高通量测序方法分析先证者 F12 基因所有的外显子编码区及外显子-内含子交界处的基因突变情况，对检出的可疑致病突变进行 Sanger 测序验证，并对家系成员的相应突变位点进行检测。采用 Mutation Taster 在线生物信息学软件预测突变位点对蛋白功能的影响。
结果 先证者 APTT 结果为 180.9s，明显延长；FXII:C 和 FXII:Ag 分别降低至 0.8%和 4.17%。高通量测序分析发现先证者 F12 基因存在复合杂合突变，即第 11 号外显子 c.1261G＞T 杂合无义突变（p.Glu421*）和第 4 号外显子 c.251dupG 杂合移码突变(p.Trp85fs)。这两个突变均为功能缺失型突变，将导致蛋白质合成提前终止，产生丧失重要功能区域的截短蛋白，具有极强的致病性；Mutation Taster 软件预测这两个突变均为致病突变。Sanger 测序家系验证结果显示，先证者 c.1261G＞T 杂合突变遗传自其母亲，其哥哥和女儿均为 c.1261G＞T 杂合突变携带者。在此家系中基因检测结果与血液学检查结果相符，即基因型和表型共分离。
结论 F12 基因第 11 号外显子 c.1261G＞T 杂合无义突变和第 4 号外显子 c.251dupG 杂合移码突变是该家系遗传性凝血因子Ⅻ缺陷症的分子发病机制，这两个突变均为国际上首次报道的新突变。

全自动血细胞分析仪高敏体液模式快速识别胸腹水恶性肿瘤细胞的价值探讨

龚继涛、曲林琳
吉林大学第一医院

目的 探讨全自动血细胞分析仪高敏体液（hsA）模式对胸腹水游离肿瘤细胞的快速识别价值。
方法 收集 2021 年 1 月~3 月在吉林大学第一医院检验科行脱落细胞学检查的胸腹水标本 100 份，应用全自动血细胞分析仪 hsA 模式检测胸腹水标本中高荧光细胞百分比（HF%）和高荧光细胞绝对值（HF#）。依脱落细胞学检查结果分为肿瘤细胞阳性组和肿瘤细胞阴性组，比较两组间 HF%和 HF#的差异；通过受试者工作特征（receiver operating characteristic，ROC）曲线分析 HF%和 HF#筛查胸腹水游离肿瘤细胞的 cutoff 值、灵敏度、特异度、阳性预测值和阴性预测值，评价 HF%和 HF#与脱落细胞检查的一致性。
结果 ①100 份胸腹水标本中，脱落细胞学检查肿瘤细胞阳性 69 份，肿瘤细胞阴性 31 份，阳性组 HF#和 HF%水平显著高于阴性组，差异具有统计学意义（P<0.05）；②HF#检出肿瘤细胞 cutoff 值为 27.65×106/L 时，最大曲线下面积（AUC）为 0.824，灵敏度为 69.57%，特异度为 93.55%，阳性预测值为 96.00%，阴性预测值为 58.00%；HF%检出肿瘤细胞 cutoff 值为 2.05%时，AUC 为 0.856，灵敏度为 81.16%，特异度为 77.42%，阳性预测值为 88.89%，阴性预测值为 64.86%；③HF#、HF%与脱落细胞学检查结果的 Cohen’s kappa 系数分别为 0.54、0.56，95%置信区间分别为 0.385-0.727（P<0.001）、0.385-0.727（P<0.001）。
结论 希森美康 XN9000 全自动血细胞分析仪 hsA 模式下检测高荧光细胞对胸腹水游离肿瘤细胞具一定的筛查作用，与脱落细胞学检测结果具有一定程度的相关性，在临床工作中应依据筛查目的、人群与疾病的分布特点对 HF#和 HF%的 cutoff 值做出一定调整，以提高筛查效果。

血小板-中性粒细胞聚集体与中性粒细胞胞外诱捕网及深静脉血栓形成的关系研究

周景艺、张艺镜、沈薇
上海交通大学医学院附属仁济医院

目的 分析深静脉血栓 (deep venous thrombosis, DVT) 患者体内血小板-中性粒细胞聚集体（Platelet-Neutrophil Aggregates，PNAs）和中性粒细胞胞外诱捕网 (neutrophil extracellular traps, NETs)的量化关系，明确 PNAs 在 NETs 形成中的作用以及 NETs 在 DVT 产生中的价值，同时摸索 PNAs 形成的生理条件。
方法 采集 20 例深静脉血栓患者（DVT 组）和 20 例正常对照（正常对照组）新鲜枸橼酸钠抗凝全血。检测血浆游离 DNA、血小板-中性粒细胞聚集体（PNAs）以及血小板活化水平。比较两组上述三个指标之间的差异，明确 PNAs 与 NETs 的量化关系以及两者在 DVT 中发挥的作用。分离正常人外周血中性粒细胞和血小板，在血小板中加入不同种类和不同剂量的血小板诱导剂活化后，加入分离所得的中性粒细胞共孵育，通过涂片染色计数 PNAs 的数量，同时检测上清液中游离 DNA 水平，进而明确不同种类和不同浓度的血小板诱导剂对 PNAs 形成的影响，摸索 PNAs 体外形成的最佳条件。
结果 对 DVT 组和正常对照组两组人群的 PNAs、血小板活化以及血浆游离 dsDNA 水平进行统计学分析和比较，发现 DVT 患者的 PNAs 表达明显上升。DVT 组的总血小板活化水平也显著高于正常对照组。 PNAs 的表达与血小板的活化呈正相关。同时，DVT 患者的游离 dsDNA 水平显著高于

正常对照组，且 dsDNA 水平与 PNAs 水平呈现明显的正相关性。体外研究表明，血小板诱导剂 ADP 可诱导体外 PNAs 的形成以及 NETs 的产生，且呈现时间和浓度依赖性，同时 ADP 诱导的血小板活化所产生的 NETs 水平显著高于花生四烯酸诱导的血小板活化所产生的 NETs。
结论 DVT 患者体内 PNAs 的存在与 NETs 的产生密切相关。血小板活化是 PNAs 形成以及 NETs 产生的前提基础。

核心抗体定量在乙肝相关慢加急性肝衰竭中的表达水平及与预后的关系

李静[1]、龚启明[2]、谢培琳[1]、林君玉[1]、陈嘉[1]、韦栋[1]、于德敏[1]、韩悦[1]、张欣欣[1]
1. 上海交通大学医学院附属瑞金医院临床病毒室
2. 上海交通大学医学院附属瑞金医院感染科

目的 研究乙肝相关慢加急性肝衰竭（HBV-ACLF）患者血清核心抗体定量（qAnti-HBc）的表达水平及与预后的关系。
方法 选取上海交通大学附属瑞金医院 2014 年 1 月-2019 年 12 月 HBV-ACLF 患者 168 例（88 例为训练集，80 例为验证集），和同期慢性乙型肝炎（CHB）患者 216 例（对照组），比较两组 qAnti-HBc 水平。进一步比较 HBV-ACLF 患者生存组与死亡组 qAnti-HBc 水平，建立预后模型，并在验证集验证。动态观察 16 例 HBV-ACLF 组患者入院后 1 月内，3 月，6 月，9 月，12 月时 qAnti-HBc 的变化。
结果 HBV-ACLF 组血清 qAnti-HBc 水平明显高于 CHB 组。HBV-ACLF 患者中，qAnti-HBc 水平在生存组明显高于死亡组，血清 qAnti-HBc 水平与 MELD 评分呈轻度负相关。HBV-ACLF 组患者中合并其他感染患者相比未合并者血清 qAnti-HBc 水平明显降低；合并肝性脑病患者相比未合并者 qAnti-HBc 水平明显降低；合并肝肾综合征患者相比未合并者 qAnti-HBc 水平明显降低；在有无肝硬化患者中无明显统计学差异。ROC 曲线提示血清 qAnti-HBc 水平对 HBV-ACLF 的预后预测价值与 MELD 评分相当。 进一步建立包含 qAnti-HBc 在内的预测模型，预测价值明显优于 MELD 评分，且在验证组中加以验证。16 例 HBV-ACLF 患者在入院 1 月内 qAnti-HBc 水平无明显变化，3 月时显著下降，6 月时再次下降，后趋于稳定。
结论 HBV-ACLF 患者 qAnti-HBc 水平显著高于 CHB 患者，在 HBV-ACLF 患者中，生存组明显高于死亡组，qAnti-HBc 水平对 HBV-ACLF 患者预后的预测价值与 MELD 相当。随着 HBV-ACLF 患者病情好转，于第 3 月和第 6 个月时明显下降，后趋于稳定。

一个基于临床检验的银屑病分型诊断模型

高骞
中南大学湘雅医院

目的 通过调查银屑病患者的临床资料及临床检验，分析相关性，探究临床检验项目在银屑病分型中的作用；选取相关性显著的临床检验项目进行机器学习，建立银屑病分型的预测模型并对模型进行评价。
方法 采用回顾性研究的方法，分析自 2016 年 11 月至 2021 年 3 月于中南大学湘雅医院皮肤科门诊就诊，诊断为“银屑病”患者的临床资料及各项临床检验。以银屑病的不同类型为变量进行与临床检验项目之间的描述性、显著性及相关性分析；最后利用检验项目与疾病类型的高度相关性进行机器学习，建立预测模型。

结果 分析 291 例银屑病患者，PASI（Psoriasis lesions area and severity of the disease index，银屑病皮损面积和病情严重程度指标）评分最低 0.3，最高 48.3，BSA（The surface area of the affected body，受累体表面积）评分最低 0，最高 93，通过 K-W H 检验发现年龄、PTGA（A doctor's general assessment of a condition，医生对病情的总体评估）、BSA 评分、风湿全套检验和皮肤病生活质量评分具有统计学意义，将这些指标并加入一些填充率较高（45%）的项目进行建模，发现分型诊断预测模型效果较好。
结论 在这项研究中可以发现银屑病患者通过一些临床检验指标可以建立预测模型，模型的效能良好，在测试集中可以区分出银屑病的分型情况，由此可见建立的模型可以对免疫性疾病银屑病的分型具有重要作用且效果好，该模型可以用于银屑病分型。

Pancreatic stellate cells regulate branched-chain amino acid metabolism in pancreatic cancer

LU QIAO
Tianjin Medical University Cancer Institute and Hospital

Background Pancreatic ductal adenocarcinoma (PDAC) is the most lethal malignancy: it has a 5-year survival rate of less than 9%. Although surgical resection is an effective treatment for PDAC, only a small number of patients can have their tumors surgically removed. Thus, an urgent need to find new therapeutic targets for PDAC exists. Understanding the molecular mechanism of PDAC development is essential for the treatment of this malignancy. This research aimed to study the mechanisms of pancreatic stellate cells (PSCs), which regulate branched-chain amino acid (BCAA) metabolism in PDAC.
Methods Differentially expressed proteins were detected via nanoliquid chromatography coupled to mass spectrometry (nano-LC-MS/MS). Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment methods were used to find the valine-leucine-isoleucine (BCAA) degradation pathway. The levels of BCAAs in the sera and tissues of patients with PDAC were measured by using nuclear magnetic resonance (NMR). The functions of BCAA concentrations and the effects of activated pancreatic stellate cells (aPSCs) were also evaluated by performing Cell Counting Kit-8, colony formation, and wound healing assays.
Results A total of 1,519 proteins with significantly differential expression were discovered in PDAC and adjacent tissues by using nano-LC-MS/MS. KEGG pathway enrichment analysis identified the BCAA degradation pathway. The content of BCAA in PDAC clinical samples was up-regulated. However, the addition of different concentrations of BCAA to PDAC cell culture medium failed to promote the proliferation and migration of PDAC cells. Given that analysis based on The Cancer Genome Atlas database showed that the number of aPSCs gradually increased with the progression of PDAC, the effects of aPSCs on PDAC cells were explored. After coculture with aPSCs, PDAC cell proliferation showed a significant increase, and the proteins involved in the BCAA degradation pathway in PDAC cells had also changed.
Conclusions aPSCs could regulate BCAA metabolism to enhance the progression of PDAC, indicating that the regulation of BCAA metabolism may serve as a new therapeutic direction for PDAC.

lncRNA profiles enable prognosis prediction and subtyping for esophageal squamous cell carcinoma

Shujun Zhang、Chuanxin Wang
The Second Hospital of Shandong University

Objective Esophageal Cancer (EC) ranks seventh and sixth in terms of incidence and mortality in the world, respectively. Although various therapies are used to treat EC, the long-term outcome is still dismal. The prognostic power of traditional prognostic factors such as sex, smoking and alcohol history are very limited. Therefore, Novel prognostic markers might be helpful for better clinical outcome prediction. Growing evidence has suggested that lncRNA profiles can provide important prognostic information for patients with cancer. We aim to explore the role of lncRNA in EC prediction and subtyping.

Method We used publicly available TCGA RNA-seq expression data and focused on evaluating the potential usefulness of lncRNA markers for EC surveillance and the efficacy. We first identified EC-specific lncRNA signatures by DESeq2 package. Then, we applied Kaplan-Meier (KM) method combined univariate cox proportional hazards regression (UniCox) method to single out prognostic lncRNAs. Combined the differential and prognostic lncRNAs, we develop a prognostic model using cox stepwise regression analysis. Time-dependent ROC for 3-year and 5-year survival were predicted by lncRNA model, TNM stage, lymph node metastasis, distant metastasis, and all combined. We further generated a lncRNA-based molecular classification of EC using an unsupervised clustering method (k-means). Last, we found that a novel lncRNA AC007128.1 was upregulated in both EC cells and tissues, associated with poor prognosis. And we validated the biological role of a novel lncRNAs AC007128.1 by cellular assays in EC progression.

Results 257 upregulated and 165 downregulated lncRNAs were identified by DESeq2 package based on TCGA RNA-seq data. 413 prognostic lncRNAs was single out based on Kaplan-Meier method combined UniCox method. Combined the differential and prognostic lncRNAs, a total of 13 overlapping lncRNAs were selected as candidate biomarkers for EC. 13 lncRNAs were subjected to cox stepwise regression analysis and find an optimal model with 11 lncRNAs. Kaplan-Meier curves showed that the high risk-score group was significantly related to EC patients' poor prognosis. Patients with high risk score prognostic s had more deaths than low-risk-score patients.The obtained prognostic prediction model could effectively predict the 3-year and 5-year prognosis and survival of patients with EC by time-dependent ROC (area under curve = 0.87 and 0.89, respectively). The model had better ability to predict prognosis compared with clinical prognostic factors. The combination of lncRNA model and clinical characteristics improved the ability to predict 5-year prognosis (AUC=1.00). Multivariate Cox regression analysis indicated that the prognostic model was an independent factor of survival for EC. In the analysis of subtype, we used 111 EC patients in TCGA as training dataset, and obtained two clusters of EC samples with 50 lncRNAs that were different between the clusters and with significantly association with race and barretts esophagus (BE) (both $P<0.001$). We also verified the robustness of 50 lncRNAs in another independent dataset from GEO (GSE53625). Last, we found that a novel lncRNA AC007128.1 was upregulated in both EC cells and tissues, associated with poor prognosis, and could promote EC cell epithelial-mesenchymal transition (EMT) by increasing activation of MAPK/ERK and MAPK/p38 signaling pathways.

Conclusion by using lncRNA expression profiles, we construct an 11 lncRNA prognostic model with high ability to predict prognosis, and generate lncRNA-based subtypes of EC with high robustness. We also have demonstrated a significant upregulation of AC007128.1 in EC tumor and cell lines and association with poor survival in EC patients. Mechanistic analysis demonstrated that AC007128.1 may function to promote cancer cell EMT by aberrantly activating MAPK signal pathway.

Four Familial Hypercholesterolemia causing LDLR mutations were identified using the Next Generation Sequencing based laboratory developed sceening test

Shitong Cheng、Xiaoxu Han
The First Affiliated Hospital of China Medical University

Objective To establish an appropriate genetic screening protocol for Familial hypercholesterolemia (FH) that can be used in clinical laboratories and to explore the FH mutation spectrum in Shenyang.
Methods Firstly, a Next Generation Sequencing (NGS) based laboratory developed test (LDT) was established. The customized sequencing panel was designed to cover the exonic regions of 24 lipid metabolism related genes. Then, the clinical records of 41803 patients whose blood lipid profile had been tested during the period from Nov.11, 2019 to Jan. 13, 2020 in the First Affiliated Hospital of China Medical University were investigated and 18 patients were clinically diagnosed as Definite FH according to the Dutch Lipid Clinical Network Criteria (Chinese Revised Version) (DLCN-CRV) established by Shi et al. The whole blood samples of 16 (out of 18) definite FH patients were collected following by the DNA extraction and NGS for screening, In-silico analyses (including SAMtools and ANNOVAR) for identifying the pathogenic mutations according to the ACMG criteria and finally the Sanger Sequecing for confirmation.
Results The prevalence of FH was found to be 0.043% for the 41803 individuals mentioned above according to the DLCN-CRV Criteria (grade>8) and 5/16 (31.25%) definite FH patients were confirmed carrying FH pathogenic mutations (ACMG Class 4 or above), including LDLR(NM_000527): exon12: c.C1783T: p.R595W, exon4: c.T493G: p.W165G, exon13: c.G1879A: p.A627T, and exon4: c.G682T:p.E228X. In addition, one Familial Combined Hypercholesterolemia pathogenic mutation (LPL(NM_000237): exon9: c.C1421G: p.S474X, ACMG Class 4) and one Statin response related genetic variant (SLCO1B1(NM_006446): exon6: c.T521C: p.V174A) were also identified using the LDT protocol, as well as five possible FH pathogenic mutations (ACMG Class 3, including APOB(NM_000384): exon12: c.C1594T: p.R532W, exon26: c.C10579T: p.R3527W, exon29: c.G12809C: p.R4270T and LDLR(NM_000527): exon10: c.G1432A: p.G478R, exon7: c.1060+7T>C) and three variants (APOA5(NM_001166598): c.*158C>T, EPHX2(NM_001256483): exon7: c.G662A: p.R221Q, USF1(NM_001276373): c.*187C>T) considered as risk factors for dyslipidemia. All genetic variants screened by the LDT protocol were then confirmed using Sanger Sequencing with a positive rate of 100%.
Conclusion The NGS based FH genetic screening protocol was reliable and could be used in the clinical laboratories to improve the rate of FH identification and to expand the local FH pathogenic mutation spectrum. More effort will be needed to discover the appropriate target population in order to make the screening test more cost-effective.

miR-133b targets NCAPH to promote β-catenin degradation and reduce cancer stem cell maintenance in non-small cell lung cancer

Qiuxia Xiong、Yong Duan
The First Affiliated Hospital of Kunming Medical University;Yunnan Key Laboratory of Laboratory Medicine;
Yunnan Institute of Experimental Diagnosis

Non-small cell lung cancer (NSCLC), one of the most common lung cancers, is well known to have diverse pathological features. Although many signaling pathways and therapeutic targets have been defined to play important roles in NSCLC, limiting efficacies have been achieved. Here, we identified that non-SMC condensin I complex subunit H (NCAPH), which is highly expressed in NSCLC, correlates with worse clinical outcome. We found that NCAPH is increased in cancerous cell lines (H1299, A549, H1975, SPC-A1, H838 and GLC-82) than that in normal human bronchial epithelium cell line (BEAS-2B), and NCAPH knockdown inhibits cell proliferation and migration. Furthermore, we validated that miR-133b directly targets NCAPH, and that miR-133b is downregulated in both cancerous cell lines and peripheral blood serum isolated from NSCLC patients. Forced expression of miR-133b inhibits the proliferation, migration and xenograft tumor formation abilities of tumor cells. In addition, mechanistic study showed that NCAPH promotes cancer stem cells (CSCs) maintenance in NSCLC through inhibiting Akt1-mediated phosphorylation and degradation of □-catenin proteins, which in turn leads to suppressed Wnt signaling activity and tumorigenesis. In summary, our findings reveal the critical role of miR-133b/NCAPH axis during NSCLC progression, indicating that miR-133b or NCAPH can be used as novel therapeutic targets in the future.

基于轮状催化发夹组装和框架杂交链反应的无酶扩增策略灵敏检测循环肿瘤 DNA

罗世华、张晔、黄国妮
南方医科大学南方医院

循环肿瘤 DNA (circulating tumor DNA, ctDNA)作为一种理想的液体活检生物标志物候选，在肿瘤的非侵入性诊断中发挥着重要作用。ctDNA 的准确分析对促进临床应用具有重要意义。为此，我们开发了一种轮状催化发夹组装(WCHA)和框架杂交链反应(FHCR)的新型 ctDNA 电化学生物传感器。ctDNA 通过立足点链位移与 DNA 传感器结合，释放引发剂促进 WCHA 的循环扩增，与固定在金电极表面的捕获探针杂交形成大量的轮状 DNA 产物。此外，还设计了亚稳态哑铃探针(DSH1 和 DSH2)用于杂交链反应。与传统的 HCR 相比，这种新型的 HCR (FHCR)可以折叠更致密的 DNA 纳米结构，大大降低了空间电位电阻，提高了电子传输能力。双信号扩增策略(WCHA/FHCR)的结合显著提高了 ctDNA 检测的灵敏度，使检测限(LOD)低至 8.3 fM。更重要的是，该方法成功地应用于临床样本的分析，具有有效的分类器，AUC 为 0.909，对乳腺肿瘤的诊断灵敏度为 86.7%，特异性为 80.0%。因此，该平台在生物分析和临床诊断方面具有巨大的潜力。

脑脊液的宏基因组测序技术用于诊断神经外科与脑室外引流和腰椎引流相关性脑室炎和脑膜炎

钱玲烨[1]、史一君[1]、李方强[1]、王玉飞[1]、马淼[1]、张艳芳[1]、邵阳[2,3]、郑光辉[1]、张国军[1]
1. 首都医科大学附属北京天坛医院
2. 南京迪飞医学科技有限公司
3. 南京医科大学公共卫生学院

宏基因组二代测序技术 (mNGS) 目前已成为一种广泛应用的可以快速准确检测感染病原体的技术。本研究是一项于 2019 年 2 月至 2019 年 9 月在中国最大的临床神经外科中心之一开展的大队列前瞻性研究。本研究旨在评估神经外科患者脑脊液的 mNGS 检测对脑室外引流和腰椎引流相关性脑室炎和脑膜炎(external ventricular and lumbar drainage-associated ventriculitis and meningitis, EVD/LD-VM) 的诊断价值。我们收集了神经外科滞留 EVD/LD 超过 24 小时的患者脑脊液标本进行常规微生物培养和 mNGS 检测。并探讨了脑脊液 mNGS 对 EVD/LD-VM 的诊断价值。共有 102 名患者被纳入本研究，并分为三组，包括确定感染组 (confirmed VM, cVM) (39) 、疑似感染组 (suspected VM, sVM) (49) 和无感染组 (non-VM, nVM) (14)。在所有患者中，mNGS 共检测到 21 株革兰阳性菌，20 株革兰阴性菌和 5 株真菌。检出的三种主要细菌分别为表皮葡萄球菌 (9) 、鲍曼不动杆菌 (5) 和金黄色葡萄球菌 (3) 。证实 EVD/LD-VM 的 mNGS 阳性符合率为 61.54% (24/39)，在 nVM 组中 mNGS 阴性符合率为 100% (14/14) 。cVM 组中有 15 例 VM 的感染病原菌未被 mNGS 鉴定出，包括 8 例 mNGS 结果阴性，7 例 mNGS 结果与常规微生物鉴定结果不一致。此外，对 22 例常规方法检测为阴性的患者进行了 mNGS 检测并成功鉴定出病原体，其中有 10 例患者获得了及时有效的临床治疗，这也显示了 mNGS 在指导 EVD/LD-VM 治疗的优势。

The Emergence of Multidrug-Resistant Candida haemulonii : Using Whole-Genome Sequencing to Describe the Population Structure

Xinfei Chen、Xin Hou、Meng Xiao、Xinmiao Jia、Yingchun Xu
Peking Union Medical College Hospital

Background The emergence of a multidrug-resistant yeast, *Candida auris*, has drawn attention to the closely related species from the *Candida haemulonii* complex includeing *C. haemulonii*, *C. duobushaemulonii*, *C. pseudohaemulonii*, and *C. haemulonii var. vulnera.* The goal of this study was to investigate the genetic relationships and drug-resistance profiles among isolates of the *C. haemulonii* from different cities and to examine possible evidence of transmission if it existed.
Materials/methods The 61 *C. haemulonii* isolates causing invasive fungal diseases were collected from twenty three tertiary hospitals through CHIF-NET. We used antifungal susceptibility testing and whole-genome sequencing (WGS) to investigate drug resistance and genetic diversity among isolates of *C. haemulonii* from different geographic areas of China.
Results Between 2010 and 2017, 61 isolates of *C. haemulonii* from China; In the China, 69% of *C. haemulonii* was isolated from blood, and other invasive sites (Table 1). Phylogenetic analysis using SNPs called against the *C. haemulonii* reference strain BMU05228. Genetic relationships among *C. haemulonii* isolates are shown in (Figure 1). The average pairwise difference between the isolates was 347 SNPs (range 6–581), and there was distinct phylogeographic population structure. Most isolates were different from each other by fewer than 57 SNPs and formed some small, well-supported cluster in the phylogenetic tree based on bootstrap analysis. Three isolates, F4450, F4454, and F4456, were different from each other by fewer than 10 SNPs. These three

isolates were recovered from different patients treated at the same hospital in Shanghai. In addition, five isolates from Nanjing，F4474, F4486, F4500, F4516, F4518, differed by fewer than 45 SNPs recovered from same hospital. We observed variable levels of susceptibility to amphotericin B among 61 tested C. haemulonii isolates: 48 (79%) had elevated MICs from 2μg/mL to >8μg/ ml, and the rest had MICs below 2μg/ml. All isolates had elevated MICs of fluconazole ranging from32 to 256μg/ml (Table 2).
Conclusions Our results indicate that, although we are not observing the widespread of the *C. haemulonii*, at least these isolates can be transmitted within a healthcare facility and may cause healthcare associated outbreaks.

外周血宏基因组二代测序对血液病患者肺孢子菌感染的诊断价值

徐春晖[1,2]、许颖出[2]、朱国庆[1]
1. 中国医学科学院血液病医院（中国医学科学院血液学研究所）
2. 中国医学科学院血液病医院 协和博精实验室

目的 探讨血液病患者外周血宏基因组二代测序技术在耶氏肺孢子菌肺炎诊断和治疗中的应用价值，为该类患者肺孢子菌感染的诊治提供依据。
方法 回顾性分析中国医学科学院血液病医院 2020 年 6 月 10 日至 2021 年 6 月 10 日采用外周血进行二代测序检出的耶氏肺孢子菌肺感染患者的实验室和临床特征，分析外周血病原二代测序对血液病患者合并该类真菌感染的应用价值。
结果 1 年内共 242 位患者送检外周血病原二代测序检测， 11 位患者检出肺孢子菌，检出率为 4.5%。11 例患者中男性 4 例（36.4%），中位年龄 38（2-57）岁。4 例为急性髓系白血病，4 例急性淋巴系白血病，1 例再生障碍性贫血，1 例骨髓增生异常综合征，1 例自免溶贫，其中 10 例患者发病前有糖皮质激素用药史。临床表现主要为发热（100%,11/11）、血氧饱和度减低（81.8%，9/11）、咳嗽(3/11,27.3%)等。除 1 例患者未进行影像检查外，其余患者均表现为肺间质纹理增多，磨玻璃样改变。实验室数据显示，11 例患者的白细胞中位数为 2.9（0.3-12.0）×109 /L，粒缺期患者占 9.1%（1/11）。使用糖皮质激素患者中共 6 例患者进行了 CD4 细胞计数检测，均低于正常值，中位数为 153（5-227）cells/μL。 1,3-β-D-葡聚糖增高见于 36.4%（4/11）的患者，11 例患者乳酸脱氢酶均有增高，中位数为 406（256.4-946.8）U/L。二代测序检出耶氏肺孢子菌序列的中位数为 2（1-184）条。10 例患者应用磺胺甲噁唑/甲氧苄啶治疗，9 例好转，接受治疗患者的平均发热时间为 8（4-17）天，无死亡病例。
结论 血液病患者外周血二代测序检出肺孢子菌具有较高的临床符合度，其创伤性小、报告周期短的特征可作为无法进行支气管镜检查和肺泡灌洗患者肺孢子菌感染的诊断方法之一。

在肺活检组织中使用 mNGS 鉴定肺部感染病原体的性能研究

郭一凡、李荷楠、王辉
北京大学人民医院

背景 宏基因组下一代基因组学 (mNGS) 具有改善肺部感染病原体鉴定的潜力。关于 Illumina 和 Nanopore 平台对肺活检组织的诊断性能的报告很少见。
方法 2018 年 7 月至 2020 年 5 月，收集 140 份肺活检组织，应用临床微生物学检测和 mNGS（Illumina 和 Nanopore 平台）进行病原体鉴定。基于 Illumina 结果计算肺部菌群多样性。
结果 我们基于 Illumina 结果检测了 α 多样性，与不确定感染患者相比，检出病原体患者的 shannon 多样性显着降低。下呼吸道感染 (LRTIs) 患者的 α 多样性显着低于癌症患者。与临床综合

判定结果相比，Illumina 的灵敏度为 77.55%，特异性为 97.62%，阳性预测值（PPV）为 95.00%，阴性预测值（NPV）为 88.17%。然而，Nanopore 的灵敏度为 34.69%，特异性为 98.65%，PPV 为 94.44%，NPV 为 69.52%。Illumina 中，细菌和真菌 cutoff 为 3516.21 和 1987.85，对于 Nanopore，cutoff 为 57 和 30。Illumina/Nanopore 平台可以比临床微生物检测更多的真菌，但对结核分枝杆菌的诊断性能较弱。

结论 α 多样性可以作为诊断不同类型疾病的指标。Illumina 平台的阴性符合率更高，比传统微生物检测鉴定出更多的真菌病原体。对于高人类背景标本时，应在湿实验过程中优化 Nanopore 流程。我们首先确定了肺活检组织的 cutoff，这可能是临床诊断的一种有前途的标本类型。

基于全基因组测序技术的碳青霉烯耐药肺炎克雷伯菌毒力溯源

王若冰、王辉
北京大学人民医院

目的 近年，越来越多的报道发现碳青霉烯耐药肺炎克雷伯菌携带了毒力基因。这意味着治疗肺炎克雷伯菌感染不仅面临大多数抗生素不起作用，还会对人体造成毒力较大的严重损伤。为此，我们借助第三代测序技术，通过获得碳青霉烯耐药肺炎克雷伯菌的完整毒力质粒数据，探索耐药菌株的毒力质粒来源。

方法 对我国流行的 ST11 型肺炎克雷伯菌进行三代测序，获得包括质粒在内的全基因组数据。下载公开数据库中的菌株序列及其相关菌株信息，整合为信息较为完整的数据集。对这些序列进行 MLST、毒力基因、血清型、耐药基因的鉴定等注释，选择血清型为 K1、K2、K47 和 K64 的菌株，用毒力基因定位毒力序列，随后构建毒力序列基于时间的系统发育树。

结果 从 9738 条非重复肺炎克雷伯菌的全基因组数据中筛选出 256 株 ST11 型肺炎克雷伯菌、毒力质粒 205 个和 217 条毒力序列。发现大多数 K1、K2 和 K64 型菌株的毒力序列相似程度较高，ST11-K64 型的毒力质粒类型以 IncHI1B(pNDM−MAR)/repB 为主。从中随机选择一株与经典 ST23-K1 型高毒力肺炎克雷伯菌相似的 ST11-K64 型的碳青霉烯耐药肺炎克雷伯菌的毒力序列作为参考序列，在数据集中寻找与之相似的毒力序列并做有时间尺度的系统发育分析。系统发育树显示 ST11-K64 型肺炎克雷伯菌的毒力质粒与 ST23-K1 型的同源，推断 ST11-K64 型菌株的毒力质粒可能是由 ST23-K1 型菌株的毒力质粒演变而来。

结论 我国流行的 ST11 型碳青霉烯耐药肺炎克雷伯菌可能从 ST23 型经典高毒力肺炎克雷伯菌中获得了毒力质粒，演变为毒力更强的耐药株。

A liquid chromatography-tandem mass spectrometry (LC-MS/MS)-based assay for simultaneous quantification of aldosterone, renin activity, and angiotensin II in human plasma

Fangjun Chen、ZI-YUN CHEN、YING-FEI PENG、ZHEN-XIN WANG、BEI-LI WANG、BAI-SHEN PAN、WEI GUO
Department of Laboratory Medicine, Zhongshan Hospital, Fudan University

Accurate quantification of plasma aldosterone (ALD) and renin activity (PRA) is critical for the diagnosis of primary aldosteronism (PA). Liquid chromatography-tandem mass spectrometry (LC-MS/MS) is considered the “gold standard” method for the determination of ALD and PRA. The aim of this study is to develop a new LC-MRM/MS assay for quantifying plasma ALD, PRA, and

angiotensin II (Ang II) simultaneously and validate its effectiveness. To be more specific, plasma samples were prepared by solid-phase extraction and separated in an ultra-performance reversed-phase column. MS detection was performed via a triple quadrupole mass spectrometer containing both positive and negative ion monitoring modes. The developed assay was then validated according to the standard guidelines and the influence of sample incubation on ALD and Ang II concentration was evaluated. In addition, the variation of endogenous Ang I was explored. The proposed LC-MRM/MS method was compared another LC-MS/MS method, which detects ALD, Ang I, and Ang II separately. Analytes were separated and quantified within 5 min. The assay was validated to be linear up to 5000 pg/ml for ALD and Ang II and 33.3 ng/ml/h for PRA. The lower limit of quantification (LLOQ) was 15 pg/ml, 15 pg/ml, and 0.1 ng/ml/h for ALD, Ang II, and PRA respectively. Specificity, precision, accuracy, and stability were tested to meet the requirements of the guidelines. Significant changes were not found in ALD and Ang II concentrations over the 3h-incubation. In addition, it was demonstrated that the result of PRA was not strongly influenced by the endogenous Ang I. Comparison with another LC-MS/MS method was performed using the same apparatus and the proposed method was proved to be in good coincidence with the correlation coefficients ranging from 0.955 to 0.996. A sensitive and reliable method for simultaneous quantification of ALD, PRA, and Ang II has been developed and this study will significantly promote laboratory workflow efficiency and throughput.

基于发光 QDs 的选择性识别和 Ce3+的配位聚合的可视化和双荧光均相传感器用于临床甲亢样品中焦磷酸酶的检测

陈飘飘、应斌武
四川大学华西医院

目的 现有医学分子诊断技术主要是依靠单个信号分子实现目标物的定量，且难以可视化读取。该体系致力于①使用双荧光信号分子，定量一种分析物，提高方法的准确性；②将发光纳米材料引入医学诊断中，实现可视化 POCT 分析；③以焦磷酸酶（PPase）为例，在考察其作为甲亢疾病标志物的潜在性的同时，验证该体系的分析性能。

方法 该方法主要是基于两个选择性识别反应：①CdTe QDs 选择性识别 Cu2+和 PPi-Cu2+-PPi 复合物（PPi，焦磷酸盐），以及②Ce3+选择性识别 PPi 和其它磷酸盐。如图 1 所示为 PPase 的分析原理图，利用 PPase 水解 PPi 生成 Pi（磷酸），而 Pi 对 Cu2+无络合力，以及 Pi 对 Ce3+荧光信号产生可忽略的影响的现象，可轻松构建 PPase 的双荧光信号均相可视化分析策略。

结果 该方法可实现 0.15 U/L 浓度级别 PPase 的准确定量，肉眼可显著区分 5 U/L 焦磷酸酶和空白溶液。已在 53 例临床甲亢病人血清样品上进行了验证，与临床甲亢诊断结果一致。使用 PPase 为甲亢标志物，其诊断准确率达 100%，具有较好的可靠性和临床应用价值。此外，我们推荐以 500 U/L PPase 含量为甲亢病人诊断的临界值。

结论 该方法无论在分析速度和通量（1 小时内），分析成本（单次检测成本低于 1 元）、分析操作（均相分析，仅仅需要将反应物质混合，不需要专业研究人员）上均显著优于现有方法。

Serum glycated albumin can serve as a good indicator of early diabetic nephropathy

Yunlai Liang[1]、ying liu[2]、kangkang huang[1]、kun wang[1]、jingzhong liao[1]、bin yi[1]
1. Xiangya Hospital of Central South University
2. 中南大学湘雅医学院

Object To explore the clinical application of GA in EDN diagnosis.
Methods 119 patients with T2DM and 36 healthy subjects were enrolled from Xiangya Hospital of Central South University and classified into 4 groups: healthy group, T2DM group (UACR < 30mg/g), early diabetic nephropathy group (30mg/g < UACR < 300mg/g) and advanced diabetic nephropathy group (UACR < 300mg/g). SPSS25.0 was used for statistical analysis.
Results The EDN group showed significantly higher GA values compared with the other 3 groups. The correlation analysis showed GA was negatively correlated with ALB and positively correlated with HbA1C in EDN group. Multivariate linear regression found GA was influenced by HbA1C, BMI and ALB. GA, TG and HLR were identified by univariate logistic regression analysis as independent variables that predicted the presence of EDN. ROC analysis found GA had the largest area under the curve (AUC = 0.800, CI 0.727 - 0.960, P < 0.01) among all indexes. Combined diagnosis of EDN by GA, GFR and age was the optimum scheme (AUC = 0.833, CI 0.758 - 0.907, P < 0.01). Interestingly, it exhibited better diagnostic efficacy in female patients. Finally, GA, GFR and age were eventually introduced by discriminant analysis and optimal discriminant formula was Y = 0.195X1 + 0.323X2 + 1.048X3 (X1 = GA, X2 = Age, X3 = GFR), which classifued 75% of patients with T2DM, 42.9% of patients with EDN and 76.6% of patients with ADN correctly.
Conclution GA might be a potential molecular marker for the diagnosis of EDN.

Determination of tryptophan and its 9 metabolites in fluid from the anterior chamber of the eye in patients with glaucoma by ultra-high performance liquid chromatography-mass spectrometry

Lin Li[2]、Kecheng Li[1]、Honglang Huang[1]、Wenna Liu[1]、Ting Zhang[1]、Yuheng Cheng[1]、Haibo Wang[1]、Liangmin Chuan[1]、Li Jiang[1]
1. Sichuan Academy of Medical Sciences & Sichuan Provincial People's Hospital
2. 电子科技大学附属医院·四川省人民医院

Objective Tryptophan (Trp) is to an essential amino acid and its metabolites are significant to human health. The dysregulation of Trp is implicated in diseases such as cancer, neurodegenerative (i.e. glaucoma) and auto immune disorders. The objective of this study was to measure the levels of Trp metabolites in the anterior chamber of the eye of both primary open-angle glaucoma (POAG) and primary angle-closure glaucoma (PACG), and to help elucidating the involvement of these metabolites in the disease pathology.
Methods Ultra-high performance liquid chromatography-mass spectrometry (UPLC-MS/MS) was used to measure the levels of Trp and its 9 major metabolites, namely kynurenine (Kyn), kynurenic acid (KYNA), 3-hydroxy kynurenine (3-OH Kyn), xanthurenic acid (XANA), 3-hydroxy anthranilic acid (3-OH AA), picolinic acid (PICA), quinolinic acid (QUIA), serotonin (5-HT) and melatonin (Mel) in fluid from the anterior chamber of the eye of 50 POAG, 50 PACG and 50 cataract patients. The analysis was carried out on a Waters ACQUITY UPLC HSS T3 (100×2.1mm, 1.8μm) column using gradient elution mode. For quantitative determination, Trp-d5,

Kyn-C13, KYNA-d5, 3-OH Kyn-C13N15, XANA-d4, 3-OH AA-d3, PICA-d3, QUIA-d3, 5-HT-d4 and Mel-d4 were used as an internal standard.
Results The method was linear in the concentration range 10.29-2058.00 ng/mL for Trp, 5.40-1080.00 ng/mL for Kyn, 0.38-76.88 ng/mL for KYNA, 5.24-1048.00 ng/mL for 3-OH Kyn and XANA, 5.63-1125.00 ng/mL for 3-OH AA, 9.42-1884.00 ng/mL for PICA, 5.22-1044.00 ng/mL for QUIA, 5.30-1060.00 ng/mL for 5-HT and 0.22-44.04 ng/mL for Mel. The mean recoveries measured at 3 concentration levels for Trp, Kyn, KYNA, 3-OH Kyn, XANA, 3-OH AA, PICA, QUIA, 5-HT and Mel were all within the range of 91.3-107.4%. The intra-day precision parameters were smaller than 6.4%. The developed method was applied to study the level of Trp, Kyn, KYNA, 3-OH Kyn, XANA, 3-OH AA, PICA, QUIA, 5-HT and Mel in the anterior chamber of the eye in POAG, PACG and cataract patients (n = 50). The results showed that the levels of Kyn, KYNA, 3-OH-Kyn were significant higher in glaucoma patient group (especially PACG) than those of cataract patient group ($P<0.05$), while the other analytes showed no significant difference among POAG, PACG and cataract patient groups.
Conclusion A UPLC-MS/MS method was successfully developed for the quantification of Trp and its 9 metabolites in the anterior chamber of the eye of POAG, PACG and cataract patients.

Exploration of Potential Biomarkers of Anthracycline-induced Cardiotoxicity Based on Targeted Amino Acid Metabolomics

Wendi Li、Ming Su、Zhenju Cao、Mei Jia
Peking University People's Hospital,

Objective Anthracyclines have become the cornerstones of cancer chemotherapy due to their significant anti-cancer effects. Although anthracyclines improve the long-term survival rate of cancer patients, severe and irreversible myocardial damage limit the clinical applications. Amino acids (AAs) play a critical role in protein synthesis, regulation, and energy metabolism in the function of cardiomyocytes. AA metabolism disorder will be caused when cardiomyocytes are seriously damaged. We can further explore the mechanism of anthracycline-induced cardiotoxicity by studying AA metabolism. In the present study, we established adriamycin (ADR)-induced cardiac injury models. By using targeted AA metabolomics, we screened the changes of AA metabolism in order to find potential biomarkers of anthracycline-induced cardiotoxicity.
Methods Fifteen C57BL/6 male mice were randomly divided into control group (n=7) and ADR group (n=8). Mice in ADR group were intraperitoneally injected with ADR 15 mg/kg to establish anthracycline-induced cardiotoxicity model. Echocardiography was performed to determine the cardiac function. H9c2 cells were treated with 1μM ADR for 18 hours and the culture medium supernatant samples were collected. A targeted AA metabolomics approach based on UPLC-MS/MS was established to detect the serum and culture medium supernatant samples. Multivariate statistical analysis was performed using Simca-P 14.1, and the integral differences of metabolic profiling were described by orthogonal partial least squares discriminant analysis (OPLS-DA). The AA profiles of ADR groups and control groups were analyzed using multivariate statistical analysis with significant alterations identified through Student-t test and variable importance in projection (VIP). Metabolites that satisfied both VIP > 1.0 and $p < 0.05$ were identified as candidate biomarkers.
Results Compared with the control group, ADR-treated mice showed significant decrease of ejection fraction (EF%), indicating that the ADR induced a significant cardiac injury. We found that there were 14 AA metabolites changed in the serum samples of ADR-treated mice, including 10 increased and 4 decreased. There were 15 AA metabolites changed in the medium supernatant of ADR treated H9c2. OPLS-DA analysis showed that the ADR groups could be clearly separated from the control groups, indicating that significant AA metabolism changes occurred after ADR

treatment. Nine AAs including L-glutamic acid, L-lysine, L-serine, L-tryptophan, L-methionine, L-histidine, L-asparagine, L-tyrosine, O-phosphorylethanolamine and five AAs including L-tyrosine, L-alanine, L-glutamine, L-serine, L-glutamic acid with VIP > 1 and $p < 0.05$ were selected as potential biomarkers of serum and medium supernatant samples, respectively. By using overlap analysis, we found that L-glutamate, L-serine and L-tyrosine were increased in the two models, suggesting that a possible mechanism of AA utilization impairment during anthracycline-induced cardiotoxicity.

Conclusion A targeted amino acid metabolomics approach based on UPLC-MS/MS detection can be used to explore the biomarkers and mechanism of anthracycline-induced cardiotoxicity and provide new clues for the prevention and treatment of anthracycline cardiotoxicity in the early clinical stage.

OR-061

PD-1+ CXCR5+CD8+ T 细胞在肾移植物失功中作为诊断标志物的应用

樊吉文、严琳、万正利、李亚梅、李壹
四川大学华西医院

目的 肾移植是肾病终末期最理想的治疗方式，而移植物失功是肾移植常见的并发症之一，其中导致其发生的最主要原因是抗体介导的排斥反应。有研究表明，PD-1+CXCR5+CD8+ T 细胞表现出滤泡辅助性 T 细胞的作用，具有免疫调节功能，并受到 STAT5 负调控。我们以肾移植患者为研究对象，通过分析 CD8+CXCR5+T 细胞频率及信号传导子及转录激活子 4（STAT4）、信号传导子及转录激活子 5（STAT5）和程序性死亡受体 1（PD-1）的表达，探讨其在肾移植患者移植物失功中的作用。

方法 纳入曾在四川大学华西医院行肾移植术的 82 例患者，收集研究对象的基本资料，包括年龄、性别、BMI、移植时间、生化检查、病理活检结果等，并收集全血标本做横断面分析，使用流式细胞术分析测定 CD8+CXCR5+T 细胞频率及 STAT4、STAT5 和 PD-1 等的表达，以 eGFR =60ml/min 为界限分为慢性移植肾功能减退（CAD）组（eGFR< 60ml/min）和肾功能正常组(eGFR> 60ml/min)，根据病理活检结果分为抗体介导的排斥反应（AMR）和 T 细胞介导的排斥反应（CMR）两组，使用 SPSS 分析 CD8+CXCR5+T 细胞的频率及 STAT4、STAT5 和 PD-1 的表达与移植物失功的相关性及 PD-1+CXCR5+CD8+ T 细胞诊断肾移植失功和抗体介导的排斥反应的 ROC 曲线。

结果 根据肾功分组且排除药物影响后，CXCR5/CD3CD8 在肾功正常组显著高于慢性移植肾功能减退组（P<0.05），STAT4/CD8CXCR5、STAT5CXCR5/CD3CD8 在肾功正常组显著高于慢性移植肾功能减退（P<0.05）， PD -1/CD8CXCR5 在慢性移植肾功能减退组表达显著高于肾功正常组（P<0.05）。根据病理类型分组后，CXCR5PD-1/CD3CD8 在 AMR 组显著高于 CMR 组（P<0.05）、PD-1/CD8CXCR5 在 AMR 组显著高于 CMR 组（P<0.05）。PD-1+CXCR5+CD8+ T 细胞诊断 CAD 的 AUC 为 0.647，PD-1+CXCR5+CD8+ T 细胞诊断 AMR 的 AUC 为 0.742。

结论 PD-1 高表达于移植物失功组和抗体介导的排斥反应组，且 CD8CXCR5 上 STAT5 和 STAT4 的表达在移植物失功组中明显下调，PD-1+CXCR5+ CD8+T 细胞可能促进抗体产生，参与体液反应，且 PD-1+CXCR5+CD8+ T 细胞诊断 AMR 的诊断效能较好。因此，PD-1+CXCR5+CD8+ T 细胞在移植物失功中可作为诊断标志物帮助诊断 AMR。

GPR56 及颗粒酶 B 在肺癌患者 T 淋巴细胞中的共表达及其临床价值研究

刘忱[1]、刘天赐[1]、曾星月[1]、王平章[2]、王辉[1]
1. 北京大学人民医院
2. 北京大学医学部基础医学院

目的 本项目旨在研究 GPR56 在肺癌患者外周血 T 淋巴细胞中的表达情况，分析 T 细胞中 GPR56 的表达与肺癌分类分期等的关系，从临床角度探讨 GPR56 在肺癌中的表达变化及其潜在诊断价值。
方法 使用生物信息学方法分析 GPR56 在淋巴细胞中的差异性表达情况，通过虚拟分选的方法分析同 GPR56 表达相关的分子。收集 68 位肺癌患者和 29 位健康对照组(HC)的外周血，采用流式细胞术分析 CD4 和 CD8 细胞的 naïve（CCR7+CD45RA+）、记忆(CCR7+CD45RA-Tcm 以及 CCR7-CD45RA-Tem)和效应(CCR7-CD45RA+)细胞亚群中 GPR56 表达比例，比较不同分类分期肺癌患者 CD4 和 CD8 细胞中 GPR56 相关亚群的比例变化，并利用 ROC 曲线来探索 GPR56 对肺癌的潜在临床诊断价值。
结果 GPR56 在 T 淋巴细胞中具有显著的差异性表达趋势，虚拟分选预测其与颗粒酶 B 表达相关。细胞学研究表明 GPR56 与颗粒酶 B 在 CD4 和 CD8 细胞中均具有显著共表达。与健康对照相比，肺癌患者 GPR56 表达水平升高。肺癌患者外周血中的 Tem 细胞比例显著升高，而 T naïve 细胞显著降低；GPR56 在肺癌患者的 CD4+T em 细胞和 CD8+Teff 细胞表面显著升高。肺鳞癌患者 T 细胞中 GPR56+占比显著高于健康对照；GPR56 的表达随着肺癌 TNM 分期而呈现上调趋势。颗粒酶 B 在肺癌患者和健康对照的外周血的表达均与 GPR56+以及 GPR56+Granzyme B+细胞的变化趋势一致。ROC 曲线分析表明了 GPR56+、Granzyme B+以及 GPR56+Granzyme B+细胞水平对于肺癌具有潜在的辅助诊断价值。
结论 肺癌患者中的 GPR56 和颗粒酶 B 显著共表达，提示其发挥作用可能与颗粒酶 B 有关，并且对肺癌具有潜在诊断价值，可用于肺癌发病以及疾病进展恶性程度的辅助诊断。

A Rapid, Simple and Low-Cost Paper-based Time-resolved Fluorescence Lateral Flow Immunoassay for CD8 Cell Count

Wei Xiao[1]、Yong Tang[2]
1. Guangdong Second Provincial General Hospital
2. 暨南大学生物工程学系

CD8+ T lymphocytes play an important role in the body's anti-infective immunity, autoimmunity and anti-tumor immunity. The number of CD8+ T lymphocytes (CD8 cells) in peripheral blood can directly reflect the immune status of the body and is widely used for auxiliary diagnosis and prognostic evaluation of diseases. There is an urgent need to develop a simple CD8 cell-counting platform to meet clinical needs.
Methods Our group designed a paper-based cell-counting method based on a blocking competition strategy. In addition, we developed a time-resolved fluorescence-blocking competitive lateral flow immunoassay (TRF-BCLFIA) for point-of-care CD8 cell counting that functions by measuring europium nanoparticle (EuNP)-labeled CD8 antibody probes that are not captured by CD8 cells, and we indirectly calculated the concentration of CD8 cells in samples. Within 30 min, four operation steps can provide an accurate CD8 cell count for a 75-μL whole-blood sample, and this approach can be implemented on a handheld device.

Results The TRF-BCLFIA reliably quantified CD8 cells in whole-blood samples, in which the assay exhibited a linear correlation (R2=0. 989) readout for CD8 cell concentrations ranging from 137 to 821 cells/μL. To validate the clinical suitability of the detection system, 33 clinical blood samples were tested, and the results showed a high correlation with flow cytometry analysis (R2=0.97).
Conclusions RF-BCLFIA can be used to count CD8 cells in blood samples, and has a high coincidence rate with FCM analysis.This analysis approach is a promising alternative for the costly standard flow cytometry-based tools for CD8 cell counting in tumor patients in community clinics, small hospitals, and low medical resource regions. This technology would deliver simple diagnostics to patients anywhere in the world, regardless of geography or socioeconomic status. This technology would deliver simple diagnostics to patients anywhere in the world, regardless of geography or socioeconomic status.

结肠癌微环境中免疫细胞浸润模式及其预后评估

梁艳玲[1,2]、吴智聪[1,2]、马尊雅[3,4]、陈华[3]、吴妮莎[2]、邓凡[3]、曾方银[2]
1. 南方医科大学南方医院检验科
2. 南方医科大学第五附属医院检验医学科
3. 南方医科大学基础医学院细胞生物学教研室
4. 南方医科大学基础医学院基础医学

目的 结直肠癌（colorectal cancer，CRC）是主要的致死性恶性肿瘤之一。其中，结肠癌是结直肠癌中的最常见类型。目前，免疫疗法已被临床验证为许多肿瘤有效治疗的选择。肿瘤浸润免疫细胞作为肿瘤免疫微环境中的主要成分，其与结肠癌患者预后之间的关联尚未明确。本研究旨在探索结肠癌微环境中免疫细胞的浸润模式及其预后价值，为临床个体化治疗提供新方向。
方法 利用 CIBERSORT 软件包从癌症基因组图谱 TCGA（The Cancer Genome Atlas）数据库、GEO（Gene Expression Omnibus）数据库共筛选 38 例正常结肠组织样本及 316 例结肠癌组织样本，基于标准化后的基因表达谱对 22 种浸润免疫细胞进行提取和量化，分析免疫细胞在正常组织和癌组织中的浸润差异。利用多因素 COX 回归构建 Nomogram 风险预测模型。
结果 本研究发现活化的 CD4+记忆性 T 细胞、M0 巨噬细胞、M1 巨噬细胞在结肠癌组织中浸润显著增多，幼稚 B 细胞、浆细胞、单核细胞及未活化的肥大细胞显著减少。高水平活化的肥大细胞及调节性 T 细胞浸润与肿瘤转移和分期进展密切相关（$p<0.05$），低水平活化的 CD4+记忆性 T 细胞和滤泡辅助性 T 细胞与肿瘤淋巴结播散及分期进展相关（$p<0.05$）。利用患者年龄、性别、临床病理分期、TNM 分期、组间分析具有差异的免疫细胞构建 Nomogram 风险预测模型，模型预测 1 年、3 年和 5 年生存率的 ROC 曲线 AUC 分别为 0.828、0.794 和 0.754。将 COAD 患者按照风险评分分为高低风险组并进行 Kaplan-Meier 分析，结果显示高风险组 COAD 患者预后较差（$p<0.001$），提示模型具有良好预测效能。
结论 结肠癌患者中免疫细胞的浸润差异可能在疾病进展中具有重要作用，其预后模型可能为结肠癌患者的生存评估提供理论和数据支持。

肺腺癌外泌体 miR-1290 靶向抑制 SOCS3 调控巨噬细胞极化

吴逸宁、王雪滢、顾嘉慧、徐建
江苏省人民医院（南京医科大学第一附属医院）

目的 肺腺癌严重威胁人类健康。阐明肺腺癌的发病机制，寻找免疫治疗的新方法，对改善预后十分重要。本研究旨在明确肺腺癌外泌体 miR-1290 对巨噬细胞极化的调控作用及其分子机制，为靶向 miR-1290 的治疗提供理论依据。
方法 利用重组慢病毒构建 miR-1290 稳定敲低的肺腺癌细胞株并分离及鉴定其外泌体。流式细胞术和 Transwell 细胞侵袭实验检测与敲低 miR-1290 的外泌体共培养后巨噬细胞表型和功能的改变。通过裸鼠皮下瘤模型在体内验证肺腺癌外泌体 miR-1290 对巨噬细胞极化的作用。采用双荧光素酶报告基因实验、qRT-PCR 和 Western blot 鉴定 miR-1290 的靶基因 SOCS3。改变 miR-1290、SOCS3 的表达水平或与肺腺癌外泌体共培养后，qRT-PCR 和 Western blot 检测巨噬细胞极化标志物及相关信号通路分子的表达变化。
结果 与敲低 miR-1290 的肺腺癌外泌体共培养抑制巨噬细胞向 M2 型极化并减弱其促肺腺癌细胞侵袭的能力。敲低肺腺癌外泌体 miR-1290 可减少裸鼠皮下移植瘤中浸润的 M2 型巨噬细胞数量并减小肿瘤体积。过表达 miR-1290 可活化巨噬细胞 STAT3 通路，同时促进其向 M2 型极化；阻断 STAT3 通路削弱 miR-1290 促巨噬细胞 M2 型极化的效应。miR-1290 能特异性结合 SOCS3 的 3'UTR，靶向抑制 SOCS3 的表达。敲低 SOCS3 可活化 STAT3 并促进巨噬细胞向 M2 型极化；回补 SOCS3 可抵消 miR-1290 上调对 STAT3 活化及 M2 型极化的促进作用。敲低 miR-1290 的肺腺癌细胞外泌体可上调巨噬细胞中 SOCS3 表达, 进而抑制 STAT3 通路及 M2 型极化。
结论 肺腺癌外泌体 miR-1290 通过调控 SOCS3-STAT3 轴, 促进巨噬细胞向 M2 型极化。

Reference intervals for glomerular filtration function markers among pregnant women of Shandong Province, east China

Fang Luan
Department of Clinical Laboratory, Shandong Provincial Hospital Affiliated to Shandong First Medical University, Shandong, China

Background The aim of the study was to establish reference intervals (RIs) for glomerular filtration function markers among pregnant women of Shandong Province, east China.
Methods From Janunary 2017 to December 2018, we retrospectively analyzed serum samples from 360 pregnant women and a control cohort of 60-non-pregnant women. The glomerular filtration function markers included Cystatin C (CysC), Creatinine (Cr), and Estimated Glomerular Filtration Rate (eGFR). BeckmanAU5800 detection system was used to determine the serological level of CysC by immunonephelometry method and Cr by enzyme method, eGFR was calculated according to age, gender and Cr results. We calculated the RIs according to the guidelines in C28-A3 published by the Clinical and Laboratory Standards Institute (CLSI).
Results The calculated RIs for serum CysC were (0.40-0.67) mg/L, (0.5-0.85) mg/L, (0.77-1.49) mg/L in 1st, 2nd, and 3rd trimester respectively. Cr were (37.26-57.47) μmol/L, (33.70-54.82) μmol/L, (33.66-62.69) μmol/L in each cohort . eGFR based on Cr were (115.24-140.05) ml/min per 1.73m2, (117.42-141.88) ml/min per 1.73m2 , (109.00-146.00) ml/min per 1.73m2.

Conclusions The results show the necessity to establish special RIs for glomerular filtration function markers during pregnancy, even in each trimester. CysC levels increase obviously, so we also should cautiously treat it in the three trimesters.

Effects of Different Doses of rAAV5-mCherry on the Transcriptome of Hippocampal Pyramidal Neurons in Male Mice

刘忆思
南方医科大学珠江医院

Recombinant adeno-associated virus (rAAV) vectors have been widely used in neuroscience for gene transduction, and high-dose rAAV induces unexpected side effects. However, little is known about the mechanisms underlying rAAV-induced toxicity in brain cells. Here, we evaluated the effects of three different doses of rAAV5 vectors, which are widely used for functional studies in the brain, on hippocampal pyramidal neurons in male mice. There was a strong correlation between rAAV dose and toxicity. As the dose increased, rAAV5-mCherry upregulated genes related to immune and inflammatory responses and neuronal apoptosis and downregulated genes associated with synaptic and axonal compartments and mitochondria, suggesting that higher doses of rAAV-5-mCherry may induce pyramidal neuronal fragility and impair synaptic transmission. Thus, the dose should be taken into consideration when rAAV vectors are used for gene transduction studies.

AKR1B10 confers resistance to radiotherapy via FFA/TLR4/NF-κB axis in nasopharyngeal carcinoma

DIXIAN LUO
HUAZHONG UNIVERSITY OF SCIENCE AND TECHNOLOGY UNION SHENZHEN HOSPITAL

Nasopharyngeal carcinoma (NPC) is one kind of human head and neck cancers with high incidence in Southern China, Southeast Asia and North Africa. In spite of great innovations in radiation and chemotherapy treatments, the 5-year survival rate is not satisfactory. One of the main reasons is resistance to radiotherapy which leads to therapy failure and recurrence of NPC. The mechanism underlying remains to be fully elucidated. Aldo-keto reductase B10 (AKR1B10) plays a role in the formation and development of carcinomas. However, its role in resistance to radiotherapy of NPC is not clear. In this research, the relationships between AKR1B10 expression and the treatment effect of NPC patients, NPC cell survival, cell apoptosis, and DNA damage repair, as well as the effect and mechanism of AKR1B10 expression on NPC radioresistance were explored. A total of 58 paraffin tissues of NPC patients received radiotherapy were collected including 30 patients with radiosensitivity and 28 patients with radioresistance. The relationships between AKR1B10 expression and the treatment effect as well as clinical characteristics were analyzed by immuno-histochemical experiments, and the roles of AKR1B10 in cell survival, apoptosis and DNA damage repair were detected using the AKR1B10 overexpressed cell models. Furthermore the mechanism of AKR1B10 in NPC radioresistance was explored. Finally, the radioresistance effect of AKR1B10 expression was evaluated by the tumor xenograft model of nude mice and the method of radiotherapy. The results showed AKR1B10 expression level was correlated with radiotherapy resistance, and AKR1B10 overexpression promoted proliferation of NPC cells, reduced apoptosis and decreased cellular

DNA damage after radiotherapy. The probable molecular mechanism is that AKR1B10 expression activated FFA/TLR4/NF-κB axis in NPC cells. This was validated by using the TLR4 inhibitor TAK242 to treat NPC cells with AKR1B10 expression, which reduced the phosphorylation of NF-κB. This study suggests that AKR1B10 can induce radiotherapy resistance and promote cell survival via FFA/TLR4/NF-κB axis in NPC, which may provide a novel target to fight against radiotherapy resistance of NPC.

检验科开展腹膜透析评估试验的临床意义

梁珊珊[1]、钟慧[2]、贾成瑶[1]
1. 四川大学华西医院实验医学科
2. 四川大学华西医院肾内科

目的 腹膜透析评估试验包括了腹膜平衡试验和溶质清除，这是腹膜透析患者进行腹透过程中两个重要评估数据，目前需要人工录入所有检测结果到第三方软件中，才能获得相应数据。因此检验科联合肾内科腹透中心对此进行改革。
方法 检验科通过 LIS 后台的设置，直接通过抓取数据的方式，代替之前的手工录入，直接完成腹膜平衡试验和溶质清除的完整报告。
结果 2019 年 3 月，检验科、肾内科腹透中心启动腹膜透析评价报告改革项目。在整个过程中，经历了不同批次腹膜透析液的更换、肌酐检测的变化方法和计算公式的更新等问题。截至目前，已成功完成 1000 余份腹膜透析评价报告。完全替代了以往的第三方软件，将人工输入造成的错误概率降低到 0，节省了大约 1 小时/天的人力；可根据不同批次腹膜透析液及时改变校正系数，更符合临床诊治需要；临床医生获得腹膜透析评估试验的报告时间至少缩短 15 小时，加快临床诊治进程；达到数据完整、客观、永久保存的目的，便于临床医生和护士及时查阅和分析动态数据。
结论 检验科联合腹膜透析中心完成腹膜透析评估报告新模式改革，是国内首次在 LIS 平台上开展的创新方法，结合腹膜透析患者持续健康管理项目的实施，医疗、护理、技术团队的配合，显示了医疗工作的有效改善。员工满意度和患者满意度提高，促进学科交叉和多学科发展。

Development and validation of a prediction model for malignant pulmonary nodules

Zhen Ren 、Hongmei Ding、Zhenzhen Cai
The First Affiliated Hospital of Nanjing Medical University

Background To develop and validate a preoperative prediction model for malignancy of pulmonary nodules (PNs).
Methods Data from 409 patients who underwent PN resection at the First Affiliated Hospital of Nanjing Medical University between June 2018 and December 2020 were retrospectively collected. Then, the patients were nonrandomly split into[Y. Mu1] a training cohort and a validation cohort. Logistic regression analysis was used to identify variables significantly associated with malignant pulmonary nodules (MPNs) that were then included in the nomogram. We evaluated the discrimination and calibration ability of the nomogram by using R software.
Results MPNs were confirmed in 215 (52.6%) patients by a pathological examination. Multivariate logistic regression analysis identified six risk factors independently associated with MPN: Gender [Female, odds ratio (OR) =2.487; 95% confidence interval (CI): 1.313–4.711; P = 0.005], location of nodule (upper lobe of lung, OR = 2.576; 95%CI: 1.380–4.806; P = 0.003), density of nodule (pure ground glass, OR = 16.899; 95%CI: 7.572-37.716; P < 0.001; part-solid

nodules, OR = 24.096; 95%CI: 10.153–57.186; P < 0.001), nodule size (OR = 1.100; 95% CI: 1.058–1.145; P < 0.001), GAGE7 (OR = 1.085; 95%CI: 1.011–1.165; P = 0.023) and GBU4-5 (OR = 1.126; 95%CI: 1.054–1.204; P < 0.001). The concordance index was 0.88 (95%CI: 0.83–0.91) and 0.92 (95%CI: 0.85–0.97) in the training and validation cohorts, respectively. The calibration curves showed good agreement between the predicted risk by the nomogram and real outcomes.

Conclusions We have developed and validated a preoperative prediction model for MPNs. The model could aid physicians in clinical treatment decision making.

Exosome-mediated secretion of CST1 promotes colorectal cancer metastasis

Weili Duan、chuanxin wang
The Second Hospital of Shandong University

Cystatin SN (CST1) , encoded by CST1, is a secretory peptide and belongs to the type 2 cystatin superfamily. Emerging evidence has demonstrated that CST1 has diverse critical biological functions, especially its roles in tumor development and metastasis. In the present study, CST1 was commonly upregulated in CRC tissues and predicted a poor prognosis. Upregulation of CST1 promoted, whereas downregulation of CST1 inhibited cell migration, invasion and EMT of CRC in vitro. Most interestingly, we found that CRC-derived exosomes transferred CST1 between HCC cells promoted cell migration by activating the MAPK pathway. In addition, CRC-derived exosomes transferred CST1 to human umbilical vein endothelial cells (HUVECs) to promote angiogenesis. Taken together, our results demonstrate a novel function of CST1 in tumor metastasis mediated by exosomes through regulation of the MAPK pathway and angiogenesis in CRC.

一组血清外泌体 miRNA 作为肾透明细胞癌新型液体活检指标的临床价值研究

王成[1]、田亚萍[1]、张辰宇[2]、张春妮[1]、汪俊军[1]
1. 中国人民解放军东部战区总医院
2. 南京大学生命科学院，医药生物技术国家重点实验室

目的 探讨肾透明细胞癌（ccRCC）患者血清特定变化外泌体 miRNA 作为 ccRCC 新型分子标志物潜能。

方法 收集治疗前 ccRCC 患者血清 126 例，同时收集 124 例年龄、性别匹配的正常对照血清。分别提取患者和对照组血清外泌体后，运用低密度芯片技术检测 miRNA 表达谱。运用 qRT-PCR 分别在复筛组（27 例 ccRCC 和 26 例正常）、验证组（72 例和 72 例正常）和测试组（27 例 ccRCC 和 26 例对照）逐步进行验证。对部分 ccRCC 患者术前、术后样本比较分析。最后评价特定变化外泌体 miRNA 及其组合的临床价值。

结果 低密度芯片显示 ccRCC 患者血清外泌体中 miRNA 的表达谱与正常对照有明显差异，44 种 miRNA 在 ccRCC 中明显上调（变化倍数 > 5）。qRT-PCR 技术验证发现 6 种 miRNA 包括 miR-28-3p、miR-200a、miR-1826、miR-103、miR-1249 和 miR-640 在 ccRCC 患者中的水平均显著且稳定高于正常对照，在早期 ccRCC 中即显著升高，且在患者术后明显下降。ROC 曲线下面积（AUC）分析显示，6 种 miRNA 及其组合对复筛组、验证组、测试组诊断的 AUC 范围分别是 0.751 ～ 0.893、0.620 ～ 0.808、0.744 ～ 0.920，具有较高的诊断准确性。此外，6-miRNA 组合

对早期 ccRCC 诊断的 AUC 为 0.832（95%CI = 0.774 ～ 0.889），敏感度 84%，特异性 83%。逻辑回归分析显示，6 种 miRNA 及 6-miRNA 组合的 OR 值均具有统计学意义。

结论 6 种血清外泌体 miRNA miR-28-3p、miR-200a、miR-1826、miR-103、miR-1249 和 miR-640 组合在一起对 ccRCC 早期诊断、手术效果评估方面具有较高的准确性，有望成为 ccRCC 潜在的液体活检指标。

肽核酸功能化的纳米通道生物传感器高灵敏检测肿瘤外泌体 MicroRNA

孙忠月、张玉林、涂济源、路淑敏
湖北中医药大学

目的 本研究构建了一种肽核酸（PNA，peptide nucleic acid）功能化纳米通道生物传感器，实现对肿瘤外泌体 miRNAs 超灵敏检测。

方法 采用不对称化学蚀刻的方法制备聚对苯二甲酸乙二醇酯（Polyethylene terephthalate，PET）锥形纳米通道，将探针 PNA 共价修饰在通道表面，并通过皮安计电流、X 射线光电子能谱及激光共聚焦显微镜等表征实验证明 PNA 功能化纳米通道生物传感器的成功构建，利用传感器检测提取的外泌体总 RNA 中的 miRNA-10b，PNA 识别靶标 miRNA-10b 并杂交，通道内产生电荷变化，从而导致离子电流的改变，通过记录检测前后电学信号的差异来区分胰腺癌细胞与正常细胞组。并从当地医院收集了 20 例临床血浆标本(10 例健康志愿者和 10 例胰腺癌患者)，利用 exoRNeasy Serum/Plasma Midi Kit 试剂盒分别提取外泌体总 RNA，随后使用我们的传感器进行分析。

结果 成功制备得到锥形纳米通道生物传感器，通过激光共聚焦和 XPS 表征进一步验证在纳米通道内表面 PNA 确实与 miRNA 杂交，该传感器可高度区分靶标 miRNA-10b 与单碱基错配及非互补序列，且检测限可低至 75aM，同时与健康样本信号值相比，发现胰腺癌患者样本的平均电流信号明显强于每个健康样本。

结论 本研究成功构建肽核酸功能化纳米通道生物传感器，可实现对 miRNA 高特异、灵敏检测及临床样本检测，为将来该传感器应用于临床癌症的早期筛查提供实验基础，并且该策略具有普适性，可通过转换不同序列的 PNA 探针，以检测不同癌症相关的核酸标志物。

基于外泌体 DNA 的肿瘤相关基因突变临床检测的方法学研究

王哲颖[1,2]、王瑞娴[2]、潘晓蓉[2]、童建华[2]
1. 山东大学齐鲁医院
2. 上海交通大学医学院附属瑞金医院

背景 研究发现外泌体 DNA 中肿瘤相关基因的突变与肿瘤患者的疾病进展和预后密切相关。但是，目前有关外泌体的分离方法以及针对外泌体 DNA 的分析研究均无法确保相关的操作是在最佳条件下进行的，不同的研究之间也缺乏可比性。本研究旨在建立一种适于临床应用的基于外泌体 DNA 的检测肿瘤相关基因突变的实验方案。

方法 以胰腺癌的 KRAS 突变检测为例，针对血液样本的不同类型以及外泌体分离、外泌体 DNA 制备和微滴式数字 PCR（ddPCR）检测基因突变过程中的一些潜在因素进行了研究，并分析其对外泌体 DNA 检测可能产生的影响。

结果 本研究发现血清样本中外泌体 DNA 的含量高于血浆样本，但血清来源的外泌体 DNA 中 KRAS 突变的等位基因突变频率（MAF）则明显低于血浆样本。在外泌体分离的过程中，基于膜亲和原理的柱膜法与传统的超速离心法相比，在外泌体 DNA 的得率和 KRAS MAF 方面均无明显差异。

对分离得到的外泌体用 DNase I 进行预处理可以有效去除外泌体外部黏附的野生型 DNA，从而提高阳性样本中 KRAS MAF 的检测值。PBS 缓冲液会干扰 DNase I 的作用，如果后续实验需对外泌体 DNA 进行检测，则应避免将 PBS 作为外泌体的重悬缓冲液。此外，使用 ddPCR 进行相关基因突变检测时，若在微滴形成之前对外泌体 DNA 进行变性解链可以有效提高 KRAS 的总拷贝数和突变的阳性微滴数。

结论 本研究为外泌体 DNA 分析最佳实验条件的选择和不同实验室研究结果的比较提供了方法学的依据，并提出了一种能适于临床应用的有关外泌体 DNA 基因突变检测的实验方案。

可编程的工程化外泌体模拟物通过协同光免疫疗法和化学免疫疗法促进有效的癌症治疗

王毅超[1]、樊志金[2,3]
1. 台州市中心医院（台州学院附属医院）
2. 台州市中心医院（台州学院附属医院）
3. 广东省人民医院

人们迫切希望开发有效的治疗策略，选择性地破坏原发实体肿瘤，同时对正常组织的副作用最小，以消除转移性病变，并防止肿瘤复发。在此，我们通过将光热(PTT)剂金纳米棒(GNR)和化疗(ChemoT)剂吉西他滨(gemcitabine)加载到 m1 型巨噬细胞来源的纳米囊泡中来设计外泌体模拟物(EEMs)，将快速和局部光疗与进展性和广泛化疗结合起来。为增强 PTT 和 ChemoT 同时诱导的免疫原性细胞死亡(ICD)的免疫效应，将免疫激动剂 CpG ODN 和免疫检查点阻断剂 PD-L1 适配体包裹于 EEMs 中。随着肿瘤组织穿透能力的增强，GNR 可以通过光诱导的热膨胀实现对肿瘤细胞的局部机械损伤和药物释放，从而实现对原发肿瘤的精确清除。更重要的是，GNR 介导的 PTT 可通过释放肿瘤相关抗原和免疫激动剂 CpG ODN 促进强抗肿瘤免疫应答。随后 CD8 阳性 T 细胞比例增加，肿瘤细胞免疫被激活。为了防止 PD-L1 对细胞免疫的干扰，PD-L1 适配体竞争性地与 PD-L1 结合，从而发挥免疫检查点的阻断作用。EEMs 还通过吉西他滨诱导远端肿瘤的免疫原性细胞死亡，导致免疫系统激活和转移性肿瘤的崩溃。EEMs 将局部光热治疗与广泛化疗相结合，并将 ICD 放大以实现长期的肿瘤特异性免疫过程，以实现原位肿瘤和转移肿瘤清除。

核受体 NR2F6 介导乳腺癌铂类药物耐药的分子机制研究

黄玲
广州医科大学附属第六医院

目的 NR2F6 与多种癌症预后不良有关，再此探讨核受体亚族 2，F 组第 6 号成员（NR2F6）对乳腺癌细胞顺铂耐药的影响及其可能的作用机制。

方法 Western blot 和 real-time PCR 检测乳腺癌正常上皮细胞 MCF-10A，5 种乳腺癌细胞 MCF7,MDA-MB-231,UACC812,SK-BR3,BT474 和乳腺癌顺铂耐药细胞株 MCF-7/DDDP 中 NR2F6 的表达水平。CCK8 法检测上述细胞的半抑制浓度 IC50，探究 NR2F6 的表达水平是否与 IC50 有关，根据 NR2F6 表达水平选择 MDA-MB-231 细胞构建 NR2F6 稳转细胞，MCF7 构建敲低细胞，Western blot 法验证细胞是否构建成功。CCK8 细胞增殖，流式凋亡实验，划痕，transwell 法验证 NR2F6 对乳腺癌细胞增殖、侵袭、迁移的影响，CCK8 法验证顺铂的最适浓度，在顺铂作用下，重复上述实验验证顺铂作用下 NR2F6 对乳腺癌细胞增殖、侵袭、迁移的影响。CCK8 法检测过表达细胞及其亲本细胞，敲低细胞及其亲本细胞的半抑制浓度 IC50。运用 RNA-seq，蛋白质

质谱，CHIP 筛选下游分子行进一步机制研究，并进一步行 rescue 实验，双荧光素酶报告基因实验验证其下游基因。
结果 NR2F6 过表达可增加顺铂对 MDA-MB-231 细胞的杀伤活性，而 NR2F6 敲低可降低顺铂对其杀伤活性，根据 RNA-seq 及蛋白质质谱筛选并验证下游基因 BCL2A1。
结论 NR2F6 可通过下调 BCL2A1 增加乳腺癌细胞对顺铂的敏感性。

泛素连接酶 TRIM7 通过调控 HIF-1α 信号抑制肾透明细胞癌的转移与侵袭

袁超、赵敬杰
山东大学第二医院

目的 肾透明细胞癌是一种具有独特发病机制的恶性肿瘤，发生机制尚未完全阐明。我们前期研究结果表明，泛素连接酶 TRIM7 在肾透明细胞癌中低表达。本课题将探讨泛素连接酶 TRIM7 抑制肾透明细胞癌发生发展的机制研究。
方法 本课题结合细胞模型、动物模型和临床病理标本，明确 TRIM7 在肾透明细胞癌中的作用；利用干扰 shRNA、RNA-seq 等分子生物学手段和基因组学方法研究 TRIM7 对 HIF-1α 信号通路的影响，进而阐明 TRIM7 影响肾透明细胞癌发生的分子机制。
结果 我们收集了 40 例 ccRCC 患者的石蜡切片和 25 例 ccRCC 患者的新鲜癌组织，免疫组化、qRT-PCR 和 Western Blot 的结果显示 TRIM7 在 ccRCC 组织中显著低表达。过表达 TRIM7 基因可以抑制乏氧条件下细胞转移和侵袭，并显著降低 HIF-1α 的蛋白水平。我们将不同量的 TRIM7 野生型过表达质粒和 CA 突变体与恒量的 Src 过表达质粒共转染 HEK293 细胞，野生型 TRIM7 可以显著降低 Src 的蛋白水平，而泛素连接酶活性缺失的 CA 突变体对 Src 蛋白水平没有影响；与 CA 突变体相比，野生型 TRIM7 可以明显缩短 Src 的半衰期；蛋白酶体抑制剂 MG132 可以废除 TRIM7 对 Src 蛋白水平的影响。
结论 本研究明确了 TRIM7 在肾透明细胞癌中的作用，揭示了 TRIM7 调控 HIF-1 信号通路的分子机制，将为肾透明细胞癌的防治提供新的策略。

4. 上海交通大学转化医学中心 Translational Medical Research Center, Shanghai Jiao Tong University
5. 厦门大学生命科学学院 School of Life Sciences, Xiamen University

Cancer cells need to generate large amounts of glutathione (GSH) to buffer oxidative stress during tumor development. A ratelimiting step for GSH biosynthesis is cystine uptake via a cystine/ glutamate antiporter Xc_x0001_. Xc_x0001_ is a sodium-independent antiporter passively driven by concentration gradients from extracellular cystine and intracellular glutamate across the cell membrane. Increased uptake of cystine via Xc_x0001_ in cancer cells increases

the level of extracellular glutamate, which would subsequently restrain cystine uptake via Xc_x0001_. Cancer cells must therefore evolve a mechanism to overcome this negative feedback regulation. In this study, we report that glutamate transporters, in particular SLC1A1, are tightly intertwined with cystine uptake and GSH biosynthesis in lung cancer cells. Dysregulated SLC1A1, a sodium-dependent glutamate carrier, actively recycled extracellular glutamate into cells, which enhanced the efficiency of cystine uptake via Xc_x0001_ and GSH biosynthesis as measured by stable isotope-assisted metabolomics. Conversely, depletion of glutamate transporter SLC1A1 increased extracellular glutamate, which inhibited cystine uptake, blocked GSH synthesis, and induced oxidative stress-mediated cell death or growth inhibition. Moreover, glutamate transporters were frequently upregulated in tissue samples of patients with non–small cell lung cancer. Taken together, active uptake of glutamate via SLC1A1 propels cystine uptake via Xc_x0001_ for GSH biosynthesis in lung tumorigenesis.

OR-079

FUT7 Promotes the Epithelial-Mesenchymal Transition and Immune Infiltration in Bladder Urothelial Carcinoma

Mulin Liu[1]、Siyi Chen[2]、Shijun Li[1]
1. The First Affiliated Hospital of Dalian Medical University
2. 大连医科大学

Background Bladder urothelial carcinoma (BLCA) is one of the most frequently appearing, lethal and aggressive malignancies of the genitourinary system with growing morbidity and mortality, which affects human health seriously. Protein glycosylation, catalyzed by specific glycosyltransferase, has been found to be abnormal in several diseases, especially cancer. Fucosyltransferase VII (FUT7), one of the fucosyltransferases, was observed abnormally expressed in various cancers, however, the role of FUT7 in BLCA, and the association between its expression and clinical outcomes or immune infiltration remains unclear.
Methodology FUT7 expression in BLCA was analyzed in Oncomine database, which was further confirmed with immunohistochemistry and ELISA. The prognostic value of FUT7 for BLCA was evaluated with PrognoScan database, and its genetic alteration was examined in cBioPortal database. The proliferation, migration, invasion and epithelial–mesenchymal transition (EMT) changes of bladder cancer cells after FUT7 siRNA or cDNA transfection were determined by CCK8, colony formation, transwell and Western blot, respectively. The correlation between FUT7 expression and immune infiltration levels was analyzed in TIMER and TISIDB databases, and the methylation level of FUT7 was detected in UALCAN database.
Results The results showed that the expression of FUT7 was increased in BLCA, and patients with high FUT7 level were predicted to have lower overall survival and diseasespecific survival rates, which were not influenced by FUT7 genetic alterations. Downregulation FUT7 inhibited the proliferation, migration, invasion and EMT of bladder cancer cells, whereas upregulation of FUT7 showed the opposite effects. We found that FUT7 was positively correlated with immune cell infiltration levels (CD8+ T cells, CD4+T cells, macrophage, neutrophil and dendritic cells), and also the expression of gene markers of immune cells. The negative correlation between FUT7 expression and FUT7 methylation level was observed, among which FUT7 expression was positively correlated with the abundance of 28 kinds of tumor-infiltrating lymphocytes (TILs), while FUT7 methylation level was negatively correlated with TILs.
Conclusion Altogether, these findings suggested that FUT7 possessed the potential to serve as a detection biomarker or immunotherapeutic target for BLCA.

OR-080

Free fatty acid is a promising biomarker in triage screening for patients with colorectal cancer: a case-control study

Bin Zhu、Yingping Cao
Fujian Medical University Union Hospital

Purpose The aim of our study was to identify the diagnostic ability of Free fatty acid (FFA) in younger CRC by comparing carcinoembryonic antigen (CEA) and carbohydrate antigen 19-9 (CA19-9).
Methods Patients screened for CRC at Fujian Medical University Union Hospital from January 2011 to December 2014 were recruited. Patients pathologically diagnosed with CRC or colorectal adenoma (CA) and healthy control participants were included. The enzyme endpoint method was applied to measure FFA levels. Receiver operating characteristic (ROC) curve analysis was performed to further evaluate the diagnostic ability of FFAs.
Results FFA levels for patients in the late-stage (TNMstage III-IV, tumour-node-metastasis-stage) were higher than that in the early-stage (TNMstage I-II) (P=0.02). The FFA levels in CRC patients were higher than controls in all ages, younger than 50, males and females (P<0.001), and there was a dramatic increase in patients younger than 50 which is bigger than all ages, also, the increase in female is bigger. There was no significant difference in the FFA level between CA patients and healthy participants (P=0.53). The area under the curve (AUC) values of FFA, CEA, CA19-9, FFA+CEA, FFA+CA19-9 and FFA+CEA+CA19-9 distinguished CRC patients from controls at all ages, with values of 0.604, 0.731, 0.640, 0.754, 0.678 and 0.758, respectively; however, in the younger CRC patients (age≤50), the AUC values were 0.701, 0.735, 0.669, 0.798, 0.749, and 0.801. The AUC in female patients younger than 50 was larger than that in males (0.769 vs 0.660) and it was also larger than males (0.739) and females (0.729) of CEA.
Conclusion FFA has not only a complementary ability of CEA and CA19-9, but also a superior ability in female and younger patients with CRC; it may have a potential role in triage screening early CRC.

长链非编码 RNA SCARNA10 促进肝癌细胞增殖及其机制研究

韩亚伟
天津医科大学肿瘤医院

目的 探究长链非编码 RNA SCARNA10 对肝癌细胞增殖的影响及其机制。
方法 在人肝癌细胞系 HepG2、MH97H 及正常肝细胞系 L-7702 中，采用实时荧光定量 PCR（qPCR）法检测 SCARNA10 的表达水平。将 HepG2 和 MH97H 细胞各分为两部分，分别转染小干扰 RNA（siRNA）和阴性对照 RNA（NC）36 h；收集细胞，采用 qPCR 法检测细胞中的增殖细胞核抗原（PCNA） mRNA，CCK-8 法检测波长 450 nm 处的吸光度（OD）值表示细胞增殖活性，克隆形成实验计数克隆形成数。核质分离提取实验观察 SCARNA10 在肝癌细胞胞核、胞质中的分布情况，RNA 结合蛋白免疫沉淀（RIP）实验验证 SCARNA10 与 SUZ12、EZH2 的相互作用。
结果 HepG2、MH97H 细胞中 SCARNA10 相对表达量均高于 L-7702 细胞（P 均＜0.05）。与转染 NC 比较，转染 siRNA 的 HepG2、MH97H 细胞中 PCNA mRNA 表达量、细胞增殖 OD 值均降低，细胞克隆数均减少（P 均＜0.05）。核质分离提取实验显示，SCARNA10 在 HepG2、MH97H 细胞胞核内的表达比例高于胞质内表达比例（P＜0.05）。HepG2 细胞中 SCARNA10 与 SUZ12、EZH2 的相对富集量分别为 5.05±1.39、3.95±0.67，MH97H 细胞中分别为 6.71 ±2.60、4.47±1.75。
结论 在细胞核中 SCARNA10 可能通过与 SUZ12、EZH2 结合而促进肝癌细胞增殖。

Recommendations for proficiency testing criteria for hemoglobin A1c based on the Shanghai Center for Clinical Laboratory's study

Yi Ju[1]、Zhimin Cao[2]、qing li[1]、liping tang[1]、yuanzhu ou[1]、xiaoxuan yu[1]、wenbin liu[1]
1. Shanghai Center for Clinical Laboratory,Shanghai,China
2. Upstate Medical University, Syracuse, New York, USA

ObjectiveThe US Centers for Medicare & Medicaid Services proposed in 2019 that glycated hemoglobin A1c (HbA1c) be a CLIA'88 regulated analyte . People who commented expressed concerns that the proposed acceptance limit (AL, HbA1c in NGSP unit) ±10% for proficiency testing (PT) would be unable to maintain already improved analytical performance and guarantee the clinical utility of HbA1c testing. Assessing impact of various ALs on PT performance is needed to provide scientific evidence for adopting an appropriate AL.
Methods Ten patient's EDTA-whole blood specimens were distributed to 318 and 336 laboratories in the 2018 and2019 PT events organized by Shanghai Center for Clinical Laboratory (SCCL). HbA1c concentrations were measured by participants using various methodologies commonly used in the USA and China. Targets were determined using secondary reference measurement procedures (SRM) at SCCL. Failed Results were results outside the SRM-defined target ±AL (5% through 10%). Laboratories with Failed Results ≥ 2 out of 5 samples per PT event obtained Event Unsatisfactory Status.
Results HbA1c target values ranged 33.3 mmol/mol (5.2 NGSP%) 102.2 mmol/mol (11.5 NGSP%) for 2018 event, and 33.3 mmol/mol (5.2 NGSP%) 84.7 mmol/mol (9.9 NGSP%) for 2019 event. Overall Laboratory Event Unsatisfactory Rates ranged 11.3-12.2%, 4.8-5.3%, 0.9-3.1%, 0.6-2.2%, 0.6-1.4% and 0.6-1.4%, at AL of ±5%, ±6%, ±7%, ±8%, ±9% and ±10%, respectively.
Conclusions The AL (in NGSP unit) of ±6% or ±7% for PT evaluation of HbA1c results would be appropriate, with satisfactory event score for about 95% of participant laboratories in a PT event.

Epidemiological, clinical and laboratory features of patients with bloodstream infection of Brucella in Anhui Province, China

Cuixiao Shi[1]、Lianzi Wang[1]、Dongmei Lv[1]、Gang Wang[1]、Hylemariam Mihiretie Mengist[2]、Tengchuan Jin[2]、Bo Wang[1]、Ying Huang[1]、Yajuan Li[1]、Yuanhong Xu[1]
1. Department of Clinical Laboratory, the First Affiliated Hospital of Anhui Medical University
2. 中国科学技术大学

Background Brucellosis is currently one of the most widespread zoonotic diseases caused by Brucella genus, and the Brucella melitensis is the major pathogen. The number of people infected with Brucella has gradually increased in Anhui Province.
Purpose To retrospectively evaluate the epidemiological, clinical, and laboratory data of brucellosis patients in Anhui Province.
Patients and Methods A total of 109 brucellosis patients were admitted to the First Affiliated Hospital of Anhui Medical University from January 2012 to March 2021. Data from all patients were retrieved from the hospital's electronic medical system. The final results were grouped and compared according to the presence or absence of bacteremic brucellosis and three phases of brucellosis.

Results The most common symptoms among all 109 brucellosis patients were fever (89.0%), followed by chills (52.3%), arthralgia (48.6%), and weight loss (30.3%), and laboratory results presented with anemia (65.1%), elevate of C-reactive protein (CRP) (91.7%), erythrocyte sedimentation rate (ESR) (86.2%), aspartate aminotransferase (AST) (40.4%), and lactate dehydrogenase (LDH) (43.1%). The percentage of fever (96.1%), arthralgia (58.8%), anorexia (35.3%), leukopenia (31.4%), and the AST (51.0%) were higher in bacteremic than nonbacteremic group. Additionally, the median level of LDH (332.0 mg/ L, IQR, 209.0–553.0) was higher in bacteremic than nonbacteremic group. Nevertheless, the albumin (36.0 mg/L, IQR, 33.9–38.2) was lower in the bacteremic group. The percentage of fever (94.9%) and the median LDH level (316.0 U/L (IQR,218.0–517.5)) in the acute phase of brucellosis were higher than the percentage of fever (72.0%) and the median LDH level (209.0 U/L (IQR,162.0–276.0)) in the subacute phase of brucellosis.
Conclusions Brucellosis has become an important public health issue in Anhui Province. Brucellosis is a disease with diverse clinical manifestations. Our data showed that unex-plained fever, arthralgia, and elevated AST and LDH should be considered as a diagnosis of bacteremia brucellosis for early treatment intervention.

HNRNPA2B1 Affects the Prognosis of Esophageal Cancer by Regulating the miR-17-92 Cluster

Kexin Li[1]、Xiaoying Lou[1]、Benheng Qian[2]、Yiling Li[1]、Shaohui Ma[1]、Wei Cui[1]
1. 中国医学科学院肿瘤医院
2. 温州医科大学附属第二医院

N6-methyladenosine (m6A) is the most abundant RNA modification in eukaryotes. Accumulating evidence suggests that dysregulation of m6A modification significantly correlates with tumorigenesis and progression. However, the function of HNRNPA2B1 in miRNA regulation in esophageal cancer (ESCA) has not been fully elucidated to date. In this study, we observed an increased expression and positive correlations of all 25 m6A regulators in ESCA data obtained from the TCGA database. Next, we used 25 m6A regulators to classify the ESCA patients into two subgroups (EC1 and EC2). We found EC2 subgroup was remarkably correlated with advanced clinical stage, distant metastasis, lymph node metastases and overall survival of ESCA. Through expression profiling of these regulators, a prognostic score model containing HNRNPA2B1, ALKBH5 and HNRNPG was established, and the high-risk subgroup exhibited strong positive correlations with ESCA progression and outcome. The risk score obtained from this model may represent an independent predictor of ESCA prognosis. Notably, the gene most frequently associated with increased risk was HNRNPA2B1. Recent study reported that HNRNPA2B1 might be involved in the progression of ESCA by regulating miRNA expression. In addition, bioinformatics analysis showed that HNRNPA2B1 was significantly positively correlated with the expression of miR-17-92 clusters, and there were binding sites for m6A and HNRNPA2B1 at miR-18a. In ESCA, the increased expression of HNRNPA2B1 alone might predict poor prognosis by affecting tumor-promoting signaling pathways through miR-17-92 clusters. An experimental study demonstrated that elevated HNRNPA2B1 expression was positively associated with distant metastasis and lymph node stage, and predicted the poor outcomes of ESCA patients. We also collected the 14 paired esophagus cancer tissues and tumor-adjacent tissues to validate the bioinformatic analysis in TCGA datasets. We found that the significantly positive correlation between HNRNPA2B1 and miR-17/miR-18a/miR-106b in 14 paired esophagus cancer tissues and tumor-adjacent tissues. Moreover, HNRNPA2B1, miR-17, miR-20a, miR-93, and miR-106b showed the higher expression in tumor tissues than tumor-adjacent tissues. We also found the positive correlation between HNRNPA2B1 and miR-17, miR-18a, miR-20a, miR-93 and miR-106b in 7 ESCA cell lines. Furthermore, m6A and HNRNPA2B1 could co-immunoprecipitate on the miR-17-92 cluster in TE1, which is consistent with our

predicated result. Knockdown of HNRNPA2B1 significantly decreased the expression of miR-17, miR-18a, miR-20a, miR-93, and miR-106b and inhibited the proliferation of ESCA cells. Therefore, our study indicated that the dynamic changes in 25 m6A regulators were associated with the clinical features and prognosis of patients with ESCA. Importantly, HNRNPA2B1 alone may affect the prognosis of patients with ESCA by regulating the miR-17-92 cluster.

长链非编码 RNA LUCAT-1 通过 miR-4316/VEGF-A 轴促进肺腺癌转移的机制研究

谢艳
山东大学第二医院

背景与目的 肺腺癌（Lung adenocarcinoma，LA）是全球癌症死亡的主要原因之一，大量研究发现，长链非编码 RNA (Long non-coding RNA, lncRNA)作为 miRNA 分子海绵参与 LA 细胞的增殖、迁移、侵袭和凋亡等病理生理学过程。本文拟探讨 LA 细胞来源 lucat-1 介导的细胞间通讯调控对 LA 进展的影响及其作用机制。

方法 选取 5 例 LA 患者血清样本为观察组，以及 5 例健康体检者血清样本作为对照组；利用测序筛选出 LA 患者及健康体检者血清差异表达的 lncRNA LUCAT-1，通过实时荧光定量 PCR(RT-qPCR)技术在大量样本集（100 例 LA 患者及 100 例健康对照者）中进行验证，受试者工作特征曲线（ROC）分析示 lucat 对结直肠癌的诊断效能。通过 tcga 数据库分析 LA 在 LA 组织中的表达情况，设计 lucat-1 过表达及敲减质粒，通过 Transwell 侵袭迁移实验检测 LUCAT-1 对 LA 细胞侵袭迁移能力的影响。双荧光素酶实验明确 lucat-1 及下游 miRNA 的靶基因，并设计挽救实验。

结果 与非癌症人群血清外泌体相比，在 LA 血清外泌体及组织中中 LUCAT-1 的表达水平均上调。LUCAT-1 能够促进 LA 细胞的迁移能力。采用生物信息软件预测 LUCAT-1 与 miR-4316 的作用靶点及 VEGF-A mRNA 的 3’非翻译区（3’-untranslated region，3’-UTR）miR-4316 结合位点，通过荧光素酶报告基因实验证实靶点；通过转染上调 miR-4316 后 VEGF-A 蛋白表达明显下降，而下调 miR-4316 后 VEGF-A 蛋白表达明显升高；上调 LUCAT-1 后 VEGF-A 蛋白表达明显升高，而下调 LUCAT-1 后 VEGF-A 蛋白表达明显下降。细 胞功能回复实验结果显示，同时上调或下调 LUCAT-1 和 miR-4316 时 VEGF-A 蛋白表达水平变化不显著。体内实验显示， LUCAT-1-KD 组瘤体中 LUCAT-1 含量及 VEGF-A 蛋白的表达水平降低，而 LUCAT-1-OE 组瘤体中 LUCAT-1 含量及 VEGF-A 蛋白的表达水平显著升高。

结论 LA 外泌体中 LUCAT-1 通过吸附 miR-4316 促进 VEGF-A 表达进而进肿瘤转移。敲低 LA 细胞中的 LUCAT-1 有望通过调控 miR-4316/VEGF-A 轴来抑制 LA 的侵袭和转移。

Consistency of aminotransferase analysis in China: Comparison of six mainstream aminotransferase routine methods and recalibration using human serum pool preparations supplemented with human recombinant aminotransferases

Zhenni Liu[1]、Qichen Long[1]、Tianqi Qi[1]、Jing Wang[2]、Haijian Zhao[2]、Jie Zeng[2]、Tianjiao Zhang[1]、Ying Yan[2]、Weiyan Zhou[2]、Jiangtao Zhang[2]、Wenxiang Chen[2]、Chuanbao Zhang[1]

1. 北京医院 国家老年医学中心 中国医学科学院老年医学研究院 国家卫生健康委临床检验中心 北京市临床检验工程技术研究中心 中国医学科学院北京协和医学院

2. 北京医院 国家老年医学中心 中国医学科学院老年医学研究院 国家卫生健康委临床检验中心 北京市临床检验工程技术研究中心

Background The purpose of this study is to evaluate the consistency of six mainstream homogeneous systems for aminotransferase measurements and improve the consistency of routine aminotransferase activity measurements through uniform calibrators.

Methods A total of 200 individual samples were grouped into four sets for the assay groups with and without pyridoxal-5-phosphate (P-5'-P) for ALT and AST. The routine assays of the P-5'-P group were compared with reference measurement procedures (RMP). In the no P-5'-P group, four routine assays were pairwise analyzed in six method pairs. Recalibration was performed using human serum pools (HSPs) supplemented with human original recombinant aminotransferases (HOR). Data were analyzed with the Passing–Bablok regression and the Bland–Altman plots.

Results In the P-5'-P group, the mean biases of Ortho and Dimension for ALT were 17.0% and -25.4%, while for AST, their mean biases were -9.5% and -9.6%, respectively. In the no P-5'-P group, the mean deviation of six method pairs ranged from -5.9% to 5.9% for ALT. For AST, the slopes and relative deviation ranged from 0.86 to 1.03 and -19.1% to 6.5%, respectively. After recalibration, in the P-5'-P group, the relative biases reduced to -12.2% ~ 7.7% for ALT and -6.9% ~ 0.8% for AST. In the no P-5'-P group, the mean deviations between the method pairs remarkably reduced for AST (-3.0% ~ 3.3%).

Conclusion Assays with P-5'-P supplemented both showed undesirable performance against RMP for ALT and AST. For assays without P-5'-P, the results for AST showed unsatisfying comparability for almost all method pairs. Using HSP preparations as the uniform calibrators could be hopeful to propel harmonization among mainstream homogeneous systems for aminotransferase activity measurement, especially for variable AST routine measurements.

An Extraction free Isothermal System for Rapid Detection of Eight Common Pathogens Causing Lower Respiratory Tract Infections

Yuying Si 、Lieying Fan
Shanghai East Hospital

Lower respiratory tract infections (LRTIs) are a leading cause of morbidity and mortality worldwide and lack of a rapid diagnostic method. To improve the diagnosis of LRTIs, we established an available loop-mediated isothermal amplification (LAMP) assay for the detection of eight common lower respiratory pathogens, including Klebsiella pneumoniae, Pseudomonas aeruginosa, Acinetobacter baumannii, Staphylococcus aureus, Escherichia coli, Haemophilus

influenza, Streptococcus pneumoniae, and Moraxella catarrhalis. Furtherly, we established a rapid, high throughput and extraction free detection planform for LRITs using direct nucleic acid releasing strategy without extra nucleic acid extraction steps and encapsulated assay agents saved multiple labor. The whole progress can be shortened to 45min from sample in to results out. 528 sputum samples collected from patients with suspected LRTIs were detected by LAMP assays (8 tests in each sample, a total of 4224 tests), which compared with standard culture method (SCM), and then samples with inconsistent results were verified by Sanger sequencing and High-throughput sequencing (NGS). The results showed that all the Kappa coefficients between LAMP assay and SCM for detecting eight kinds of bacteria exceeded 0.4 as well as $P < 0.001$, indicated fair to good agreement. Besides, LAMP method (44.51%) detected more multiple infections than SCM (12.69%), and 367 inconsistent tests between the two methods were verified by Sanger sequencing. Results showed that 231 tests (62.94%) were concordant with LAMP, presenting higher sensitivity and detection rate than SCM, especially for multiple infection samples. 50 inconsistent samples were randomly selected for NGS and the diagnostic efficiency of LAMP assay was as follows: specific 94.49%, sensitive 75.00%, positive predictive value 90.44%, negative predictive value 84.47%, positive likelihood ratio 13.62, and negative likelihood ratio 0.26. In summary, an extraction free and high throughput LAMP platform was established to detect eight common pathogens causing LRTIs, which was significant for point of care testing and can be implemented in primary hospitals.

我国部分地区区域检验中心建设及运营情况调查

吴炯[1]、殷杏[1]、樊绮师[2]
1. 上海嘉会国际医院
2. 上海交通大学医学院附属瑞金医院

目的 随着我国医改政策的持续推进，各地先后建立了不同模式和规模的区域医学检验中心。据不完全统计，目前全国已建立的区域医学检验中心已达数十家之多。区域检验中心在我国建设、运营情况如何，目前尚无调查及研究。我们对我国不同区域及地区的区域检验中心进行调研，了解其类型及规模、相关政策及制度、建设情况及人员利用率情

方法 对我国华东、华北、西北、西南地区正在运营的 9 家区域检验中心进行调研。通过问卷调查、电话访谈及现场调研的方式收集相关信息资料。问卷内容包含：区域检验中心类型及规模、区域检验中心相关政策及制度、区域检验中心建设情况、区域检验中心人员利用率情况等。

结果 调查中的区域检验中心主体是以公立医疗机构为主（77.8%）。此类型区域检验中心依附于其附属的公立医疗机构，大多无独立法人资质。区域检验中心建设及运营过程中，无 1 家由国家投资，部分经济发达地区区域检验中心（22.2%）有运营补贴。区域检验中心建设资金来源中，集中采购补贴是一种较为特殊的方式。区域检验中心建设存在规模（面积、设备投入、收入）差异，较小规模的区域检验中心并未设立分子诊断亚专科（22.2%），实验室整体质量建设尚有待提高（实验室认可通过率 44.4%）。区域检验中心建设中设备投入 3.01±1.60 万元/平方米，其中临床免疫亚专科单位面积设备投入最高（3.75±2.21 万元/平方米）。区域检验中心由于集中化检测，其人员利用率较普通实验室更高，区域检验中心临床化学亚专科最低（0.065 小时/项），而分子诊断及微生物亚专科相对较高。

结论 目前我国区域检验中心建设及发展正处于起步阶段。不同类型、不同地区的区域检验中心在发展模式、规模等各方面均存在较大差异。希望本文的研究内容和成果，可为今后全国各类型、各模式的区域医学检验中心的建设运营提供有价值的参考标准。使已建和新建的区域医学检验中心达到更好的“社会效益”和“经济效益”。

中高危甲状腺癌患者术后血清甲状腺球蛋白水平与临床结局的相关性研究

刘茜辉、李贵星、贺勇、银梦婷
四川大学华西医院

目的 探究中高风险分化型甲状腺癌（DTC）患者术后血清 Tg 水平对远期临床结局的预测价值。
方法 以 2011 年 1 月至 2015 年 12 月就诊于四川大学华西医院的 194 名 DTC 患者为研究对象，依据最后一次随访结果分为三组：A 组：存在结构性的复发；B 组：生化反应不全；C 组：无病生存。三组患者均接受甲状腺全切手术和碘 131（131I）放射治疗，并规律随访，中位随访时间为 62 个月（2~120 个月）。比较三组患者术后刺激性甲状腺球蛋白水平（ps-Tg）和抑制性甲状腺球蛋白水平（bTg）的差异；通过 ROC 曲线确定 ps-Tg 和 bTg 预测患者无病生存的最佳临界值；采用多因素 logistic 回归分析疾病复发的危险因素。
结果 A 组和 B 组的 ps-Tg、bTg 水平高于 C 组（P＜0.01），A 组和 B 组间 ps-Tg、bTg 水平没有显著差异（P＞0.05）。ps-Tg 和 bTg 预测患者无病生存的最佳临界值分别为 5.18ng/mL（AUC：0.949，95%CI：0.913-0.986）和 0.85ng/mL（AUC：0.911，95%CI：0.867-0.956）。颈部淋巴结转移分期（OR：3.42，95%CI：1.33-8.76，P＜0.01），ps-Tg 水平（OR：1.43，95%CI：1.23-1.67，P＜0.001）是患者出现生化反应不全或疾病结构性复发的危险因素。此外，血清 Tg 倍增时间小于一年的患者，更容易出现疾病结构性的复发。
结论 淋巴结转移分期较高、术后 ps-Tg 高于 5.18ng/mL、bTg 高于 0.85ng/mL、Tg 倍增时间小于 1 年的中高风险 DTC 患者疾病复发的可能性较大。

Identification of potential core gene GMPS in Hepatocellular Carcinoma using bioinformatics analysis

Xiaoli Zhou[1]、Shu Feng[1]、Renwei Jing[2]、Li Jiang[1]
1. Department of Laboratory Medicine, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China.
2. Department of Cell Biology and Key Laboratory of Immune Microenvironment and Disease (Ministry of Education), Tianjin Medical University, Qixiangtai Road, Heping District, Tianjin, 300070, China

Background Hepatocellualr carcinoma (HCC) is one of the most malignant cancers in the world. It has the characteristics of high incident rate, high mortality rate and limited treatment options.Therefore, it's urgent to find out more new targets related to hepatocellular carcinoma.
Materials and Methods To explore potential therapeutic targets for HCC, we analyzed two microarray datasets (GSE117361 and GSE46408) derived from the Gene Expression Omnibus (GEO) database. The GEO2R tool was used to screen out differentially expressed genes (DEGs) between HCC and normal liver tissue. Gene Ontology(GO) function and Kyoto Encyclopedia of Genes and Genomes(KEGG) pathway enrichment analysis were performed using the Database for Annotation, Visualization and Integrated Discovery to identify the pathways and functional annotation of DEGs. Protein–protein interaction of these DEGs was analyzed based on the Search Tool for the Retrieval of Interacting Genes database and visualized by Cytoscape software. In addition, we used the online Kaplan–Meier plotter survival analysis tool to evaluate the prognostic value of hub genes expression in HCC patients.
Results A total of 363 up-regulated DEGs and 122 down-regulated DEGs were identified. Among them, ten hub genes with a high degree of connectivity were picked out. Over-expression of genes VCL, LOX and GMPS was associated with unfavorable prognosis of HCC, down-

expression of gene CXCL12 was associated with unfavorable prognosis of HCC. Especially, GMPS over-expression was observed and indicated poor outcome of HCC.
Conclusion Our study suggested that GMPS was over-expressed in HCC compared with normal liver tissue, and over-expression of GMPS was an unfavorable prognostic factor of HCC patients. Further study is needed to explore the value of GMPS in the treatment of HCC.

EGFR 介导 FRK 抑制 β-catenin 入核影响脑胶质瘤

石琼、马萍
徐州医科大学附属医院

目的 研究 FRK 是否通过 EGFR 抑制 β-catenin 入核，从而影响胶质瘤细胞的凋亡。
方法 1.将 FRK 质粒转染入脑胶质瘤 U251 细胞中，Western blot 检测过表达 FRK 对细胞浆，细胞核和整个细胞中 β-catenin 水平的影响，验证 FRK 是否影响 β-catenin 入核。2. Western blot 检测过表达 FRK 对 EGFR 和磷酸化的 EGFR-Y1173 水平的影响。3.转染 EGFR(WT)和 EGFR(Y1173F)质粒，流式细胞仪检测细胞凋亡情况，研究 EGFR(WT)、EGFR(Y1173F)对脑胶质瘤 U251 细胞凋亡的作用。4. 共转 FRK 和 EGFR(WT)、EGFR(Y1173F)质粒，分别检测细胞浆，细胞核和整个细胞中 β-catenin 水平，验证 FRK 是否通过影响 EGFR-Y1173 磷酸化从而抑制 β-catenin 入核。5. 共转 FRK 和 EGFR(WT)、EGFR(Y1173F)质粒，流式细胞术检测细胞的凋亡情况，检测 FRK 是否通过影响 EGFR-Y1173 磷酸化从而促进胶质瘤的凋亡。
结果 1. 与对照组相比，过表达 FRK 降低细胞核内 β-catenin 蛋白水平，但不改变细胞内总的 β-catenin 蛋白水平。2. 与对照组相比，过表达 FRK 增加 EGFR-Y1173 磷酸化水平（$P<0.05$），而对 EGFR 总蛋白水平无影响。3. 流式细胞术结果显示：过表达 EGFR(WT)、EGFR(Y1173F)质粒，细胞凋亡均减少（$P<0.05$）。4. 与对照组相比，过表达 FRK 抑制了 β-catenin 的核转位，EGFR 促进了 β-catenin 的核转位，且转染 EGFR（Y1173F）质粒组的作用比转染 EGFR（WT）的效果更明显，此外，转染 EGFR（Y1173F）质粒逆转了过表达 FRK 对 β-catenin 核转位的抑制作用（$P<0.05$）。5. 流式细胞术结果显示：与对照组相比，过表达 FRK 促进了细胞凋亡，EGFR 抑制了细胞凋亡，且转染 EGFR（Y1173F）质粒组的作用比转染 EGFR（WT）的效果更明显，此外，转染 EGFR（Y1173F）质粒可逆转过表达 FRK 对胶质瘤细胞的促凋亡作用（$P<0.05$）。
结论 FRK 可以通过促进 EGFR-Y1173 磷酸化抑制 β-catenin 入核，从而促进胶质瘤细胞凋亡。

OR-092

Withaferin A reduces doxorubicin-induced cardiac injury by inducing MAPK phosphatase-1

Jun Qiu、Dong Zheng
The First Affiliated Hospital of Soochow University

Aims Doxorubicin is widely used as a first-line chemotherapeutic drug for various malignancies. However, doxorubicin causes severe cardiotoxicity which limits its clinical use and therapeutic approaches are limited. Recent studies demonstrated that impaired autophagic flux contributes to doxorubicin cardiotoxicity. This study investigated whether withaferin A (WFA) protects against doxorubicin cardiotoxicity by improving autophagic flux via inducing MAPK phosphatase-1.
Methods Cardiac injury was induced in mice by intraperitoneal injection of doxorubicin (20 mg/kg). WFA (1, 2 or 5 mg/kg) was intraperitoneally given 30 min before doxorubicin injection. Five days later, myocardial function and myocardial injury were analyzed. Cultured cardiomyocytes were incubated with WFA followed by doxorubicin for 24 hours. Cell death and

oxidant stress were determined. Autophagy and autophagic flux were analyzed in cardiomyocytes and mouse hearts.
Results Administration of WFA reduced oxidant stress, inhibited cardiac cell death and attenuated myocardial dysfunction in doxorubicin-injected mice in a dose-dependent manner. These protective effects of WFA were recapitulated in cultured cardiomyocytes stimulated with doxorubicin. Mechanistically, WFA prevented autophagic flux block and accumulation of autolysosomes in doxorubicin-induced cardiomyocytes and a mouse model of doxorubicin cardiotoxicity, the effects of which were associated with inducing MKP-1 expression. Furthermore, blocking autophagic flux with chloroquine or knock-down of MKP-1 with siRNA abrogated these protective effects of WFA in doxorubicin cardiotoxicity.
Conclusions WFA prevents doxorubicin cardiotoxicity by improving autophagic flux and autolysosome clearance via MKP-1 signaling. Thus, WFA may be a potentially useful drug to prevent doxorubicin cardiotoxicity.

OR-093

CD73 severed as a potential prognostic marker and promote lung cancer cells migration via enhancing EMT progression

Zhao-wei Gao、Ke Dong
Tangdu hospital， Air Force Medial University

Objective To investigate the expression levels and prognostic value of CD73 in lung cancer. And moreover, to identify the effect and potential mechanism of CD73 on lung cancer cells proliferation and migration.
Method CD73 expression levels in lung cancer were analyzed base on GEPIA2 and GEO database. GEPIA2 and Kaplan-Meier Plotter (KM Plotter) was used to analyzed the correlation between CD73 expression and prognosis. GEO dataset were analyzed via GEO2R. CD73 overexpression cell model was construction via recombinant lentivirus transfection into A549 cells. CCK8 and colony formation assay were used to investigate cells proliferation. Migration and invasion ability were evaluated by scratch and transwell method.
Results Base on GEPIA2, GSE32683, GSE116959 and GSE37745 dataset, we found that CD73 expression were significant higher in tumor tissues of lung adenocarcinoma (LUAD) compared with that in non-tumor normal tissues and in lung squamous cell carcinoma (LUSC), while there were no significant difference of CD73 expression between LUSC and normal control tissues. Moreover, a high CD73 level predict poor overall survival (OS) of LUSC. However, GEPIA2 and KM plotter showed the opposite conclusion of prognostic value of CD73 in LUAD. By using cell experiment, we found that CD73 overexpression promoted proliferation, migration and invasion of lung cancer A549 cells. Furthermore, CD73 overexpression facilitates epithelial to mesenchymal transition (EMT) progression.
Conclusion Our results indicated that higher CD73 expression in LUAD and might be an poor prognostic marker for LUSC patients. CD73 play an important role in lung cancer cells proliferation and migration. These data allowed to support CD73 as a therapeutic target for lung cancer.

基于液相色谱-串联质谱技术骨关节结核血清生物标志物的初步研究

陈汐濛、温新宇、王成彬
中国人民解放军总医院第一医学中心

目的 骨关节结核是结核分枝杆菌直接感染或迁延至骨关节组织所引起的一种肺外结核病。该病早期临床表现特异性差，现有临床影像学和实验室检查对该病早期检出率低，极大地影响患者的治疗和预后。针对骨关节结核早期诊断较为困难的情况，本课题利用液相色谱-串联质谱 (LC-MS/MS) 筛选骨关节结核患者血清中特异性表达的血清差异蛋白并进行临床验证和诊断评价，从实验室诊断的角度为骨关节结核早期诊断提供思路。
方法 收集临床上已确诊的骨关节结核、风湿免疫性骨关节炎患者血清样本，同时收集健康成人血清样本作为对照，并据此设置相应的疾病分组。应用 LC-MS/MS 对所收集血清样本的蛋白质成分进行分析，以 $p<0.05$ 且差异倍数>1.5 为标准，筛选在骨关节结核患者血清中特异性表达的血清差异蛋白。根据蛋白差异表达情况挑选特异性较好的数种蛋白，使用另一批次相同纳入排除标准的血清样本进行酶联免疫吸附试验 (ELISA) 验证以评估差异蛋白的诊断效能。
结果 经过 LC-MS/MS 分析，共筛选出 56 种在骨关节结核患者血清中特异性表达的血清差异蛋白，包含 29 种表达上调蛋白和 27 种表达下调蛋白。根据差异蛋白表达情况及 ELISA 验证的结果，初步得出人类血清补体 H 因子相关蛋白 1 (CFHR1)、人类血清补体 H 因子相关蛋白 2 (CFHR2) 为诊断效能较好的潜在血清差异蛋白标志物，其 ROC 曲线下面积值分别为 0.8733 和 0.8176。
结论 应用 LC-MS/MS 初步筛选出两种诊断效能较好的在骨关节结核患者血清中特异表达的潜在血清差异蛋白标志物，为骨关节结核早期实验室诊断的生物标志物研究和骨关节结核机体相关免疫机制研究提供了参考。

The changes of vanA gene cluster mediate the collateral sensitivity between daptomycin and glycopeptide antibiotics in Enterococcus faecium

Weiliang Zeng[2]、lingbo wang[2]、相阔 zheng[2]、huaiyu jia[1]、wenya xu[2]、liqiong chen[1]、tieli zhou[2]、yao sun[2]、jianming cao[1]
1. Department of Medical Lab Science, School of Laboratory Medicine and Life Science, Wenzhou Medical University, Wenzhou, Zhejiang Province, China.
2. 温州医科大学附属第一医院

Objective Collateral sensitivity (CS), where resistance to one antimicrobial increases susceptibility to other drugs, is a good example against bacterial resistance. The aim of this study was to explore the molecular mechanisms of CS between daptomycin (DAP) and glycopeptides in Enterococcus faecium.
Methods 2 vancomycin-resistant and DAP-susceptible E. faecium strains (SC1174 and SC1762) were surveyed. Adaptation laboratory evolution was carried out to investigate CS by DAP induction experience in vitro. The susceptibility of strains to DAP and antibiotics was detected by antimicrobial susceptibility testing. Polymerase chain reactions (PCR), quantitative Real-time PCR (qRT-PCR), overlapping PCR and efflux pump inhibition testing were performed to explain the molecular mechanisms of CS.
Results Both strains exhibited high level resistance to DAP after exposure DAP for 36 days. CS between DAP and glycopeptides was observed in SC1762 and SC1762-D (highly DAP-induced SC1762 mutant) strains. The vanH gene mutations (Gly899Ala and Val914Asp) were only found

in SC1762-D. Compared with corresponding parental strains, the transcriptional expression level of vanA gene cluster in SC1174-D (highly DAP-induced SC1174 mutant) was significantly up-regulated, inversely, those in SC1762-D was obviously down-regulated except for the vanX gene. Overlapping PCR showed that the reversed insertion of IS1216 element between vanXY in SC1762 and SC1762-D. Besides, the results of efflux pump inhibition testing indicated that all strains had positive efflux pump phenotype.
Conlusions The decrease of vanA gene cluster expression was the main mechanism of CS between DAP and glycopeptides, and vanH mutation might also be related to resensitization.

Nosocomial transmission and rearrangement of large resistance-virulence hybrid plasmids between two bacteremic ST11 carbapenem-resistant hypervirulent Klebsiella pneumoniae strains with low fitness cost

Yang Liu 、si chen、qisen huang
First Affiliated Hospital of Nanchang University

Objectives To characterize nosocomial transmission and rearrangement of the resistance-virulence plasmid between two ST11-K64 carbapenem-resistant hypervirulent Klebsiella pneumoniae (CR-hvKP) strains (JX-CR-hvKP-10 and JX-CR-hvKP-9) with low fitness.
Methods The serum killing assay, the quantitative biofilm formation assay, the Galleria mellonella infection model, and the mouse lethality assay were used to assess the virulence of JX-CR-hvKP-10 and JX-CR-hvKP-9. Whole-genome sequencing was used to analyze JX-CR-hvKP-10 and JX-CR-hvKP-9 chromosomes and plasmids. Fitness and conjugation experiments were also conducted using these two CR-hvKP isolates.
Results Clinical characteristics and phenotypic tests indicated that both JX-CR-hvKP-10 and JX-CR-hvKP-9 were multidrug-resistant and hypervirulent K. pneumoniae. Whole-genome sequencing and clinical information demonstrated that the super large resistance-virulence fusion plasmid pJX10-1 formed precisely by the fusion of pJX9-1 and pJX9-2 via the nosocomial transmission. Interestingly pJX9-1 itself was also a classic resistance-virulence fusion plasmid by way of the blaKPC-carrying resistance plasmid and pLVPK-like virulence plasmid. While pJX9-2 included numerous genes encoding for nucleotide transport and metabolism such as exonuclease, DNA polymerase, DNA ligase, integrase, recombinase. Compared with classic K. pneumoniae ATCC700603, fitness analysis revealed no significant difference in growth was observed between JX-CR-hvKP-10 and JX-CR-hvKP-9.
Conclusion Nosocomial transmission and rearrangement of a blaKPC-harboring plasmid and a pLVPK-like virulence plasmid with a low fitness cost in ST11 K. pneumoniae enhances drug resistance and virulence simultaneously. This can enhance the environmental adaptability of CR-hvKP, and promote its spread and prevalence. Thus, active surveillance of this hybrid plasmid is needed to prevent these efficient resistance-virulence plasmids from disseminating in hospital settings.

肺炎链球菌疫苗蛋白 ΔA146Ply 的矿化纳米颗粒在鼻咽部感染中的研究

吴静雯
成都市第三人民医院

目的 本文旨在研究肺炎链球菌蛋白疫苗 ΔA146Ply 的矿化纳米颗粒在鼻咽部感染中的免疫保护作用。
方法 利用大肠杆菌原核表达系统，通过分子克隆技术表达肺炎链球菌疫苗蛋白 ΔA146Ply 及含有生物矿化肽的疫苗蛋白 ΔA146Ply-PA44，分别经 Ni2+柱纯化、去除内毒素。将 ΔA146Ply-PA44 置于富含 Ca2+和 PO43-的弱碱性溶液中处理后制备成纳米级的生物矿化颗粒（ΔA146Ply-PA44@CaP）。以 ΔA146Ply、ΔA146Ply-PA44@CaP 及 PBS 分别免疫小鼠后取其末梢血检测特异性抗体效价；于末次免疫后取小鼠脾细胞，再刺激并检测上清液中细胞因子分泌量。末次免疫后经鼻腔攻毒肺炎链球菌 CMCC31693，于 3 天后取肺泡灌洗液计数鼻腔及肺部细菌载量，同时取其肺部行 HE 染色评估炎症情况。
结果 以 ΔA146Ply、ΔA146Ply-PA44@CaP 及 PBS 分别免疫小鼠后，测得 ΔA146Ply-PA44@CaP 免疫组小鼠产生的特异性抗体效价较 ΔA146Ply 及 PBS 组均有显著升高；ΔA146Ply-PA44@CaP 免疫组小鼠脾细胞再刺激后产生的细胞因子 IL-4，IFN-γ 较 ΔA146Ply 及 PBS 免疫组均有显著增高。末次免疫后经鼻腔攻毒肺炎链球菌 CMCC31693，于 3 天后取肺泡灌洗液计数鼻腔及肺部细菌载量，结果显示 ΔA146Ply-PA44@CaP 免疫组小鼠肺泡灌洗液中细菌载量较 ΔA146Ply 及 PBS 免疫组明显减少，同时小鼠肺部 HE 染色提示，ΔA146Ply-PA44@CaP 免疫组的小鼠肺部炎症反应较 ΔA146Ply 及 PBS 免疫组明显较弱。
结论 以上结果提示肺炎链球菌蛋白疫苗 ΔA146Ply 的矿化纳米颗粒能诱导小鼠产生较强免疫保护效应并可有效抵抗肺炎链球菌的鼻咽部定植及感染。

肺炎克雷伯菌肝脓肿不同临床特征分组的比较分析

鲁敏仪、郑佳佳
北京大学第三医院

目的 通过比较分析肺炎克雷伯菌肝脓肿（KPLA）与其他细菌肝脓肿（NKPLA）的临床特征以及对肺炎克雷伯菌肝脓肿亚分组的临床特征和实验室指标差异分析，为 KPLA 的诊断治疗提供参考和依据。
方法 分析北京大学第三医院 2016 年 1 月至 2020 年 12 月收治的 215 例肝脓肿患者的临床资料，比较 KPLA 患者和 NKPLA 患者、KPLA 是否合并糖尿病、是否患有胆道疾病、是否患有消化道疾病亚分组的临床特征，实验室检测指标，病原学结果、治疗方法及预后情况，$P<0.05$ 认为具有显著性差异。
结果 215 例肝脓肿病例中细菌培养结果阳性 98 例，其中 72 例为肺炎克雷伯菌，KPLA 分离的肺炎克雷伯菌对除氨苄西林外的大部分抗菌药物敏感。与 NKPLA 相比，KPLA 患者多同时患有糖尿病（$P=0.013$），且临床表现以畏寒或寒战（$P=0.010$）为主，KPLA 组 AST 水平较高（$P<0.01$）；而 NKPLA 患者多同时患有胆道疾病（$P<0.01$），且 NKPLA 组血红蛋白水平较低（$P=0.029$）。KPLA 合并糖尿病患者相比于不合并糖尿病患者白细胞计数（$P=0.049$）、中性粒细胞绝对计数（$P=0.041$）高于非糖尿病组，而 KPLA 非糖尿病组的 AST 水平高于糖尿病组（$P=0.043$）；两组在并发症、治疗方法、治疗结果上无明显差异，但糖尿病组的治疗时间明显长于非糖尿病组（$P=0.017$）。KPLA 合并胆道疾病患者血小板计数（$P=0.035$）及 GGT（$P=0.016$）水平高于无

胆道疾病的患者，且治疗效果差（*P*=0.033）。而 KPLA 是否合并消化道疾病两组间除年龄外无显著差异。
结论 肺炎克雷伯菌是引发细菌性肝脓肿的主要致病菌，KPLA 患者多同时患有糖尿病，易发生其他部位脓肿，眼内炎等侵袭性并发症，且炎症指标升高，治疗时间长；此外 KPLA 合并胆道疾病治疗效果差，应早期合理应用抗菌药物治疗，脓肿液化应及时穿刺引流。

Profile analysis of circRNAs in osteoclasts infected by intracellular Staphylococcus aureus

Haifang Zhang、Hong Du
Department of Clinical Laboratory, The Second Affiliated Hospital of Soochow University, Suzhou, Jiangsu, 215004, China.

Circular RNAs (circRNAs) play important roles in multiple physiopathological processes. However, little is known about the roles of circRNAs in the pathogenesis of osteomyelitis, which is primarily caused by Staphylococcus aureus infection. It has been reported that S. aureus can survive in osteoclasts, but the function of osteoclast circRNAs in response to intracellular S. aureus infection remains unclear. In this study, the circRNA expression profile of mouse osteoclasts intracellularly infected with S. aureus was investigated by RNA sequencing. In total, 24 upregulated and 62 downregulated differentially expressed circRNAs (DEcircRNAs) were identified. Subsequently, Gene Ontology annotation and Kyoto Encyclopedia of Genes and Genomes pathway enrichment analysis were used to further study biological functions of the DEcircRNAs. Interestingly, the phospholipase D signaling pathway, bacterial invasion of epithelial cells, and Fc gamma R-mediated phagocytosis were the most significant pathways enriched for the host genes of upregulated DEcircRNAs, while T cell and B cell receptor signaling pathways and axon guidance were the most significantly enriched pathways of downregulated DEcircRNAs. Moreover, we constructed circRNA-microRNA and protein-protein interaction networks that may be associated with intracellular S. aureus infection in osteoclasts. Finally, we confirmed that circPum1 regulated Pmp22 expression via miR-767 by quantitative reverse transcription PCR and Western blot analyses. This study provided the first profile analysis of circRNAs in osteoclasts infected by intracellular S. aureus and a novel idea for understanding the pathogenesis of osteomyelitis.

Hypoxia stimulats adipogenesis at the expense of the osteogenesis via leptin in fibroblast-like synoviocytes from patients with rheumatoid arthritis

Menglei Ding、Lieying Fan
Shanghai Dongfang Hospital Affiliated Tongji University

Objective This study aimed to investigate the role of hypoxia on rheumatoid arthritis fibroblast-like synoviocytes (RA-FLSs) osteogenesis and adipogenesis.
Methods RA-FLSs and osteoarthritis (OA)-like synoviocytes (OA-FLSs) were isolated and cultured, The expression of CD73, CD90, CD105, and CD45 as well as apoptotic cells in both groups was examined by flow cytometry. The self-renewal capacity was measured by the clone-forming assay. The osteogenic or adipogenic differentiation potential was confirmed by specific staining after continuous cultivation in osteogenic or adipogenic induction medium, respectively. All these experiments were performed in parallel under hypoxia (3% O2). The gene expression

profiles GSE21959, GSE32006, and GSE5587 were downloaded from the Gene Expression Omnibus (GEO) database. The differentially expressed genes (DEGs) between normoxic and hypoxic cells were identified and overlapped. Subsequently, the role of leptin in osteogenesis and adipogenesis of RA-FLSs was assessed by RNA interference. the mRNA and protein expression levels of leptin as well as osteogenic and adipogenic markers were measured using qRT-PCR and western blotting.
Results RA-FLSs presented a mesenchymal stem cell (MSC)-like phenotype and showed limited self-renewal capacity and multi-differentiation potential. Hypoxia inhibited RA-FLSs osteogenic differentiation by downregulating the expression of runt-related transcription factor 2 (Runx2), osteocalcin (Ocn), alkaline phosphatase (Alp) and osteostrix (Osx). In contrast, hypoxia significantly promoted RA-FLSs adipogenic differentiation by upregulating CCAAT enhancer-binding protein α (C/EBPα), peroxisome proliferator activated receptor γ (PPARγ) and fatty acid binding protein 4 (FABP4). Bioinformatics analysis indicated that leptin was the only overlapping gene among the three gene expression profiles. The expression of leptin increased when RA-FLSs responded to hypoxic stimuli. Konckdown of leptin rescued the imbalance of adipogenesis and osteogenesis induced by hypoxia in RA-FLSs.
Conclusion RA-FLSs possess MSC-like characteristics. Hypoxia readily stimulated RA-FLSs to differentiate into adipocytes instead of osteoblasts via leptin. Our results indicate that leptin could be a new molecular target for therapy in RA.

Association of serum total cholesterol with pegylated interferon-α treatment in HBeAg-positive chronic hepatitis B patients

Zhen Xun 、Qishui Ou
The First Affiliated Hospital of Fujian Medical University, Fuzhou, China

Background Recent studies suggest that serum lipids are associated with pegylated interferon-alpha (PegIFNα) treatment response in chronic hepatitis C patients. However, the role of serum lipids in influencing the outcome of HBV treatment is not well understood. This study aims to investigate the association of serum lipids with the response to interferon-alpha treatment for chronic hepatitis B (CHB) patients.
Methods We dynamically measured 11 clinical serum lipid parameters of 119 HBeAg-positive CHB patients, including 53 patients who achieved sustained response (SR) and 66 patients who achieved nonresponse (NR) induced by PegIFNα treatment for 48 weeks.
Results The dynamic analysis showed that the baseline serum total cholesterol (TCHO) level was higher in the NR group than that in the SR group (P = 0.004). Moreover, the correlation analysis demonstrated a significant positive correlation between TCHO and HBsAg at baseline (P = 0.009). In addition, CHB patients with the high baseline TCHO levels exhibited higher HBV DNA, HBsAg, HBeAg and HBeAb levels during early treatment periods (weeks 0, 4, 12 and 24) than those with the low TCHO levels. Furthermore, the logistic regression analysis identified that baseline serum TCHO was a risk factor of NR achievement (OR = 4.94, P = 0.047).
Conclusions Our results indicated that serum TCHO was associated with PegIFNα therapeutic response in HBeAg-positive CHB patients which suggested that serum TCHO could be useful as an auxiliary clinical factor to predict poor efficacy of PegIFNα therapy.

Anti-Citrullinated Protein Antibodies Induce Trained Immunity in RA Synovial Tissues and Its Gene Signature Correlates with the Response to Clinical Therapy

Qiao Zhong[1]、Xiaoli Dai[2]、Xiaoqiu Dai[3]、Fangyuan Gong[3]、Xiaoming Gao[3]
1. the Affiliated Suzhou Hospital of Nanjing Medical University, Suzhou Municipal Hospital, Suzhou, China
2. 苏州大学附属第二医院
3. 苏州大学生物医学研究院

Much evidence suggests that trained immunity is inappropriately activated in the synovial tissue in rheumatoid arthritis (RA), but the underlying mechanism remains unclear. Here, we describe how RA-specific autoantibody deposits can train human monocytes to exert the hyperactive inflammatory response, particularly via the exacerbated release of tumor necrosis factor α (TNFα). Comparative transcriptomic analysis by plate-bound human IgG (cIgG) or β-glucan indicated that metabolic shift towards glycolysis is a crucial mechanism for trained immunity. Moreover, the cIgG-trained gene signatures were enriched in synovial tissues from patients with ACPA- (anticitrullinated protein antibody-) positive arthralgia and undifferentiated arthritis, and early RA and established RA bore a great resemblance to the myeloid pathotype, suggesting a historical priming event in vivo. Additionally, the expression of the cIgG-trained signatures is higher in the female, older, and ACPA-positive populations, with a predictive role in the clinical response to infliximab. We conclude that RA-specific autoantibodies can train monocytes in the inflamed lesion as early as the asymptomatic stage, which may not merely improve understanding of disease progression but may also suggest therapeutic and/or preventive strategies for autoimmune diseases.

A novel class of tsRNA signature as a biomarker for diagnosis and prediction of nephritis in SLE

Ping Yang、han shen
Department of Laboratory Medicine，Drum Tower Hospital，Nanjing University Medical School

Object To explore the value of a novel class of tsRNA signature as a biomarker for diagnosis and prediction of nephritis in SLE.
Methods First, 110 normal controls and 191 SLE patients of which 75 SLE without LN patients and 116 SLE with LN patients were recruited from The Affiliated Drum Tower Hospital of Nanjing University Medical School. A total of 10 mL serum was respectively mixed in each group (24 normal controls , 23 SLE without LN patients and 33 SLE with LN patients) were performed initial screening by small RNA sequencing. Real-time fluorescence quantitative Polymerase Chain Reaction (RT-qPCR) was used to verify the screened out 10 differentially expressed tsRNAs. Differentially expressed tsRNAs were further validated by RT-qPCR in residual 52 SLE without LN patients, 83 SLE with LN patients and 86 healthy controls. The severity degree in SLE patients was assessed by the systemic lupus erythematosus disease activity index 2000 (SLEDAI-2K). The diagnostic efficacy was assessed by Receiver Operating Characteristic Curve (ROC). Further more, correlations of tsRNAs with clinical manifestations of SLE patients were analyzed. Finally, a bioinformatic analysis was performed to investigate the potential functions of differentially expressed genes.
Results 393 tsRNAs were differentially expressed between the SLE without LN patients and NC patients. Among which, significantly upregulated expression levels of tRF-1:23-chrM.Ala-TGC, tRF-27:42-Gly-GCC-1-M3, tRF-1:28-His-GTG-1, tRF-68:85-Ser-GCT-3-M4, tRF-1:22-Val-AAC-1-

M7, tRF-68:85-Ser-TGA-4, tRF-65:86-Leu-CAA-1-M5, tRF-53:71-chrM.Pro-TGG, tRF-57:76-Tyr-GTA-2-M2,
tRF-57:75-Gln-CTG-2-M3 were further validated in serum from SLE with LN patients by RT-qPCR. Meanwhile, we identified the area of the tsRNA under the AUC curve of distinguishing SLE group and normal group was 0.67, LN group and normal group was 0.73, SLE without nephritis group and nephritis group was 0.81. The area under the AUC curve of tsRNA combined with dsDNA in distinguishing SLE group and normal group was 0.95, the area under the AUC curve of tsRNA combined with 24-hour urine protein in distinguishing SLE without nephritis group and nephritis group was 0.89. We also identify tsRNA biomarkers for the classification of both dsDNA-positive and negative SLE patients, as well as anti-smith antibodies-positive and negative RA patients. Bioinformatic analysis suggested several gene ontology (GO) and KEGG terms and signal pathways may play important roles in the development of SLE.
Conclusion In summary, Our data provided comprehensive evidence regarding the differential expression of tsRNAs in serums from SLE patients indicating that these tsRNAs may be a potential biomarker for diagnosis and prediction of nephritis in SLE.

2. 国家蛋白质科学中心(北京)，北京蛋白质组研究中心
3. 国家蛋白质科学中心(北京)，北京蛋白质组研究中心

Objectives Behcet's disease (BD) is a heterogeneous chronic vasculitis, with the highest prevalence along the ancient Silk Road. However, the pathogenesis is still unclear and satisfactory biomarkers for diagnostics and prognostics are lacking. The clinical heterogeneity further increases the difficulty of marker discovery. To address this challenge, we executed the largest proteomics analysis of plasma proteins in BD to reveal the potential pathogenesis and identify markers that are expected to be used in diagnosis and treatment.
Methods The plasma proteins from 98 BD patients with various manifestations and 31 healthy controls (HC) were measured using our in-depth proteomics platform comprised of data-independent acquisition mass spectrometer (DIA-MS) and Antibody Microarray (AA) to screen candidate protein markers for BD. Functional annotation and pathway analysis of significant proteins were applied to uncover their pathogenic roles in BD. Potential markers for diagnostics, phenotypes and severity evaluation were identified and further validated in an independent cohort by ELISA comprised of 39 BD patients and 10 HC.
Results 228 significantly expressed proteins were identified between BD patients and HC ($P<0.05$). The most extensively enriched biological process by 130 proteins ($P<0.01$) are 1) complement and coagulation cascades, 2) immune and inflammatory response, 3) serine-type endopeptidase activity, 4) platelet activation and coagulation dysfunction, 5) plasma lipoprotein metabolism, highlighting the vital role of complement, serine-type endopeptidase, lipoprotein in BD, and the involvement of complement, leukocyte, platelet and immunoglobulin during the inflammation, immune response and coagulation dysfunction in BD. KEGG analysis further highlighted the role of pathogenic infection in BD. Specifically, different proteins panels and pathologic pathways underline various phenotypes of BD. In the subsets with vascular involvement, the role of platelet, component of complement systems and IGF/IGFBPs (Insulin-like Growth Factor/Insulin-like Growth Factor Binding Proteins) were further highlighted and present potential therapeutic values in BD. The protein markers of HABP2, TNC and SERPINA3 were discovered and validated to indicate vascular involvement and disease risk in BD.

Conclusion We performed the largest proteomics study in BD. The results obtained from this proteomics study provide the in-depth insight in the BD pathogenesis and different phenotypes. Three biomarkers (HABP2, TNC and SERPINA3) were associated with the vascular lesion and severity of BD progression.

OR-105

The value of AMA-M2, gp210 and sp100 antibody levels in disease progression of primary biliary cholangitis

Zhan Wang、Mingjun Liu、Tiantian Xu、Wenshuai Li
The Affiliated Hospital of Qingdao University

Objective In this study, multiplex bead-based flow fluorescent immunoassay (MBFFI) was used to quantitatively detect serum AMA-M2, gp210 and sp100 antibodies in patients with PBC, and to explore the clinical value of antibody level in evaluating the disease progression of PBC.
Methods The case group included 340 patients with PBC. Other disease groups included 81 patients with autoimmune hepatitis (AIH) and 62 patients with systemic lupus erythematosus (SLE). And there are 171 healthy subjects served as healthy control group. We used MBFFI to detect the AMA-M2, gp210 and sp100 antibodies quantitatively in all serum samples. The difference in serum autoantibody contents between PBC, other disease and healthy control groups were compared. Another purpose of this study is to explore the relationship between the level of antibodies to AMA-M2, gp210 and sp100 antibody and the disease progression, especially with the natural course of disease. In PBC group, the difference in antibody levels between PBC cirrhosis patients and non-cirrhosis patients was compared. And the correlation between antibody level and other laboratory indexes was also evaluated. In addition, we analyzed AMA-M2, gp210 and sp100 antibody levels in 25 patients with PBC at two visits before and after a 1-year interval to evaluate the changes in antibody levels and their relationship with disease progression.
Results The serum levels of AMA-M2, gp210 and sp100 antibodies in PBC group were significantly higher than those in other disease groups and healthy controls (P=0.000). The serum gp210 antibody levels of patients in natural course stage I [3.09 (2.16-18.08) AU], natural disease stage II [3.46(2.16-6.61) AU] and natural disease stage III [6.28(2.13-16.33) AU] were lower than that of patients with natural disease stage IV [27.90 (4.28-169.56) AU] (P=0.000). The level of serum gp210 antibody in cirrhosis group [27.90 (4.28-169.56) AU] was higher than that in non-cirrhosis group [3.57 (2.16-12.46) AU] (P=0.000). However, there was no significant difference in the antibody levels of AMA-M2 and gp210 between cirrhosis group and non-cirrhosis group (P>0.05). Serum AMA-M2 level was positively correlated with ALP (r=0.186, P=0.001) and GGT (r=0.143, P=0.013), but not with other laboratory indexes. Serum gp210 antibody level was positively correlated with ALT (r=0.150, P=0.007), AST (r=0.257, P=0.000), TBIL (r=0.241, P=0.000), DBIL (r=0.263, P=0.000), ALP (r=0.266, P=0.000) and GGT (r=0.188, P=0.001), and it was negatively correlated with ALB (r=-0.240, P=0.000). However, there was no correlation between gp210 antibody and PLT. Serum sp100 antibody level was negatively correlated with ALP (r=-0.123, P=0.034) and GGT (r=-0.142, P=0.013), but there was no significant correlation between other laboratory indexes. In this study, twenty-five PBC patients had a second visit in our hospital during sample collection, the interval between two visits was 12.2 ± 3.38 months. The patients with serum AMA-M2, gp210 and sp100 antibody levels ≥ 20AU at the first visit had different degrees of changes in antibody levels during the follow-up. However, in the patients with serum antibody levels＜20AU at first visit, their antibody levels were stable and did not fluctuate significantly during the treatment of the disease.
Conclusion The level of serum gp210 antibody in PBC patients is correlated with the disease natural course. And High level of gp210 antibody may indicate rapid progression of the disease. PBC patients with higher levels of gp210 were more likely to develop cirrhosis. In addition, the level of AMA-M2 and sp100 may be an indicator of cholestasis.

无精症患者精液代谢组学分析

轩冉
解放军总医院

目的 无精子症（Azoospermia），是指在所射出的精液中连续 3 次找不到一个精子，约占男性不育症患者的 15%-20%，病因繁多，根据输精管道有无阻塞分为梗阻性无精症（obstruction azoospermia，OA）和非梗阻性无精症（non-obstruction azoospermia, NOA）。研究精液成分可以提高临床诊断的准确性，更好的了解无精症患者的病理生理学。代谢组学为评价生物标志物和更好的理解病理机制提供了新的平台。本研究目的是利用代谢组学的方法分析无精症患者的精浆，找到能鉴别诊断无精症类型的生物标志物，从而为无精症患者的临床诊断治疗提供更多的信息。
方法 收取门诊健康查体患者（n=30）和无精症患者（n=40）精液，并将无精症患者根据诊断分为 OA 组（n=23）和 NOA（n=17）。在 LC-MS 分析之前，将标本进行混合模式固相萃取和两步衍生化；预处理好的标本上机进行 LC-MS 质谱分析（系统包括 LC-30AD 超高性能 LC 系统、离子陷阱-飞行时间质谱仪、LCM solution3.72 程序）；质谱系统得出的数据导入到 MZmine2.0 软件中进行峰检测、同位素峰分组、峰积分和特征对比，然后在三个水平对代谢物数据进行鉴（第一级是通过比较保留时间和 MS/MS 信息与商业标准的特征阳性鉴定代谢物；第二级将特征的 MS/MS 信息与 HMDB、脂质组学谱、MSFINDER 软件中的预测/报道片段进行比较；第三级对没有 MS/MS 谱的特征通过在 HMDB 数据库中搜索准确的特征量进行推定识别，并且选择具有最低 Δppm 的候选物质）；最后得到预期结果。
结果 研究发现健康对照组和无精症组存在差异性代谢物，且差异具有统计学意义；OA 组和 NOA 组存在具有鉴别诊断的生物标志物。
结论 无精症是目前男性不育中常见的疾病，部分患者的发病机制目前尚不明确。代谢组学是新兴的组学技术，与基因组学、蛋白组学不同的是，该技术分析的是整个代谢组，即生物系统内代谢的最终产物；代谢组的组成决定了细胞当前的表型状态，以及对细胞和细胞外刺激的相应变化，从而使代谢组学研究比其他组学方法提供更多的信息，特别是在研究细胞对外源性刺激的反应或在病理情况下。基于此，对精液的代谢组学分析具有重要意义。

POU4F3 基因两个新突变致常染色体显性遗传非综合征型耳聋家系的鉴定分析及其分子标志物价值研究

白晓卉[1]、张凤国[2]、肖云[2]、卢志明[1]、徐磊[2]
1. 山东第一医科大学附属省立医院
2. 山东大学附属省耳鼻喉医院

目的 分析两个遗传性非综合征型耳聋家系的临床听力学特征，并利用遗传性耳聋基因目标区域捕获测序技术鉴定致聋基因,并评价致病突变作为分子标志物的诊断价值及意义。
方法 通过家系调查，收集到两个感音神经性聋家系的临床资料，整理并分析该家系成员的临床听力学和遗传学特征，对家系成员进行调查并绘制系谱图。我们利用进行耳聋基因目标区域捕获技术和大规模平行测序技术，对先证者的 DNA 标本进行了已知耳聋基因突变筛查。继而对获得的测序结果进行分析，确定候选基因。利用 Sanger 测序技术对所有家系成员进行候选基因突变验证，并对氨基酸保守性进行分析。结合临床患者资料，评价 POU4F3 基因 2 个新突变作为分子标志物的价值。
结果 根据绘制的系谱图，该耳聋家系遗传方式为常染色体显性遗传。该家系耳聋特征为双侧对称性的全频感音神经性耳聋，发病特点为语后发病、进展性听力损失。耳聋基因目标区域捕获测序技

术分析结果提示，耳聋基因 POU4F3 存在 2 个新突变 c.704_705del (p.T235fs) 和 c.593G>A(p.R198H)，分别为这两个耳聋家系的致病病因。这 2 个位点在多物种之间保守，Sanger 测序确认 2 个新突变与家系耳聋表型共分离，在 200 个正常人群中未发现。

结论 耳聋基因 POU4F3 存在 2 个新突变 c.704_705del (p.T235fs) 和 c.593G>A(p.R198H)，分别是两个耳聋家系的致病病因，在诊断常染色体显性遗传性耳聋致病病因中具有重要意义和临床价值。

3. 复旦大学附属华山医院北院检验科
4. 复旦大学附属华山医院中心实验室

Objective Homologous Recombination Deficiency (HRD) is the emerging genomic marker for malfunction of homologous recombination and determines the surgical intervention, chemotherapy, and targeted medication of breast cancer. However, detection of HRD requires the quantification of genomic scars by high-throughput DNA sequencing, which is both labor- and technical-intensive. The aim of this study is to establish a gene expression panel (GEP) representing the HRD status and evaluate its clinical significance in breast cancer management.

Methods A 23 differentially expressed gene (DEG) list was generated with the transcriptomic data of HRD-high and HRD-low subgroup from the cancer genomic atlas (TCGA) breast cancer cohort (n = 981). Lasso regression model was performed on the DEG list to establish a GEP with the best performance fitting. The pathway specificity of the GEP was determined by gene set enrichment analysis (GSEA) and DNA repair score ranking test in the TCGA group and further validated by HRD quantification with an independent cohort of 20 breast cancer tissues collected in the Department of General Surgery, Huashan Hospital. Survival analysis was performed to evaluate the clinical significance of the GEP in 5 breast cancer cohorts with over 5,000 cases (TCGA, n = 1,020; METABRIC, n = 1,903; GSE42568, n = 104; GSE20685, n = 327; GSE96058, n = 3,273). The sensitivity and specificity of GEP, OncotypeDX Breast Cancer Assay and PAM50 in overall survival prediction were compared by receiver operating characteristic (ROC) curve analysis. Drug response of breast cancer chemotherapy agents was compared with the pharmacogenomic data from two cell line databases [Genomics of Drug Sensitivity in Cancer (GDSC) and Cancer Therapeutics Response Portal (CTRP)] and cancer tissue database (TCGA ncRNA model).

Results A three-gene (*PHGR1*, *CAPN8*, and *PRAME*) expression based GEP was generated to represent the HRD status in TCGA. GSEA analysis revealed cell cycle, DNA replication, homologous recombination repair, oxidative phosphorylation and proteasome as the top 5 enriched pathways of GEP. Decreased RPPA DDR score, recombination proficiency score, and increased TP53 inactive score and PARPi7 was enriched in TCGA samples with high GEP (Kolmogorov–Smirnov test, $P < 10^{-5}$). In the 20 fresh breast cancer tissues, GEP score was significantly increased in the HRD high group (Fisher's exact test, $P = 2.03\times10^{-3}$). Breast cancer with higher GEP demonstrated unfavored overall survival in TCGA [HR = 1.87 (95% CI = 1.33-2.63), $P = 2.90\times10^{-4}$], METABRIC [HR = 1.20 (95% CI = 1.07-1.35), $P = 2.41\times10^{-3}$], GSE42568 [HR = 2.84 (95% CI = 1.39-5.82), $P = 4.30\times10^{-3}$], GSE20685 [HR = 1.90 (95% CI = 1.21-2.96), $P = 5.04\times10^{-3}$], and [HR = 2.04 (95% CI = 1.63-2.56), $P = 2.45\times10^{-6}$]. Moreover, the GEP score outperformed the 21 gene OncotypeDX and PAM50 in the overall survival prognosis in TCGA [AUC = 0.634 (GEP) vs 0.619 (OncotypeDX) vs 0.585 (PAM50)]. Subgroup analysis further revealed the association between high GEP and chemotherapy sensitivity in TCGA [n = 434, HR

= 2.4 (95% CI = 1.15-5.02), *P* = 0.02], which was further supported by the drug response analysis in the GDSC and CTRP cell lines and TCGA tissue samples (Olaparib, Rucaparib, 5-Fluorouracil, Cisplatin, Doxorubicin, Methotrexate, IC50 comparison by two sample t-test, all *P* < 0.05).
Conclusion The three-gene (*PHGR1*, *CAPN8*, and *PRAME*) GEP represents the HRD status of breast cancer. This gene expression marker sets a promising index for the prognosis and drug response prediction of breast cancer patients.

长链非编码 RNA AC012073.1 对乳腺癌细胞迁移侵袭的影响及临床价值研究

孔雪、王传新
山东大学第二医院

目的 探讨长链非编码 RNA（lncRNA）AC012073.1 在乳腺癌（BC）中的表达及对细胞迁移侵袭的影响，并对其临床价值进行研究。
方法 运用高通量芯片和 TCGA 数据挖掘分析在 BC 组织中高表达并与患者预后不良相关的 lncRNAs。利用实时荧光定量 PCR（qRT-PCR）检测 AC012073.1 在乳腺癌细胞和血清中的表达水平。通过小干扰或质粒转染技术敲减或过表达 AC012073.1 并利用 Transwell 和划痕实验检测其对细胞迁移和侵袭能力的影响。利用 TargetScan 等数据库对下游作用靶点和功能富集分析进行预测，并运用 Cytoscape 软件绘制 ceRNA 调控网络。采用受试者工作曲线（ROC）分析血清 AC012073.1 对乳腺癌的诊断效能。
结果 筛选发现一种新型 lncRNA AC012073.1，在乳腺癌组织中高表达且与患者预后不良显著相关（P=0.031），乳腺癌细胞系中 AC012073.1 表达水平明显高于正常乳腺上皮细胞。选择 MDA-MB-231 和 MCF-7 两株细胞进行功能实验，结果显示，敲减 AC012073.1 显著抑制细胞迁移和侵袭能力，反之过表达 AC012073.1 后，细胞的迁移和侵袭能力明显增强。下游靶点和基因通路分析显示 AC012073.1 可能通过调控肿瘤经典信号通路促进乳腺癌的进展。此外，qRT-PCR 结果显示，与健康对照相比，乳腺癌患者血清中 AC012073.1 显著升高，ROC 曲线结果显示曲线下面积（AUC）为 0.833，表明其对乳腺癌具有良好的诊断价值。
结论 研究表明 AC012073.1 在乳腺癌中显著高表达,促进乳腺癌细胞的迁移和侵袭，并可能成为乳腺癌诊断和预后的潜在生物标志物。

Epithelial circulating tumor cells with a heterogeneous phenotype are associated with metastasis in NSCLC

Yujuan Zhang
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Objectives To analyze the clinical relevance of heterogeneous phenotypes of peripheral circulating tumor cells (CTCs) in non-small cell lung cancer (NSCLC).
Materials and Methods CTCs in 5 mL venous blood were enriched by using the CanpatrolTM CTC technique in 82 NSCLC patients. 60 patients did not receive any treatment and 22 patients had received chemoradiotherapy or targeted therapy. And then CTCs were subjected to RNA in situ hybridization with a combination of epithelial (EpCAM and CK8/18/19) and mesenchymal (vimentin and TWIST1) markers.
Results In 82 NSCLC cohort, only 2 patients didn't detect CTCs, the overall CTCs detection rate was 97.5% (80/82). The median number of total CTCs per 5mL blood was 21 (range 0-90).

Across all the patients, the median number of hybrid E/M phenotype CTCs was 17 cells/5mL (range 0-83), and the median number of E-CTCs and M-CTCs was 1 cells/5mL (range 0-17 and 0-47, respectively).
For 60 treatment naïve NSCLC, only one patient didn't detect CTCs and 27 patients showed all three phenotypes. A total of 13 patients showed both M-CTCs and hybrid E/M-CTCs, 7 patients showed both E-CTCs and hybrid E/M-CTCs, 11 patients showed pure E/M-CTCs and 1 patient showed pure M-CTCs.
The total number of CTCs detected in the 59 treatment naïve NSCLC ranged from 1-90 cells/5mL with the median value being 22 cells/5mL. The number of hybrid E/M phenotype CTCs, the most common phenotype observed in each patient, ranged from 0-83 cells/5mL with a median value of 13 cells/5mL. The number of E-CTCs and M-CTCs ranged from 0-17 cells/5mL and 0-47 cells/5mL, respectively, with the median value being 1 cells/5mL.
According to the fluorescence intensity of epithelial and mesenchymal markers, hybrid E/M phenotype CTCs were further divided into three subtypes, including the number of E>m CTCs, e=m CTCs and e<M CTCs that contained ranges of 0-17 cells/5mL, 0-65 cells/5mL and 0-21 cells/5mL, with median values being 1 cells/5mL, 15 cells/5mL and 1 cells/5mL, respectively.
The distribution of total CTCs/5ml blood between advanced versus early stages showed no significant differences. However, the non-E/M CTCs, especially the M-CTCs, were significantly greater more in advanced stage NSCLC patients compared to patients in early stages. The ROC curve with a cutoff value of M-CTCs being 2 cells/5 mL blood demonstrated that the sensitivity of M-CTCs in the diagnosis of advanced NSCLC was 58.62% and the specificity was 77.42% (AUC=0.6974, 95% CI, 0.5609 to 0.8340).
The distribution of total CTCs/5ml blood between patients with versus without distant metastasis showed no significant difference, while hybrid E/M CTCs, especially the e=m-CTCs, significantly differed between them. Interestingly, compared to distant metastasis cohort, patients without distant metastasis had more number of hybrid E/M CTCs and e=m-CTCs.
Findings showed that 1/15patients (7%) with distant metastasis showed pure hybrid E/M-CTCs and pure M-CTC, a total of 3/15 (20%) showed both E-CTCs and E/M-CTCs (E+E/M CTCs), a total of 5/15 (33%) showed both E/M CTCs and M-CTCs (E/M+M CTCs) and a total of 6/15 (40%) showed three phenotypes (E+E/M+M CTCs). In patients without distant metastasis, a total of 10/45 (22%) showed pure hybrid E/M CTCs, a total of 4/45 (9%) showed E+E/M CTCs, a total of 9/45 (20%) showed E/M+M CTCs, a total of 21/45 (47%) showed E+E/M+M CTCs and only one did not show detectable levels of CTCs. Though statistical analysis showed that the distribution of CTCs subpopulations in patients with and without distant metastasis was not statistically significant, from the figures, we found that patients with pure hybrid E/M-CTCs showed a lower proportion in distant metastasis positive cohort compared to negative ones(7% vs 22%); while patients with E+E/M CTCs (20% vs 9%) and E/M+M CTCs (33% vs 20%) showed a higher proportion.
Conclusion We concluded that E-CTCs with a hybrid E/M phenotype are associated to metastasis in therapy-naïve NSCLC patients.

Membrane feature-inspired identification biosensor assists extracellular vesicle differentiation and pancreatic cancer diagnosis

Ping Li、Mengqiu Gao、Zijian Hu、Yueqing Gu
China Pharmaceuticle University

Purpose To demonstrate the benefits and promote the practicality of liquid biopsy based on extracellular vesicles for pancreatic cancer diagnosis, realizing precise and sensitive EV

identification and eliminating macromolecule disturbances, biomarker heterogeneities and EV abundance limitations in current EV assay.
Methods The sensor synergistically integrates EV capture and detection by virtue of EV membrane features (membrane protein and lipid bilayer). Firstly, specific antibody-conjugated magnetic beads (AbMBs) and bivalent cholesterol (biChol, cholesterol modified on the adjacent end of each signal strand)-modified RNA-DNA duplexes served as the EV capturer and signal transporter, respectively. Then duplex-specific nuclease (DSN), a unique nuclease that is preferable to cleave DNA in RNA-DNA duplexes and practically inactive toward RNA, was introduced for signal amplification. The fluorescent signal emerged and amplified after selective digestion of DNA probe, followed by recurrent RNA detection cycles (Scheme 1). Bivalent cholesterol (biChol)-modified RNA-DNA duplexes were designed to insert into the EV membrane, transforming EV signals into RNA signals and initiating the signal amplification. The membrane-based signal production pattern eliminated protein interference. Finally, after modified with antibodies specific to four PCa-related protein biomarkers (EGFR, EpCAM, GPC-1 and EphA2), the AbMB-biChol platform was applied in plasma collected from PCa patients (n=21) and healthy donors (n=29).
Results The bivalent cholesterol strategy improved the anchoring efficiency of the duplex, allowing it to irreversibly bind to the EV membrane. The antibody modified magnetic beads along with bivalent cholesterol based amplification detection system enabled profound EV capture and detection efficiency, achieving an LOD of 10 particles/μL, which is competitive with current EV analysis methods. A linear relationship was observed between the change in FL intensity and the EV concentrations (R2 = 0.978). Moreover, the AbMB-biChol system allowed differentiation of EVs originated from various cancer cells, realizing cell-traceable EV identification. After inosculated with antibodies against PCa-related biomarkers, the proposed biosensor exhibited great promise for PCa-related EV identification and PCa diagnosis, demonstrating superior characteristics to CA19-9 (AUC: 0.714) and four PCa-related protein combination analysis (AUC: 0.737), achieving impressive diagnostic efficacy in discriminating between PCa patients and healthy donors (AUC: 0.909). In addition, KRAS mutation rates in the captured EVs were 79% (G12D), 62% (G12V), and 17.2% (G12R) for PCa patients and 6.8% (G12D) and 0% (G12V, G12R) for healthy donors, further confirming the strong correlation between captured EVs and PCa.
Conclusion The proposed platform paves the way for the implementation of precise and sensitive EV differentiation and noninvasive PCa detection, embracing great potential in clinical applications.

流式细胞术检测多发性骨髓瘤患者 NK 细胞及其表面 PD-1 表达的初步研究

王亚奇[1]、张琳[1]、岳保红[2]
1. 郑州大学第五附属医院
2. 郑州大学第一附属医院

目的 本研究旨在探讨多参数流式细胞术（multiparameter flow cytometry，MFCM）检测多发性骨髓瘤患者 NK（CD3-CD56+）细胞及其细胞表面 PD-1 表达，从而为病人的诊断、治疗和预后提供依据。
方法 回顾性分析 2018 年 07 月至 2020 年 11 月收治的多发性骨髓瘤患者的临床资料，随访至少半年时间，并将研究对象分为对照组、初诊组、复发难治组。
结果 97 例患者均经组织病理活检及免疫组化确诊为多发性骨髓瘤，其中男性 55 例，女性 42 例，发病年龄为 60 岁（40~84 岁）。流式细胞术检测显示，相比于对照组，初诊组、复发难治组 NK 细胞的比例增高，但是初诊组 NK 细胞增高没有统计学意义（P > 0.05），复发难治组 NK 细胞比

例显著增高，差异具有统计学意义（P < 0.05）。复发难治组患者骨髓中 NK 细胞与初诊组相比比例增高，差异具有统计学意义（P < 0.05）。进一步对 PD-1 在 NK 细胞表面的表达情况进行分析，流式细胞术检测结果显示相比于对照组，在复发难治组多发性骨髓瘤患者骨髓中 NK 细胞上的 PD-1 表达增高，差异有统计学意义（P < 0.05）。并且复发难治组多发性骨髓瘤患者骨髓中 NK 细胞上 PD-1 的表达比初诊组增高，差异有统计学意义（P < 0.05）。

结论 流式细胞术检测到 PD-1 在多发性骨髓瘤患者的 NK 细胞上表达，并且 PD-1 在多发性骨髓瘤患者骨髓中的表达与疾病的进展相关，PD-1/PD-L1 通路可能与多发性骨髓瘤的预后有关。

基于 SERS 技术鉴别急性髓系白血病亚型相关血液特征

叶旻璐[1]、段正伟[1]、肖丽荆[1]、王玉婷[1]、林秋[2]、陈阳[1]、冯尚源[3]、曹颖平[2]
1. 福建医科大学， 医学检验系
2. 福建医科大学附属协和医院，检验科
3. 福建师范大学，医学光电科学与技术教育部重点实验室

目的 本文应用表面增强拉曼光谱（surface-enhanced Raman spectroscopy, SERS）技术对急性髓系白血病（AML）患者的血浆进行分析，以期找寻 M3、M5 亚型相关特征性血浆标志物及其变化趋势，为 SERS 技术用于 AML 的快速分型、诊断及预后分析提供实验依据。

方法 按 WHO MICM 分型标准将采集的急性髓系白血病患者血浆样本分为 4 组，M3、M5、其他 AML（包括 M0、M2 和 M4 亚型）及正常对照组。应用基于银纳米粒子的 SERS 技术用于探索不同 AML 患者血浆之间存在的生化差异。后续应用相关多元统计分析方法及通路分析手段，探寻不同组间谱带强度的差别是否具有显著统计学意义，找寻可能的特征标志物，进一步评价 SERS 技术识别不同亚型 AML 的性能。

结果 谱带 495（L-精氨酸）、725（腺嘌呤和辅酶 A）、1002（苯丙氨酸）、1070（胶原蛋白）、1616（苯丙氨酸和酪氨酸）以及 1653（酰胺 I）cm-1 的强度在多个 AML 组与对照组之间存在显着差异且有着良好的检验效能（受试者工作曲线（ROC）曲线下面积 AUC≥0.9），且与 AML 患者的亚型分化有关。分析显示 725/1653、533/1002 、 1070/1653 和 1616/1653 的谱带强度比值能够在对照组与几种 AML 亚型之间进行有效鉴别。这些强度比值经多指标联合 ROC 分析，在不同亚型 AML 患者与健康人以及 M3 和 M5 亚型的鉴别方面具有显著性意义。

结论 本文发现的特征性谱带相应变化可能是通过血浆标本区分不同亚型 AML 的关键。研究证明了 SERS 技术作为一种新型分析方法，在临床检验实践中作为一种无创、微量检测方法的巨大潜力。

伴有-5/del(5q)和/或-7/del(7q)的骨髓增生异常综合征的（相关）基因表观遗传学研究

虞亚菲
中国人民解放军总医院第一医学中心

目的 骨髓增生异常综合征(MDS)是一种克隆性血液学疾病，以造血细胞发育不良、外周血细胞减少和易发生急性髓系白血病(AML)为特征。5 和 7 号染色体的全部或部分缺失[-5/del(5q)和-7/del(7q)]被认为是最常复发的遗传异常，包括骨髓增生异常综合征(MDS)和急性髓系白血病(AML)在内的10-20%的髓系恶性肿瘤。有研究认为，5、7 号染色体常见缺失区域(common deleted regions, CDRs)的肿瘤抑制基因的单倍性是 MDS 和 AML 的发病机制之一。而表观遗传变化，包括启动子区高甲基化和翻译后组蛋白修饰，可能使肿瘤抑制基因失活，从而导致肿瘤的发生。本研究拟应用高通量测序（NGS）技术，对[-5/del(5q)和-7/del(7q)]阳性患者的常见缺失区域（CDRs）相关基因

启动子区的甲基化水平检测，分析表观遗传变化，进一步评估其在携带 del(5q)和/或-7/del(7q)的 MDS/AML 患者中的临床意义。
方法 通过常规细胞遗传学、荧光原位杂交（FISH）筛选出-5/del(5q)和/或-7/del(7q)阳性骨髓标本，对 5、7 号染色体 CDRs（5q32-q33，7q31、7q34、7q35-q36）的候选基因启动子区进行生物信息学预测及验证，并应用二代测序（NGS）方法进行基因启动子区甲基化验证，并结合血液常规及血细胞形态、骨髓细胞形态与骨髓活检病理、染色体核型分析等相关临床检查，进行单因素和多因素分析，Kaplan－Meier 法和 COX 回归模型分析其生存情况。
预期结果和结论 通过高通量测序技术提取靶向基因特异的甲基化状态，并结合相关临床检查，不同分组之间的预后进行单因素和多因素分析，分析其生存情况。建立和完善 MDS 发生和发展分子评估模型，为 MDS 患者的潜在遗传机制提供了新的见解。

Aberrant lactate dehydrogenase A signaling contributes metabolic signatures in pancreatic cancer

LU QIAO
Tianjin Medical University Cancer Institute and Hospital

Background Pancreatic cancer (PC) has the lowest 5-year survival rate; therefore, new early screening methods and therapeutic targets are still urgently required. Emerging technologies such as metabolomic_x0002_based liquid biopsy may contribute to the field. We found aberrant lactate dehydrogenase A (LDHA) signaling to be an unfavorable biomarker for PC.
Methods A total of 9 genes of the glycolysis pathway were detected by enrichment analysis in the PC Gene Expression Omnibus (GEO) dataset. The relationship between LDHA/pyruvate kinase (PKM)/ fructose biphosphate aldolase A (ALDOA)/glyceraldehyde-3-phosphate dehydrogenase (GAPDH) and patient survival was analyzed by Kaplan-Meier plotting analysis of The Cancer Genome Atlas (TCGA). The detection of changing metabolites in the serum of PC patients was performed using a nuclear magnetic resonance (NMR) spectrometer.
Results We found LDHA was an independent predictor of overall survival (OS) in PC patients ($P<0.001$). Consistent with genetic aberrance of LDHA, we identified significant alterations in patients' glycolysis_x0002_related metabolites, including upregulation of lactic acid and downregulation of pyruvic acid. A 0.956 area under the curve (AUC) was achieved using the combinative metabolites score of lactic acid, pyruvic acid, citric acid, and glucose to distinguish PC from healthy controls.
Conclusions Aberrant LDHA signaling is an unfavorable biomarker for PC and consequential metabolic changes constitute potential diagnostic signatures of PCs.

Plasma D-Dimer can be used as an independent predictor for stroke-associated pneumonia: A cohort study from northeastern China

Yinting Xing、Feifan Ding、Wei Yang、Yingyu Jin、Caijun Zha、Yanhong Liu
The First Affiliated Hospital Of Harbin Medical University

Purpose Stroke-associated pneumonia (SAP), a complication with many negative effects on acute ischemic stroke (AIS) patients, is in urgent need to find laboratory test items as its predictive factors. The study was aim to investigate whether D-Dimer can be used as a predictor for SAP and long-term prognosis of AIS.

Methods According to whether the AIS patients had SAP or not during hospitalization, 392 AIS patients were divided into two groups: SAP group and non-SAP (NSAP) group. The basic clinical information was collected, and blood samples were collected twice within 24 h and 48 h after admission to test clinical laboratory items, especially D-Dimer. Patients were followed for up to 18 months to check the long-term prognosis. The receiver operating characteristic (ROC) curves of SAP were drawn, and the sensitivity and specificity of D-Dimer were calculated. To verify the correlations, multivariate regression models were established. Cox regression was used for univariate and multivariate survival analysis. A nomogram was used for predicting 1-year unfavorable outcomes in Chinese AIS patients.
Results The D-Dimer levels in the SAP group were significantly higher than that in the NSAP group (P<0.001). D-Dimer showed the highest AUC compared with the other clinical laboratory items (0.763, 95% CI: 0.694-0.832, P<0.0001). When the maximum level of YI in D-Dimer was 0.441, the D-Dimer level was 0.515 DDU: μg/mL. The sensitivity and specificity of D-Dimer for SAP diagnosis were 0.972 and 0.469, respectively. After adjusting for confounding and risk factors, the multivariate logistic regression relationship between D-Dimer and SAP was significant (P=0.031, adjusted OR: 1.174). The multivariate Cox regression analysis showed that D-Dimer was significantly correlated with long-term prognosis in the NSAP group (P<0.001, RR: 2.480, 95% CI: 1.811-3.396) but not in the SAP group.
Conclusions Plasma D-Dimer was a strong predictor for SAP at an early stage in Chinese AIS patients. D-Dimer might be a useful tool to evaluate the long-term poor prognosis of patients without SAP.

ID1 表达水平指示肝癌患者 sorafenib 药物敏感性

牛蕾蕾
山东大学第二医院

研究背景 Sorafenib 是 FDA 批准用于治疗晚期 HCC 的靶向药。然而，HCC 患者耐药性的出现大大削弱了 sorafenib 的药效。因此，揭示并探明有关 sorafenib 的耐药机制变得尤为重要。越来越多的数据表明衰老细胞内部的新陈代谢依然活跃，它们可以分泌多种生物活性分子，如促炎细胞因子和生长因子等。人们将这种现象定义为衰老相关分泌表型（SASP）。许多促使肿瘤发生发展的恶性因子如 IL6 等都属于 SASP 的关键成分。本研究旨在观察衰老对 sorafenib 药效的影响，并进一步揭示衰老是如何介导的 sorafenib 耐药。
方法与结果 首先，我们利用 MTT 检测了 sorafenib 在五种不同的 HCC 细胞系中的毒性。Sorafenib 在 HepG2, SK-Hep-1 和 huh7 中的细胞毒性明显强于 Hep3B 和 PLC5。结合 western blot 和 qRT-PCR 实验，我们观测到衰老诱导基因 p16 和 SASP 标志物 IL6 在 Hep3B（非敏感）中的表达水平显著高于 HepG2（敏感）。此结果说明，sorafenib 在 SASP 水平高的 HCC 细胞中药效弱。利用干扰 RNA 将 p16 敲除可提高 sorafenib 在 Hep3B 中的细胞毒作用。深入研究发现衰老介导的 sorafenib 耐药源于 ID1 对 p16 的负调控。在五种细胞株中 ID1 的表达水平与药物敏感性高低成正相关，与 p16 成负相关。过表达或敲除 ID1 可抑制或刺激 p16 的表达，引起 sorafenib 药效增强或减弱。此结论在人肝癌细胞的裸鼠移植瘤模型中得到了验证。采用体外低浓度梯度递增法成功将 HepG2 诱导为了耐药细胞株。和亲代敏感细胞株相比，ID1 在耐药细胞株中的表达水平降低，而 p16/IL6 表达水平升高。
结论 ID1 介导的 SASP 可被认为是 sorafenib 的潜在耐药机制。确定 ID1 的表达水平有助于判定何类患者更适于接受 sorafenib 治疗。

分化抑制因子 1 通过与新型 cccDNA 结合蛋白 E2F4 相互作用介导 HBV 的转录抑制

魏杰、江咏梅
四川大学华西第二医院

目的 乙型肝炎病毒(HBV)是肝细胞肝癌(HCC)发展的主要危险因素，尽管对 HBV 生命周期的了解逐渐加深，乙肝疫苗和抗病毒药物的应用，全球仍超过 2 亿人患有慢性乙肝，长期的慢乙肝又会导致肝硬化和肝癌的发生，对人类的健康造成严重威胁。因此希望从 HBV 的多个生命周期环节联合用药实现治愈乙肝，于是我们探索了不同的靶点来开发靶向抑制 HBV 复制和转录的新疗法。
方法 我们在体外细胞学实验和体内动物实验研究了分化抑制因子 1 (Id1) 和转录因子 E2F4 在 HBV 转录和复制中的作用。这两种 DNA 复制的调控因子和 HBV cccDNA 之间的相互作用通过亚细胞定位、蛋白-蛋白相互作用、染色质免疫沉淀和荧光素酶等试验进行分析评估。
结果 过表达 Id1 在 HBV 表达细胞和 HBV 转基因小鼠中均显著降低了 HBV 的转录和复制，相反下游分子 E2F4 对 HBV 的转录和复制产生促进作用。Id1 通过和 E2F4 形成异源二聚体，阻止 E2F4 与 cccDNA 结合并失活 HBV 的核心启动子。此外，SPR 及 ITC 实验证实，1758'-TTAAAGGTC-1766'是 E2F4 同源二聚体的结合靶点，该位点在 HBV A-D 的基因型中高度保守，为 E2F4 成为治疗靶点提供了理论基础。同样在 HCC 组织中存在 HBV 的表达水平与 Id1 负相关，与 E2F4 正相关的现象。
结论 该发现强调了 E2F4，一种新的 cccDNA 结合蛋白，作为一个潜在的治疗 HBV 转录靶点能被 Id1 所抑制，提示对 E2F4 的抑制可能成为一种新的抗 HBV 策略。

肉桂醛通过抑制粘附发挥对白念珠菌生物膜滞留菌的抑制作用研究

陈丽华、刘雅婷、郝治云、魏于涵、李思、曾莫琦裔、伍勇
中南大学湘雅三医院

目的 研究肉桂醛对白念珠菌生物膜滞留菌的影响及其相关机制。
方法 用微量肉汤稀释法检测肉桂醛对白念珠菌 2 株标准菌株 90028 和 14053、8 株氟康唑耐药性不同的白念珠菌临床菌株的最低抑菌浓度（MIC），用结晶紫染色法和 XTT 法检测肉桂醛对白念珠菌生物膜的影响，用平板培养法检测肉桂醛对白念珠生物膜滞留菌的影响，用棋盘实验检测肉桂醛与氟康唑联合对耐氟康唑白念珠菌的作用。检测 30 株白念珠菌临床菌株各菌株的黏附能力、生物膜形成能力及生物膜滞留菌生成能力，并分析它们的相关性；用 real-time PCR 方法检测白念珠菌生物膜滞留菌中粘附分子 MP65 的表达。检测肉桂醛对白念珠菌粘附的影响。
结果 肉桂醛对所测白念珠菌的 MIC 值均为 32μg/mL；结晶紫染色法结果显示 0.5×MIC 的肉桂醛即可抑制白念珠菌生物膜总量（$P<0.05$），且呈现剂量依赖性；XTT 法结果显示 2×MIC 的肉桂醛可以显著抑制白念珠菌生物膜的代谢（$P<0.01$）；1×MIC 肉桂醛即可抑制白念珠生物膜滞留菌的形成（$P<0.05$），并呈剂量依赖性；联合药敏检测结果显示，肉桂醛与氟康唑具有相加作用，可使对氟康唑的 MIC 从 128μg/mL 降到 32μg/mL；白念珠菌黏附能力与生物膜滞留菌生成能力之间（$r=0.4275$, $P<0.0001$）呈正相关关系；real-time PCR 结果显示生物膜滞留菌中 MP65 表达显著升高，0.5×MIC 肉桂醛即可显著抑制白念珠菌粘附，并具有剂量依赖性。
结论 肉桂醛可以抑制白念珠菌生物膜滞留菌形成，其机制可能与肉桂醛抑制白念珠菌黏附分子 MP65 表达有关。

金黄色葡萄球菌磷霉素 MIC 动态变化及主要耐药基因

陈天驰、李敏
上海交通大学医学院附属仁济医院(东院)

目的 本研究旨在探究上海地区 ST5 及 ST239 金黄色葡萄球菌磷霉素最低抑菌浓度（MIC）动态变化及磷霉素相关耐药基因。
方法 对 2008-2019 年某三甲医院分离金葡菌进行 MLST 分型。通过标准纸片扩散法检测所有金葡菌的磷霉素耐药表型，琼脂稀释法检测耐药菌株磷霉素 MIC。随机挑选 ST5 金葡菌 169 株及 ST239 金葡菌 62 株进行全基因组测序（NGS）。通过文献搜集目前已知磷霉素耐药相关基因，CLC Genomics Workbench 12.0 分析上述耐药相关基因突变情况。根据菌株耐药表型，去除磷霉素敏感菌株中良性突变，筛选出磷霉素耐药菌株中突变频率最高的关键基因，使用 MAFFT 进行多序列比对，PhyloSuite 进行多基因联合建树。后续拟敲除关键耐药相关基因进行验证。
结果 12 年间 MLST 分型结果显示临床 ST5 金葡菌分离率及磷霉素耐药率常年处于较高水平，而 ST239 分离率和磷霉素耐药率则逐年下降，同时 MIC 检测发现 ST5 金葡菌大多属于磷霉素高水平耐药（>1024mg/l）而 ST239 则多为低水平耐药（64-128mg/l）。通过阅读文献共搜集 11 种磷霉素耐药相关基因（*uhpT*, *glpT*, *hptR*, *hptS*, *hptA*, *ptsI*, *cyaA*, *murA*, *fosB*, *tet38*, *mgrA*）。经过全基因组测序数据分析及各基因突变情况统计筛选得到金葡菌中突变频率最高的 5 个基因（*uhpT*, *glpT*, *hptR*, *hptS*, *hptA*），同时发现 ST5 耐药株中突变多发生于 *glpT* 及 *uhpT*，而 ST239 耐药株则以 *hptA* 居多。多基因联合建树结果表明金葡菌中可能存在关键基因突变导致磷霉素高水平耐药，同时也可能多个基因突变累加导致耐药水平升高，需后续敲除实验进一步验证。
结论 与 ST239 不同，ST5 金葡菌在 12 年间长期对磷霉素高水平耐药，提示磷霉素的使用可能为 ST5 金葡菌提供生长优势。磷霉素高水平耐药金葡菌多由 *glpT* 及 *uhpT* 突变所致，而低水平耐药则可能为 *hptA* 导致。

铁载体毒力基因 entB 对碳青霉烯类耐药肺炎克雷伯菌毒力的影响

韩睿辉[1,2,3]、刘淑敏[1,2,3]、毕建蝶[1,2,3]、杜艳[1,2,3]
1. 昆明医科大学第一附属医院
2. 云南省检验医学重点实验室
3. 昆明医科大学第一附属医院临床检验诊断省创新团队

目的 以临床分离的碳青霉烯类耐药肺炎克雷伯菌(CRKP)为野生株(WT)，构建 entB 基因缺失株△entB 和回补株 C-△entB。探究与铁载体毒力因子肠杆菌素相关的 entB 基因，对 CRKP 菌落形态、黏液表型、生物膜形成能力、生长情况以及其毒力对小鼠生存率的影响。
方法 1.通过 Crispr Cas9 基因敲除技术构建 entB 基因缺失株△entB 和回补株 C-△entB，并用 PCR 验证敲除及回补是否成功。2.通过观察 WT、△entB、C-△entB 菌株的菌落形态和拉丝实验结果，了解 entB 基因对 CRKP 菌落形态及黏液表型的影响。3.通过结晶紫染色法了解 entB 基因对 CRKP 生物膜形成的影响。4.绘制生长曲线，探究 entB 基因对 CRKP 生长的影响。5.通过预实验选择合适菌液浓度后，腹腔注射相同浓度的等量菌液感染 4～5w 龄 ICR 小鼠，根据小鼠生存率直观地了解 entB 基因对 CRKP 毒力的影响。
结果 1.PCR 结果显示 entB 基因在缺失株△entB 中不表达，在回补株 C-△entB 中重新表达，表明通过 Crispr Cas9 基因敲除技术构建 entB 基因缺失株和回补株成功。2.通过观察菌落形态及拉丝实验，结果显示 entB 基因对 CRKP 的菌落形态及黏液表型并无明显影响。3.结晶紫染色结果显示三组之间差异无统计学意义(P> 0.05)，说明 entB 基因对 CRKP 生物膜形成能力无明显影响。4.生长

曲线显示△entB 组生长能力更强，且与 WT 组、C-△entB 组差异均有统计学意义(P< 0.05)。5.将 $0.8x10^7$cfu/mL 0.1mL 菌液分别通过腹腔注射感染 ICR 小鼠，结果显示△entB 组小鼠生存率明显高于 WT 组和 C-△entB 组，且差异有统计学意义(P< 0.05)，表明 entB 基因缺失显著降低了 CRKP 的毒力。

结论 铁载体毒力基因 entB 缺失导致 CRKP 生长能力增强而使毒力显著下降。

SPR741 联用大环类酯类抗生素治疗泛耐药及全耐药肺炎克雷伯菌

刘亚倩、佘鹏飞、徐兰兰、伍勇
中南大学湘雅三医院

目的 广泛耐药(XDR)及全耐药（PDR）肺炎克雷伯菌的出现对全球医疗保健系统造成了巨大威胁，本研究旨在探究 SPR741 和大环类酯类抗生素联用对 XDR 及 PDR 肺炎克雷伯菌的体外及体内协同作用。

方法 采用微量肉汤稀释法检测 SPR741 和大环类酯类抗生素对肺炎克雷伯菌的最低抑菌浓度（MIC）及最低杀菌浓度（MBC)，应用棋盘稀释法、纸片扩散法检测 SPR741 与大环类酯类抗生素的两药及三药联合抗菌作用，采用时间-杀菌曲线评价其联合抗菌效果。利用微孔板构建生物膜，检测 SPR741 和大环类酯类抗生素联用对肺炎克雷伯菌生物膜的抑制和成熟生物膜分散作用以及对膜内菌的杀灭作用。通过 CCCP 法诱导形成持留菌，检测 SPR741 和大环类酯类抗生素联用对持留菌的杀灭效果。构建小鼠中性粒细胞缺少的大腿肌肉感染模型，评估 SPR741 和大环类酯类抗生素联用的体内抗菌效果。

结果 棋盘稀释法、纸片扩散法显示，SPR741 与克拉霉素（CLA）、红霉素（E）具有协同抗菌作用，并且三药联用时抗菌效果更显著。杀菌曲线进一步验证三药联用组与对照组相比，细菌细胞数显著降低。SPR741 与 CLA 或 E 联用可以抑制肺炎克雷伯菌生物膜形成，并杀死膜内细菌。对 CCCP 诱导的持留菌有明显清除作用。在中性粒细胞缺少的小鼠大腿肌肉感染模型中，SPR741 与 CLA 和 E 三药联用使右侧大腿肌肉细菌数从 8.72log10 减少至 0，展现出显著的体内疗效。

结论 SPR741 联用大环类酯类抗生素在体内和体外对 XDR 及 PDR 肺炎克雷伯菌均具有良好的协同抗菌效果，本研究成果有望为泛耐药及全耐药肺炎克雷伯菌的治疗提供新的途径。

OR-123

An outbreak of ST859-K19 Carbapenem-Resistant Hypervirulent Klebsiella pneumoniae in a Chinese teaching hospital

Junying Zhu [1]、Xuemei Jiang[2]、Min li[1]
1. Department of Laboratory Medicine, Renji Hospital, School of Medicine, Shanghai Jiao Tong University, Shanghai,
2. 新疆维吾尔自治区妇幼保健院

Objectives Carbapenem-resistant and hypervirulent K. pneumoniae（CR-hvKP）has recently attracted extensive attention worldwide. In this study, we report an outbreak caused by a new and rare sequence type (ST859) CR-hvKP strains.

Methods The outbreak occurred in intensive care unit (ICU) of Renji Hospital Affiliated to Shanghai Jiao Tong University (Shanghai, China). Eleven CR-hvKP strains were collected from 11 patients. We performed antimicrobial susceptibility, multilocus sequence types (MLST), and

whole genome sequencing for the 11 isolates. One representative isolate (RJ-K9299) was selected for further sequencing with the Nanopore platform. Hypervirulence phenotype potential was established using serum resistance assay and Galleria mellonella model for all the CR-hvKP strains.

Results The 11 patients aged 36-70 years had various underlying diseases, including hypertension, cerebral hemorrhage and tumour，and admitted to ICU between Oct. 2019 and Feb. 2020. All the 11 patients received antimicrobial treatment. In the end, 7 patients developed pneumonia and of which 3 patients died of CRKP infection, the other 4 patients discharged. MLST results showed all the 11 CR-hvKP isolates belonged to ST859 type, which is single locus variant of ST11, and KL19 serotype. Antimicrobial susceptibility assays results showed that all the isolates exhibited high-level resistance to carbapenems, cefotaxime, cephalosporin, aztreonam, cefoperazone/sulbactam and levofloxacin, while remaining susceptible to colistin, tigecycline and ceftazidime/avibactam. When comparing the other 10 CR-hvKP isolates against reference genome of RJ-K9299, our analysis revealed 15 single-nucleotide polymorphisms (SNPs) at most (minimum, 0). Furthermore, the phylogram also showed a homogenous picture with all the 11 CR-hvKP isolates clustered in one clade, which indicated probable interbacterial transmission. WGS data analysis showed the 11 isolates had same resistance genes profile (blaKPC-2, blaTEM-1B, blaSHV-187, rmtB, fosA6 positive) and virulence genes (rmpA, rmpA2, iutAiucABCD, iroE, irp1, irp2 positive) profile, which hint clone transmission again. Five plasmids were assembled in RJ-K9299, including one virulence plasmid, namely pVir-RJ9299 and one resistance plasmid harboring blaKPC-2 carbapenem resistance gene, namely pKPC-RJ9299. Similar to pLVPK plasmids (~230kb) which belonged to the 'IncHI1B-IncFIB' replicon incompatibility type, pVir-RJ9299 is an IncHI1B -type plasmid with a length of 215959 bp and an average GC content of 49.87%. Comparative genomics of pVir-RJ9299 showed that they possess over 99% similarity (with 92% query coverage) to pLVPK (GenBank AY378100). However, unlike previous version of ~170kb KPC-2-producing plasmids, pKPC-RJ9299 belonged to IncFII-IncR type plasmid of ~109kb with IS26 located upstream and downstream of blaKPC-2. Serum resistance assays showed that survival of 3 isolates (RJ-9299, RJ-9582, RJ-9717) significantly increased in the presence of human serum over 3h while survival of the other 8 isolates decreased. Using Galleria mellonella model, Mouse lethality assay showed that the LD50 of all the 11 CR-HMKP strains was 104 ~105.5CFU, suggesting that they were hypervirulent.

Conclusion This is the first report of outbreak caused by ST859 CR-hvKP isolates. The emergence of ST859 clone isolates which converged carbapenem resistance and hypervirulence maybe the next threat for public threat.

OR-124

Anticardiolipin IgA may be an independent risk factor for pregnancy morbidity in APS patients

Xiaodan Di、Shuo Yang、Liyan Cui
Peking University Third Hospital

Objective Antiphospholipid syndrome (APS) is an autoimmune disorder characterized by venous or arterial thrombosis and/or obstetric morbidity, along with persistently present antiphospholipid antibodies (aPLs). However, the relationship between the immunoglobulin A isotype of aPL positivity and its clinical utility in APS with pregnancy morbidity is controversial. Thus, we determine the clinical utility of IgA–aPL from female APS patients.

Methods 3265 female APS patients were evaluated. Six antiphospholipid antibodies (aPLs) were tested using commercial kits, including aβ2GPI of the IgA/IgG/IgM isotypes and aCL of the IgA/IgG/IgM isotypes.

Results The overall prevalence of aCL IgA was 43.7% and aβ2GPI IgA was 1.8%. Only 4.9%(31/628) of the aCL-positive subjects with isolated aCL IgA. Similarly, isolated aβ2GPI IgA only accounted for 6.4%(18/281) of the aβ2GPI-positive subjects. aCL IgA showed the largest

area under the curve(AUC=0.671,95%CI: 0.647-0.694,P ＜ 0.05), followed by SCT ratio(AUC=0.535,95%CI: 0.511-0.560,P ＜ 0.05). The combination of aβ2GPI IgG/IgM/IgA provides perfect performance for fetal loss in APS patients.
Conclusion the positive rates of aCL IgA and aβ2GPI IgA were very low when it comes to each isolated isotype of aPL. ACL IgA showed perfect diagnostic efficacy for fetal loss in APS patients., But the combination of IgA aPLs and IgG or IgM aPLs provide poor performance for fetal loss in APS patients. And aCL IgA can be used as an independent risk factor for the development of APS-related fetal loss. Besides, it is important to establish the standardized diagnosis of IgA aPLs.

OR-125

Analysis of BCR characteristics of antigen-specific single memory B cells in patients with long-term HIV-1 infection

Mingyu Li、Ya Li
The First Affiliated Hospital of Kunming Medical University

Objective Human immunodeficiency virus type 1, HIV-1 antigen-specific B cell receptor (BCR) of single memory B cell was analyzed objective to understand the BCR characteristics and functional correlation of memory B cells, so as to provide theoretical basis for exploring the humoral immune mechanism of broad-spectrum neutralizing antibodies and antibody affinity maturation in patients with long-term non progression of HIV-1 infection, and further provide new ideas for the prevention and treatment of HIV-1 infection.
Methods The antigen-specific single memory B cells were sorted by flow cytometry The variable region genes of BCR heavy chain and light were amplified by reverse transcription, nested polymerase chain reaction (nested PCR) and touch up nested PCR, Then the PCR products were recovered and purified by agarose gel electrophoresis, they were digested, linked to expression vector, transformed into E.coli competent cells, and clones were picked up and sequenced , Paired heavy chain and light chain plasmids were expressed in 293T cells and 293F cells,respectively Recombinant protein A was used to purify the antibody secreted by 293F cells ,and the purified antibodies were identified by SDS polyacrylamide gel electrophoresis (SDS-PAGE)and Coomassie brilliant blue staining, The binding and neutralizing activities of the antibodies were detected by enzyme linked immunosorbent assay (ELISA) and TZM-bl cell neutralization assay.
Results (1) 407 heavy chain variable regions and 258 light chain variable regions of PT15 antigen-specific single memory B cells were obtained by gene amplification; (2)Touch-up nested PCR can effectively improve the positive rate of light chain variable region gene amplification; (3) different antigen-specific single memory B cells have different sources of BCR heavy light chain genes, AE, YU2-gp140 specific single memory B cells have rare types of BCR light chain, and the types of germline genes are more abundant; (4) different sorting antigens can get single memory B cells BCR heavy chain variable region SHM; (5) somatic hypermutation (SHM) of heavy chainand light variable region gene from different embryo lines mostly occurred in the complementary determining region, The light chain variable region gene SHM mostly occurs in CDR1、CDR2 ,the heavy light chain variable region gene with high level of SHM had high mutation in CDR1 region; (6) with the increase of time, the BCR gene of memory B cells in pt sample appeared the phenomenon of old germline gene disappearance and new germline gene production, and the length of SHM and CDR3 increased; (7) eight antibodies were successfμlly expressed in T cells; (8) 293F cells expressed and expressed successfμlly Purified three monoclonal antibodies P1A2-2、P1B4-1、P1A9-1; (9) monoclonal antibodies P1A2-2、P1B4-1、P1A9-1 have high binding activity to different subtypes of HIV-1 pseudovirus, low binding activity to gp120, and weak neutralization activity to global panel HIV-1 pseudovirus.
Conclusions The neutralization antibody needs to mature for a long time and evolve under the stimulation of various antigens. The long-term progress of HIV-1 infection provides an appropriate

immune environment for the production and maturity of broad-spectrum neutralization antibody. The BCR characteristics of single memory B cells with different sorting antigens and different time points sμggest that the memory B cells of the long-term non progressors of HIV-1 infection gradually evolve towards the trend of increasing broad-spectrum reactivity and affinity under the condition of long-term exposure to different antigens.

OR-126

Treponema pallidum Tp0768 protein enhances endothelial cell migration and adhesion through ER stress and NF-κB/HIF-1α pathway

Yun Tang、xiangping zhou、shuangquan liu
The First Affiliatd Hospital Of University Of South China

Objective To explore the mechanism of recombinant Treponema pallidum lipoprotein Tp0768 on vascular endothelial cells attracting THP-1 cells to migrate and adhere to it, and to screen the key signal pathway of Tp0768 in promoting migration and adhesion, so as to provide a new idea for revealing the pathogenic mechanism and therapeutic target of Tp.
Methods After human umbilical vein endothelial cells were stimulated by Tp0768, the viability of endothelial cells was detected by CCK8, and the levels and contents of ICAM-1, MCP-1 and IL-8mRNA in endothelial cells were detected by qRT-PCR and ELISA to determine the effect of TP0768 on them. The migration rate of THP-1 cells to endothelial cell culture supernatant was detected by Transwell method, and the adhesion degree of THP-1 cells to endothelial cells by adhesion test, so as to observe the effect of Tp0768 on these adhesion factors and the ability of these factors to promote the migration and adhesion of THP-1 cells to endothelial cells. The subtle structural changes of endoplasmic reticulum were observed by transmission electron microscope, the protein level of endoplasmic reticulum stress marker by WesternBlot, the degree of nuclear translocation of NF- κB P65 and the expression of p65 protein by immunofluorescence and WesternBlot. After transfection, HIF-1α in endothelial cells was knocked out, and the expression levels of ICAM-1, MCP-1 and IL-8mRNA in endothelial cells in negative / positive control group and knockout group were detected by qRT-PCR. After pretreatment with endoplasmic reticulum stress inhibitor 4-PBA, PERK pathway inhibitor GSK, IRE1α pathway inhibitor STF and NF- κB pathway inhibitor PDTC, the expression levels of ICAM-1, MCP-1 and IL-8mRNA were detected by qRT-PCR. In order to detect the relationship between endoplasmic reticulum stress and NF- κB pathway, HIF-1α pathway and the relationship between these pathways and the above adhesion molecules.
Results (1) .Tp0768 can up-regulate the expression of ICAM-1, MCP-1 and IL-8 mRNA in vascular endothelial cells in a dose-and time-dependent manner, and promote the migration and adhesion of THP-1 cells to vascular endothelial cells.
(2) .Tp0768 could cause endoplasmic reticulum deformation, enlarge endoplasmic reticulum lumen and form vacuoles, and increase the protein expression of PERK, IRE1a and ATF6. ER stress inhibitor 4-PBA, PERK inhibitor GSK and IRE1α inhibitor STF significantly down-regulated the levels of ICAM-1, MCP-1 and IL-8mRNA induced by Tp0768.
(3) .After Tp0768 stimulation, the protein level of NF-κB p65 was up-regulated and nuclear translocation occurred in a time-and dose-dependent manner; after inhibition of ER stress, the nuclear translocation of NF- κB p65 decreased and the expression of p65 protein decreased; inhibition of NF-κB pathway decreased the levels of ICAM-1, MCP-1 and IL-8mRNA induced by Tp0768.
(4) After Tp0768 stimulation, the mRNA level of HIF-1α was up-regulated in a dependent manner, and the mRNA level of HIF-1α was significantly decreased after inhibition of ER stress pathway and NF-κB pathway, respectively. After knocking down HIF-1α, the levels of ICAM-1, MCP-1 and

IL-8 mRNA decreased, the protein expression of ICAM-1 decreased, and the adhesion rate of THP-1 cells to endothelial cells decreased.
(5)Tp0768 could regulate the secretion of ICAM-1, MCP-1 and IL-8, by endothelial cells and the migration and adhesion of THP-1 cells to vascular endothelial cells through ER stress and NF-κB / HIF-1α pathway, and significantly down-regulated the migration and adhesion rate of THP-1 cells to vascular endothelial cells after inhibiting ER stress pathway and NF-κB pathway, respectively. Pretreatment with anti-MCP-1 neutralization antibody could significantly reduce the migration rate of THP-1 cells to the supernatant of vascular endothelial cell culture medium, and anti-ICAM-1 neutralization antibody could significantly reduce the adhesion rate of THP-1 to vascular endothelial cells.
Conclusion The promotion of migration and adhesion of Tp0768 for endothelial cells is mediated by ER-stressed PERK and IRE-1α pathways through NF-κB, which also involves the activation of downstream pathway HIF-1α, thus promoting endothelial cell production of migration-promoting adhesion molecules ICAM-1, MCP-1 and IL-8.

OR-127

In vitro activity of antirheumatic drug auranofin in combination with aztreonam-avibactam against metallo-β-lactamase (MBL)-producing Enterobacterales

Siqiang Niu
Department of Laboratory Medicine, The First Affiliated Hospital of Chongqing Medical University

Objectives Auranofin (AUR), an antirheumatic metallo-drug, was recently demonstrated to be a potent metallo-β-lactamases (MBLs) inhibitor. To assess the efficacy of ceftazidime-avibactam-auranofin (CAZ-AVI-AUR) and aztreonam-avibactam-auranofin (ATM-AVI-AUR) against a collection of 88 carbapenemase-producing Enterobacterales (CPE) clinical isolates (37 single KPC-producers, 33 single MBL-carriers, and 18 dual/triple carbapenemase-producers) and 6 in vitro selected ATM-AVI-resistant CPE with CMY-16 Tyr150Ser and Asn346His mutants or transformants.
Methods Minimum inhibitory concentrations (MICs) of imipenem (IPM), auranofin (AUR), CAZ-AVI, ATM-AVI, CAZ-AVI-AUR and ATM-AVI-AUR were determined via the broth microdilution method. Genetic background and carbapenemase genes were determined by PCR and Sanger sequencing.
Results The addition of AUR (16 mg/L) reduced the CAZ-AVI MIC50 from >64 to 1 mg/L in the 88 clinical CPE isolates. The addition of AUR (16 mg/L) resulted in an 8-fold reduction of ATM-AVI MIC50 (from 0.5 to 0.0625 mg/L) and a 4-fold reduction of MIC90 (from 1 to 0.25 mg/L) against these 88 clinical CPE isolates, respectively. Notably, the reduced ATM-AVI MIC values were mainly found in MBL-producers, and the MIC50 and MIC90 reduced by 4 folds (from 0.25 mg/L to 0.0625 mg/L) and 8 folds (from 2 to 0.25 mg/L) respectively by 16 mg/L AUR among the 51 MBL-producers. By contrast, the addition of AUR (16 mg/L) did not showed significant effects of ATM-AVI MIC50 (0.0625 mg/L) and MIC90 (0.125 mg/L) among single KPC-producers (n = 37). Interestingly, the addition of AUR (16 mg/L) re-sensitized the ATM-AVI susceptibility against the 6 in vitro selected ATM-AVI-resistant CMY-16 Tyr150Ser and Asn346His mutants or transfromants, with the MICs reduced from ≥32 mg/L (32->256 mg/L) to ≤8 mg/L (0.0625-8 mg/L).
Conclusions Our results demonstrated that AUR potentiated the activities of CAZ-AVI and ATM-AVI against MBL-producing isolates in vitro. Importantly, AUR restored the ATM-AVI activity against ATM-AVI resistant mutant strains. As a clinical approved drug, AUR might be repurposed in combination with other β-lactams (e.g. ATM-AVI) to treat infections caused by highly resistant MBL-producing Enterobacterales.

OR-128

Identification of the conjugative and mobilizable plasmid fragments in the plasmidome using sequence signatures

Zhencheng Fang、Hongwei Zhou
Department of Laboratory Medicine, Zhujiang Hospital, Southern Medical University.

Aim Plasmids are the key element in horizontal gene transfer in the microbial community. Recently, a large number of experimental and computational methods have been developed to obtain the plasmidomes of microbial communities. Distinguishing transmissible plasmid sequences, which are derived from conjugative or at least mobilizable plasmids, from non-transmissible plasmid sequences in the plasmidome is essential for understanding the diversity of plasmids and how they regulate the microbial community. Unfortunately, due to the highly fragmented characteristics of DNA sequences in the plasmidome, effective identification methods are lacking. This work addresses a challenge associated with plasmid characterization, more precisely, the identification of transmissible plasmid sequences in plasmidome data.
Method In this work, we first used information entropy from information theory to assess the randomness of synonymous codon usage over 4424 plasmid genomes. We then further developed a novel algorithm named PlasTrans. PlasTrans takes the triplet code sequences and base sequences of plasmid DNA fragments as input and uses the convolutional neural network of the deep learning technique to further extract the more complex signatures of the plasmid sequences and identify the conjugative and mobilizable DNA fragments.
Result The results showed that for all amino acids, the choice of a synonymous codon in conjugative and mobilizable plasmids is more random than that in non-transmissible plasmids, indicating that transmissible plasmids have different sequence signatures from non-transmissible plasmids. Moreover, Tests showed that PlasTrans could achieve an AUC of as high as 84–91%, even though the fragments only contained hundreds of base pairs.
Conclusion To the best of our knowledge, this is the first quantitative analysis of the difference in sequence signatures between transmissible and non-transmissible plasmids, and we developed the first tool to perform transferability annotation for DNA fragments in the plasmidome. We expect that PlasTrans will be a useful tool for researchers who analyse the properties of novel plasmids in the microbial community and horizontal gene transfer, especially the spread of resistance genes and virulence factors associated with plasmids. PlasTrans is freely available via https://github.com/zhenchengfang/PlasTrans

OR-129

Outbreak of Invasive Infections Caused by Rhodotorula mucilaginosa in a Tertiary Hospital

Jingjing Huang 、Yingchun Xu
Peking Union Medical College Hospital

Rhodotorula mucilaginosa is a rare opportunistic yeast. It often infects immunocompromised persons and most infections have been associated with intravenous catheters. In China, relatively little is known of identification of *R. mucilaginosa* and of its antifungal susceptibility patterns and ability of biofilm formation before 2020. As a part of the National China Hospital Invasive Fungal Surveillance Net (CHIF-NET) Program, we found outbreak of invasive infections caused by *R. mucilaginosa* in a tertiary hospital in northern China.

Here we studied 78 non-duplicate *R. mucilaginosa* isolates from patients at 22 hospitals participating in CHIF-NET program (2010-2018). Molecular sequencing of ITS region and D1/D2 domain of rDNA and MALDI-TOF MS identification methods were compared for their performance in species identification. Antifungal susceptibility testing was performed using Sensititre

YeastOne™ YO10 methodology. The biofilm formation assay was carried out by crystal violet staining. Microsatellite typing (MT) method was also established to study the genetic relationships between the 78 strains isolated from different provinces in China. Phylogenetic analysis was performed with software Molecular Evolutionary Genetic Analysis (MEGA_X software) using the neighbor-joining (NJ) method based on single nucleotide polymorphisms (SNPs) in genome, compared with reference genome in NCBI database.

All isolates were identified correctly by the Vitek MALDI-TOF MS system (bioMérieux) and the Clin-TOF MS system (Bioyong Technology Company Inc). The Bruker MS system (Bruker Daltoniks) also correctly identified all *R. mucilaginosa* isolates but using a lowered (≥1.700) cut-off score for species assignment. MICs of ≥256μg/ mL for fluconazole were seen for all 78 isolates, whilst MICs of ≥4 μg/mL for voriconazole, ≥4 μg/mL for itraconazole and ≥2 μg/mL for posaconazole were seen for 78.2, 10.3 and 74.4% of isolates, respectively. All sequences can be divided into 4 ITS types compared to the reference sequence NR_073296.1 from *R. mucilaginosa* CBS316. Differences of biofilm quantification between 78 isolates were significant ($P<0.001$) with three classification.

There were 30 strains isolated from one hospital in northern China. Only 24 to165 SNPs were calculated between the 30 isolates. 96.7% of strains were collected from peripheral blood and 63.3% of patients were admitted in Intensive Care Unit. A total of 53 MT types for 78 isolates were identified. Among them, 38 genotypes were distributed sporadically and the 30 strains causing outbreak infections accounted for 15 MT types.

The study has provided a global picture of the identification, antifungal susceptibility profile, phylogenetic situation and ability of biofilm formation of *R. mucilaginosa* in China during the period of the study. We should look out these emerging, pathogens especially in immunodeficient and immunocompromised patients.

OR-130

Interleukin-11 Is Upregulated By Hypoxia-inducable factor-1α Under Hypoxia To Promote Breast Cancer Progression

Yahui Liu 、Li Ren
Tianjin Medical University Cancer Institute and Hospital

Background Interleukin-11(IL-11), a member of the IL-6 family of cytokines, is found expressed abnormal in human cancers. Nevertheless, the relationship between hypoxia and IL-11 in human breast cancer are little understood. In this study, we explored the expression of IL-11 in hypoxia microenvironment of breast cancer and the detailed mechanism behind it, and IL-11's role in breast cancer.

Methods The expression of IL-11 in breast cancer cell incubated either in normoxia condition or hypoxic condition was detected by Quantitative real-time PCR and ELISA; The level of IL-11 was also detected when hypoxia-inducable factor-1α(HIF-1α) was silenced under hypoxic condition; The ability of cell proliferation induced by IL-11 were measured by assays of colony formation and MTS; Cell motility in response to IL-11 was measured by assays of transwell. Serum samples were obtained from 166 patients with breast cancer for analyzing of relationship between the level of IL-11 and clinicopathological features. Immunohistochemical staining of surgically resected specimens of 30 patients with breast cancer was performed to detect the correlation between hypoxia markers and IL-11 in vivo.

Results We found the expression of IL-11 significantly increased in hypoxic condition compared with normoxia condition and in a time-dependent pattern. Furthermore, silencing of HIF-1α dramatically abrogated the increased expression of IL-11 mediated by hypoxia. Cell proliferation，migration and invasion were also enhanced by IL-11.In the clinical aspect, the level of serum IL-11 was related to CA15-3, CA-125, CEA, lymph node metastasis, tumor stage, clinical stage, tumor size. Immunohistochemical staining showed that the expression of IL-11 was significantly correlated with the expression of HIF-1α and CA-IX.

Conclusions IL-11 is a novel hypoxia-inducible and HIF-1α-regulated gene and elevated IL-11 promotes the malignant progress of breast cancer.

OR-131

ILF2 cooperating with E2F1 to maintain mitochondrial homeostasis is a potential biomarker for small cell lung cancer progression

Meng Zhao
Tianjin Medical University Cancer Institute and Hospital

Objective Mitochondria playing multifunctional roles in carcinogenesis. Deciphering uncertainties of molecular interactions within mitochondria will promote further understanding of cancer. Interleukin enhancer binding factor 2 (ILF2) is upregulated in several malignancies, however, much remains unknown regarding ILF2 in small cell lung cancer (SCLC). In the current study, we explored ILF2's role in SCLC and demonstrated its importance in mitochondria quality control.
Methods Colony formation, cell proliferation, cell viability and xenograft studies were performed to examine ILF2's role on SCLC progression. Glucose uptake, lactate production, cellular oxygen consumption rate and extracellular acidification rate were measured to examine the effect of ILF2 on glucose metabolism. RNA-sequencing was utilized to explore genes regulated by ILF2. E2F1 transcriptional activity was determined by dual luciferase reporter assay. Mitochondria quantification and mitochondrial membrane potential assays were performed to examine mitochondrial quality. Gene expression was determined by RT-qPCR, western blotting and IHC assay.
Results LF2 promotes SCLC tumor growth in vitro and in vivo. ILF2 elevates oxidative phosphorylation expression and declines glucose intake and lactate production. Genome-wide analysis of ILF2 targets identified a cohort of genes regulated by E2F1. In consistent with this, we found ILF2 interacts with E2F1 in SCLC cells. Further studies demonstrated that suppression of E2F1 expression could reverse ILF2-induced tumor growth and enhanced mitochondria function. Significantly, expression of ILF2 is progressively increase during SCLC progression and high ILF2 expression is correlated with higher histologic grades, which indicates ILF2's oncogenic role in SCLC.
Conclusions Our results demonstrate that ILF2 interacts with E2F1 to maintain mitochondria quality and confers SCLC cells growth advantage in tumorigenesis.

Sensitive detection of Escherichia coli O157:H7 and Salmonella typhimurium in food samples using two-channel fluorescence lateral flow assay with liquid Si@quantum dot

Shuai Zheng、Xingsheng Yang、Chongwen Wang、Rui Xiao
Beijing Institute of Radiation Medicine

Background Foodborne diseases, which are mainly caused by bacterial contamination, are major threats to human health and result in one-third of global deaths each year. Common foodborne bacteria, such as S. typhi and E. coli are spread through contaminated water and food (e.g., meat and vegetables) and could result in serious illness (e.g., gastroenteritis, diarrhea, and shock).

Methods Here, we proposed a silica–quantum dot (QD)-based fluorescent lateral flow immunoassay (LFA) method with high sensitivity for the simultaneous qualification of Salmonella typhimurium (S. typhi) and Escherichia coli (E. coli) O157:H7 in food samples. To meet the demand of rapid, sensitive, and simultaneous detection of the highly pathogenic E. coli O157:H7 and S. typhi in the food samples, we proposed a two-channel fluorescent LFA strip by using novel silica-quantum dot nanocomposites with dual-QD shell (Si@DQD) as the signal tags. The high-performance Si@DQD tags were fabricated by coating two layers of CdSe/ZnS MPA QDs onto the surface of 190 nm SiO_2 spheres by using our previously proposed polyethyleneimine (PEI)-mediated electrostatic adsorption method. The new Si@DQD with a dual QD-shell has adsorbed hundreds of carboxylated QDs onto its surface, thus greatly enhancing the fluorescence performance and the antibody conjugation. Second, the excellent stability and monodispersity provided by the big SiO_2 core (~190 nm) allowed the tags used to detect two different bacteria via the LFA strip without interfering.
Results The fluorescence intensities of Si@DQD tags observed on the two test lines can be quickly measured for quantitative E. coli O157:H7 and S. typhi analysis. The IUPAC protocol (LOD = yblank + 3 SDblank) was used to define the limit of detection (LOD) of the assay, where yblank and SDblank are the mean fluorescence intensity and standard deviation of the blank control, respectively. Based on the analysis of the fluorescence signal, the LOD of the proposed method for target S. typhi/E. coli O157:H7 was determined to be 50 cells/mL. Thus, the sensitivity of Si@DQD-LFA strip for bacterial detection was at least 200 times higher than that of AuNP-LFA strip. Moreover, the fluorescence intensities of T1 line for S. typhi and T2 line for E. coli O157:H7 exhibited wide dynamic relationships with the concentrations of two target bacteria with $R2 = 0.9997$ for S. typhi and $R2 = 0.9998$ for E. coli O157:H7. These results show the excellent quantitative analysis capability of the Si@DQD-LFA by fluorescence mode. Subsequently, the repeatability and precision of our method were evaluated by recovery test of the spiked bacterial samples (including meat extraction, vegetable extraction, and milk). The average recovery values of spiked S. typhi and E. coli O157:H7 were calculated to be 75%–121%, with RSD values ranging from 2.2%–12.7%.
Conclusions To our knowledge, this work is the first to simultaneously detect two foodborne bacteria by using QD-based LFA strip. Therefore, the proposed method has great potential for food safety monitoring and the actual detection of pathogens.

OR-133

Serum GSDMD as a Novel Predicting Biomarker for the Natural Courses of HBeAg-positive and HBeAg-negative HBV-Chronic Hepatitis

Lijing Zhou、Pu Li
重庆医科大学附属第二医院检验科

BACKGROUND & AIMS Hepatitis B virus (HBV) infection which causes about 1 million deaths every year is a major global health care problem and always accompanied by hepatocyte inflammation, as well as the imbalance of the host's immune system. The natural course of chronic HBV infection is generally divided into four sequential phases according to HBeAg seroconversion: hepatitis B e antigen (HBeAg)-positive chronic infection (EPCI) and hepatitis (EPCH), followed by HBeAg-negative chronic infection (ENCI) and hepatitis (ENCH) with reference to the European Association for the Study of the Liver guidelines and the guidelines of prevention and treatment for chronic hepatitis B (2019 version) in China. To monitor the natural history and distinguish the sequential phases of chronic hepatitis B virus (HBV) infection is still extremely desired. The pore-forming protein Gasdermin D (GSDMD), controlling pyroptosis in cells, contributed to the inflammation-associated liver cell damage and chronic liver inflammation. We aimed to investigate the expression and to evaluate

the diagnostic efficacy of serum GSDMD levels during the four natural courses of chronic HBV infection: hepatitis B e antigen (HBeAg)-positive chronic infection (EPCI) and hepatitis (EPCH), followed by HBeAg-negative chronic infection (ENCI) and hepatitis (ENCH).
Methods We enrolled 273 healthy individuals, 614 liver patients containing 126 autoimmune hepatitis (AIH) patients, 110 hepatocellular carcinoma patients, 378 viral hepatitis patients and 480 chronic HBV infection consecutive patients including 127 with EPCI, 105 with EPCH, 139 with ENCI, and 109 with ENCH. HepG2-NTCP-HBV infected cell platform systems were created to evaluate the performance of GSDMD in vitro. Immunofluorescence and western blot analysis were applied to vitro expriments. Sandwich ELISA kits we invented previously was applied to detect the GSDMD levels both in the clinical specimen and cell systems. The viral markers of HBV were detected by chemiluminescent enzyme immunoassays. HBV DNA was detected by real-time PCR. The receiver operating characteristic (ROC) curve was conducted to explore the diagnostic and predictive performance of GSDMD. The spearman's Correlation coefficients were calculated the correlation among GSDMD, biochemical parameters and virological biomarkers.
Results The serum GSDMD was prominent higher in liver disease groups compared with that in healthy individuals groups. In liver disease groups, GSDMD secretion of HBV infection patients had significant strengths than the others. The same phenomenon was observed in vitro experiments. And the gradually significantly elevated tendency of serum GSDMD with the development of chronic HBV infection nature course, especially in EPCI, EPCH and ENCH. While the levels of serum GSDMD in ENCI was slightly lower than that in EPCH. The mean values of these two groups were relatively closer. Even though the other biochemical parameters and virological biomarkers had significant differences in four phases of chronic HBV infection, there existed no obvious tendency changes in the development. Moreover, areas under ROC curves (AUCs) of serum GSDMD in healthy individuals, EPCI, EPCH, ENCI and ENCH were 0.982, 0.713, 0.593, 0.595 and 0.756; optimal cutoffs were ≤ 4.8, ≥ 104.3, ≤ 143.8, ≤161.1 and ≥ 178.0 ng/mL with sensitivities and specificities 100% and 99.35%, 92.92% and 39.37%, 44.27% and 80.95%, 52.17% and 71.429%, 54.13% and 85.98% , respectively. The serum GSDMD levels remarkably correlated to serum ALT, AST, HBsAg and HBV DNA levels in different nature phases of chronic HBV infection, respectively.
Conclusions Serum GSDMD levels had relatively diagnostic and predictive performance in predicting HBeAg-positive and HBeAg-negative Chronic Hepatitis sequential phases and strongly correlated with ALT. The cell system detection also identified the results in clinical specimens. These mentioned above provided convincing evidence that serum GSDMD may be an early and efficacious serum biomarker for auxiliary definitions of the natural course of HBeAg-positive and HBeAg-negative Chronic Hepatitis.

OR-134

Development of Spike Protein-based Fluorescence Lateral Flow Assay for the Simultaneous Detection of SARS-CoV-2 Specific IgM and IgG

Chongwen Wang、Rui Xiao、Shengqi Wang
Beijing Institute of Radiation Medicine

Background The pandemic outbreak of the 2019 coronavirus disease (COVID-19), which caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), is still spreading rapidly and poses a great threat to human health. As such, developing rapid and accurate immunodiagnostic methods for the identification of infected persons is needed.
Methods We developed a high-performance fluorescence LFA strip for the rapid, sensitive, and specific detection of SARS-CoV-2-specific IgM/IgG in clinical samples by using S protein-conjugated quantum dot nanotags. Advanced silica–core@dual QD–shell nanocomposites

(SiO2@DQD) with superior luminescence and stability were prepared to serve as a fluorescent nanotags in the LFA strip and guarantee the high sensitivity and reliability of the assay. The novel SiO2@DQD NP with 200 nm monodisperse SiO2 core and dual layer of carboxylated QD shell was fabricated for practical application in the clinical samples and possessed monodispersity, good stability, and high luminescence. The SARS-CoV-2 spike protein was immobilized onto the surfaces of SiO2@DQD NPs, whereas anti-human IgM and IgG antibodies on the two test lines enabled the simultaneous and highly specific detection of anti-SARS-CoV-2 IgM and IgG in one human sample.
Results By optimization of the assay conditions, the proposed SiO2@DQD-based LFA strip can sensitively and simultaneously detect the low concentration of IgM/IgG (1:107 dilution) from 1 μL serum within 15 min. The performance of SiO2@DQD-strip was fully optimized and confirmed by using 10 positive serum samples from COVID-19 patients and 10 negative samples from patients with other respiratory diseases. The practical clinical value of the assay was further evaluated by testing 316 serum samples (114 positive and 202 negative samples). The overall detection sensitivity and specificity reached 97.37% (111/114) and 95.54% (193/202), respectively, indicating the huge potential of our proposed method for the rapid and accurate detecting of SARS-CoV-2-infected persons and asymptomatic carriers.
Conclusions The proposed research demonstrated that the strategy of combined IgM/IgG detection via SiO2@DQD-based LFA allows the early and accurate identification of SARS-CoV-2-infected persons and can be used in monitoring the progress of the disease.

Identification of Novel Autoantibodies for Idiopathic Inflammatory Myopathies Using Human Proteome Microarray

Liubing Li[1]、Li Yongzhe[2]
1. Peking Union Medical College Hospital, Chinese Academy of Medical Sciences
2. 北京市东城区北京协和医院东院检验科

Objectives Idiopathic inflammatory myopathies (IIMs) are a group of clinically heterogeneous, inflammatory muscle disorders characterized by proximal and symmetric muscle weakness and multisystem involvement. Autoantibodies are important biomarkers for IIMs, aiding in diagnosis, classifying patients into more homogeneous groups, and understanding additional clinical complications and responses to treatment. We aimed to employed human proteome microarrays, each composed of about 20,000 unique human proteins, to identify IIMs-specific autoantibodies.
Methods A Three-Phase strategy was used. To screen candidate autoantigens, in Phase I, 90 serum samples collected from 40 IIMs patients, 30 autoimmune disease controls and 20 healthy subjects were probed individually to human proteome microarrays. To verify these candidates, in Phase II, a focused array with candidate IIMs-associated autoantigens was constructed, and this was used to profile a much larger cohort, comprised of serum samples collected from 397 IIMs patients (100 polymyositis, 217 dermatomyositis, 45 cancer-associated myositis, and 35 juvenile dermatomyositis), 197 disease controls (40 systemic sclerosis, 39 systemic lupus erythematosus, 40 primary Sjogren's syndrome, 39 rheumatoid arthritis, and 39 other chronic diseases), and 98 healthy controls. In Phase III, sera with high signal values (value > 3 standard deviation of the mean of the healthy group) for verified proteins were validated using western blot analysis.
Results Ninety-one candidate autoantigens that were significantly associated with IIMs were identified in Phase I. After verification in Phase II, glycine n-methyltransferase (GNMT) was considered as a new IIMs-specific autoantigen. Twenty-five polymyositis, ten dermatomyositis, six cancer-associated myositis, two juvenile dermatomyositis, and two disease controls had high signal values for GNMT, while no healthy subject showed high signal values. In Phase III, 13 of the 25 polymyositis, four of the ten dermatomyositis, five of the six cancer-associated myositis,

two of the two juvenile dermatomyositis, and one of the two disease controls were positive for anti-GNMT autoantibodies using western blot.
Conclusion Anti-GNMT autoantibodies serve as a novel biomarker for IIMs and is expected to help clinical diagnosis. The prevalence of anti-GNMT autoantibodies in different ethnic populations and the association between anti-GNMT autoantibodies and clinical features should be further studied.

Serum Exosome MiRNA Sequencing Identifies Diagnostic Biomarkers for Alzheimer's Disease

Zhiwu Dong[1]、Hongjun Gu[2]、Qiang Guo[1]、Shuang Liang[1]、Jian Xue[3]、Feng Yao[3]、Xianglu Liu[1]、Feifei Li[1]、Huiling Liu[1]、Li Sun[1]

1. Jinshan Branch of Shanghai Sixth People's Hospital
2. 上海市金山区中西医结合医院
3. 上海市金山区众仁老年护理院

Aim Alzheimer's disease (AD) is a common neurodegenerative disease leading to dementia in the eldly. Till now, few diagnostic biomarkers, such as amyloid-β, and phosphorylated tau, were clinically used. It is in urgent need to identify novel peripheral blood-based biomarkers. Exosomes (30–150 nm in diameter) are endosome-derived small extracellular vesicles which function in cellular communication. They are found in many kinds of biofluids, such as blood, CSF, saliva, breast milk and urine. However, the circulating exosomal miRNA expression patterns in AD remain largely unknown.

Methods Eight AD patients (4 females, 4 males) and 8 matched healthy controls (HC, 4 females, 4 males) were included in the NGS experiment. Another 40 AD patients (20 females, 20 males) and 40 age- and gender-matched HC (20 females, 20 males) were enrolled in the validation test. The circulating exosomes were collected using the Exosome Isolation Q3 kit for serum (Wayen Biotechnologies, Shanghai, China) according to the manufacturer's instructions. The exosome morphology was observed with transmission electron microscope (TEM). Exosome markers CD63 and CD9 were detected by western blot assay. The exosomal miRNA profile was characterized by RNA sequencing to evaluate the potential for AD diagnosis. Quantitative reverse transcription PCR was applied to validate the sequencing data. Subsequently, Gene Ontology analysis and pathway analysis were performed for the genes targeted by the differentially expressed miRNAs. All statistical analyses were performed by SPSS 19.0, MedCalc 12.1.4.0, and GraphPad Prism 5.01 software. $P < 0.05$ was considered statistically significant.

Results The NGS data revealed that 207 miRNAs in exosomes were differentially expressed in the AD compared with the normal controls (p-value < 0.05, and ± 1.2-fold change;), including 113 miRNAs up-regulated, and 94 miRNAs down-regulated. Twenty-four miRNAs showed significant difference when ± 2.0-fold change at p-value <0.05 and at least 50 reads for each sample. Gene Ontology analysis showed that the differentially enriched basic functions include cell adhesion, regulation of transcription, and the ubiquitin system. Functional network analysis revealed the pathways including proteoglycans in cancer, viral carcinogenesis, signaling pathways regulating pluripotency of stem cells, and cellular senescence in AD pathology. Serum exosomal hsa-miR-30b-5p, hsa-miR-22-3p, hsa-miR-375-3p, hsa-miR-378a-3p, and hsa-miR-22-5p were validated by RT-PCR on a larger cohort. The data showed that miR-30b-5p, miR-22-3p and miR-378a-3p were significantly associated with AD, with the area under the curve (AUC) of 0.668, 0.637 and 0.718, respectively. Compared with healthy controls, AD patients had a lower level of hsa-miR-30b-5p (X1), with odds ratio (OR) 0.987, 95% confidence interval (CI) 0.980-0.994, a higher hsa-miR-22-3p (X2) with OR 1.017, 95% CI 1.004-1.031, and hsa-miR-378a-3p (X3) with higher OR value 4.454, 95% CI 2.060-9.629. Logistic regression analysis established a diagnostic model for AD by serum exosomal miR-30b-5p, miR-22-3p and miR-378a-3p:$Y = -0.909 - 0.013 \times X1 + 0.017 \times X2 + 1.494 \times X3$ The combination of the three miRNAs had an AUC of 0.880, 95% CI: 0.802-0.959.

Conclusions Exosome miRNA profile may distinguish AD patients from healthy controls. The circulating exosome hsa-miR-30b-5p, hsa-miR-22-3p and hsa-miR-378a-3p were differentially expressed and independently associated with AD. These data emphasized the potential clinical use of exosomal miRNA for AD diagnosis.

PO-0002

全自动样本前后处理系统提升临床分子检测效率

刘朝晖[1]、崔凯[2]、赵娟[2]、周洲[2]
1. 云南省阜外心血管病医院
2. 中国医学科学院阜外医院

目的 分子诊断广泛应用于传染性疾病、肿瘤个体化诊疗、血液筛查、产前筛查、遗传性疾病筛查、药物代谢基因组学等领域。COVID-19 的到来极大推动了分子诊断特别是 PCR 检测技术的发展，而目前在 PCR 检测的实际应用中，在效率上仍有非常大的提升空间。本文旨在研究临床分子检测效率的提升方案，探究自动化技术对核酸检测技术发展的意义。
方法 本文针对核酸检测流程中操作最为繁杂的核酸提取环节，在实验室已有核酸提取仪的基础上，引入了全自动样本前后处理系统，可自动完成核酸提取前处理的扫码传输、拧盖、吸取样本移液至核酸提取 96 孔板等步骤。同时可实现在提取结束后，独立后处理的产物分配、反应体系构建等操作。由于样本前后处理系统可与核酸提取仪同步处理运行，因此效率将远高于步骤自动顺序运行核酸提取工作站。此次实验对病毒采集管拧盖吸样成功率进行了 200 批 48 样本/测试。对于全流程的交叉污染率实验进行取 48 人份试剂、3 个样本架阳性、阴性样本交叉放置的方式，测试 30 次，根据扩增检测结果观察加样过程及提取产物分配过程的污染情况。在此过程中同时评估该方案与纯手工操作及工作站时的检验人效比，根据实验效果对临床分子检测效率提升方案进行研究。
结果 在超过 200 次开盖实验中，开盖及加样成功率均达到了 99%以上，无错加漏加情况发生。在进行 30 次交叉污染实验之后，均未出现交叉污染率的情况。在使用样本前后处理系统之后，保持原有测试数相同条件时，实验室操作人员可由 4 人调整为 1 人，较工作站方案时间缩短 70%，人效比提升 300%。
结论 本文所研究的临床分子检测效率的提升方案，仅需 1 人，即可完成大量样本核酸提取工作，免人工拧盖，样本进结果出，交叉污染及人员感染风险极低，样本信息自动扫码传输，进一步推动核酸检验报告自动化。因此，方案能较好地提升提升临床分子检测效率。

PO-0003

Development of a reverse transcription recombinase polymerase amplification coupled with nanoparticle-based lateral flow biosensor (RT-RPA-LFB) assay for rapid detection of SARS-CoV-2 RNA

Qiuyue Xu、yong duan
Department of Clinical Laboratory,the Frist Affiliated Hospital of Kunming Medical University

Background The ongoing global pandemic (COVID-19), caused by the SARS-CoV-2, has become a huge public health issue. Currently, the standard molecular techniques for SARS-CoV-2 detection include RT-PCR and RT-qPCR. These diagnostic methods are highly sensitive but time consuming, labor intensive and require sophisticated expensive instruments, thus not suitable for point-of-care use. The objective of this study was to develop and optimized a rapid, sensitive, robust, reliable, and highly specifc reverse transcription-RPA technique coupled with nanoparticle-based lateral flow biosensor (RT-RPA-LFB) assay.
Methods Using two RPA primer sets, the ORF1ab and N genes of SARS-CoV-2 were simultaneously amplified in a single-tube reaction, and detected with the diagnosis results easily interpreted by LFB. In presence of FITC (fluorescein)-/digoxin- and biotin-labeled primers, RT-RPA produced numerous FITC-/digoxin- and biotin-attached duplex amplicons, which were determined by LFB through immunoreactions (FITC/digoxin on the duplex and anti-FITC/digoxin on the test line of LFB) and biotin/treptavidin interaction (biotin on the duplex and strptavidina on

the polymerase nanoparticle). The accumulation of nanoparticles leaded a characteristic crimson band, enabling multiplex analysis of ORF1ab and N gene without instrumentation. We also evaluated this RT-RPA-LFB for clinical use using SARS-CoV-2 reference standard material (GBW(E)091099) ， 53 clinical samples， and spiked samples (including Streptococcus pneumoniae, Staphylococcus aureus, Streptococcus pyogenes, Mycobacterium tuberculosis, Haemophilus influenzae, Klebsiella pneumoniae, Mycoplasma pneumoniae, Legionella pneumophila, influenza A virus and influenza B virus).
Results We achieved rapid detection of SARS-CoV-2 within an hour. The assay could detect SARS-CoV-2 with high sensitivity (20 copies/μL for each detection target), and no cross-reactivity was generated from non-SARS-CoV-2 templates. The analytical sensitivity of SARS-CoV-2 was 100% (3/3 nasopharyngeal swab samples collected from COVID-19 patients), and the assay's specificity was also 100% (50/50 nasopharyngeal swab samples collected from non-COVID-19 patients).
Conclusions RT-RPA-LFB was established in this study to detect SARS-CoV-2, a method that was highly specific, sensitive, cost-effective and easy to operate, and provides a new method for the prevention and diagnosis of COVID-19,especially in locations without access to large platforms or sophisticated equipment.

基于 BI-HSV-TK/GCV 系统抑制胃癌细胞增殖的作用研究

皇海
空军军医大学西京医院

目的 探讨双歧杆菌-单纯疱疹病毒胸苷激酶基因-丙氧鸟苷（BI-HSV-TK/GCV）系统对裸鼠体内成瘤的抑制效应和分子机制。
方法 建立裸鼠胃癌实验模型，观察裸鼠的的体重、荷瘤的体积等参数；运用 Western blot 试验，TUNEL 法，Real-time PCR 试验，观察裸鼠胃癌组织和裸鼠胃癌组织中 casepase3、casepase8、Fas 及 FAP-1 的 mRNA 表达、增殖，凋亡相关基因和蛋白的改变。
结果 BI-HSV-TK/GCV 系统能够有效抑制裸鼠体内成瘤的体积和重量，并能够促进胃癌组织细胞的凋亡发生，诱导体内胃癌细胞凋亡相关蛋白 Caspase3，Caspase8，FAP-1，Fas 蛋白水平以及 mRNA 的表达增加，促进凋亡的发生。
结论 BI-HSV-TK/GCV 系统能够有效抑制胃癌细胞在裸鼠体内成瘤的体积和重量，并促进胃癌细胞凋亡的发生。

PO-0005

一组神经胶质瘤恶性分级及临床预后评估分子标志物

刘春芳、刘爱平
复旦大学附属华山医院

神经胶质瘤是对人类健康和生命威胁最大的恶性肿瘤之一，按病理形态学特征 WHO 将神经胶质瘤分为：WHO II、WHO III 、WHO IV。WHO 病理分级是诊断神经胶质瘤的金标准，然而病理形态学诊断具有耗时长、主观性强、病理改变常具有滞后性、难以自动化，而且对病人预后的判断并不太好。尤其是对较低级别胶质瘤，它们在病理组织学上非常接近，但预后却千差万别，从几个月到十年以上。1p19q 状态 1p19q-codel 还是 1p19q-non 是神经胶质瘤预后评估的重要指标。
目的 分子生物学技术具有快速、微量、高通量、客观等巨大优势。因而，用分子生物学方法对神经胶质瘤进行分型、恶性分级及预后评估是未来的发展方向。在本研究中，我们旨在寻找用于神经胶质瘤快速临床预后评估的分子生物学指标。

结果 通过生物信息学，对与神经胶质瘤相关的肿瘤标志物做大规模筛查后，我们找到一组用于神经胶质瘤恶性分级及预后评估的分子生物学指标，包括 WEE1、ISL2、HOXD10、IGF2BP2、EN1、ZNF217、EFNB1、TNFRSF11B、CABP4、UBE2C 等 10 个基因的 mRNA Sequencing 表达量与神经胶质瘤的预后密切相关，P<0.0001；该基因组（Molecular group， MG）的联合应用可提高诊断效率。该 MG 的 mRNA Sequencing 表达量对神经胶质瘤进行分类，表达量高值组和低值组的总体生存期（Overall Survival, OS）具有显著性差异 (高值组 OS 中位数=438，n=513；低值组 OS 中位数=3299，n=457；P<0.0001)。
该 MG 组与 WHO 的神经胶质瘤病理分型相结合，可以将神经胶质瘤分为六种不同亚型的肿瘤；可以根据不同亚型对病人进行预后评估及恶性分级（P<0.0001）。IV+MG （高值组=356，n=310；低值组=694，n=64)；III+MG（高值组=564，n=147；低值组=2633，n=175）。II+MG（高值组=2199，n=52；低值组>5000，n=218）。
该 MG 组与 1p19q 状态相结合，可以将神经胶质瘤分为四种不同亚型的肿瘤；可以根据不同亚型对病人进行预后评估及恶性分级（P<0.0001）。1p19q-codel+MG(高值组=1048， n=32；低值组>5000，n=167)；1p19q-non+MG（高值组=415，n=464；低值组=2367，n=233）。
结论 本研究为神经胶质瘤恶性分级、预后评估提供了一组高效、快速的分子标志物。

PO-0006

催化发夹自组装快速检测甲型流感病毒

吴绘娜
东南大学附属中大医院

目的 甲型流感病毒是一种常见的呼吸道病毒，传染性强，可以引起季节性流行和全球大流行，对公共卫生造成严重负担。目前流感检测的金标准为逆转录聚合酶链式反应（RT-PCR），然而 RT-PCR 操作复杂，对操作人员技术要求高。早期筛查流感病毒对于患者治疗及流感控制至关重要，而本研究基于催化发夹自组装（CHA）原理检测甲型流感病毒的方法操作简便、成本低、检测快速非常适用于流感病毒早期大规模筛查。
方法 催化发夹自组装涉及三个基本成分：目的 RNA 片段及基于目的 RNA 片段设计的两个发夹称为 H1 和 H2，在发夹 H2 的两端标记荧光基团和淬灭基团用于监测反应的可行性，最终通过检测标记生物素的 H1 和标记地高辛的 H2 双链反映目的 RNA 的含量。
结果 荧光结果及电泳分析证明方案可行，在优化反应条件后，本研究最低检出限达到 fM，反应的特异性结果好。
结论 本实验研发了一种操作简便、快速检测甲型流感病毒的方法，可以用于流感病毒大规模筛查。

PO-0007

14 种 VWF 基因剪切位点突变的致病性研究

梁茜、丁秋兰、王学锋
上海交通大学医学院附属瑞金医院检验科

目的 从 mRNA 水平证实 14 种 VWF 基因剪切位点突变的致病性。
方法 抽提先证者外周血白细胞及血小板来源的 mRNA，逆转后通过 PCR 特异性扩增 VWF 转录产物，分析突变对 VWF 基因剪切方式的影响。通过荧光定量 PCR 检测 VWF 基因总体转录水平，并联合 VWF 基因 SNP 位点通过单碱基延伸进行等位基因表达不平衡检测，验证异常转录产物是否存在无义突变介导的 mRNA 降解（NMD）。
结果 5 种突变（c.322A>T 、 c.875-5T>G 、 c.7884C>G 、 c.8116-2delA 和 c.1534-13_c.1551delinsCA）导致了外显子缺失；5 种突变（c.221-2A>C、c.323+1G>T、c.1730-2A>G、

c.2547-13T>A 和 c.7464C>T）激活了隐匿的剪切位点；1 种突变（c.2968-14A>G）产生了新的剪切位点。其余 3 例患者中（c.-1+3A>C、c.2684A>G 和 c.5171-9delT）未检测到异常转录产物。等位基因表达不平衡检测显示 c.5171-9delT 突变除外的其余突变均存在不同程度的 NMD 现象，且血小板中 NMD 程度远高于白细胞。

结论 13 种 VWF 基因剪切位点突变均有致病性，突变 c.5171-9delT 很可能是多态性。本研究提供了 VWF 剪切位点突变致病性研究的通用方案，所有剪切位点突变的分子致病机制均需在 mRNA 水平进行验证。

PO-0008

外周血循环甲状腺乳头状癌细胞 NTRK1 融合基因检测方法的初步建立

张玉娟
中国医学科学院肿瘤医院

目的 预期建立一种外周血 NTRK 融合基因检测方法，以利于复发或转移甲状腺癌患者临床检测治疗。

方法 收集 27 例甲状腺乳头状癌（papillary thyroid carcinoma，PTC）患者和 13 例健康对照的外周血并在 4 小时内进行 CD45 阴性富集外周血循环肿瘤细胞（circulating tumor cell, CTC），然后采用免疫荧光化学染色联合 FISH 法进行 NTRK1 基因融合检测，自动荧光显微镜扫描仪 IMSTAR-CYTTEL 扫描记录结果。

结果 NTRK1 断裂探针阳性表现为 3’端的绿色信号和 5’端的红色信号的分离（3’+5’）或者单个绿色信号（3’）；NTRK1 基因融合阳性细胞为 DAPI 阳性、CD45 表达阴性、NTRK1 断裂探针表现阳性（DAPI+ CD45-/NTRK1+）的细胞。16/27 例 PTC 患者检测到了 3’/5’,3’+5’断裂，检测范围为 1~3 个/3.75ml；2/27 例患者检测到了 3’/5’≥2,3’断裂，3/27 例患者检测到了 3’+5’≥2 断裂，均检测到 1 个/3.75ml； 3/13 例正常对照组中检测到 3’/5’,3’+5’断裂，检测个数均为 1 个/3.75ml。ROC 曲线分析显示，cutoff 值为 2 个/3.75ml 时，NTRK1 断裂诊断 PTC 的敏感性为 14.8%，特异性为 100%。数据初步显示 PTC 患者外周血 NTRK1 基因融合阳性率为 14. 8%。

结论 首次在 PTC 患者外周血中检测到了 NTRK1 基因融合，虽然检测到的阳性个数以及例数均比较低，但是该检测方法仍为无法获得病理组织的肿瘤患者提供了一种新的检测治疗思路。

PO-0009

Potential clinical value of plasma circ_0004592 as an auxiliary diagnostic biomarker for gastric cancer

Yanhua Xu、Shan Kong、Ming Zheng、Shaoqing Ju
Affiliated Hospital of Nantong University

Background Gastric cancer (GC) is one of the world’s most common cancers with high mortality which lacks of ideal diagnostic biomarkers. Circular RNAs (CircRNAs) are a new class of non-coding RNAs which is closely related to GC. However, the clinical application value of circRNAs in GC are largely unknown. Therefore, we studied the role of a novel circRNA named circ_0004592 in early screening and prognosis of GC.

Methods High-throughput sequencing of circRNAs was performed to screen out the target molecule. Real-time fluorescent quantitative PCR (qRT-PCR) was used to detect the expression level of circ_0004592 in GC tissues, cells and plasma. The correlation between the expression level of plasma circ_0004592 and clinicopathological data of GC patients was further analyzed.

Receiver operating characteristic curve (ROC) and the area under ROC curve (AUC) were used to evaluate the diagnostic performance.
Results Has_circ_0004592 was first found up-regulated in both tissues (P=0.0009) and plasma of GC patients (P=0.0001). Circ_0004592 was resistant to RNA exonuclease digestion and had a long half-time. The expression level of circ_0004592 was significantly correlated to tumor pathological differentiation (P=0.002), tumor depth (P=0.004), lymph node metastasis (P=0.022). The AUC of plasma circ_0004592 was 0.787 (95%CI: 0.719-0.854) with high sensitivity (66.00%) and specificity (84.00%) in discriminating GC patients from healthy donors. More importantly, the combined diagnosis of circ_0004592, CEA and CA199 achieved the superior AUC of 0.831 (95%CI: 0.773-0.889) with a highest sensitivity (85.00%).
Conclusion Plasma circ_0004592 may prove to be a potential non-invasive auxiliary diagnostic biomarker for GC patients.

PO-0010

Lower respiratory tract samples are reliable for severe acute respiratory syndrome coronavirus 2 nucleic acid diagnosis and animal model study

Cuixian Yang 、Mi Zhang 、xingqi Dong
Yunnan Infectious Diseases Hospital

Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) and coronavirus disease 2019(COVID-19) continue to impact countries worldwide. At present, inadequate diagnosis and unreliableevaluation systems hinder the implementation and development of effective prevention and treatmentstrategies. Here, we conducted a horizontal and longitudinal study comparing the detection rates ofSARS-CoV-2 nucleic acid in different types of samples collected from COVID-19 patients and SARS-CoV-2-infected monkeys. We also detected anti-SARS-CoV-2 antibodies in the above clinical and animal model samples to identify a reliable approach for the accurate diagnosis of SARS-CoV-2 infection. Results showed that, regardless of clinical symptoms, the highest detection levels of viral nucleic acid were found in sputum and tracheal brush samples, resulting in a high and stable diagnosis rate. Anti-SARS-CoV-2 immunoglobulin M (IgM) and G (IgG) antibodies were not detected in 6.90% of COVID-19 patients. Furthermore, integration of nucleic acid detection results from the various sample types did not improve the diagnosis rate. Moreover, dynamic changes in SARS-CoV-2 viral load were more obvious in sputum and tracheal brushes than in nasal and throat swabs. Thus, SARS-CoV-2 nucleic acid detection in sputum and tracheal brushes was the least affected by infection route, disease progression, and individualdifferences. Therefore, SARS-CoV-2 nucleic acid detection using lower respiratory tract samples aloneis reliable for COVID-19 diagnosis and study.

PO-0011

Association of Polymorphism rs1045411 in the HMGB1 Gene with Cancer Risk

Quansong Xia
The Third Affiliated Hospital of Kunming Medical University, Kunming 650118, China.

The high-mobility group box protein 1 (HMGB1) rs1045411 polymorphism has been demonstrated to be associated with cancer risk in some studies. However, the results regarding this topic are inconsistent. A meta-analysis was applied to elucidate the association between the HMGB1 rs1045411 polymorphism and cancer risk. Ten relevant studies were subjected to our analysis, and pooled odds ratios (ORs) and 95% confidence intervals (CIs) were calculated. In

total, of 3,918 cases and 5,296 controls were included in this study. The pooled ORs were calculated using a random-effects or fixed-effects model according to the heterogeneity. The pooled results revealed that TT genotype was significantly related to increased cancer risk in the comparisons of TT vs. CC+TC (OR=1.35; 95% CI: 1.09–1.67; p=0.005). Though no statistical significance was achieved between HMGB1 rs1045411 polymorphism and cancer risk in other four genetic models (T vs. C: OR=1.08, 95% CI 0.90-1.30; TC vs. CC: OR=1.01, 95% CI 0.82-1.24; CC vs. TC+TT: OR=0.95, 95% CI 0.77-1.18; TT vs. CC: OR=1.42; 95% CI 0.98-2.05), a trend of increased risk could be drawn. In the subgroup analysis by type of malignancy and ethnicity, no obvious difference was found in the tumour risk regarding the HMGB1 rs1045411 polymorphism amongst the cancer types except for breast cancer (OR=1.94; 95% CI: 1.05-3.59; p=0.03) and hepatocellular carcinoma (OR=1.82; 95% CI: 1.15-2.88; p=0.01), while rs1045411 polymorphism was positively associated with risks of cancer amongst Hans (OR=1.37; 95% CI: 1.11-1.69; p=0.004) rather than Caucasians (OR=0.89; 95% CI: 0.26-3.02; p=0.85). These results suggest that the HMGB1 rs1045411 polymorphism might be associated with increased cancer risk.

PO-0012

Dynamic changes of IgM and IgG antibodies in asymptomatic patients as an effective way to detect SARS-CoV-2 infection

Ping Li
First Affiliated Hospital, Hunan University of Chinese Medicine

Background COVID-19 has become a global pandemic, and close contacts and asymptomatic patients are worthy of attention.
Methods A total of 1844 people in close contact with 76 COVID-19 patients were investigated, and nasopharyngeal swabs and venous blood were collected for centralized medical quarantine observation. Real-time fluorescence was used to detect SARS-CoV-2 nucleic acid in nasopharyngeal swabs of all close contacts, and the colloidal gold method was used to detect serum specific antibodies. Levels of IgM and IgG specific antibodies were detected quantitatively through chemiluminescence from the first nucleic acid negative date (0 week) and on weekly intervals of:1, 1-2, 2-3, and 6-7 weeks.
Results The total positive rate of the colloidal gold method (88.5%,23/26) was significantly higher ($\chi2 = 59.182$, $P < 0.001$) than that of the healthy control group (2.0%, 1/50). There was significant difference in IgG concentration at different time points (0-7week) after negative nucleic acid conversion ($\chi2 = 14.034$, $P = 0.029$).
Conclusions The IgG concentration in asymptomatic cases remained at a high level after nucleic acid turned negative. Nucleic acid detection combined with IgM and IgG antibody detection is an effective way to screen asymptomatic infections.

PO-0013

Internally controlled recombinase-aided amplifcation (IC-RAA) assays for the detection of human papillomavirus genotypes 16 and 18 using extracted DNA and samples treated with nucleic acid releasing agent

Jinrong Wang[1,2,3]、Jianli Liu[4]、Guowei Song[1]、Zhi Cao[5]、Jing Pan[1]、Xinna Li[3]、Yuan Gao[2,3]、Juju Qi[1]、Ziwei Chen[3]、Guohao Fan[3]、Xueding Bai[3]、Ruiqing Zhang[2,3]、Ruihuan Wang[3]、Qingxia Duan[2,3]、Lixin Li[1]、Xinxin Shen[3]、Xuejun Ma[3]

1. Shijiazhuang People's Hospital
2. 河北医科大学
3. 中国疾病预防控制中心
4. 海关总署(北京)国际旅行卫生保健中心
5. 北京市朝阳区妇幼保健院

Objectives Cervical cancer is primarily caused by persistent infection with high-risk human papillomavirus (HPV), and 70% of cases are associated with HPV16 and 18 infections. The objective of this study was to establish rapid, simple, and sensitive internally controlled recombinase aided amplification (IC-RAA) assays for the detection of HPV16 and 18. And we explored a nucleic acid release agent suitable for the IC-RAA assay to combine the extraction free nucleic acid method with the IC-RAA assay.

Methods In the E6/E7 gene regions of HPV16 and HPV18, probes and primers were designed based on RAA design principles, and competitive internal control was added to establish a method for detecting HPV16 and HPV18 by IC-RAA assay. A nucleic acid release agent was used to process the sample, and the extraction-free nucleic acid method was combined with the IC-RAA assay. The assays were performed at 39℃ and were completed within 30 minutes. A total of 277 clinical samples of exfoliated cervical cells were tested by IC-RAA assays and commercial HPV real-time fluorescent PCR kits using extracted DNA and samples treated with a nucleic acid releasing agent.

Results The analytical sensitivity of the IC-RAA assay was found to be 10 copies/μL for the detection of HPV16 and 18 when using recombinant plasmids as targets. The optimal analytical concentration of the internal control (IC) plasmid was 1000 copies/μL for HPV16 and 100 copies/μL for HPV18. The clinical sensitivity of the IC-RAA assays for HPV16 using extracted DNA and samples treated with the nucleic acid releasing agent was 98.73% and 97.47%, respectively, with Kappa values of 0.977 ($P < 0.01$) and 0.955 ($P < 0.01$), respectively. The specificity of both were 100%. The sensitivity and specificity of each assay for IC-RAA detection of HPV18 were 100%, and the Kappa value was 1 ($P < 0.01$).

Conclusion We have successfully established highly sensitive, specific and rapid IC-RAA assays for the detection of HPV16 and 18 using extracted DNA and samples treated with the nucleic acid releasing agent. In addition, the method for detecting HPV16 and HPV18 without nucleic acid extraction combined with IC-RAA assay does not require nucleic acid extraction equipment, complex nucleic acid extraction, and purification steps, and simplifies the operating steps of the IC-RAA assay, making it possible for the development of RAA assay to POCT. The IC-RAA assay is a promising tool for detecting HPV16 and 18, and provides a new strategy for realizing HPV16 and HPV18 screening in the grassroots and resource-limited areas.

PO-0014

一例 F11 基因复合杂合变异导致的遗传性凝血因子XI缺陷症的家系分析

程晓丽、杨柳、郝晓柯、刘家云
空军军医大学西京医院

目的 对 1 个遗传性凝血因子XI（coagulation Factor FXI，FXI）缺陷症家系进行临床表型和基因变异分析，探讨其分子致病机制。
方法 提取基因组 DNA，sanger 测序法测定 F11 基因所有外显子及侧翼序列；用 ClustalX-2.1-win 及 MutationTaster 软件分析突变氨基酸的保守性及对蛋白质功能的影响；通过 Swiss-Pdb Viewer 软件分析突变氨基酸对蛋白结构的影响。
结果 基因测序结果显示先证者 F11 基因第 10 和 13 外显子分别存在 c.1067C>T 和 c.1556G>A 变异，导致 p.Pro338Leu 错义变异和 p.Trp501stop 无义变异；先证者父亲和姐姐存在 p.Pro338Leu 杂合错义变异；先证者母亲和儿子存在 p.Trp501stop 杂合无义变异，先证者丈夫为正常野生型。
结论 p.Pro338Leu 和 p.Trp501stop 复合杂合变异是该家系遗传性 FXI缺陷症的分子致病机制，并且 p.Pro338Leu 为国内外首次发现的新变异。

PO-0015

Genetic landscape of DNA repair defects in human monogenic disorders

Niu Li、Yufei Xu、Ru-en Yao、Tingting Yu、Xiumin Wang、Jian Wang
Shanghai Children's Medical Center, Shanghai Jiaotong University School of Medicine

Purpose To provide an unbiased and global view of the proportion of the disorders with DNA repair defects (DRD) in human monogenic diseases.
Methods we retrospectively analyzed the genetic and clinical data of 9,107 unrelated patients from a single center, and sort relevant genes from literature retrieval.
Results From the 127 candidate DNA repair genes, three groups based on the functional study evidence were identified: 26 well-known DNA repair genes, 69 with strong evidence, and 32 with limited evidence. Deleterious variants of these genes were collected from 539 patients, including 72 (13.4%), 249 (46.2%), and 218 (40.4%) for each gene group, respectively. Patients with multiple system involvement as the main manifestation accounted for the largest proportion (47.7%, 257/539), followed by those with prominent neurological symptoms (13.7%, 74/539). We obtained an overall diagnostic rate of 33.5% (3052/9107) and proposed that DRD disorders account for 21.7% (539/2,488) of human monogenic diseases after excluding 564 patients with copy number variations.
Conclusion This is the first report to survey the contribution of DRDs in monogenic diseases from a large cohort. This study expands the DNA repair gene and phenotype spectra and demonstrates that DRD disorders are much more complex than our traditional knowledge.

PO-0016

血浆 cfDNA 结直肠癌 14 基因检测性能及临床应用评估

朱赟洁、沈敏娜、王蓓丽、郭玮
复旦大学附属中山医院

目的 基于 IonS5XL 二代测序平台对 OncomineColoncfDNAAssay（以下简称结直肠癌 cfDNApanel）进行性能确认和临床应用评价。
方法 根据《我国医学检验部门自建检测方法发展与管理建议》和《实验室自建分子诊断项目基本要求专家共识》的试剂盒性能评价相关要求评估结直肠癌 cfDNApanel 的准确性、精确性、参考范围、可报告范围、抽提起始量和投入量、空白限和分析灵敏度、分析特异性等指标。比较本平台与 IlluminaMiseqDx 二代测序平台及突变扩增阻滞系统（amplificationrefractorymutationsystem，ARMS）PCR 的一致性。分别检测临床标本 17 例和 22 例例结直肠癌患者血浆中 cfDNA。
结果 结直肠癌 cfDNApanel 准确性为 99.97%，同时具有很好的精确性。最低可兼容的血浆抽提量为 1ml，血浆投入量为 10ng。分析灵敏度是 0.2%。结直肠癌 cfDNApanel 兼备较好的抽提抗干扰能力和检测特异性。与 IlluminaMiseqDx 二代测序平台一致率为 94.12%，KRAS/NRAS/BRAF/PIK3CA 的阳性符合率（PPA）和阴性符合率（NPA）分别为 100%和 99.60%。与分子病理（组织 ARMS）结果一致率为 90.91%。
结论 结直肠癌 cfDNApanel 性能确认数据符合临床应用需求，在治疗前晚期结直肠癌患者中，血浆 cfDNA 结果与匹配的肿瘤组织结果高度一致，是组织活检的有益补充。

PO-0017

Novel therapeutic evaluation biomarkers of lipid metabolism targets in uncomplicated pulmonary tuberculosis patients

Jiaxi Chen
Enze Hospital of Enze medical center group

Currently, the management of pulmonary tuberculosis (TB) lacks potent medications and accurate efficacy evaluation biomarkers. In view of the fact that the host lipids are the important energy source of Mycobacterium tuberculosis (Mtb), UPLC-MS/MS based on lipid metabolism was used to monitor the plasma lipid spectrum of TB patients from the initial diagnosis to cured. The analysis showed that TB patients presented aberrant metabolism of phospholipids, glycerides, and sphingolipids. Upon the treatment, the abnormal expression of Cer (d18:1/24:0), CerP (d18:1/20:3), LPE (0:0/22:0), LPA (0:0/16:0) and LPA (0:0/18:0) in TB patients were gradually normalized, indicating that the intervention of lipid metabolism could block energy metabolism and inhibit the cell wall synthesis of Mtb. Furthermore, the increase in ceramide (Cer) levels could promote the autophagosome-lysosome fusion. LPA (0:0/16:0) and LPA (0:0/18:0) had a great potential in the early diagnosis (both sensitivity and specificity were 100%) and efficacy evaluation (both sensitivity and specificity were 100%) of TB, indicating that the above lipid metabolites could be used as potential biomarkers for TB.

PO-0018

APN-mediated phosphorylation of BCKDK promotes hepatocellular carcinoma metastasis and proliferation via the ERK signaling pathway

Mengying Zhai
Tianjin Hospital
天津医科大学

Background Hepatocellular carcinoma (HCC) is one of the most prevalent human malignancies worldwide and has high morbidity and mortality. Elucidating the molecular mechanisms underlying HCC recurrence and metastasis is critical to identify new therapeutic targets. This study aimed to determine the roles of aminopeptidase N (APN, also known as CD13) in HCC proliferation and metastasis and its underlying mechanisms.
Method We detected APN expression in clinical samples and HCC cell lines using immunohistochemistry, flow cytometry, real-time PCR and enzyme activity assays. The effects of APN on HCC metastasis and proliferation were verified in both in vitro and in vivo models. RNA-seq, phosphoproteomic, Western blot, point mutation, coimmunoprecipitation and proximity ligation assays were performed to reveal the potential mechanisms.
Findings We found that APN was frequently upregulated in HCC tumor tissues and high metastatic cell lines. Knockout of APN inhibited HCC cell metastasis and proliferation in vitro and in vivo. Functional studies suggested that loss of APN impedes the ERK signaling pathway in HCC cells. Mechanistically, we found that APN might mediate the phosphorylation at serine 31 of BCKDK (BCKDK^{S31}), promote BCKDK interacting with ERK1/2 and phosphorylating it, thereby activating the ERK signaling pathway in HCC cells.
Interpretation Our findings indicate that APN mediates the phosphorylation of BCKDK^{S31} and activates its downstream pathway to promote HCC proliferation and metastasis. Therefore, the APN/BCKDK/ERK axis may serve as a new therapeutic target for HCC therapy, and these findings may be helpful to identify new biomarkers in HCC progression.

PO-0019

PRISMA-compliant meta-analysis of diagnostic value of microRNA-375 in prostate cancer

Xin Wang、Zhuo Li、Jian Zhou、Li Wang
The First Affiliated Hospital of Xi'an Medical University

Objectives MicroRNA-375 (miR-375) plays an important role in the diagnosis of prostate cancer (PCa). However, the diagnostic parameters in previous studies are inconsistent. In order to evaluate the diagnostic value of miR-375 in PCa, we conducted a meta-analysis.
Methods We searched for PubMed, Medline, Cochrane Library, Embase, Web of Science and Chinese database (CNKI and Wanfang database), comprehensively from the inception to November 31, 2020. Meta disc 1.4 and StataSE15 were used to analyze the data. The bivariate meta-analysis model was employed to summarize sensitivity (SEN), specificity (SPE), positive likelihood ratio (PLR), negative likelihood ratio (NLR) and diagnostic odds ratio (DOR) for miR-375 in the diagnosis of PCa. Summary receiver operating characteristic curve (SROC) analysis and the area under the curve (AUC) were used to check the overall test performance.
Result Sixteen studies, evaluating the diagnostic value of miR-375 in patients with prostate cancer, were included in this meta-analysis. The combined sensitivity and specificity of miR-375 in the diagnosis of PCa were 0.75 (95% CI: 0.73-0.77) and 0.77 (95% CI: 0.74-0.79), respectively. The PLR was 2.94 (95% CI: 2.30-3.76), and the NLR was 0.29 (95% CI: 0.23-0.38). In addition, we noted that the overall DOR of miR-375 for PCa was 12.90 (95% CI: 8.84-18.83). The AUC of

total area under receiver operating characteristic curve (ROC) was 0.86 (95% CI: 0.82-0.89). Multiple regression analysis showed that the heterogeneity mainly came from the total number of samples. Subgroup analysis showed that the diagnostic efficiency of serum was the highest and the heterogeneity was the lowest among the different sample types. Fagan nomogram results showed that miR-375 detection significantly increased the diagnosis of PCa.
Conclusion Serum miR-375 has a high diagnostic value for prostate cancer. Rigorous and high-quality prospective studies are required to verify our conclusion.

PO-0020

Urea as a By-product of Ammonia Metabolism can be a Potential Serum Biomarker of Hepatocellular Carcinoma

Changsen Bai、Li Ren
Tianjin Medical University Cancer Institute and Hospital

Objective Hepatocellular carcinoma (HCC) is highly malignant; nearly half of the new cases and deaths are in China. The poor prognosis of HCC is mainly due to late diagnosis; many new biomarkers have been developed for HCC diagnosis. However, few markers are quickly translated into clinical practice; early and differential diagnosis of HCC from cirrhosis and/or hepatitis is still a clinical challenge. We set out to find a biomarker that could be used to distinguish HCC from other liver diseases.
Methods The metabolites of the serum were analyzed by quantitative targeted metabolomics for differential analysis to find specific potential markers of HCC patients. The biochemical analysis method was used for in-depth analysis and verification. The serum of 115 cases of healthy controls, 69 cases of HBV, 108 cases of HBV positive cirrhosis, 95 cases of HCV, 294 cases of HBV positive HCC patients, and 77 cases of metastatic HCC patients (other cancers metastasize to the liver) were preliminary verified as the training set. Next, the serum of 118 normal healthy controls, 142 cases of lung cancer patients, 150 cases of breast cancer patients, 140 cases of colorectal cancer patients, and 165 cases of HBV positive HCC patients were analyzed as the validation set. Besides, we have demonstrated the underlying mechanism through multiple cell models and co-culture models.
Results Most of the elevated metabolites in HCC and HBV patients were overlapped compared with controls. Urea was the specifically elevated serum biomarker of HCC patients. Moreover, urea combined with AFP and CEA can improve the sensitivity of HCC diagnosis. The plasma ammonia of HCC patients was significantly higher than healthy controls. Co-culture cell model revealed normal liver cells cooperated with cancer cells to metabolize ammonia into urea. The urea metabolism in cancer cells marginally depended on the expression of CPS1. However, the expression of CPS1 did not change with ammonium chloride, which might regulate the urea cycle through enzyme activity. The urea cycle could detoxify high concentrations of ammonia to promote cancer cell proliferation.
Conclusion Urea was a by-product of ammonia metabolism and could be a potential serum biomarker for HCC. The combined application of metabolomics and biochemical methods can discover new biomarkers for the early diagnosis of HCC and be quickly applied to clinical diagnosis.

PO-0021

Novel evidence for an oncogenic role of SOX9 in lung cancer stem cells

Qingli Bie、Haixin Dong、Fenglian Shan、Bin Zhang
Department of Laboratory Medicine, Affiliated Hospital of Jining Medical University, Jining, Shandong, P. R. China

Lung cancer is the second most common malignant tumor and is the leading cause of cancer death worldwide. SOX9 is an important transcription factor that functions in development, and it has been demonstrated to be abnormally expressed in various cancers. In the present study, we found that SOX9 was overexpressed in lung cancer tissues and that SOX9 could promote proliferation, migration, invasion and self-renewal by gain- and loss-expression of SOX9 in vitro. Clinicopathological characteristics analysis showed a significant relationship between SOX9 expression and TNM stage, sex, VEGF and EGFR; moreover, overexpression of SOX9 predicted a poor outcome in lung cancer patients. Transcriptome profiles revealed 364 differentially expressed genes between A549 cells transfected with shControl and those transfected with shSOX9. Potential signaling pathways associated with malignant biological behavior were identified, including GnRH, MAPK, and PPAR. In conclusion, SOX9 is an important transcription factor promoting malignancy in lung cancer, and it may be a novel therapeutic target for lung cancer.

PO-0022

ISO15189 质量管理体系在医院检验科实习生带教工作中的实践和运用

周庆丰、曹辉、陈洪卫、刘军
上海市松江区中心医院

随着医学的不断进步，医院对于检验科实习生的带教要求也越来越高，借鉴 ISO15189 质量管理体系对实习教学过程进行全面质量控制，培养学生独立操作、发现问题、分析问题和解决问题的能力，综合运用医学检验与理论知识的能力，加强与临床医患沟通的能力。将 ISO15189 质量管理体系融入实习带教中，引导实习生关注影响检验结果的各个环节，训练其从检验和临床的角度全面分析问题，有助于拓宽实习生的知识面，帮助实习生形成系统全面的综合判断思路，从而有效地提高实习生的理论知识与专业技能，提高实习生的实习效果。

PO-0023

不同教学模式对培养创新型检验人才的临床效果评估

邓文平、谢小义、刘琪、黄琳淋
重庆市涪陵中心医院（重庆市微创外科研究所）

目的 为提高医学检验的教学质量，提升实习学生的学习能力和临床思维方式，本文探讨不同教学模式下对医学检验创新型人才的培养效果。
方法 选择 40 名实习学生随机分成两组，实验组和对照组，以传统讲授教学模式与分段联合 EBLM 与 PBL 的教学模式，进行比较，分别对实习学生的基础理论成绩、实际操作成绩、临床思维能力、提出问题解决问题能力、沟通与合作能力等内容进行评价。
结果 在初期传统教学模式下，学生对理论定义掌握与其它教学模式相比，基本一致，较全面，教学中花费的时间最少；分段联合 EBLM 与 PBL 教学模式学生对于检验项目在临床的应用比较有更

为直接的证据，对临床应用的接收程度和临床思维能力提高较为显著；学生在实际工作中发现的问题提出解决问题的能力提高也较为明显。
结论 对医学检验创新型人才的培养中，以分段联合 EBLM 与 PBL 的方式，在实习不同的时间段，分配不同的教学模式主体能更好地提高学生的学习水平和综合素质，促进创新型检验人才的培养，顺应时代赋予医学检验专业培养检验人才的要求。

PO-0024

多元化教学与过程性考核相结合在临床生化检验带教中的探索与实践

高佳
中国医学科学院肿瘤医院

临床生化检验是医学检验的重要亚专业之一，其知识点繁杂、与临床结合紧密，带教难度颇大，而与此同时，临床生化室又是自动化程度较高的实验室，容易出现只教仪器操作，而忽略了更深层次的仪器检测原理、项目临床意义的情况。中国医学科学院肿瘤医院检验科自 2006 年首批取得北京市检验住院医师培训基地资格以来，针对临床生化检验的教学特点和难点做了大量的探索。本文将结合中国医学科学院肿瘤医院检验科检验医师规范化培训基地在检验医学住院医师规范化培训的具体实施情况与经验，对临床生化检验的带教模式进行探讨。
1 解读培训及考核要求，根据培养对象的特点及背景确定培养目标
依据《临床住院医师规范化培训大纲》及《检验医师培训细则》对在培检验医（技）师进行培训，但不同培训人员的培训要求和培训重点不尽相同。即使对于同类的培训人员，培训侧重点也应根据其学历和工作背景个性化设置。
2 确认培训要点、制订培训计划
结合《临床住院医师规范化培训大纲》和《临床生物化学检验》课本，由带教老师集中讨论，确认并列举本专业组的所有培训要点。按照循序渐进的原则，将培训要点分类并确定每一大类的培训时长，制订规范的培训计划及培训方案。
3 采用导师负责制与日常带教相结合的带教模式，灵活运用操作演示、专题小讲座、结合案例教学等多种教学手段，辅以面试、笔试、PPT 汇报等过程性考核形式。
通过一系列的改进，极大地提高了临床生化检验的教学质量，形成了涵盖实验室常规操作、检验相关的质量控制、临床诊疗知识的教学培训体系。临床生化检验的带教工作是繁重的，但“教学相长”，带教本身也是一个查缺补漏、自我提高的过程，只有合理地安排培训周期、设计培训计划，不断在教学过程中进行监督和考核，才能使教学管理渐趋科学化、规范化，最终提高教学质量。

PO-0025

Development, application, and evaluation of a problem-based learning method in clinical laboratory education

Chunyan Peng[1,2]、xiandong Li[1]、Fei X[1]
1. Taihe hospital, Hubei University of Medicine
2. 湖北医药学院

Background There is a big gap between theory and real clinical practice with respect to the structure of clinical laboratory medicine (CLM) education in China. An integrated teaching method is urgently required, to improve student competency and prepare students to deal with complex challenges in the working environment.

Methods A total of 122 fourth-year CLM students studying at Hubei University between 2018 and 2019 were randomly assigned to a traditional teaching methods group or a problem-based learning (PBL) group. In the PBL group students were instructed to exchange their thoughts, identify information gaps, rehearse and perform simulated clinical scenarios, and incorporate the new information into cases in small groups. Theory tests, questionnaires, and clinical performance assessments were used to evaluate the effectiveness of PBL and compare it with that of traditional teaching methods.
Results PBL resulted in significantly better theory test scores, better student feedback scores, and clinical performance assessments, and a higher rate of satisfaction among students and teachers.
Conclusion PBL is an effective way to help CLM students develop comprehensive abilities to deal with real clinical laboratory work. It is a promising education method and should be generalized to all subtypes of clinical laboratory curriculums in the future.

PO-0026

带有样本相关信息二维码的载玻片示教片应用与形态学示教的优势

张玲
阿克苏地区第一人民医院

背景 在临床或医学教学时，载玻片是医学实验中重要的材料。通常将包含细菌、真菌、细胞或组织切片等的样本放在载玻片上，然后将其放置在显微镜下对样本的病理、形态学进行观察与分析。而用于临床检验、病理病例资料及教学的示教载玻片保存时需要对其进行标记。由于载玻片的尺寸小，那么可用于标记的内容也就极其有限。目前载玻片上标记的信息一般包括样本编号或类别及名称-具体的病理及形态学还需要根据标签上的编号或类别、名称通过电脑或其他的途径另作查询。这给实验人员尤其医学教学人员造成了极大的不便。基于上述原因，对现有载玻片标记方式进行改进。提供一种带有样本信息二维码贴在载玻片上，只需通过扫描二维码即可调取储存在载玻片上的与样本有关的各种形式（文档、图谱、PPT 甚至视频）的信息。方便了病历资料整理及保存，也为教学人员的教学提供了便利。
方法 根据载玻片上样本包含的内容制作需要展示的文档、图谱、PPT 甚至视频；信息化解码；生成二维码；扫码提取信息。选取 2020 年我院检验科学员及新进员工 16 人随机分组，A 组 8 人采用传统培训模式，集中授课、现场演示练习等；B 组 8 人，在传统培训模式的基础上，加用二维码示教片进行自主学习。两组干预周期均为两个月，干预后比较两组人员学习的效果，指标包括形态学理论知识与实践操作考核、培训的满意度。
结果 传统培训的基础上，加用二维码示教片进行自主学习后理论考试操作考试均高于 A 单纯的传统培训模式；并且培训的满意度也比单纯的传统培训模式高，且差异具有统计学意义。
结论 带有二维码信息的教学载玻片示教片是将现代信息技术与临床技能教学结合，有效激发了学员、新进员工及工作人员的学习兴趣，可提高对形态学教学的培训效果。让现代化信息技术为临床技能教学添彩加翼。

PO-0027

多模式教学在医学检验实习带教中的应用

武睿
重庆医科大学附属第一医院

目的 为提高医学检验科本科生实习教学质量，将 PBL、CBL 结合翻转课堂多模式教学应用于实习带教管理程序中，探讨多模式教学在医学检验科实习带教中的应用效果。
方法 2018 年进入本科室的 18 名医学检验技术专业的本科实习生以传统管理方式进行实习带教，为对照组，2019 年进入本科室的 20 名医学检验技术专业的本科实习生以多模式教学方式进行实习带教，即将 PBL、CBL 结合翻转课堂教学方式加入实习带教中，设为实验组，将两组毕业考试成绩及满意度评价进行对比。
结果 实验组出科考试的理论成绩与操作成绩均高于对照组，差异有统计学意义（$P < 0.05$），并且实习满意率明显高于对照组($P < 0.05$)。
结论 采用 PBL、CBL 结合翻转课堂多模式教学进行医学检验科实习带教，可有效提高教学质量，提高实习生的满意度。

PO-0028

瑞金医院检验医师规范化培训的模式和体会

孟俊
上海交通大学医学院附属瑞金医院

住院医师规范化培训是高层次医学生毕业后教育的重要组成部分，是，其中检验医师规范化培训是培养检验专科医师的有效手段和重要措施，；是专业检验科医生成长的必由之路，也是为其之后行医奠定关键基础的关键阶段，，也是一个专业检验科医生成长的必由之路。同时也在扩大检验医学影响力和提高检验科在医院地位等方面具有同等重要价值。本文结合上海交通大学医学院附属瑞金医院十多年来检验医师培养方面的一些措施和体会，为检验医师的工作及其规范化培训过程提供一些意见和建议。

PO-0029

临床血液学检验规范化培训教学模式探索与实践

沈迪、车轶群、王力、宋桂瑜、崔巍
中国医学科学院肿瘤医院

目的 通过建立系统的临床血液学检验规范化培训教学体系，为培养高素质应用型临床血液学检验医师和技师提供教学支撑作用。
方法 制定合理的规范化培训规程，建设完整的组织管理体系；指导教师的选拔和培训，内容涉及基地管理、教学方法改进、教学能力提升、科研能力提高等；规培学员的录取和培训，根据规范化培训大纲和标准细则要求，制定临床血液学检验的教学计划和培训细则；建立系统的考核模式，考核形式包括组内阶段性考核、出科考核和年度模拟考核；实行师生双向评价和反馈机制，设置规培学员与指导教师互评体系，定期举办师生座谈会，收集学员对教学工作的意见和建议；带教教师采用多元式教学形式与教学方法进行教学，包括传统的教学形式，日常线上练习及讲解，充分应用案例教学法（case-based learning,CBL），以学员为主导的微课教学模式；注重医学人文的培养，应用人文关怀加强医患沟通。

结果 通过制定合理的规范化培训规程，有序实施教学活动，规范教师带教，促进教师带教能力的提升，提高了教学水平。学员通过系统的规范化课程培训，通过日常练习和系统考核，明确了学习的重点和难点，促进了学习兴趣，并且重视日常的积累，为以后步入工作岗位打下坚实基础。
结论 临床血液学检验是一门多学科交叉的课程，并且实践性强、发展迅速，在今后的教学过程中，我们在未来的实践中不断探索和研究，尝试更多更新的教学手段、理念，创造更加合理的人才培养模式。

PO-0030

多元化教学模式在检验科实习生带教中的应用

岳宏波
西安市阎良铁路医院

目的 探讨多元化教学模式在检验科实习生带教中的应用效果。
方法 将我科 2018 年 8 月-2019 年 3 月 13 名实习生作为对照组，2019 年 8 月-2020 年 3 月 15 名实习生作为观察组，对照两组实习效果。对照组实行传统带教模式，即学员轮转到各专业组由各专业组老师带教本专业组内容。学习没有系统性，学员的学习质量也受带教老师的带教态度和和能力影响很大；观察组采用多元化教学模式。实行带教导师负责制对所带教的学员全过程负责。在培训方法上注重多元化、趣味化、及时性，实习生接受度更高效果好。通过完善的考核机制，“师生双向”效果评价和反馈，不仅提升了带教老师工作责任心和教学技巧，同时调动了实习生的主动性。多元化具体教学模式为：1.确定教学组织架构，由科主任-教学组长-带教导师组成。科主任负责对整个培训计划和方案的制定与落实，对整个培训过程管理督导和检查；教学组长负责总带教，负责具体培训内容和考核内容的实施，对带教导师和教学计划进行工作督导和考评；带教导师进行“一对一”导师负责制。 2.培训方法采用多模式教学：每日晨课、理论督导、各专业组轮转学习；技能比赛、学员 PPT 授课比赛；情景模拟；突发事件应急演练；视频反馈教学和评价。3.采用 SPSS17.0 软件进行数据分析，计量资料使用（`X±S）表示，采用 t 检验；计数资料使用 X2 检验，以 P<0.05 则差异有统计学意义。
结果 观察组实习生理论知识考核评分为（94.25±4.31），操作技能考核评分为（95.05±3.82），教学质量评分为（96.36±2.23）；对照组实习生理论知识 考核评分别为（88.76±5.35），操作技能考核评分为（90.57±4.06），教学质量评分为（88.53±8.20）。观察组理论知识考核、操作技能考核、教学质量评分均高于对照组，差异均具有统计学意义（P<0.05）。观察组实习生对教学方法满意度调查中，满意为 100%；对照组实习生对教学方法满意度调查中，满意为 76.9%，一般为 23.1%。观察组实习生对教学方法满意度评价高于对照组，差异均具有统计学意义（P<0.05）。
结论 多元化教学模式在检验科实习生带教中应用效果显著，不仅提升实习生的实习质量，并且提高其对教学方法评价的满意度，同时也提升带教老师教的带教能力。

PO-0031

Explore the growth path of clinical laboratory graduate students with a background in clinical medicine from the perspective of "cultivation of laboratory physicians"

Yingmei Wu[1]、Yingchun Zhou[2]
1. Department of Clinical Laboratory, The First Affiliated Hospital of Guangzhou University of Chinese Medicine
2. 广州中医药大学第一附属医院白云医院

In September 2012, the Ministry of Education adjusted the medical laboratory specialty from five to four years. The specialty was thus classified as a science degree and no longer belonged

to a bachelor of medicine. This decision in turn made it impossible for students who enrolled in the future to participate in the physician qualification examination. The COVID-19 epidemic has brought the normally unknown clinical lab staff to the front line of the response teams and also made the entire society aware of the importance of building a team of clinical lab doctors. At present, the clinical labs and clinical departments usually lack in-depth communication, and medical staff has limited understanding of many reports issued by the lab. The cultivation of lab physicians is conducive to mutual understanding and growth of departments and labs, and improves the efficiency of hospital diagnosis and treatment services.

In this context, clinical lab graduate students with a bachelor's degree in clinical medicine are particularly suitable to take the path of clinical lab physicians. It is reasonable to say that graduate students who have just entered the lab have little knowledge of the diagnostic techniques available. Therefore, the process of learning for each professional group in the laboratory is particularly important. First of all, in the rotating learning process of the laboratory, the staff should master every process of the lab work, and become involved in more hands-on operations, from daily reagent preparation, quality control, calibration to report review, and so on. Students should understand the various inspection projects, the settings and work content of each professional group, etc. Additionally, it is necessary for students to master the principles, methods, and clinical significance of each test item, and become familiar with the factors that affect the test results. For example, when the test results do not match the clinical symptoms, they should be able to further analyze and find out the reasons. Through practical training in the clinical lab, graduate students with a clinical background can have a deep understanding of the work and its limitations.

Later, in the training of clinical departments, graduate students should learn to treat and manage patients independently, and be proficient in various basic clinical skills, including medical history collection, physical examination, and preliminary diagnosis and treatment of diseases. In addition, lab physicians should focus their training on the interpretation of various test reports, learn to look at test results from the perspective of clinicians, maintain a flexible clinical thinking mode and guide and help clinicians to choose test items correctly and reasonably. When doctors or patients have questions or doubts about the test results, they can provide professional answers. Training experience will inevitably broaden the scientific research thinking of laboratory physicians and will bring great benefits to their future scientific research in the hospital. The cooperation and promotion of laboratory and clinical departments is inseparable from the cultivation of laboratory physicians.

PO-0032

以“强化科研素养”为成果导向的《分子生物学检验技术》课程模式构建

林艳凤、林东红、林旎
福建医科大学

培养具备科研能力与创新能力的医学人才是 21 世纪高等医学教育教学承载的责任与使命。反思分子生物学检验技术教学现状，引入成果导向教育理念，提出“强化科研素养教育，培养卓越型医学人才”学习成果目标，从教学理念、教学模式、教学手段和考核评价等方面进行改革，解决学生科研素养与未来需求不相适应的问题，满足当代医学对临床实验室医学检验专业高素质应用型人才的需求。

PO-0033

线上与线下混合式教学在临床检验诊断学研究生深度学习中的应用探讨

张利霞、张启声、王娜
内蒙古科技大学包头医学院第一附属医院

目的 在线上线下混合教学情境下，明确哪些因素可以促进临床检验诊断学研究生的深度学习(反思性与整合性学习），从而为临床检验诊断学研究生制定线上与线下深度融合的优质教学模式，并进一步探索检验高级人才培养新策略。

方法 1.通过文献查阅、哲学思辨对深度学习的核心进行理论界定，提出影响深度学习的主要因素。通过 NSSE 中国改良版（NSSE-China）心理学问卷调查，确定临床检验诊断学研究生在教学过程中影响深度学习的实际主要因素，由此制定深度学习的在教育学中的评价标准。2.将深度学习的评价标准与临床检验诊断学的研究生教学相结合，通过教师访谈，学生调查问卷，分析教学内容的特点，制定基于线上线下混合的教学新模式。

结果 1.促进临床检验诊断学研究生深度学习的方式有：师生互动分析讨论，学生积极有效表达想法；以小组为单位的文献阅读共同体的建立；线上资源包括知识点视频、开放性试验、专题讨论资料、创新性前沿信息分享讨论等。

2.结合深度学习的评价标准制定了学科中每节课的深度学习的评价标准和实际评价方法。基于此通过整合和制作线上教学资源和线下教学调整，构建了新的教学模式。

结论 线上与线下混合式教学深度融合，能根据学生的个性化需求，重置学习的时间与空间，有效提升了学生学习的有效性，增强了学生的实践和创新能力。但混合式教学设计在国内临床检验诊断学硕士研究生培养中仍处于探索阶段，在实践中需要不断创新和总结经验。

PO-0034

BOPPPS 教学法在《临床免疫学检验技术》实验教学中的应用探索

张丽翠、马雅静
石河子大学医学院第一附属医院

目的 探讨基于 BOPPPS 教学法在《临床免疫学检验技术》实验教学中的应用效果及其评价。

方法 选取 2020 年 09 月-2020 年 11 月在石河子大学医学院进行《临床免疫学检验技术》实验课的医学检验专业的本科 2018 级 1 班 40 名学生作为实验对象，并随机分为实验组与对照组(每组 20 名)。对照组采用传统教学方法，实验组采用 BOPPPS 教学方法。在教学实验结束后比较两组学生理论考核成绩、技能操作考核成绩、案例分析能力得分，并建立学生对教学满意度评价、自我提升能力等多方面建立评价机制。

结果 实验组学生理论知识、技能操作以及案例分析成绩均明显高于对照组($P<0.05$)。实验组学生对教学的满意度(100%)明显高于对照组(85%)，$P<0.05$，实验组学生综合能力提升显著高于对照组 $P<0.01$。

结论 在《临床免疫学检验技术》实验教学中应用 BOPPPS 教学法可取得较好的教学效果，学生能同时具有实验操作技能及与临床案例相结合的思维和认知能力相融合，建立系统的临床思维能力。为培养以“检验技术”为核心的医学检验人才，对现如今的临床免疫学技术的实验课教学方法进行革新能够有效提高学生的临床与检验综合分析能力，同时有助于学生更好地培养其临床检验思维能力与兴趣，并显著提高了学生对教学质量的满意度，值得进一步研究及推广。

PO-0035

检验医学规培模式探讨培养实用型人才

宋立兴[1]、余晓林[1]、宋自阆[1]、刘孝桢[2]
1. 自贡市第四人民医院
2. 四川省卫生康复职业技术学院

目的 对检验医学规培人员探索在新形势下，如何培养适应时代发展要求的新型复合型检验医学人才。
方法 通过改革教学内容、创新教学方法和改进教学形式，致力于学员的操作能力、临床思维能力、适应社会能力的培养。
结果 在检验医学规培带教中采用多种教学模式，培养学员临床思维能力，检验结果与临床相结合的意识，可以激发学员主动学习的兴趣，教会学员如何发现问题、分析问题、解决问题，可以大大增强学员对自我能力的认识和对检验专业的认同感。
结论 通过创新规培模式，改革规培方法和内容，有利于培养学员良好的临床沟通能力、临床思维能力和解决临床实际问题的能力，有利于培养适应现代医学发展的新型实用型人才

PO-0036

医学检验专业本科生专业思想稳定性的调查与分析

黄奔、王洁、张祥、赵鸿
南京医科大学第一附属医院（江苏省人民医院）

目的 为了解新形势下医学检验专业本科生专业认知的情况，了解医学检验本科生的专业基本情况、专业思想稳定性、专业评价与专业学习的现状。
方法 采用分层整群的抽样方法，调查江苏省某医学院校医学检验学专业三个年级的在校本科生，发放问卷 336 份，回收有效问卷 269 份，有效率为 80.59%。采用 Epidata3.1 软件建立数据库，双人双录入的方式来确保数据输入的准确性。采用 IBM SPSS Statistics 25.0 统计软件进行一般性统计学分析。
结果 此次调查分析中，共有男生 78 名，女生 191 名；大一学生 93 名，大二学生 95 名，大三学生 81 名。调查显示，所学专业为报考第一志愿的学生仅有 99 人（36.80%），其中，因自身兴趣爱好而报考的仅占 20.20%。在专业思想稳定性方面，有 5 名（1.85%）学生想过要转专业，只有 79 人（22.07%）认为自身适合医学检验专业学习，并且有 207（76.95%）人选择毕业后会从事所学专业工作。在专业社会地位评价方面，只有 11 人（4.08%）认为医学检验专业的社会地位较高。在专业学习方面，只有 19 人（7.06%）认为专业课程学习设置合理。
结论 此次调研显示，超过半数的医学检验专业本科生认为所学专业社会地位不高，并且对专业学习课程评价度低，医学检验专业本科生的专业思想稳定性存在问题，亟待重视。

PO-0037

临床医学本科《实验诊断学》课程教学改革实践

张翔、郝晓柯、杨柳、周柯、周磊、刁艳君、李蕊、贺文芳、刘家云
空军军医大学西京医院

目的 实验诊断学是临床医学专业的一门必修专业课程，是诊断学中重要部分，也是重要的医学“桥梁”课程。以往课程局限于检验项目原理逐条单一讲授，学员反映知识繁杂难记、运用困难；而实验诊断学发展迅速，教学与临床相脱节的矛盾日趋明显。

方法 为引领学员顺利进入后续临床专业课程学习，尽早建立临床思维，空军军医大学西京医院实验诊断学教研室近年来对课程设置和内容进行了大幅度改革，调整如下：（1）优化内容，调整教学方法以系统、器官、疾病为主线进行排课，形成“五位一体“的板块式教学模式，即在理论按照临床血液学检验、体液检验、生化检验、免疫学检验、微生物学检验五个部分知识体系重点学习的基础上，分别结合各相关疾病的实验室诊断来进行系统讲授；（2）强调实用性：舍弃老旧、传统的检验项目，把与临床联系密切、实用性强的内容作为课程的主要内容，增加新技术、新方法讲授和病例分析，使学生在日后临床工作中学有所用；（3）重点培养学以致用的能力：重实践，改变传统实验课只重技术操作的方式，增加用学生自己的实验结果分析病例，穿插以报告单解读和实诊病例讨论为主要内容进行的讨论式教学，加之观摩实验室了解临床工作流程，激发学习的兴趣，提高动脑与动手能力；(4)通过结合学习通、雨课堂等学习 APP 和虚拟仿真（VR）软件“沉浸式“实践教学，辅以翻转课堂、知识竞赛等多维形式为补充，搭建信息化、混合式立体教学平台，更好地培养学员综合素质和整体临床医学观。

结果 经过几学期的教改和实施，教学取得良好成效。回收调查问卷提示，临床学员普遍反映学习兴趣增加，临床思维得到训练。

结论 “学生为主体，教师为主导”的教学原则下，多种手段相结合的混合式教学方法给实验诊断学教学改革提供了新的方向。

PO-0038

从“人机法料环”浅谈临床检验诊断学学术型研究生的科研能力培养

吴洪坤
海军军医大学第二附属医院（上海长征医院）

科研能力的培养对临床检验诊断学研究生、尤其是学术型研究生至关重要，但目前临床检验诊断学学术型研究生的科研培养存在科研水平不足及科研环境欠佳等诸多问题。结合多年培养经验，提出从“人机法料环”五个因素方面入手，通过发挥自身内驱力、增强导师引导力、提高培养工具性、提高思维科学性、提升环境友好性等对策来提高临床检验诊断学学术型研究生的科研能力和水平，为其以后的职业发展奠定坚实的科研基础，为临床检验诊断学的发展贡献新生力量和高水平人才。

PO-0039

医学检验技术专业 PBL 课程建设与应用探讨

程龙、李小宁、徐五琴、张鹏、邢子禾
皖南医学院弋矶山医院

为满足新时代综合性专业人才培养，我校在医学检验技术专业尝试建设 PBL 课程。本文主要论述 PBL 课程在医学检验技术专业中建设与应用，在课程的建设中重点加强课程导师队伍建设已经课程案例库建设；课程实施过程要坚持 PBL 小组讨论的主要形式并且重点关注课程的考核与评价。在课程建设与实施阶中发现 PBL 课程在学生临床思维能力培养方面较传统教学方法有显著优势。在医学检验技术专业教学教改中起到了积极作用。

PO-0040

互联网+医学检验高等教育的数字化资源库建设研究

林旎[1]、欧启水[2]
1. 福建医科大学
2. 福建医科大学附属第一医院

在"互联网+教育"跨界融合大背景下,阐述了当前环境下创建数字化资源库对推进教学模式和学习形态变革的必要性。创建数字化资源库符合信息时代教育网络化、数字化、智能化的要求,有助于改进教学效果和提升学习体验,有助于推动网络共享课程建设,有助于实现兄弟院校资源共享和学习型社会建设,具有一定的社会效益。

PO-0041

改良 Mini-CEX 在医学检验专业硕士研究生教学中的应用探索*

任美英、王翠峰
内蒙古科技大学包头医学院第一附属医院

目的 探讨改良迷你临床演练评估（Mini-CEX）在医学检验专业硕士研究生教学中的应用价值。
方法 将医学检验专业 2018~2020 级硕士研究生共 18 名作为研究对象，分别在检验科 5 个亚专业组（临检组、细胞组、微生物组、生免组，急诊检验组）轮转实习，分三轮进行，每轮 6 名学生，随机分为实验组和对照组，每组各 9 名。对照组遵循传统的带教模式；实验组在传统教学的基础上，实施 Mini-CEX 教学。 具体的研究**方法** 1.师资培训 2.操作流程，包括：时间预约、地点选择、学生准备、学生操作、当场评分、及时反馈 3.测评指标，采用医学检验科自制的评分表。4.评分标准，Mini-CEX 评估量表采用 9 分制评分。所有学生完成实习后，参加统一的理论和操作技能考评。
结果 在轮转结束时，两组学员的 Mini-CEX 考核成绩中实验组成绩（ 包括标本接收与处理、标本检测、检验结果审核与报告、标本保存与废弃物处理、临床思维、医患沟通、整体表现 7 个方面） 均优于对照组，差异具有统计学意义（ $P<0.05$）；两组学生轮转结束后的出科考核包括理论知识和操作技能考核。两组的理论知识考核成绩，差异无统计学意义（ $P> 0.05$）；而实验组的出科操作技能考核成绩高于对照组，差异具有统计学意义（ $P< 0.05$）。
结论 将改良 Mini-CEX 应用于医学检验专业硕士研究生的轮转考核中，能够更加全面客观地评价学生在临床实习中的表现，逐步建立一套具有临床检验专业特点的研究生综合实践能力评价体系，其信度和效度均优于传统的评估方法，有效提高我科临床教学质量，值得在医学检验带教硕士研究生教学活动中推广应用。

PO-0042

临床检验诊断学专业硕士研究生住院医师规范化培训的带教体会

张静[1,2]、李芳[1,2]、马雯[1,2]、樊瑞军[1,2]、朴文花[1,2]
1. 宁夏回族自治区人民医院
2. 西北民族大学第一临床医院

作为西北民族大学第一临床学院，本院开展临床检验诊断学硕士研究生住院医师规范化培训九年，在培训的过程中发现学员对培训目标定位不明确、师资带教水平参差不齐，缺乏临床思维的培养、与住院医师规范化培训共用的培训大纲落实不到位、教学模式单一、与导师和带教老师沟通的主动性欠佳等问题。通过归纳总结带教中的一些体会，医院建立了住院医师规范化培训导师、带教老师遴选制度，季度、年度考核制度、出科汇报、导师谈话制度。结合执业医师资格通过情况优化培训轮转的模式。各专业组制定分层递进的培训计划，保证每个阶段的学习内容和深度逐层有所提

高。尝试将案例教学法引入临床检验诊断学专业硕士研究生教育，让学员自己动手动脑寻找病例的蛛丝马迹，加强师生之间的互动，提升团队精神和合作意识，不断提高检验诊断学专业的培训能力，提高学员分析、解决问题的能力，为检验医学高层次临床应用型人才队伍培养出优秀的检验医师。

PO-0043

牢固课堂教学主阵地，打造来华留学生实验诊断学“金课”

张洁心、王芳
江苏省人民医院（南京医科大学第一附属医院）

目的 根据 2019 年教育部发布《关于深化本科教育教学改革全面提高人才培养质量的意见》的内容和要求，以坚持立德树人，围绕学生忙起来、教师强起来、管理严起来、效果实起来的目标为导向，我校医学检验学系在来华留学生实验诊断学课程三年改革的基础上继续探索，旨在突出来华留学生教学特色，深化课堂教学质量标准建设与评估，同时加强师资培训以提高教师综合素质。
方法 我们将改革前后共十年间留学生课堂表现、课后作业、实验操作及笔试成绩分别计算制表，以调查问卷方式获得学生反馈信息，运用统计学方法进行量化分析。
结果 近三年来留学生绩点与改革前、改革开始前两年相比有显著差异，综合成绩显著提高，尤其是实验操作部分。多数学生反馈在小班教学中实验操作能够从零快速提高到熟练，结合带课教师的逐步讲解、一对一实练和小组讨论，能够更好掌握理论知识，完善作业。
结论 在来华留学生实验诊断学的教改过程中，应增强先进教学理念、技术与实验课堂教学的密切联系，逐步达成“金”益求精、与时俱进的“金课”建设目标，实现知行合一，学以致用。

PO-0044

临床寄生虫学检验实现“浇花浇根、育人育心” 的探索与实践

丁淑琴、张玮、张爱君
宁夏医科大学

目的 牢固树立“立德树人”理念,坚决贯彻“浇花浇根、育人育心”。在临床寄生虫学检验专业知识传授中，秉承专业知识与价值引领相结合的基本原则，以“德”为中心，引导学生树立正确的人生观、世界观和价值观，继承和发扬传统中国文化，关注公众健康，提高职业认同感，培养良好的社会责任意识。
方法 秉承“课程承载思政”和“思政寓于课程”的理念，充分发挥课堂教学的主渠道作用，将医学检验技术专业在我国发展的历程、学校学科的成长积淀、以及伴随国家的发展壮大本专业同步建设过程等各类丰富详实、激动澎湃的教学资源等融入课程教学中，把国家成长发展中所积累的传统文化精髓、名人壮士的传奇跌宕爱国情怀融入课程教学中，把为国为民为科技进步所奉献终身的仁人志士的一生学习及教育理念等融入课程教学中，润物细无声地浇灌育人。开展专题演讲、作业评比、寄生虫形态绘图比赛、寄生虫知识科普宣传手册制作等丰富多彩的第二课堂活动提升学生的职业认同感及职业素养。
结果 学生的学习态度明显改观、学习目的更加明确，学习兴趣更加浓厚，学习成绩大大提高。大部分学生对融入专业的思政育人要素表现了极大热情和关注。教师在良好的课程氛围中教学更富有激情。通过课程中出现的思政案例潜移默化地教育学生爱党爱国、敬业守信、勇于创新，同时专业课程的理解和认知得到了升华。
结论 通过将思政课程与临床寄生虫学检验专业教学进行有机结合，把学生价值观培育和塑造的重任以“基因嵌入式”教学模式融入临床寄生虫学检验专业课程，使学生在丰富多彩、有血有肉的感性实例中步入理性认识的殿堂，在“润物细无声”的知识学习中实现理想信念层面的精神指引。

PO-0045

新型冠状病毒肺炎疫情背景下检验科实习生带教思考

王馨、李卓、何天娇
西安医学院第一附属医院

在新型冠状病毒肺炎（COVID-19）疫情“全球大流行”的背景下，随着现阶段复工复产复学逐步推进、疫情境外输入压力不断增大以及无症状感染者频频出现，对我国当前 COVID-19 疫情的防控和检测工作提出了新的挑战。在 COVID-19 的诊疗中，因对病原体的传染途径和致病力尚未完全明确，作为近距离接触病原体样本的实验室一线工作人员，存在较大的感染风险，因而检验科实习学生的心理状况、生物安全以及工作质量也是此次疫情防控工作中各教学医院的重要关注点。本文旨在从疫情中暴露出不足的方面（医德教育、安全防护、质量管理等）进行探讨，促进实习生的综合分析能力和临床批判性思维的形成，为培养合格的医学检验专业人才提供参考。

PO-0046

临床检验渗透人文教育实践的探索

王睿霞
哈尔滨医科大学附属第一医院

目的 当前医学检验的迅猛发展，检验设备的仪器化、自动化，人文意识逐渐淡化，医护人员与检验者之间相互信任度不够，故加强检验技术人员的人文教育非常重要。
方法 尝试在医学检验专业课程临床基础检验技术教学中进行专业教育与人文精神相结合的教学改革尝试，对提升检验医学专业人员职业认同感的价值的作用。**结论** 探索既能促进培养提高独立思考问题的能力，又能开拓视野、拓展知识的方法，了解本学科领域的新进展、新动态，将知识进行整合。网络平台可方便群聊讨论或私聊沟通，帮助学生逐渐树立自信心，并且鼓励学生提出批判性的创新性观点。课内与课外结合、理论与实践结合、素质与技能结合的“三结合” 模式，可进一步加强专业与人文教育的融合与并行，体现了科学与人文的紧密结合，使人文教育不受时间、场所和空间的限制，从而达到事半功倍的效果。
结果 作为检验技术工作者，虽然更多是面对自动化仪器操作，接触人体各种标本，很少与人直接交涉，但却关系到患者的重要疾病信息，所以加强人文素养，对每一份标本负责，对每一个生命负责尤为重要。在医学检验专业课程教学中全程贯穿 人文素质教育，通过转变思想认识、学会换位思考、拓宽交流渠道、提升实战能力等方式，使专业与人文精神相互融合、相互渗透，学生的职业素养及工作能力明显有所提高。通过问卷调查和座谈讨论，学生自我评价较好。教学改革是一个需要长期坚持和不断改进的过程，故需要进一步探索，以期更好地为临床、为社会服务，培养出具有服务意识、法律意识、竞争意识、创新意识的新型医学检验人才。

PO-0047

医学检验技术线上实习的实践及思考

聂鑫、贾成瑶、付阳、罗俐梅、唐思诗、周燕虹、陈春霞、谢轶
四川大学华西医院

目的 通过问卷调查对新冠疫情期间医学检验技术线上实习进行分析并结合线下实习教学的经验，探索出医学检验“线下”+“线上”交互式实习教学模式，让线下、线上实习相互取长补短，进一步发展和完善医学检验实习教学。

方法 采用问卷星对医学检验技术师生进行网络调查分析，对实习同学进行线下、线上实习满意度调查，对带教老师进行线下、线上实习教学评估，同时请所有研究研究对象分别对线下和线上实习进行优缺点评价并对改进实习教学提出建议。
结果 学生线上、线下实习总体满意度评分分别为 95.84±1.81 分和 97.24±1.74 分，差异无统计学意义。相较线下实习教学，大多数带教老师认为线上实习教学的带教前准备更复杂耗时、带教中的讲授更困难且更不能达到预期效果。带教老师认为，在线教学软件的学习与在线教学视频的录制是带教前准备中最复杂和最花费时间的环节，实景演示和引导互动是线上实习讲授中面临的最大困难，线下实习不能被线上实习完全取代。被调查师生认为线上、线下实习各有优缺点，应将两者结合，取长补短。
结论 以线下实习为主体，在线下实习前、中、后分别增加不同内容与形式线上教学的交互式实习教学模式能给广大医学检验教育工作者提供一种新的实习教学思路与方法，可提高医学检验实习教学效率与质量，为探索实习教学新模式、培养新时代医学检验人才贡献力量。

PO-0048

加强医学检验专业学生临床思维培养提高临床诊断能力教学模式的探讨

赵欣、龙军
南方医科大学珠江医院

目的在于结合目前医学检验专业学生培养现状来探讨医学检验专业学生如何加强临床思维的培养。临床思维培养对检验人员至关重要，但是目前医学检验专业学生培养存在着不重视临床思维培养，检验与临床脱节的现象，希望通过本院检验临床教学模式的改革与探讨，提出几点建议希望能有所改善此现象。

近年来，随着现代医学的飞速发展，检验医学在临床诊疗工作中的作用越 来越重要。作为未来检验工作的直接参与者，医学检验专业学生仅仅掌握检验 相关知识，认为为临床提供准确数据为最终目标是远远不够的，还应该具备良 好的临床思维能力，能够快速准确地将实验数据转化成临床信息，并能有效且 合理地应用这些数据，充分发挥医学检验的导向作用。为了更好地服务于临床， 更大程度上辅助临床诊疗工作，加强医学检验专业学生临床思维的培养势在必 行。然而就目前医学检验专业学生培养现状来说，普遍存在着不重视临床思维 培养的现象。因此，本文旨在探讨如何加强医学检验专业学生临床思维能力的 培养。

PO-0049

The utility of competency-oriented clinical laboratory teaching combined with case-based learning (CBL)

Jingfang Sun、hongchun li、shuang ding、yi guo、ping ma
Affiliated Hospital of Xuzhou Medical University

Background This study aimed to evaluate the benefit and efficiency of competency-oriented clinical laboratory teaching combined with case-based learning (CBL), to improve the examination of students' competence of laboratory medicine.
Methods On their voluntary basis of students, a total of 107 medical laboratory medicine interns at the Affiliated Hospital of Xuzhou Medical University from June 2017 to July 2019 were assigned into a control group with training of the traditional teacher-centered method, and an experimental group under a CBL teaching program. Student theory tests and skill assessment were designed to evaluate what the students gained from their internship when they completed their studies at the Affiliated Hospital of Xuzhou Medical University.

Results Compared to students in control group with traditional method, those in CBL teaching program had significantly higher theory test scores and skill assessment scores in average, especially in identification and processing of instrument alarm information, analysis of test results, identification and solution of the problem, as well as identification and reporting of the critical value and clinical communication.
Conclusion The competency-oriented teaching method combined with CBL is effective in improving students' professional knowledge, interpersonal relationship, language expression and teamwork, which is worthy of being carried out in laboratory medicine teaching.

PO-0050

关于医学专业"大创计划"参与度调查及近六年大创项目分析

王霞、张玫
四川大学华西医院

目的 为提高医学类大学生创新创业型人才的建设质量，以"大创计划"为出发点，从大学生参与情况及近年来获奖项目详情两个角度进行深入分析，为创新创业型人才的建设提供可靠的数据支持。
方法 结合文献及学生访谈对问卷进行设计，采用"问卷星"进行线上匿名问卷调查大学生"大创计划"的参与情况并对 2015 年至 2020 年我校国家级和省级"大创项目"的项目学院、项目类型、项目类别、项目级别进行统计描述，卡方检验进行不同专业组间的比较，SPSSAU. (Version 20.0)对数据进行统计分析及可视化。
结果 医学类大学生参与度明显高于非医学类大学生，"大创计划"中兴趣度最高的项目类型是"创新训练类项目"，未参与"大创计划"的主要原因是"不知道参加途径"。2015 年至 2020 年我校 6 个医学类学院申请的国家级和省级"大创项目"占比最高的项目类型是"创新项目类"，项目类别占比最高的是"科学探索类"。
结论 目前我校医学类大学生"大创计划"参与度尚可，对于未参与"大创计划"的大学生需要提供更多的参与机会和多样化结题标准；医学类大学生对创业型项目的兴趣度有待提高，项目类别上"科学探索类"热度最高。

PO-0051

新冠疫情影响下多元化模式教学方案在线上教学中应用的探索 ——以《临床血液学》为例

金咏梅、蒋能刚、廖红艳、粟军、郑沁
四川大学华西医院

目的 始于 2020 年初的一场惊世新型冠状病毒肺炎席卷全球，人类正面临着一个包括生存、生产以及生活的全方位的大挑战。在新冠肺炎疫情防控的特殊时期，教育部发文要求全国高校"停课不停教"、"停课不停学"，充分利用现有资源积极开展线上教学。
方法 以《临床血液学》为例，组织师生建立 qq 聊天群及微信群，线上教学期间 qq 群主打，利用各种群功能，如打卡、作业星等，课前发放相关课程的彩色图谱（来源于 2012 版 WHO 白血病与淋巴组织相关疾病分册）及生动形象的幻灯片讲解视频，高效利用慕课资源，建立语音聊天室，实时语音答疑交流，翻转课堂教学。微信群以备不时之需（网络拥堵时）。分小组进行多人协作病案讨论，基于维普在线专业考核进行期末实验及理论双考试。
结果 学生及教师对本学期该课程满意度较高，教学效果评估优秀。
结论 若是能实施显微镜实时投影，并增加骨髓片全片扫描上传到网络，由学生在 PC 端自主学习并进行分类计数，完成骨髓形态学报告，将会更大程度提高学生的学习积极性，进一步提升《临床血液学》的教学质量。

PO-0052

新型冠状病毒疫情下如何加快培养和提升中医检验人员科研能力的思考

刘佳[1]、孙鲁英[1]、陶庆春[2]
1. 北京中医药大学房山医院
2. 北京中医药大学第三附属医院

目的 全球新型冠状病毒引起的肺炎确诊病例超过 1 亿 1662 万例、死亡病例超过 259 万例，已有 21 个国家确诊病例超过 100 万例。新型冠状病毒(下文简称"新冠")疫情流行传播速度快，世界性范围广，造成危害极大。疫情下，中西医特色治疗鲜明、新冠疫苗副作用小、检测试剂盒创新等均取得阶段性胜利，并获得国内外肯定和赞誉。医学检验技术涵盖生化检验、微生物检验、免疫学检验等，为临床诊断和治疗提供较多的便利，更具有科研前瞻性优势。PCR 快速核酸检测、观察中西医药物联合治疗新冠患者疗效的检验指标变化、新冠患者检验指标在中医证型鉴别等研究方向与检验科研工作有密切联系。本文作者 2020 年 2 月支援区级收治新冠病人定点医院检验科 28 天，对中医检验人员参与新冠科研工作有一定亲身经历，阐述加快培养和提升科研能力的几点思考。
方法 采用问卷星 APP 制作和开展中医检验人员新冠疫情下从事研究现状调查，共收集六所三甲中医院检验人员有效问卷 175 份，总结科研能力停滞不足的四个因素，并提出应对措施。
结果 中医与检验相关的继续教育学习机会较少、科研投入时间与岗位工作有冲突、科研难于得到专业指导或领导支持及个人主观意识缺乏科研创新精神等造成新冠疫情下检验人员科研能力不足。
结论 提出鼓励检验人员积极参加科研能力提升班或西学中课程学习、成立多专业协作的科研团队定期交流和搜集研究热点、有条件实验室设立科研岗位加大补贴和技术支持、加强中医检验的科研思维培养，可以起到提升科研能力作用。

PO-0053

房水、玻璃体液白介素-6 和白介素-10 水平在眼内淋巴瘤中的诊断价值

陈锟[1,2]、李向宇[1,2]、王庆平[1]、陈波斌[1]、关明[1]
1. 复旦大学附属华山医院
2. 复旦大学附属华山医院北院

目的 眼内淋巴瘤（VRL）是一种罕见的眼部恶性肿瘤。分析玻璃体液、房水中白介素 10（IL-10）、IL-10/白介素 6（IL-6）比值和眼内淋巴瘤诊断的白细胞介素评分（ISOLD）水平对玻璃体视网膜淋巴瘤的诊断价值。
方法 回顾性分析 2018 年-2020 年 38 例可疑 VRL 行玻璃体切除术的临床资料。采用流式细胞微球阵列术（CBA）检测玻璃体及房水中 IL-6、IL-10 细胞因子水平，比较分析最终诊断为 VRL 和非 VRL 的患者玻璃体、房水中 IL-10、IL-10/IL-6 比值和 ISOLD 水平差异及诊断效能。
结果 38 例可疑 VRL 玻璃体、22 例房水 IL-6、IL-10 及 IL-10/IL-6 比值与 40 例玻璃体、15 例房水标本的非 VRL 有显著统计学差异（$p<0.001$）；两组患者房水与玻璃体之间 IL-10、IL-6 水平无显著统计学差异($p>0.05$)； IL-10 水平与玻璃体细胞数呈正相关（$r=0.581$，$p<0.01$）；玻璃体液 IL-10、IL-10/IL-6 比值及 ISOLD 在诊断 VRL 的 ROC 曲线下面积（AUC）分别是 93.5%、93.6%和 93.8%；房水中 IL-10、IL-10/IL-6 比值及 ISOLD 在诊断 VRL 的 ROC 曲线下面积分别是 82.9%、72.1%和 84.8%。IL-6 水平异常升高的 VRL 患者有严重的视网膜下色素上皮剥离表现。
结论 检测玻璃体液 IL-10、IL-10/IL-6 比值及 ISOLD 评分对诊断 VRL 具有较高的敏感性和特异性，房水较之玻璃体标本易获取、稳定性好、操作风险小，使用房水进行诊断效能评价与玻璃体液相当，两组房水细胞因子水平与玻璃体液无明显统计学差异。虽然 IL-10 水平升高与 VRL 相关，但 IL-10、

IL-10/IL-6 比值及 ISOLD 评分低于 Cutoff 值并不能完全排除 VRL。因此无临床表现房水 IL-10 升高可能预示 VRL 的复发，一旦明确诊断 VRL，房水 IL-10 可以作为随访监测和治疗评估。特别是使用 ISOLD 评分具有较高的敏感性和特异性。

PO-0054

TLR4 通路的活化诱导 CD11b+髓系细胞增殖促进 HBV 清除

王琴、张浩、张云云、周强
安徽医科大学第二附属医院

目的 有效的免疫应答在清除乙肝病毒（HBV）感染中发挥关键作用。然而天然免疫应答在病毒清除过程中发挥的具体作用仍不十分清楚。本研究旨在探讨 LPS 刺激 TLR4 通路活化后对天然免疫细胞 CD11b+髓系细胞增殖分化的影响，及其对病毒清除的作用。
方法 采用高压水尾静脉注射 HBV 质粒的方法，在 C57BL/6 小鼠体内建立 HBV 复制模型，给予小鼠腹腔注射 TLR4 配体 LPS，观察小鼠病毒血症变化的情况，分离小鼠肝脾内免疫细胞，流式分析肝脾内 CD11b+髓系细胞增殖及其分化情况。分析 LPS 活化 TLR4 通路后天然免疫细胞 CD11b+髓系细胞的变化及其在 HBV 感染过程中对病毒清除的作用。
结果 给予小鼠 LPS 刺激 TLR4 通路活化诱导小鼠肝脏和脾脏内 CD11b+髓系细胞增殖分化为中性粒细胞和炎症性单核巨噬细胞，其中肝脏内单核巨噬细胞表面 F4/80 蛋白的表达水平低于对照小鼠，表明 LPS 刺激后小鼠肝脏内促进免疫耐受的 Kupffer 细胞减少，促进 HBV 感染病毒的清除。
结论 TLR4 通路活化后诱导 CD11b+髓系细胞增殖分化为炎症性天然免疫细胞中性粒细胞和单核巨噬细胞，并且肝内免疫耐受细胞 Kupffer 细胞减少，促进 HBV 感染过程中病毒的清除

PO-0055

抗 PAD2 和抗 PAD4 自身抗体对类风湿关节炎的临床应用价值研究

詹明华、刘昱东
北京大学人民医院

目的 评估中国 RA 人群中抗 PAD2 抗体和抗 PAD4 抗体与 RA 的相关性及对 RA 并发 ILD 风险的临床预测应用价值。
方法 本研究共入选 227 名受试者，其中包括 148 名 RA 患者，35 名非 RA 关节炎患者（疾病对照，DCs）和 44 名健康对照（HCs）。通过 ELISA 确定血清抗 PAD2 抗体和抗 PAD4 抗体水平。
结果 抗 PAD2 抗体分别存在于 26.4％的 RA、5.7％的 DC 和 4.5％的 HC 患者中。RA、DC 和 HC 患者中抗 PAD4 抗体的阳性率分别为 20.9％，5.7％和 2.3％。与抗 PAD4 抗体阴性的 RA 患者相比，抗 PAD4 抗体阳性的 RA 患者病程更长、肺间质性疾病（ILD）发生率更高（p=0.002）。在 RA 患者中，抗 PAD4 抗体与 ILD 之间存在显著正相关（OR=3.521，p=0.002），而加入抗 PAD2 抗体的检测后（即抗 PAD2 抗体阴性且抗 PAD4 抗体阳性的患者）可以进一步将 OR 提升到 5.429。在血清阳性的 RA 中，抗 PAD4 抗体与 ILD 表现出较弱的相关性（OR=2.324，p=0.046），而联合应用抗 PAD2 抗体和抗 PAD4 抗体，可以显著提高抗 PAD4 抗体对于 ILD 的临床预测价值（OR=4.059，p=0.007）。
结论 本研究探讨了抗 PAD2 抗体和抗 PAD4 抗体与 RA 的相关性，发现抗 PAD2 抗体和抗 PAD4 抗体的联合检测有助于识别具有 RA-ILD 风险的患者。抗 PAD2 抗体和抗 PAD4 抗体的检测可以作为现有 RA 血清学标志物的重要补充。

PO-0056

Tp0136 targets fibronectin (RGD)/Integrin β1 interactions promoting human microvascular endothelial cell migration

tianci yang
Center of Clinical Laboratory, Zhongshan Hospital, School of Medical, Xiamen University, Xiamen, China,

In this research, we purposed to analyze the role of Tp0136 in the migration of human microvascular endothelial (HMEC-1) cells and to explore the related mechanism.

First, Tp0136 significantly promoted HMEC-1 cell migration. Furthermore, the levels of C–C motif ligand 2 (CCL2) mRNA and protein expression rose with the concentration and time increasing of Tp0136. The migration of HMEC-1 cells was significantly suppressed by an anti-CCL2 antibody and a CCR2 (the CCL2 receptor) inhibitor. Additionally, after pretreatment with an anti-fibronectin antibody, an anti-integrin β1 antibody or RGD, the migration of HMEC-1 cells treated with Tp0136 was obviously suppressed. These results show that Tp0136 promots the migration of HMEC-1 cells by inducing CCL2 expression via the interaction of the fibronectin RGD domain with integrin β1 and the CCL2/CCR2 signaling pathway, and these interactions may contribute to the mechanisms that increase the capacity for self-healing syphilis infection.

PO-0057

基于 SLE 家系高通量芯片检测自身抗体对 SLE 诊断价值初探

张苹
四川大学华西医院

目的 通过自身抗体检测芯片对系统性红斑狼疮（Systemic lupus erythematosus，SLE）三个不同家系的样本进行检测，探讨不同 SLE 家系自身抗体反应的差异，寻找针对不同遗传背景家系患者的自身抗体检测模型。

方法 纳入四川大学华西医院确诊的 7 例 SLE 患者（来自 3 个 SLE 家系）、健康对照 4 例作为研究对象，采用包被有 120 种自身抗原的 OmicsArrayTM 自身抗体检测芯片进行检测，并将结果绘制热图。使用 SPSS25.0 软件进行统计学处理，定量资料数据符合正态分布，采用`x±s 表示，数据不符合正态分布时采用中位数与四分位数表示，定性资料用例数表示。两组间比较，若数据符合正态分布且方差齐，使用两独立样本 t 检验，否则采用 Wilcoxon 秩和检验，多组间比较采用 Kruskal-Wallis H 秩和检验，两两比较采用 Dunnett-t 检验。当 P＜0.05 时，认为差异具有统计学意义。

结果 热图显示，SLE 病例组 120 种自身抗体表达水平总体较对照组上调。SLE 家系 1、2、3 分别与对照组分析，筛选出包括抗 dsDNA 抗体、抗 ssDNA 抗体、抗染色体 DNA 抗体、抗胶原 VI 抗体 4 种自身抗体在 SLE 患者显著升高（P＜0.05），将 3 个 SLE 家系病例汇总为一组（SLE 家系 1+2+3）与对照组进行分析，得到抗 dsDNA 抗体、抗 ssDNA 抗体、抗染色体 DNA 抗体、抗胶原 VI 抗体、抗硫酸软骨素 C 抗体、抗 GP210 抗体、抗 U1-snRNP 68/70 抗体、抗 U1-snRNP C 抗体 8 种自身抗体在 SLE 患者显著升高（P＜0.05）。

结论 SLE 家系内表现出自身抗体表达聚集性，而不同家系间表现出不同自身抗体的异质性，且差异性项目随样本量的扩大而增多，可作为辅助 SLE 疾病预防与诊断的方法之一。

PO-0058

SERS-based immunoassay enhanced with silver probe for selective separation and detection of Alzheimer' s disease biomarkers

Shibao Li
The Affiliated Hospital of Xuzhou Medical University

The demand for simple and sensitive detection method is urgent, owing to the key role of Aβ-amyloid and P-Tau-181 in the early diagnosis of Alzheimer's disease (AD). In this study, a novel SERS-based sandwich immunoassay, which consists of tannin-capped silver nanoparticles and magnetic graphene oxide (Fe3O4@GOs), was firstly developed to detect quantitatively serum biomarkers (Aβ-amyloid and P-Tau-181) of AD in standards and to differentiate AD from non-AD dementia patients. The detection linear range of Aβ1-42 and P-Tau-181 standards was observed to range from 100 pg mL-1 to 10 fg mL-1 and 100 pg mL-1 to 1 fg mL-1 respectively. And the concentration of proteins in human serum samples was calculated firstly by regression equation obtained from standards. The results confirmed that even a very small amount of biomarkers in human serum can be caught by the proposed SERS-based immune method. We finally explored the clinical application of this method in 63 serum samples. As a result, the P-tau-181 levels differentiated AD from non-AD dementia patients (AUC = 0.770), with a more favored ROC than Aβ1-42 (AUC = 0.383). These findings indicated that this developed SERS-based immunoassay was successfully applied to the determination of Aβ-amyloid and P-Tau-181 in human serum specimens, which provided a promising tool for the early diagnosis of AD.

PO-0059

细胞因子及 PCT 检测在经皮肾镜手术治疗上尿路结石术后脓毒症诊疗中的应用价值

于宝丹、赵晓颖、刘冠炤、林勇平
广州医科大学附属第一医院

目的 尿源性脓毒症是经皮肾镜手术（percutaneous nephrostolitho tomy，PCNL）治疗上尿路结石术后风险最大的并发症之一，其早期诊断、病情评估对降低病死率和改善预后具有重要意义。细胞因子和降钙素原(procalcitonin, PCT)是脓毒症患者常见感染性炎症指标，本文研究了 IL-6、IL-8、IL-10、IL-1β、TNF-α、IFN-γ 及 PCT 在经 PCNL 治疗上尿路结石术后尿源性脓毒症早期诊断、病情评估及预后中的作用。

方法 收集本院 2020 年 4 月至 2021 年 4 月期间收治的经 PCNL 治疗上尿路结石患者 49 例，分为脓毒症组（17 例）、全身性炎症反应综合征（Systemic Inflammatory Response Syndrome, SIRS）组（12 例）和对照组（20 例），检测 3 组患者术前、术后 2 － 4 小时、术后第 2 天、第 4 天、第 7 天血清中 6 种细胞因子 IL-6、IL-8、IL-10、IL-1β、TNF-α、IFN-γ 及 PCT 含量。

结果 术前 3 组患者细胞因子及 PCT 无差异；术后脓毒症组及 SIRS 组 6 种细胞因子升高迅速，术后 2-4 小时各细胞因子最高，其后逐日下降；PCT 上升速度不及细胞因子，脓毒症组及 SIRS 组 PCT 在术后第 2 天达到高峰，其后逐日下降；诊断尿源性脓毒症的 ROC 曲线显示：单因子中 IL-8 的 AUC 最高（0.958），敏感性、特异性分别为 94.1%、87.5%；IL-6 的 AUC 次之（0.954），敏感性、特异性分别为 82.4%、96.6%；单个细胞因子联合 PCT 结果显示，PCT+IL-8 的 AUC 最高（0.971），敏感性、特异性分别为 94.1%，87.5%；PCT+IL-6 的 AUC 次之（0.961），敏感性、特异性分别为（88.2%，96.9%）；相关分析结果显示，脓毒症组术后 2-4h 的 IFN-γ、术后第 2 天 PCT 浓度与 SOFA 评分中度相关；脓毒症组术后第 4 天 IL-6 浓度与 ICU 住院天数高度相关；术后 2-4h 的 IFN-γ、第 2 天、第 7 天的 PCT 浓度与 ICU 住院天数中度相关。

结论 术后 2-4h 的 PCT 联合 IL-8 检测可作为上尿路结石 PCNL 术后尿源性脓毒症较好的早期诊断指标；术后 2-4h IFN-γ、第 2 天的 PCT 和 SOFA 评分相关，可作为病情严重程度评估指标；术后第 4 天 IL-6 浓度对预后的指导意义最大，此外，术后 2-4h IFN-γ、第 2 天及第 7 天 PCT 浓度与对尿源性脓毒症预后评估有一定价值。总之，本研究表明 IL-6、IL-8、IFN-γ 及 PCT 检测对尿源性脓毒症早期诊断、病情评估及预后具有重要价值。

PO-0060

血清特异性抗体对儿童麸质敏感性肠病诊断价值的研究

鄂建飞、赵 铭、杨 浩、詹 璐、郑 茂
德阳市人民医院

目的 通过分析麸质敏感性肠病（GSE）患儿血清特异性抗体 TGA、EMA、DGP 的检出情况，为临床筛查和诊断 GSE 提供依据。
方法 选取 2018 年 1 月至 2020 年 10 月 GSE 患儿 50 例作为 GSE 组，选取同期同年龄段健康儿童 50 例作为对照组，分别进行 TGA、EMA、DGP 检测，并对结果进行分析。
结果 50 例 GSE 患儿主要临床表现为慢性腹痛腹泻（34.0%，17/50）、贫血（28.0%，14/50）、生长发育迟缓（20.0%，10/50）、营养不良（16.0%，8/50）和焦虑抑郁（2.0%，1/50）。GSE 组 TGA-IgA、TGA-IgG、EMA-IgA、EMA-IgG、DGP-IgA、DGP-IgG 阳性率分别为 90.0%、66.0%、92.0%、94.0%、92.0%、96.0%，均显著高于对照组（P<0.01）。在对 GSE 的诊断效能上，DGP-IgG 的 AUC 最高（98.0%），而 TGA-IgG 的 AUC 最低（83.3%），TGA、EMA、DGP 的 IgA 和 IgG 特异性均大于 95.0%，EMA、DGP 的 IgA 和 IgG 敏感性均大于 90.0%，但 TGA-IgG 敏感性较低（66.0%）；DGP-IgG 的 PLR 最高，且 NLR 最低。≤7 岁年龄组 DGP-IgG 诊断效能最好，敏感性、特异性、阳性预期值、阴性预期值均为 100%；>7 岁年龄组 TGA-IgA 诊断效能最好，敏感性、特异性、阳性预期值、阴性预期值均为 96.2%。≤7 岁年龄组 TGA-IgG 敏感性为 45.8%，>7 岁年龄组 TGA-IgG 敏感性为 84.6%，两组相比差异具有统计学意义（P<0.05）；≤7 岁年龄组 TGA-IgA 敏感性为 75.0%，>7 岁年龄组 TGA-IgA 敏感性为 96.2%，两组相比差异具有统计学意义（P<0.05）。
结论 TGA、EMA、DGP 检测是儿童 GSE 筛查和诊断的重要手段，其中以 DGP-IgG 敏感性和特异性最佳，可作为首选筛查抗体；TGA-IgA 和 TGA-IgG 在诊断 GSE 时受年龄影响较大，不建议作为≤7 岁儿童的 GSE 筛查实验。

PO-0061

甲胎蛋白异质体比率联合异常凝血酶原诊断原发性肝癌的相关性研究

谈艳芳、刘利洪、袁成良
德阳市人民医院

目的 检测原发性肝癌患者血清中的甲胎蛋白（AFP）、甲胎蛋白异质体(AFP-L3)与甲胎蛋白的比率，以及异常凝血酶原(PIVKA-Ⅱ)，通过分析并探讨各项指标及联合运用三项指标在原发性肝癌中的诊断价值。
方法 收集 2019 年 4 月—2020 年 4 月原发性肝癌患者 50 例，良性肝病组患者 50 例（包括急慢性肝病，肝硬化、继发性肝癌等）。采用 Centaur XP 全自动化学发光免疫分析仪、亲和吸附离心和 LUMIPULSEG1200 全自动免疫分析仪分别检测 AFP、AFP-L3、PIVKA-II 水平。

结果 原发性肝癌组血清 AFP、AFP-L3/AFP、PIVKA-II 的表达水平明显高于良性肝病组（P<0.05）。血清 AFP 诊断原发行肝癌的敏感性为 64%，特异性为 58%，；AFP-L3/AFP 敏感性为 84%，特异性为 90%，PIVKA-II 敏感性为 76%，特异性为 84%，采用 AFP+AFP-L3/AFP+PIVKA-II 三者联合诊断的敏感性为 94%，特异性为 78%。原发性肝癌的工作特征（ROC）曲线显示 AFP、AFP-L3/AFP、PIVKA-II、AFP+AFP-L3/AFP+PIVKA-II 分别为 0.581，0.843，0.770，0.905。

结论 三种指标联合检测原发性肝癌的敏感度和特异性都优于各项指标单独检测，可为原发性肝癌的早期诊断奠定坚实的基础。

PO-0062

LncRNA GAS5 promotes autophagy process and antimicrobial responses via miR-221-3p/ATG12 axis during mycobacterial infection

Zikun Huang 、Yongqin Guo、Peng Fu、Qing Luo、Junming Li
The First Affiliated Hospital of Nanchang University

Objectives Autophagy plays a key role in activating the antimicrobial host defense against Mycobacterium tuberculosis (Mtb). The emerging roles of long non-coding RNAs (lncRNAs) in regulating host antimicrobial responses against Mtb have gained widespread attention. However, the process by which lncRNAs specifically influence antibacterial autophagy during mycobacterial infection is largely uncharacterized.
Methods The present study assessed lncRNA GAS5 for antimicrobial immune functions and defined mechanisms wherein lncRNA GAS5 regulates Mtb growth, autophagy and microRNA in macrophages.
Results The Mtb infection leads to downregulation of lncRNA GAS5 in a time- and dose-dependent manner and concomitant downregulation of ATG12 in THP-1 macrophages. Overexpression of lncRNA GAS5 dramatically promoted Mtb-induced activation of autophagy in human THP-1 macrophages, whereas inhibitors of lncRNA GAS5 remarkably inhibited Mtb-induced autophagy. Mechanistically, lncRNA GAS5 targets an inhibiting element miR-221-3p, as shown by bioinformatics, dual-luciferase reporter gene analysis and pull-down assay, respectively. Notably, miR-221-3p inhibited autophagy via suppressing autophagy protein ATG12 by binding to its 3'-UTR in Mtb-infected macrophages and thus promoting intracellular Mtb growth. Concurrently, lncRNA GAS5 enhanced autophagy in Mtb-infected macrophages by blocking the ability of miR-221-3p to inhibit ATG12.
Conclusion These data indicate that lncRNA GAS5 regulates the innate host defense by promoting the activation of autophagy and antimicrobial effects against Mtb via the miR-221-3p/ATG12 axis.

PO-0063

外周血 CD3+CD4-CD8-双阴性 T 淋巴细胞在复发性流产患者中的表达及意义

张吟眉、吴宇鑫、郑佳佳
北京大学第三医院

目的 分析复发性流产（RSA）患者外周血淋巴细胞亚群以及双阴性 T 淋巴细胞（DNT）水平, 并探讨 DNT 在 RSA 发病中的意义。

方法 选取 2018~2019 年北京大学第三医院有 RSA 病史的非妊娠患者 106 例以及健康非妊娠对照者 50 例。采用流式细胞术分析 RSA 患者及对照组外周血淋巴细胞亚群以及 DNT 细胞的表达，比较 RSA 与对照组淋巴细胞亚群及 DNT 细胞比例差异, 以及 RSA 患者中抗核抗体（ANA）和阴性组 DNT 比例差异。
结果 RSA 患者与健康对照组相比，CD3+ CD8+T 细胞以及 DNT 细胞显著高于对照组（P=0.006，P<0.001）。在 RSA 患者中，ANA 阳性患者 DNT 水平高于 ANA 阴性患者(P<0.05)；此外，RSA 患者中抗磷脂抗体阳性患者 NK 比例高于与阴性患者(P<0.05)，但 DNT 比例无明显差异，DNT 水平与抗磷脂抗体水平无相关。
结论 RSA 患者的 DNT 水平较正常对照组显著升高，可对 RSA 发生提供一定预测价值

PO-0064

Combining Calcitonin and Procalcitonin and Rheumatoid Arthritis-related Biomarkers Improve Diagnostic Outcomes in Early Rheumatoid Arthritis

Yingwen Liu[1]、Jing Shi[2]、Bo Wang[3]、Lijing Zhou[3]、Xiaolan Zhou[3]、Yane Du[3]、Dandan Li[3]、Liang Duan[3]、Qin Hu[3]、Weixian Chen[3]、Pu Li[3]
1. Department of Laboratory Medicine, Peoples Hospital of Deyang City
2. Department of Laboratory Medicine, the First Hospital of Chongqing Medical University
3. The Second Hospital of Chongqing Medical University

Objective To demonstrate whether procalcitonin (PCT) combined with calcitonin (CT) could provide additional diagnostic value to other clinically available rheumatoid arthritis (RA)-related biomarkers in the early diagnosis of RA.
Method The blood samples aseptically collected by venipuncture were centrifuged within 1 hour and frozen at -80°C. PCT and CT levels were measured using electrochemiluminescence immunoassay (ECLIA) in 260 subjects (48 patients with early RA, 34 patients with established RA, 37 patients with systemic lupus erythematosus, 30 with osteoarthritis, 31 with gouty arthritis, and 80 healthy participants). Anti-cyclic citrullinated peptide (Anti-CCP) and anti-RA33 antibodies (Anti-RA33) were analyzed by ELISA. RF was detected by transmission immunoturbidimetry. Mann-Whitney U tests and Kruskal-Wallis tests compared differences among groups. Spearman's rank correlation analysis determined the relationship between biomarkers. Receiver-operator characteristic (ROC) curves were generated and diagnostic performance was assessed by area under the curve (AUC), as well as specificity, sensitivity, likelihood ratios (LR).
Results Median serum PCT concentrations were significantly higher ($p < 0.0001$) in patients with early RA (0.065 ng/ml) when compared with healthy controls (0.024 ng/ml), and patients with osteoarthritis (0.025 ng/ml). When compared with gouty arthritis (GA) controls (0.072 ng/ml) and systemic lupus erythematosus (SLE) controls (0.093 ng/ml), median serum PCT concentrations were not significant in patients with early RA (0.065 ng/ml). Median serum CT concentrations were significantly lower ($P < 0.0001$) in patients with early RA (0.880 pg/ml) compared with healthy controls (3.159 pg/ml), patients with SLE (2.480 pg/ml), patients with GA (2.550 pg/ml). When compared with osteoarthritis controls (0.586 pg/ml), median serum CT concentrations were not significant in patients with early RA (0.880 pg/ml). ROC curve analysis comparing early RA with healthy controls demonstrated that the AUC of RF, anti-CCP and anti-RA33 were 0.66, 0.73 and 0.64, respectively, the additions of PCT and CT further improved the diagnostic ability of early RA with the AUC of 0.97, 0.98 and 0.97, respectively ($p < 0.01$). The sensitivities of RF, anti-CCP and anti-RA33 for early RA were 33.33%, 44.74% and 58.33%, respectively, and the additions of PCT and CT showed very high sensitivities of 83.33%, 92.11%, 87.50%. The high-value groups of PCT moderately correlated with the anti-RA33 levels ($r = 0.417$, $P < 0.05$). CT had no significant correlation with disease duration, radiographic progression

or clinical/serological variables, such as ESR levels, CRP levels, RF, anti-CCP, anti-RA33 levels in early RA.
Conclusions Serum PCT and CT combined with clinically available RA-related biomarkers could further improve the diagnostic efficiency of early RA.

PO-0065

SARS-CoV-2 灭活疫苗接种后机体免疫系统动态变化的研究

殳洁、盛慧明
上海交通大学医学院附属同仁医院

The severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) pandemic has dramatically expedited global vaccine development efforts. The first vaccine to be used in China is an inactivated SARS-CoV-2 vaccine. Here, we investigated the dynamic changes of the immune system in volunteers upon SARS-CoV-2 inactivated vaccine. We found that total SARS-CoV-2 antibodies and specific neutralizing antibodies both increase upon the inactivated vaccine inoculation (post second dose). Subsequently plasma protein peptide microarray detection of subjects showed high expression of RBD and S protein sequences of IgM and IgG in plasma post second dose vaccination. Furthermore, the expansion of ICOS+CXCR5+ Follicular helper T cell (Tfh) and CD27+CD19+ B cells in PBMC upon the inactivated vaccine inoculation, providing a potential biomarker for testing vaccine efficacy. Overall, although subjects upon the inoculation of inactivated SARS-CoV-2 vaccine have shown a variety of features, including production of neutralizing antibodies and associated immune cells suggests that more research is needed.

PO-0066

血清学标志物检测对酒精性肝病肝脏纤维化程度的诊断价值探讨

车媛媛、黄晶、金宇亭
吉林大学第一医院

目的 探讨血清学肝纤维化检测标志物透明质酸酶、III 型前胶原、IV 型胶原和层粘连蛋白在酒精肝纤维化进程中的诊断价值。
方法 本研究纳入北京解放军 302 医院 88 例临床明确诊断为酒精性肝病的患者，诊断标准全部符合《2018 年美国胃肠病学院酒精性肝病诊治临床指南》。根据其无创肝硬度值（LSM）以及肝穿病理活检分期（S）结果将患者分成酒精性肝纤维化（AHF）、酒精性肝硬化（AC）以及酒精相关性肝癌组（ARHC），对照组选自同期体检中心年龄、性别匹配的健康人群 15 例（HC）。根据 MELD 评分和 CTP 评分/分级标准对全部患者进行疾病严重程度评估。血清透明质酸酶（HA）、III 型前胶原（PIIINP）、IV 型胶原（IV-Col）和层粘连蛋白（LN）浓度检测采用安图生物工程有限公司的化学发光试剂盒。数据分析应用 GraphPad Prism 和 medcalc 软件。
结果 HA、PIIINP 和 IV-Col 在各组患者血清中水平均高于对照组，AHF 与 AC 两组比较 HA 和 LN 差异有统计学意义，AC 与 ARHC 两组比较只有 LN 差异无统计学意义，AHF 与 ARHC 组比较四项差异均具有统计学意义；相关性分析显示：HA、PIIINP、IV-Col 和 LN 与 MELD 评分、CTP 评分和无创肝硬度值正向相关；根据无创肝硬度值及病理分期将患者分成轻度纤维化（LSM<7.7/S<2）和中重度纤维化及硬化（LSM≥7.7/S≥2）组，ROC 分析结果显示：血清 HA、PIIINP、IV-Col 和 LN 的诊断敏感性分别为 0.82、0.62、0.72 和 0.51，特异性分别为 0.56、0.70、0.55 和 0.85，AUC 值分别为 0.709、0.669、0.734 和 0.722；根据无创肝硬度值及病理分期将患者分成轻中度纤维化（LSM≤12.5/S≤3）和重度纤维化及硬化（LSM＞12.5/S＞3）组，ROC 分析结果显示：血清 HA、PIIINP、IV-Col 和 LN 的诊断敏感性分别为 0.67、0.64、0.97 和 0.78，特异性分别为 0.87、0.63、0.37 和 0.63，AUC 值分别为 0.818、0.664、0.680 和 0.754；

结论 传统肝纤维化四项联检在酒精性肝病患者肝脏纤维化严重程度的分级诊断中意义明确，其中血清 HA 在纤维化早期的诊断敏感性优于 PIIINP、IV-Col 和 LN，可能更适用于过度饮酒者肝纤维化早期筛查。

PO-0067

长链非编码 RNA MALAT1、SNHG14 和 HIF1A-AS2 在膀胱尿路上皮癌的表达及意义

高娟、李卓
西安医学院第一附属医院

目的 通过研究 MALAT1、SNHG14 和 HIF1A-AS2 在膀胱尿路上皮癌的表达，探讨其在膀胱尿路上皮癌发生、发展中的作用。
方法 运用免疫组织化学 Envision 法检测 MALAT1、SNHG14 和 HIF1A-AS2 在 143 例膀胱尿路上皮癌和 35 例癌旁正常组织中的表达。
结果 MALAT1、SNHG14 和 HIF1A-AS2 在膀胱尿路上皮癌及癌旁正常组织中的表达分别为 79.7%(114/143)和 22.9%(8/35)、40.6%(58/143)和 17.1%(6/35)、75.5%(108/143)和 20%(7/35)，且差异均具有统计学意义(P＜0.05)。同时，MALAT1、SNHG14 和 HIF1A-AS2 的表达随着肿瘤浸润程度的增加，表达呈上升趋势，浸润性膀胱尿路上皮癌阳性表达显著高于非浸润性尿路上皮癌，差异具有统计学意义（P＜0.05）。且膀胱尿路上皮癌中 MALAT1、SNHG14 及 HIF1A-AS2 的表达均呈正相关。
结论 MALAT1、SNHG14 及 HIF1A-AS2 蛋白在膀胱尿路上皮癌中均有异常表达，并与膀胱尿路上皮癌的分化和浸润程度密切相关，提示 MALAT1、SNHG14 及 HIF1A-AS2 可能参与膀胱尿路上皮癌的发生、发展。

PO-0068

CpG-modified plasmid DNA encoding flagellin inhibits dissemination of Treponema pallidum in C57BL/6 mice

Kang Zheng、liqun peng、qiguo xiao、xi deng
Hengyang Central Hospital

Treponema pallidum (T. pallidum), an obligate extracellular bacterium, is the causative agent of sexually transmitted bacterial diseases. In this study, the CpG motifs cloned into the plasmid DNA backbone encoding the flaB3 gene of T. pallidum were injected intramuscularly into C57BL/6 mice, resulting in higher levels of specific anti-FlaB3 antibodies and FlaB3-specific splenocyte proliferation than those in the mice immunized with pcDNA3/FlaB3. Cytokine (IL-4, IL-6, IL-10, IFN-γ, and TNF-α) analysis of splenocytes showed that the CpG-modified plasmid DNA could slightly trigger the Th1-biased immune response. Furthermore, immunization of mice with pcDNA3/CpG-FlaB3 elicited a significant production of IFN-γ by CD4+ T-cells in the spleen. Subsequently, mice were inoculated intradermally (between the scapulae), intraperitoneally, intrarectally and via the corpora cavernosa with 2.5×106 organisms per site (1×107 total organisms). The bacterial organ burden detected in the blood, spleen, liver, testes or brain of immunized mice suggested that CpG-modified plasmid DNA enhances protective immunity to inhibit T. pallidum colonization in distal tissues. Therefore, CpG-modified plasmid DNA vaccination enhances FlaB3-specific immunogenicity and provides protection against T. pallidum dissemination.

PO-0069

The potential application of serum free light chain in the early diagnosis and and staging of chronic kidney disease

Fan Zhang 、Mianyang Li、Chengbin Wang
Chinese People's Liberation Army General Hospital

Objective Three kinds of serological biomarkers were analyzed in the diagnosis and staging of chronic kidney disease (CKD), including serum free light chain (sFLC), serum creatinine (Scr) and cystatin C (Cys C).
Methods 155 patients with CKD of 5 stages were divided into CKD1 group (2 cases), CKD2 group (10 cases), CKD3 group (22 cases), CKD4 group (43 cases), CKD5 group (78 cases). 64 healthy subjects were selected as normal control group. The sFLC was detected by immunoturbidimetry. Scr and serum Cys C were detected by enzymic method.
Results In CKD1 group, κ-type serum free light chain (κFLC) was significantly different compared with that of normal control group, but the other indicators including λ-type serum free light chain (λFLC), Scr and Cys C were not significantly different compared with that of normal control group. In CKD2 group, κFLC, Scr and Cys C were significantly different compared with that of normal control group, but λFLC was not significantly different compared with that of normal control group. From CKD3 to CKD5 group, κFLC, λFLC, Scr and Cys C were all significantly different compared with that of normal control group.
Conclusion The detection of sFLC, Scr and Cys C play important roles in the early diagnosis and clinical staging of CKD.

PO-0070

Apoptosis inhibitor of macrophage/CD5L：A novel marker for assessing disease activity in rheumatoid arthritis

Xianan Wu
Tangdu Hospital, Airforce Military Medical University

Objective Cytokines are implicated in many of the immune processes that are associated with the pathogenesis of rheumatoid arthritis. Here we investigate the association between Apoptosis inhibitor of macrophage (AIM) and disease activity in patients with rheumatoid arthritis (RA).
Methods In this study, concentrations of serum AIM in 110 RA patients, 38 patients with osteoarthritis (OA) and 50 sex&age- matched control subjects were determined by enzyme-linked immunosorbent assay (ELISA). Meanwhile, we also detected the expression of AIM in the articular fluid of patients with OA and RA.
Results Serum AIM concentrations in RA patients were dramatically higher than those from patients with OA or healthy controls. The levels of synovial fluid AIM displayed a significant increase as compared with OA patients. we also found that circulation of serum AIM was significantly elevated in the RA-associated comorbidities including RA-associated metabolic syndrome (RA-MS) and RA-associated interstitial lung disease (RA-ILD). More importantly, AIM levels was significantly correlated with RA disease activity features such as ESR, CRP and DAS28. The predictive value of AIM on high disease activity was superior to those of CRP and ESR. A noteworthy correlation in our study was observed between the serum AIM levels and laboratory parameters, particularly serum lipids. Furthermore, serum AIM levels could be significantly down-regulated after effective integrative treatment.
Conclusion AIM may be served as a novel sensitive biomarker to assist disease activity assessment and monitor therapeutic effects in active RA patients.

PO-0071

风湿病合并 COVID-19 患者的临床和实验室特征及预后

赵军、夏欣一
中国人民解放军东部战区总医院

目的 COVID-19 患者合并风湿免疫性疾病的特点鲜有报道。风湿病患者由于长期服用免疫抑制的药物导致其自身免疫功能受到抑制，可能会增加其对 COVID-19 的易感性。然而，患者免疫低下的状态可能在 SARS-CoV-2 引起的细胞因子风暴中对机体产生保护性的作用。
方法 在这项回顾性研究中，我们对武汉火神山医院确诊的 3059 例 COVID-19 患者的电子病历进行数据提取，并使用 SPSS(version 25.0)分析临床和实验室特征。
结果 3059 例患者中有 29 例合并风湿免疫性疾病，类风湿关节炎（Rheumatoid arthritis,RA)15 例，系统性红斑狼疮（Systemic lupus erythematosus,SLE)5 例，重叠综合症（Rhupus）1 例，重症肌无力（Myasthenia gravis,MG)2 例，干燥综合征（Sjogren's syndrome,SS)1 例，强直性脊柱炎（Ankylosing spondylitis,AS)1 例，皮肌炎(Dermatomyositis ,DM)1 例，自身免疫性肝病(Autoimmune hepatitis ,AIH)1 例，未分化结缔组织病(Undifferentiated connective tissue disease ,UCTD)2 例。研究人群包括 4 名男性和 25 名女性，平均年龄 61 岁，危重症患者占 3.4%（1/29），重症患者占 58.6%（17/29），轻症患者占 38%(11/29)。临床症状表现为，咳嗽 21 例；乏力 21 例；腹泻 3 例；不同程度呼吸困难 14 例；均有发热。实验室检查结果主要表现为，D-二聚体和 C 反应蛋白的增高以及血红蛋白的降低，与普通人群的检查结果无显著性差异。29 例患者中 28 例治愈出院，1 例患者死亡，死亡病例感染新冠前合并多种基础疾病且多脏器衰竭。
结论 初步研究表明，风湿病患者感染 SARS-CoV-2 的风险较高，但可能不会有发展为危重病程的风险，需要进一步研究以了解这些疾病的免疫学特征。免疫疗法作为一种替代疗法，可能在维持免疫功能、延缓或防止疾病恶化以及进一步减少机械通气的治疗方面发挥作用。（本文部分内容已发表于 Ann Rheum Dis, IF=16.102，Correspondence）

PO-0072

Identification and Verification of Ubiquitin D as a gene associated with HCV-induced HCC

Kai Yang
Department of Clinical Laboratory, First Affiliated Hospital of Kunming Medical University

Introduction Accumulated studies have suggested that hepatitis C virus (HCV) infection is one of the leading causes for hepatocellular carcinoma (HCC). However, the mechanisms underlying the effect of HCV on the occurrence of HCC is still poorly understood.
Methods HCV infection datasets (GSE82177 and GSE17856) and HCC datasets (TCGA-LIHC (The Cancer Genome Atlas Liver Hepatocellular Carcinoma) and GSE89377) were downloaded from Gene Expression Omnibus (GEO) or TCGA for analysis.The common differentially expressed genes (DEGs) in the above four datasets were identified by R software. The expression of Ubiquitin D (UBD) in HCV infected HepG2 cells was detected by RT-qPCR and western blot, respectively.The interaction between NS3 and p53 was detected by Co-Immunoprecipitation. The influence of UBD on the proliferation and migration ability of HepG2 cells was evaluated by CCK-8 and wound healing assay, respectively.
Results UBD was upregulated in both HCV infected samples and HCC samples. HCV NS3 interacted with p53 and inhibited its expression. HCV NS3 induced UBD could promote the proliferation and migration of HepG2 cells.
Conclusion Our results suggest that HCV NS3 induced UBD is positively correlated with the development of HCV-related HCC during HCV infection. Targeting UBD could be a potential strategy for preventing and treating HCV-induced HCC.

PO-0073

SARS-CoV-2 感染期和恢复期患者抗体变化的动力学特征

夏欣一
中国人民解放军东部战区总医院

目的 检测 1,850 例 COVID-19 患者抗 SARS-CoV-2 总抗体 IgM、IgG 水平，与 spike 蛋白(S)-、受体结合结构域(RBD)-和核蛋白(N)特异性抗体 IgM、IgG 水平在入院、住院和出院时的变化，以及病毒脱落与抗体反应的关系，全面阐述不同抗体在 SARS-CoV-2 感染期和恢复期过程中的动态变化。
方法 纳入 2 月 4 日至 3 月 30 日在武汉火神山医院的所有 COVID-19 确诊病例，患者的临床特征和实验室诊断数据均取自医院电子病历。使用化学发光磁酶免疫分析法(MCLIA)在不同时间点连续测定总抗体 IgM 与 IgG 水平，S-、RBD-和 N-特异性抗体 IgM 与 IgG 水平。
结果 （1）抗体动态变化与临床分型有关：与轻/中度患者相比，重症/危重型患者 S-、RBD-和 N-特异性 IgG 晚于 1 周产生，且重症/危重型患者住院期间 S-和 RBD-特异性 IgG 水平高出轻/中度患者 1.5 倍(P=0.005 和 P=0.006)。（2）抗体动态变化与年龄有关：住院期间，老年患者的 RBD 特异性 IgG 水平比年轻患者高 4 倍(P＜0.0001)。（3）抗体动态变化与核酸载量有关：核酸阴性康复患者的 S-和 RBD-特异性 IgG 水平是核酸阳性患者的 2 倍。（4）抗体动态变化与临床指标有关：较低的 S-、RBD-和 N-特异性 IgG 水平与较低的淋巴细胞百分比、较高的中性粒细胞百分比和较长的病毒脱落持续时间显著相关。（5）出院时抗体水平低下的患者在恢复后可能有较高的核酸检测再次阳性的风险，表明抗体水平对 COVID-19 出院患者的预后具有重要价值。
结论 抗体动态变化与临床分型、年龄、病毒载量等密切相关，尤其是 S-，RBD-特异性抗体 IgG 在 COVID-19 患者的病毒清除和康复中发挥了重要作用。部分患者出院后核酸复阳，可能有两个原因：第一，采集鼻咽拭子样本可能会导致假阴性；第二，部分出院患者缺乏足够的抗体，可能发生再次感染。因此，出院前抗体检测十分重要，对于 S-、RBD-特异性 IgG 水平较低的鼻咽拭子阴性患者，应提高出院标准，或在出院后加强保护和监测。本研究的局限性包括：核酸假阴性标本的存在；最初收治的部分患者来自非定点医院，难以追溯更早的抗体水平数据；并不是所有患者都有连续的观察数据；疫情初期未检测中和抗体水平。总之，研究各种抗 SARS-CoV-2 抗体的动态变化，可为 COVID-19 的诊断、监测和预后以及疫苗研发提供重要参考。（本文部分内容已发表于 Nat CommunIF=12.121）

PO-0074

A combined test strips with fluorescent microspheres as tracer to detect rotavirus and adenovirus

Qingjun PAN、Na Jiang、Han Wu、Ping Wu
Affiliated Hospital of Guangdong Medical University

Background Rotavirus (RV) and enteric adenovirus (AdV) mainly cause infantile infectious gastroenteritis. Several separate test methods for the detection of RV or AdV are currently available, but few tests are able to simultaneously detect both RV and AdV viruses, especially in primary medical institutions.
Methods The present study was mainly designed to compare the performance of two combined test strips for the detection of RV and AdV: a rotavirus-adenovirus strip with fluorescent microspheres for tracers (FMT); and the CerTest rotavirus-adenovirus blister strip with colored microspheres for tracers (CMT). To test the strips cultures of RV, AdV and from other enteric pathogens were used, in addition to 350 stool specimens from 45 symptomatic patients with gastrointestinal infections.

Results Detection thresholds for RV and AdV cultures using serial dilutions showed that the sensitivity of FMT was significantly higher than that of CMT (both $P < 0.05$). Specificity evaluation demonstrated that with culture mixtures of Coxsackie (A16), ECHO (type30), and entero- (EV71) viruses there was no detection of cross reaction using the two test strips, i.e., all the results were negative. With regard to the detection of RV in 350 clinical specimens, the total coincidence rate was 92.9%, the positive coincidence rate was 98.2%, and the negative coincidence rate was 90.8%. With regard to AdV detection, the total coincidence rate was 95.4%, the positive coincidence rate was 95.2%, and the negative coincidence rate was 95.5%.
Conclusions FMT performed better than CMT with regard to the combined detection of RV and AdV.

PO-0075

光激化学发光法检测 CA242，CA19-9、CA50 在胰腺良恶性疾病中的诊断价值研究

周剑锁、甘奕箫、王攀、崔丽艳
北京大学第三医院

目的 评估酶联免疫检测系统与光激化学发光检测系统之间检测结果的相关性和一致性，评价光激化学发光检测系统检测 CA242、CA19-9、CA50 在胰腺良恶性疾病诊断中的临床价值。
方法 连续留取 530 例临床酶联免疫法检测 CA242 剩余血清样本，使用光激化学发光系统(LiCA)检测，对两种检测系统的检测结果进行相关性分析。另留取 149 例患有胰腺疾病患者的血清样本，其中 65 例胰腺癌患者为恶性疾病组，31 例胰腺癌术后患者为术后对照组、53 例胰腺良性疾病患者为良性对照组，检测三组患者血清中 CA19-9、CA50、CA242 的表达水平，描述其差异并绘制 ROC 曲线，分析不同的血清标志物的联合诊断效能。
结果 两种方法检测 CA242 线性回归分析，$R^2 = 0.9093$。单独检测患者 CA19-9、CA242、CA50 的血清浓度对鉴别胰腺疾病良恶性质的 AUC 分别为 0.777、0.771、0.798；CA19-9 与 CA242、CA19-9 与 CA50、CA242 与 CA50 以及三项指标联合诊断的 AUC 分别为 0.772、0.798、0.800、0.799。CA242 与 CA50 联合诊断的效能最优。胰腺癌患者、胰腺癌术后患者、良性疾病患者之间的非参数检验结果显示，胰腺癌患者的三种标志物血清浓度与其他两组的差异具备统计学意义（$P<0.05$），术后对照组 CA19-9、CA50 的血清浓度均高于良性对照组，差异具备统计学意义（$P<0.05$），术后对照组与良性对照的 CA242 血清浓度无显著性差异（$P=0.262$）。
结论 对照系统 ELISA 与考核系统 LiCA 之间相关性较好，具有可比性。在 CA19-9 水平升高时，CA242 与 CA50 的表达水平可作为判断胰腺良恶性疾病的辅助鉴别指标，CA242 表达水平可作为胰腺癌术后预后判断的指标。

PO-0076

成都地区 1887 例患儿呼吸道感染病原体检测结果分析

黄潇苇
成都市第三人民医院

目的 了解本地区呼吸道感染患儿病原体分布及流行特点。
方法 收集于 2018 年 11 月至 2020 年 11 月在本院就诊的 1887 例呼吸道感染患儿血清标本，采用间接免疫荧光法检测九种呼吸道感染病原体的 IgM 抗体，分别为嗜肺军团菌(Legionella pneumophila,LP) 、肺炎支原体(Mycoplasma pneumoniae,MP) 、肺炎衣原体(Chlamydia pneumoniae, CP)、Q 热立克次体(Q fever rickettsia,COX)、腺病毒(adenovirus,ADV)、呼吸道合

胞病毒(respiratory syncytial virus,RSV)、甲型流感病毒(influenza A vi-rus,FluA)、乙型流感病毒(influenza B virus, FluB)和副流感病毒(parainfluenza virus，PIV)。

结果 1887 例标本中 1042 例检测到至少 1 种病原体抗体阳性，阳性率 55.22%。单一病原体感染 645 例，占 61.9%。最常见感染病原体 MP,共 807 例，感染率达 42.77%；其次为 FluB,感染率 20.45%。混合感染 397 例，占阳性标本的 38.10%，其中以 MP 合并 FluB 感染最为常见，共 185 例，占混合感染的 52.86%。女性患儿感染率低于男性患儿，差异有统计学意义（P<0.05）。呼吸道感染患儿中，1 岁以下婴儿感染率最低，为 22.01%；学龄前组感染率最高，达 66.67%，差异有统计学意义（P<0.05）。春季感染率最高，与另外三个季节相比具有显著差异（P<0.05），夏秋冬三季阳性率无显著差异（P>0.05）,夏秋冬三季感染率最高的均为 MP,其次为 FluB 和 PIV,春季 MP 和 FluB 均有较高的感染率。

结论 MP、FluB 和 PIV 是引起成都地区儿童呼吸道感染的主要病原体，各种病原体的检出率在不同年龄段患儿和不同季节具有差异性，混合感染较为常见。因此，对于易发生呼吸道感染的儿童有针对性地进行预防和治疗具有重要意义。

PO-0077

膜性肾病患者 PLA2R 抗体定量水平与肾损伤标志物的相关性

黄宇、洪国斧
厦门大学附属第一医院

目的 探讨膜性肾病患者 PLA2R 抗体定量水平与肾损伤标志物的相关性。

方法 回顾性分析 60 例膜性肾病患者（男性 39 例、女性 21 例）临床资料、血清和尿液检测结果，采用酶联免疫吸附法定量检测血清抗磷脂酶 A2 受体（PLA2R）抗体水平、仪器法测定尿液 24h 尿蛋白（24-UTP）、ACR，以及血清尿素氮（UREA）、肌酐（CREA）、半胱氨酸蛋白酶抑制剂 C（CYSC）、总蛋白（TP）、白蛋白（ALB）、降钙素（PCT）。采用统计学分析不同年龄组 PLA2R 抗体定量水平变化、比较不同性别 PLA2R 抗体定量水平差异，按血清 PLA2R 抗体不同定量水平（150 RU/mL，KDIGO 指南）分为高、低浓度两组，分析比较两组各肾损伤标志物的差异以及相关性。

结果 ①PLA2R 抗体定量水平随年龄增加而升高，不同年龄分组年龄≤40 岁组、41～60 岁组、＞60 组中位数水平分别为 48.83 RU/mL、119.72 RU/mL、200.56 RU/mL；

②不同性别 PLA2R 抗体定量水平无统计学差异（P=0.186），男性、女性 PLA2R 抗体定量中位数水平分别为 96.30 RU/mL、143.87 RU/mL；

③不同 PLA2R 抗体浓度水平分组比较提示尿液标志物中 PLA2R 抗体高浓度组 24-UTP 水平（6675mg/24h）显著高于低浓度组（5446mg/24h），ACR 值在两组无统计学差异；血清标志物中 PLA2R 抗体高浓度组 UREA 水平（7.76 mmol/L）显著高于低浓度组（5.54 mmol/L），CYSC、CREA、TP、ALB、PCT 等标志物两组无显著差异。24-UTP、UREA 表达水平与 PLA2R 抗体定量水平存在一定的相关性（P=0.002、0.034）。ACR、CYSC、CREA、TP、ALB、PCT 表达水平与 PLA2R 抗体定量水平无显著相关（P=0.800、1.000、0.728、0.270、0.146、0.726）。进一步进行相关性分析提示 24-UTP、UREA 与 PLA2R 抗体定量水平呈正相关关系。

结论 PLA2R 抗体定量水平随年龄增加而升高，PLA2R 抗体定量水平与 24-UTP、UREA 存在正相关，本研究结论为膜性肾病的临床诊断治疗提供参考。

PO-0078

应用肿瘤标志物评估 COVID-19 患者预后的初步探索

何帮顺、吴秋月、夏欣一
东部战区总医院

目的 探讨与肺癌相关的肿瘤标志物对新型冠状病毒肺炎（COVID-19）患者预后的指导意义，为临床病例诊治应用提供参考。
方法 纳入武汉火神山医院 129 例 COVID-19 确诊病例和 80 例健康对照，采集临床资料，包括年龄、性别、基础疾病和预后等数据进行统计分析；采用化学发光法对 COVID-19 患者和对照组肿瘤指标 CEA, CYFRA21-1, NSE, SCCA 和 ProGRP 进行检测，比较两组之间指标差异，同时对不同临床特征 COVID-19 患者进行肿瘤指标的比较分析。
结果 该研究共纳入 129 例 COVID-19 确诊患者，其中 20 例轻症（15.50％），73 例重症（56.59％）和 36 例危重症（27.91％），危重症患者的平均年龄显著高于重症和轻症患者。糖尿病、慢性肾脏病和其他合并症患者的分布在疾病不同严重程度之间具有显着差异。129 例 COVID-19 患者中，114 例（88.37％）经治疗康复出院，15 例（11.63％）治疗无效死亡。与对照组相比，COVID-19 患者中 5 种肿瘤生物标志物的血浆浓度均明显升高（Pall<0.01）。此外，根据疾病严重程度和临床结局分组，各组间 CEA，CYFRA21-1 和 SCCA 的血浆水平存在显著差异，并且 CEA，CYFRA21-1，SCCA 的血浆水平随疾病严重程度增加而显著提高。采用逻辑回归分析来衡量肿瘤生物标志物水平与死亡风险之间的关系，结果显示 CEA、CYFRA21-1、NSE 和 SCCA 水平的升高分别与死亡风险增加相关。同时，还评估了 22 例出院和 11 例死者的生物标志物动力学与预后的相关性，结果表明，CYFRA21-1，SCCA 和 NSE 浓度升高是死亡的风险。ROC 曲线显示 SCCA（AUC：0.937，P= 0.000，临界值：2.57 ng / ml），CYFRA21-1（AUC：0.882，P= 0.000，临界值：7.29 ng / ml）和 CEA（AUC ：0.737，P= 0.003，截断值：8.55 ng / ml）可以预测 COVID-19 患者的临床结局。
结论 COVID-19 患者 CEA，CYFRA21-1，NSE，SCCA，ProGRP 肿瘤标志物浓度升高，且 CEA，CYFRA21-1，SCCA 可预测 COVID-19 患者的临床结局，本文为相关成熟生物标志物在突发疫情中的探索应用提供了新思路。（本文部分内容已发表于 J Infect， IF=4.842）

PO-0079

Four myositis-specific autoantibodies—anti-Mi-2, anti-MDA5, anti-TIF1γ and anti-ARS—in adult dermatomyositis in a Chinese cohort

Liubing Li
Peking Union Medical College Hospital, Chinese Academy of Medical Sciences

Objective Dermatomyositis (DM) is an idiopathic inflammatory myopathy, characterized by muscle weakness and cutaneous lesions. Our study aimed to determine the prevalence of anti-Mi-2, anti-melanoma differentiation-associated gene 5 (MDA5), anti-transcription intermediary factor 1γ (TIF1γ) and anti-aminoacyl-transfer RNA synthetase (ARS) autoantibodies, and their associations with clinical features in DM patients of Han Chinese.
Methods There were 428 subjects including 189 DM, 36 polymyositis, 89 connective tissue diseases (CTD) and 114 healthy individuals who underwent testing for four myositis-specific autoantibodies (MSA) including anti-Mi-2, anti-MDA5, anti-TIF1γ and anti-ARS autoantibodies. Clinical characteristics of DM patients were compared between those with and without these autoantibodies.
Results The prevalence of anti-Mi-2, anti-MDA5, anti-TIF1γ and anti-ARS autoantibodies in our DM cohort were 9.0%, 43.9%, 26.5% and 9.5%, respectively. Patients with anti-Mi-2 autoantibody

had higher risk of developing muscle tenderness and lower risk of developing ILD than patients without anti-Mi-2 autoantibody. Patients with anti-MDA5 autoantibody had higher risk of developing skin ulceration, ILD, and fever and lower risk of developing gastroesophageal reflux than patients without anti-MDA5 autoantibody. Patients with anti-TIF1γ autoantibody had higher risk of developing periungual erythema and malignance, and had lower risk of developing arthralgia, ILD and fever than patients without anti-TIF1γ autoantibody. Patients with anti-ARS autoantibody had higher risk of developing mechanic hands and gastroesophageal reflux than patients without anti-ARS autoantibody.
Conclusion The clinical features determined by these myositis-specific autoantibodies differ from each other. Detection of MSA is helpful for the diagnosis and prediction of complications of patients with DM.

PO-0080

Impact of heat-inactivation on the detection of SARS-CoV-2 IgM and IgG antibody by ELISA

Xiumei Hu
Nanfang Hospital, Southern Medical University

Background To establish a safe and accurate method for detecting SARS-CoV-2 IgM and IgG, we assessed the impact of sera after heat-inactivation on the SARS-CoV-2 IgM and IgG levels measured by ELISA-immunoassay.
Methods The serum samples of 62 patients with COVID-19 and 18 healthy controls were collected in Hankou's Hospital of Wuhan from February 27 to March 6, 2020. Before and after the samples were inactivated, the levels of IgM and IgG antibodies were measured.
Results The indexes of antibodies after inactivated were signifificantly higher than those in fresh sera, while the positive rates in all participants or in patients with COVID-19 did not change. The positive coincidence rate, negative coincidence rate and total coincidence rate of IgM antibodies before and after inactivation were 100.00% (55/55), 96.00% (24/25) and 98.75% (79/80), respectively ($\kappa = 0.971$, $P < 0.001$), while those for IgG antibodies were 98.21% (55/56), 91.67% (22/24) and 98.75% (79/80) respectively ($\kappa = 0.910$, $P < 0.001$). These results showed a good consistency.
Conclusions Heating-activation does not decrease the diagnostic effifffifficacy of SARS-CoV-2 IgM or IgG antibodies. Sera inactivated by heating at 56 °C for 30 min should be recommended to minimize the risk of virus con_x0002_tamination of laboratory staff.

PO-0081

基于微流控技术的肺癌循环肿瘤细胞检测及其在诊疗中的应用研究

魏雪菊[1,2]、洪国斐[1,2]
1. 厦门大学附属第一医院检验科
2. 厦门市基因检测重点实验室

原发性肺癌是常见的恶性肿瘤之一，其发病率和死亡率始终居于恶性肿瘤的首位，严重威胁人类的健康和生活质量。肺癌的主要亚型为非小细胞型肺癌（non-small cell lung cancer ,NSCLC），约占 80%-85%，并且大多数患者确诊时已经处于中晚期。随着人们对肺癌驱动基因的发现和相应靶向药物的研究与应用，肺癌的治疗模式已经进入分子靶向治疗时代。以表皮生长因子受体（epidermal growth factor receptor，EGFR）和间变淋巴瘤激酶（anaplastie lymphoma kinase，ALK）为靶点的药物临床应用使得 NSCLC 患者个体化治疗具有重大意义。液体活检（liquid

biopsy）是指从体液中获得来源于组织的生物标志物，并通过对所得标志物的分析来反应来源组织的相关信息。相比于传统的活检技术，液体活检的优势在于快速、方便、侵袭性小、可重复操作、能够密切监测肿瘤对治疗的反应和预测癌症的复发。循环肿瘤 DNA（ctDNA）是死亡肿瘤细胞释放出的核酸物质，在肿瘤的早期释放量少，所包含信息有限；外泌体是肿瘤细胞释放的小囊泡，包含肿瘤细胞的 DNA、RNA 和蛋白组，现有基础研究少，临床意义有限；而循环肿瘤细胞（CTCs）可以提供肿瘤病灶的基因组变异、mRNA 表达异常、细胞形态与功能等信息，更能全面、系统地反应整个肿瘤发展进程的液体活检内容，是一个极具潜力的检测靶标。该课题拟采用的方法是发展基于微流控技术的肺癌循环肿瘤细胞液体活检技术。对循环肿瘤细胞进行捕获、计数及分析，可用于肺癌患者靶向治疗的用药指导，预测靶向治疗的疗效、以及复发监测等伴随诊断领域。

PO-0082

新型冠状病毒肺炎患者不同血清模式下淋巴细胞亚群细胞数量比较

叶巍
湖北省新华医院

目的 探讨因新型冠状病毒肺炎（COVID-19）患者新型冠状病毒（2019-CoV-2，2019-nCoV）抗体免疫球蛋白 M（IgM）和免疫球蛋白 G（IgG）抗体检测结果，比较不同结果间的淋巴细胞数量区别。
方法 收集 2020 年 3 月 4 日至 3 月 18 日在湖北省中西医结合医院因新型冠状肺炎入院 245 例患者检测结果，回顾性研究入院患者核酸检测结果、血清学 IgM 和 IgG 抗体以及流式细胞学检测结果，并对根据血清学结果将患者分为 IgM（+）/IgG（+）、IgM（-）/IgG（+）以及 IgM（-）/IgG（-）3 组，对 3 组人群分别抽取 20 名患者，比较其淋巴细胞检测结果。
结果 245 例患者中，血清学 IgM（+）/IgG（+）95 例，IgM（-）/IgG（+）126 例,IgM（-）/ IgG（-）24 例。2019-nCoV IgM 抗体检测的灵敏度为 38.77%， 2019-nCoV IgG 抗体检测的灵敏度为 90.20%。IgM（-）/IgG（-）组和 IgM（+）/IgG（+）以及 IgM（-）/IgG（+）组在外周血淋巴细胞总数、CD4+T 细胞、CD8+T 细胞、B 细胞均有显著性差异。
结论 应将核酸检测和抗体检测结果结合进行诊断，采用免疫疗法提高淋巴细胞数量可能作为治疗 COVID-19 的一种潜在重要疗法。

PO-0083

Combined Detection of Norovirus GI and GII: An Innovative Fluorescent Particles Test Strip

潘庆军、张莉芳、蒋娜、吴晗、吴平、刘华锋
广东医科大学附属医院

We used selected chromatographic materials and antibodies specific to Norovirus GI and GII, the Norovirus GI and GII fluorescent particles combined detection test strip (tested method) was prepared as a conventional double antibody sandwich. The samples assayed included cultured rotavirus and 465 specimens from patients with symptoms of gastrointestinal infection. Norovirus was detected using the tested method and a reference method (CerTest Norovirus GI-GII test card). The results indicated that the sensitivity of the tested method was 4 (for GI detection) or 8 times (for GII detection) greater than the reference method. Neither of the two methods cross-reacted with rotavirus and so on. For specimens, 29 were found to be negative by the reference method and positive by the tested method, and 8 were found to be negative by the tested method and positive by the reference method. Furthermore, a retesting of these samples by qPCR

showed that 28 of the 29 were positive, and 3 of the 8 were positive. so, our test strip was successfully prepared and had good detection performance.

PO-0084

One-step-combined test strips with fluorescent microspheres as the tracer to detect influenza A and B

Qingjun PAN、Na Jiang、Lifang Zhang、Han Wu、Ping Wu
Affiliated Hospital of Guangdong Medical University

Background Influenza A and B viruses mainly cause respiratory infectious disease. Till now, few tests are able to simultaneously detect both, especially in primary medical establishments.
Methods This study was designed to compare the performance of two different one-step-combined test strips for the detection of influenza A and B: one strip with fluorescent microspheres for tracers (FMT); and the other strip with colored microspheres for tracers (CMT). To test the strips, cultures of influenza A, B, and other pathogenic viruses were used, in addition to 1085 clinical specimens from symptomatic patients with respiratory infections. Real-time RT-PCR was also considered as a reference method used to detect the different results of FMT and CTM.
Results Detection thresholds for influenza A and B cultures using serial dilutions revealed that the sensitivity of FMT was higher than that of CMT (both $P < 0.05$). With the culture mixtures of Coxsackie virus (A16), enteric cytopathic human orphan virus (ECHO type30), enterovirus (EV71), rotavirus (LLR strain), and enteric adenovirus (AdV 41), specificity assessment demonstrated that there was no cross reaction during the usage of the two test strips as shown by the results which were negative. In the detection of influenza A in 1085 clinical specimens, the total coincidence rate was 96.7%, the positive coincidence rate was 97.1%, and the negative coincidence rate was 96.7%. In the case of influenza B detection, the total coincidence rate was 99.1%, the positive coincidence rate was 92.6%, and the negative coincidence rate was 98.5%. In addition, with influenza A or B real-time RT-PCR detection method, the results showed that, for influenza A, 26 of the 33 specimens that negative with CMT but positive with FMT, showed positive results, and none of the 3 specimens that positive with CMT but negative with FMT showed a positive result; For influenza B, 12 of the 15 specimens that negative with CMT but positive with FMT, showed positive results, and none of the 5 specimens that positive with CMT but negative with FMT showed a positive result.
Conclusions FMT performed better than CMT in the combined detection of influenza A and B viruses.

PO-0085

Emerging Molecular Markers for Developing Disease Biomarker Panels in Lupus

Gongjun Tan
zhuhai center for maternal and children healthcare

Systemic lupus erythematosus (SLE) is a multifactorial autoimmune disease which affects various organs and tissues, posing significant challenges in clinical diagnosis and treatment. It is known that elevated autoantibody production and hyper-proliferation and activation of autoreactive T cells and B cells are major hallmarks of this devastating disease, however, the etiology of SLE is highly complex, contributed by environmental factors, stochastic factors and genetic susceptibility. The current criteria for diagnosis of SLE are mainly based on the combination of clinical manifestations and traditional laboratory tests. However, these tests are

suboptimal in sensitivity and specificity and are not able to inform disease cause or guide physicians in decision-making for medication. Therefore, there is an urgent need to develop a more accurate and robust biomarker of SLE for effective clinical management and drug development for lupus patients. It is fortunate that the emerging Omics has empowered the discovery and identification of potential novel biomarkers of SLE, especially markers from blood, urine, cerebral spinal fluids (CSF) and other body fluids. In this review, we summarize the sensitivity, specificity and performance of detection of these novel disease markers and discuss the potentials of these markers for the development of biomarker panel based diagnostics or disease monitoring system in SLE.

PO-0086

Establishment and evaluation a high selective, sensitive method to separated and identified antigens in immune complexes

Gongjun Tan
zhuhai center for maternal and children healthcare

Comprehensive identification and profiling of antigens in immune complexes (ICs) in biological fluids, such as serum and other body fluid, is useful for developing early diagnostic biomarkers and specific therapy for many diseases. “immune complexes analysis” method include separation of ICs from serum with protein A/G, papain-digestion and elution, then tryptic digestion, and nano-LC–MS/MS for the identification and profiling of antigens in CICs, that method is selective and sensitive. However, Protein G or Protein A bind the fragment of crystallization (Fc) domain of antibodies is nonselective, the separation efficiency of the immune complex by this method is not high selective because the binding antibodies and the unbinding antibodies cannot be distinguished by Protein G or Protein A, and the amount of the unbinding antibodies in the serum is greater than the binding antibodies. To selectively purified CICs with enhanced sensitivity, in this study, complement 1q (C1q) was applied for the specific recognition of antibody–antigen complex to separated CICs from specimens, combined papain-digestion and elution, tryptic digestion, and nano-LC–MS/MS. Result showed that C1q capture Method provided the high selective and sensitive detection of CIC-antigens, without interference by antibodies and proteins non-specifically bound to the beads. These data suggest that t C1q capture CIC separation technique is a good general pretreatment technique for the identification of antigens incorporated in CICs.

PO-0087

LATS2 is a prognostic biomarker and correlated with immune infiltrates in colorectal cancer

chengwen zhao[1]、jianping chen[1]、yonghui liu[2]、xiaoyu gu[1]、shunhao zhang[1]、shaoqing ju[1]
1. Department of Laboratory Medicine
2. 南通大学附属医院分院

Background Colorectal cancer (CRC) is one of the most common malignancies with high prevalence and low five-year survival. Although immunotherapy has made impressive progress in the treatment of CRC, it still faces huge challenges. LATS2, as a critical molecule of Hippo signaling pathway, has been well accepted that its expression level is associated with cancer progression. How-ever, the prognostic and immune response roles of LATS2 expression in CRC remain unclear.

Methods To investigate the value of LATS2 in prognosis and immune infiltration, a retrospective study of 213 CRC patients was carried out. Immunohistochemi-stry analysis on tissue microarray and qRT-PCR were used to determine the expression of LATS2. Besides, bioinformatics was used to analyze the level of immune infiltration and related pathways of LATS2.
Results indicated that LATS2 levels were decreased in CRC tissues compared with those in non-tumor tissues, which was notably associated with tumor differentiation (P=0.002) and tumor stage (P=0.002). Multivariable analysis showed that low LATS2 protein expression was a significantly independent predictor in CRC. In the Kaplan-Meier analysis, patients with high LATS2 expression had significantly better overall survival than those with low LATS2 expression. Furthermore, we identified that LATS2 was involved in the regulation of immune-related pathways and its expression had positive correlation with tumor immune infiltrating cells like T cells, macrophages and dendritic cells by GSEA, TIMER and ssGSEA analysis.
Conclusion In summary, our data suggested that LATS2 may act as a cancer suppressor gene in CRC and be associated with prognosis and immune infiltration. Thus, LATS2 can be used as a novel biomarker for predicting prognosis and immune infiltration in CRC.

PO-0088

新型分泌蛋白冠层成纤维细胞生长因子信号调节因子 2 在甲状腺乳头状癌中的临床应用价值

段文冰
山东第一医科大学附属省立医院临床医学检验部

目的 通过分析冠层成纤维细胞生长因子信号调节因子 2(CNPY2)在甲状腺乳头状癌(PTC)患者癌组织及血清上的表达，探讨其临床应用价值。
方法 甲状腺乳头状癌(PTC)组为 2010-2012 年山东省立医院两腺外科收治并行手术的患者 92 例，良性病变组 45 例，组织切片做免疫组化(IHC)；PTC 组术前患者血清样本 102 例、良性病变组 64 例及正常对照 54 例，进行血清酶联免疫(ELISA)实验。采用 t 检验、秩和检验、卡方检验及 ROC 曲线进行分析。
结果 ① PTC 患者癌组织 CNPY2 的 IHC 得分[9.74(8,12)]均显著高于癌旁组织[5.78(4,8)](Z=8.25,P=0.000)和良性病变组织[5.87(4,8)](Z=6.82,P=0.000)。②CNPY2 蛋白在年龄≥55 岁与<55 岁 PTC 患者[11.47(12,12)比 9.40(8,12);Z=3.08,P=0.002]、女性与男性患者[10.05(8,12)比 8(8,8);Z=3.42,P=0.001]、淋巴结转移与未转移患者[10.44(8,12)比 9.28(8,12);Z=2.03,P=0.042]、恶性肿瘤分期(TNM 分期)II 期与 I 期患者[12(12,12)比 9.58(8,12);Z=2.45,P=0.014]均有显著差异。③ PTC 患者血清 CNPY2 的浓度(ng/ml)[0.19(0.13,0.23)]显著高于正常组[0.13(0.13,0.15)](Z=4.27,P=0.000)及良性组[0.15(0.10,0.17)](Z=2.79,P=0.005);PTC 患者中女性血清 CNPY2 浓度(ng/ml)[0.22(0.14,0.29)]显著高于男性[0.16(0.13,0.17)](Z=3.70,P=0.000)。④根据受试者工作特征曲线确定的最佳截断值 0.159ng/ml，分 CNPY2 高值组和低值组，并将 PTC 患者分为 PTC 组(42 例)、合并淋巴细胞性甲状腺炎的 PTC 组(21 例)及合并结节性甲状腺肿或腺瘤样增生的 PTC 组(39 例)，发现 PTC 组中抗甲状腺球蛋白抗体在 CNPY2 高值与低值组中有明显差异[31.17(10.10,61.01)比 10.39(10.21,10.43);Z=2.04,P=0.044]。
结论 通过检测 PTC 患者组织及血清 CNPY2 的表达水平，分析其与病理因素及甲功血液指标的相关性，推测 CNPY2 对于 PTC 的预测有着一定的临床应用价值。

PO-0089

全血细胞及肺泡灌洗液组织研磨匀浆后培养测 IFN-γ 实验室技术对诊断肺结核效能比较研究

方晓露、刘德扬
襄阳市第一人民医院

目的 不同来源组织全血细胞及肺泡灌洗液研磨的匀浆组织培养后测 IFN-γ 释放试验技术对诊断肺结核效能比较研究，以提高临床早期诊断肺结核的水平。
方法 选择襄阳市第一人民医院检验科 2019 年 5 月-2021 年 4 月期间接收的 137 例成年疑似肺结核患者送检标本，包括 91 例 TB 组患者（确诊组 46 例, 很有可能组 33 例, 可能组 12 例)及 46 例非肺结核组患者，然后将送检肺泡灌洗液研磨后的匀浆及全血组织分别设置阴性对照组，本底实验组，阳性对照组三组 进行培养，24 小时候后用 ELISA 方法对 IFN-γ 释放进行检测（北京万泰结核感染 T 细胞检测试剂盒 体外释放酶免疫法）；评价上述 2 种不同来源组织 IFN-γ 释放试验对诊断肺结核的效能。
结果 结果以临床诊断为标准，检测技术诊断肺结核的阳性率分别为全血组织培养后 IFN-γ 释放试验阳性率为 19.2%(15/78), 肺泡灌洗液组织研磨匀浆培养测 IFN-γ 实验室技术阳性率 85.8%(67/78)。肺泡灌洗液组织研磨匀浆测 IFN-γ 实验室技术的敏感度高于全血细胞培养测血清 IFN-γ，差异均有统计学意义（p<0.05）。
结论 在肺结核的早期诊断中，选取肺泡灌洗液组织研磨后，取匀浆培养测得 IFN-γ 的释放试验对肺结核诊断的敏感性高于全血组织培养后 IFN-γ 的释放试验，肺泡灌洗液检测实验可有效提高临床肺结核检出率，肺泡灌洗液组织研磨匀浆测 IFN-γ 实验室技术方法值得在临床推广。

PO-0090

广西玉林市 2015-2020 年 HIV 抗体不确定结果的随访分析

庞晓泸[1]、叶瑞国[1]、庞贤武[2]、宁珺茹[1]、林瑞玲[1]、黄佐妮[1]、蒋宁[1]
1. 玉林市疾病预防控制中心
2. 广西壮族自治区疾病预防控制中心

探讨 HIV 抗体不确定结果转归特点及 HIV-1 病毒载量检测在 HIV 抗体不确定诊断中的应用。
方法 收集 2015-2020 年全市 HIV 抗体筛查为 HIV 抗体有反应的标本，使用两种快速法检测试剂复核，出现单反应或双反应的标本使用免疫印迹法（WB）进行补充试验，结果为不确定的使用 HIV-1 病毒载量检测作为补充试验。
结果 2015-2020 年共 HIV 抗体确证检测样本 4906 人份，不确定结果 153 人份（3.12%），最终完成随访并有检测结果 91 例。在 91 例中有 59 例阳转，32 例阴转；复核双反应和单反应的阳转率分别为 94.74%和 14.71%；第一次 WB 结果为两条带以上的阳转率为 87.76%，WB 结果仅有 1 条带的阳转率为 35.71%。91 例随访中病毒载量＞5000CPs/m 的有 59 例，病毒载量≤5000CPs/ml 的有 32 例。
结论 HIV 抗体复核均有反应且 WB 至少 2 条带型的样本阳转率比较高，HIV 抗体复核仅单反应且 WB 仅有 1 条带型的也有感染的高风险，同时采用 HIV 抗体确证结果结合 HIV 病毒载量检测方法作为补充试验尽早确定是否感染。

PO-0091

An analysis of predictive value of HIV serology COI for confirmation of HIV infection using Elecsys® HIV combi PT assay

Mengying Zhang
The First Affiliated Hospital of Nanjing Medical University

Background 4-th generation assays performed high sensitivity and specificity, greatly improved early diagnosis of HIV. While false positive rate (FPR) was high in low prevalence region, which caused inconvenience for clinical practice and anxiety for patients.
Objectives To analyze the relation between COI values and HIV confirmatory results, and explore new COI threshold in our own laboratory to predict HIV infection.
Methods We retrospectively analyzed primarily reactive results by Elecsys® HIV combi PT assays and their confirmatory results by WB at Nanjing CDC. The mean COI values of true positives (TP), false positives (FP) and indeterminate group were compared to understand the COI values distribution. And ROC analysis was performed to determine the optimal COI value for predicting HIV infection status.
Results Totally 150980 HIV serological results by Elecsys® HIV combi PT assays were reviewed, 305(0.2%) were primarily reactive. There are 82(26.89%) true positives, 210(71.92%) false positives and 11 indeterminate by WB tests, another 2 patients rejected WB tests. Mean COI values of TP (3.174) were greatly higher than that of FP (643.5) ($P < 0.0001$), but there is no significant difference between FP and indeterminate group. Combining the requirement of HIV diagnosis and ROC analysis, 9.87 was established as the optimal threshold to predict the infection, with 100% sensitivity and 99.99% specificity.
Conclusions By adjusting the COI cutoff, the false positive rate (FPR) can be reduced and the efficiency of screening assays can be increased, which can save much additional reagent and staff costs and much time for delivery of HIV test results.

PO-0092

结肠癌 TP53 相关外泌体定量蛋白质组学研究

朱琳
中国人民解放军总医院第一医学中心检验科

目的 比较分析 TP53 突变、敲除及野生的肿瘤细胞分泌外泌体的蛋白质组差异，探讨突变的 TP53 对肿瘤微环境中的分泌蛋白质的影响。
方法 从 TP53 野生型（HCT116-p53(WT)）、敲除型（HCT116-p53(-/-)）和构建的 273 位点突变型的结肠癌 HCT116 细胞（HCT116-p53(R273H)）培养上清中分别提取外泌体，通过透射电镜观察其形态和免疫印迹法检测外泌体标志性蛋白，并经 iTRAQ-LC-MS/MS 策略分析三种细胞外泌体蛋白组成的差异并通过酶联免疫吸附测定（ELISA）进行差异蛋白验证。
结果 HCT116-p53(WT)分泌的外泌体和 HCT116-p53(R273H)分泌的外泌体相比有 144 个差异蛋白，HCT116-p53(WT)分泌的外泌体和 HCT116-p53(-/-)分泌的外泌体相比有 480 个差异蛋白，大部分差异蛋白主要参与代谢和细胞的生物学过程以及凋亡、应激、增殖、细胞粘附等功能。通路分析（IPA）显示 HCT116-p53(WT)分泌的外泌体相比于 HCT116-p53(R273H)分泌的外泌体的差异蛋白主要富集在泛素化、mTOR、DNA 损伤修复通路中；HCT116-p53(WT)分泌的外泌体相比于 HCT116-p53(-/-)分泌的外泌体的差异蛋白主要集中在泛素化、EIF2、糖酵解通路中。而且，结肠癌患者的血清视网膜母细跑瘤蛋白（RB1）水平明显高于健康对照（P=0.0012）
结论 TP53 突变和缺失会改变外泌体的蛋白组成，富集许多泛素化蛋白，结肠癌患者的血清 RB1 水平明显高于健康对照，这为深入探讨 TP53 状态对外泌体蛋白组成和肿瘤微环境的影响奠定基础。

PO-0093

A nonlinear time-series analysis to identify thresholds in associations between antimicrobial consumption and rates of resistance at a Chinese tertiary care hospital, 2009-2020

Xiaohan Hu
Nanjing drum Tower Hospital

Background Antibiotic abuse is the major cause of increasing antimicrobial resistance. Infections caused by drug-resistant bacteria carry significant mortality. However, many studies supported the hypothesis that resistance of antibiotic is associated with 'fitness cost' which reduces virulence of these pathogen. Therefore, the numbers of cases caused by drug-resistance bacteria only increase when the selection pressures from antibiotics exceed critical thresholds. Our purpose is to investigate the association between the usage of antibiotics and the number of infections caused by drug-resistance bacteria and find the critical thresholds.
Methods Data regarding monthly consumption of six kinds of antibiotics (daily defined doses (DDDs)/1,000 inpatient-days) and the number of cases caused by five kinds of drug-resistance bacteria (occupied bed days (OBDs)/10,000 inpatient-days) from inpatients during 2009 to 2020 were retrieved from the electronic prescription system at a tertiary hospital in Jiangsu Province, China. Generalized additive models (GAM) was used to analyze correlations and trends between antibiotics consumption and antimicrobial resistance on a monthly basis.
Results Six kinds of antibiotics and five kinds of drug-resistance bacteria established 30 models. And 8 models (carbapenems-CRAB, lag=0; carbapenems-CRKP, lag=0; carbapenems-P.aeruginosa, lag=1; carbapenems-E.coli, lag=2; glycopeptides-CRAB, lag=0; glycopeptides-CRKP, lag=0; glycopeptides-P.aeruginosa, lag=1; fluoroquinolones-E.coli, lag=0) were considered statistically significant. 5 of 8 above-mentioned models had definite thresholds showing selection pressures overweigh the fitness costs while other models hardly to find typical thresholds.
Conclusions We identified significant correlations between antibiotics consumptions and the incidence density of drug-resistance bacteria. Our study suggested threshold can be interpreted as a limit and it may guide rational compromises between the selection pressure and the survival advantage for providing targets for access to effective treatments.

PO-0094

PLR、D-二聚体和 CA125 对上皮性卵巢癌诊断的研究价值

蔡针针
江苏省人民医院（南京医科大学第一附属医院）

目的 探讨血小板（Platelet，PLT）/ 淋巴细胞（Lymphocyte）、D-二聚体（D-dimer）和糖类抗原 125（CA125）在上皮性卵巢癌诊断中的应用价值。
方法 回顾性分析南京医科大学第一附属医院 2015 年 1 月−2020 年 12 月收治的上皮性卵巢癌患者 136 例[年龄：57.00(49.00,64.00)]、卵巢良性疾病患者 126 例[年龄：40.00(29.00,51.00)]。首先采用单因素分析和多因素 Logistic 回归分析与上皮性卵巢癌诊断相关实验室指标。其次用 ROC 曲线分析 PLR（PLT/Lymphocyte)、D-dimer、CA125 单独检测和联合检测对上皮性卵巢癌的诊断效能，最后分析上皮性卵巢癌患者 PLR、D-dimer、CA125 水平与其临床病理特征的关系。
结果 经 Logistic 回归分析，患者年龄、PLR、D-dimer 和 CA125 水平为上皮性卵巢癌独立危险因素。PLR、D-dimer 和 CA125 联合检测时诊断效能最好（AUC=0.955, 95%CI 0.922～0.977)。在上皮性卵巢癌组中，PLR 和 D-dimer 水平与肿瘤大小显著相关（P<0.05)；晚期患者与早期患者相比，PLR、D-dimer 和 CA125 水平均显著升高（P<0.05)；腹水<1000ml 的上皮性卵巢癌患者，

PLR 水平明显低于腹水≧1000ml 的患者（P<0.05)；PLR、D-dimer 和 CA125 水平与上皮性卵巢癌淋巴结转移有关，有淋巴结转移的患者 PLR、D-dimer 和 CA125 水平均升高（P<0.05)。
结论 联合 PLR、D-dimer 和 CA125 有利于上皮性卵巢癌的诊断。

PO-0095

Establishing Reference Intervals for Islet Autoantibody Assay and its Potential Utility in Type 1 Diabetes

yu fu
the First Affiliated Hospital of Nanjing Medical University, Nanjing, People's Republic of China.

Background Currently, islet autoantibodies (IAbs) constitute the most reliable marker for detecting the autoimmune process of type 1 diabetes (T1D). However, there are no appropriate reference intervals (RIs) to interpret the results of IAbs in China.
Objective In this study, we aimed to establish the RIs of four common IAbs based on the Chinese Han population and evaluate their clinical diagnostic values in patients with T1D.
Methods We collected 177 blood samples from healthy volunteers to detect the levels of IAbs directed against insulin (IAA), glutamic acid decarboxylase-65 (GADA), insulinoma antigen 2 (IA-2A), and zinc transporter-8 (ZnT8A) using a chemiluminescence immunoassay. RIs were calculated using nonparametric 95th percentile intervals in accordance with the Clinical and Laboratory Standards Institute guidelines, and their clinical diagnostic values were evaluated by detecting the levels of IAbs of 140 blood samples from patients with T1D in a clinical setting.
Results We defined 138 individuals as the apparently healthy population. No association between the levels of the four IAbs and gender ($p > 0.05$) and age ($p > 0.05$) were found in the apparently healthy population. The combined RIs for GADA, IA-2A, ZnT8A, and IAA were 0–1.78 IU/mL, 0–3.91 IU/mL, 0–2.36 AU/mL, and 0–0.58 COI, respectively. Collectively, the diagnostic efficiency for the four IAbs, especially for GADA and IAA, were improved by using the RIs established in this study.
Conclusions The RIs for IAbs established in this study, for the first time, will be a valuable tool for disease diagnosis and the therapeutic management of T1D in a clinical setting.

PO-0096

新冠疫苗接种者体内抗体水平变化和外周血淋巴细胞亚群相关性分析

刘阳、侯彬、袁丹、王芳、杨平、蔡志龙、王丹、方堃
四川省科学城医院

目的 研究新冠疫苗接者体内抗体水平变化及临床意义，分析其水平与外周血淋巴细胞亚群相关性。
方法 收集某单位 2021 年 3 月至 2021 年 5 月期间完成第二剂新冠灭活疫苗接种者 56 例作为研究对象，同时收集未接种疫苗志愿者 20 例作为对照组。分析疫苗接种人群抗体水平变化，比较各组间外周血体液免疫指标差异，分析中和抗体水平与外周血免疫细胞相关性。
结果 同对照组相比，中和抗体水平、IgM、IgG 显著升高（P<0.001）；疫苗接种组：（6-8 天）、（13-15 天）两组中和抗体水平阳性率 100%，在 3 天组和（27-35 天）组分别是 20%和 88.6%; 疫苗接种组间比较，3d 组和（6-8d）组 IgM 有差异（P<0.05）；而 IgG 水平在 3d 组同（6-8d）、（13-15d）、（27-35d）间均具有显著差异（P<0.05，P<0.01，P<0.01）。中和性抗体的表达在 3d 组同（27-35d）组间差异非常显著（P<0.01）,同（6-8d）、（13-15d）组，P<0.05。总抗体水平的结果显示：3d 组与（6-8d）、（13-15d）（27-35d）相比，分泌显著增加，差异明显，P

值分别为 P<0.01，P<0.01，P<0.05。接种疫苗组 CD3+CD4+辅助性 T、CD3+CD8+杀伤性 T、CD3-CD19+B 淋巴细胞比例增加，其中 CD3+CD4+辅助 T 升高最明显，而 CD3+T 淋巴细胞百分比轻度下降，差异具有统计学意义（P<0.05）。
结论 新冠疫苗第二剂接种 13-15 天以后，产生了较高水平的 IgG、中和性抗体和总抗体水平，能激发人体体液免疫和细胞免疫应答，产生免疫力，这对我们估计疫苗疗效提供了一定的临床依据。

PO-0097

GPC3 联合 PIVKA-Ⅱ在 AFP 阴性肝癌的诊断预后价值

林莺莺、陈燕
福建省肿瘤医院

目的 探讨磷脂酰肌醇蛋白聚糖-3（GPC-3）和异常凝血酶原（PIVKA-Ⅱ）联合检测对 AFP 阴性肝癌的诊断和预后价值，为患者的临床治疗提供参考。
方法 从福建省肿瘤医院 408 例肝癌首诊患者中筛选出 101 例 AFP 阴性肝癌患者作为实验组，并对其中 13 例接受肝癌手术治疗的患者进行疗效监测，同时选择同期入院的 114 例良性肝病患者以及 60 例体检的正常人群作为对照组进行前瞻性队列研究。收集肝癌实验组临床诊疗数据进行生存随访。检测研究对象血清中 GPC3 及 PIVKA-Ⅱ的表达水平，建立 ROC 曲线并计算两者诊断指标以及在不同肿瘤分期的诊断敏感性；单因素分析 GPC3 和 PIVKA-Ⅱ与 AFP 阴性肝癌患者临床特征的相关性；分析手术患者治疗前后 GPC3 及 PIVKA-Ⅱ的表达水平变化；比较治疗前 GPC3 和 PIVKA-Ⅱ与肝癌患者预后相关性。
结果 AFP 阴性肝癌患者血清中 GPC3 及 PIVKA-Ⅱ的表达水平显著高于良性肝病患者和正常对照者，差异有统计学意义。在 AFP 阴性肝癌患者中，GPC3 和 PIVKA-Ⅱ单项及组合的 ROC 曲线下面积分别为 0.792，0.928 和 0.862；GPC3 和 PIVKA-Ⅱ单项及联合检测的敏感性分别为 77.2%、86.1%和 83.2%，特异性分别为 82.2%、93.1%和 83.3%。GPC3 及 PIVKA-Ⅱ随着肿瘤分期的增高而增高，在Ⅰ期肝癌中的敏感性高达 86.5%和 83.8%。GPC3 水平与 AFP 阴性肝癌患者年龄相关，PIVKA-Ⅱ水平与 AFP 阴性肝癌患者门脉癌栓情况相关；肝癌患者术后 GPC3 及 PIVKA-Ⅱ血清水平较术前明显减少。肝癌患者的生存时间与治疗前 GPC3 及 PIVKA-Ⅱ的表达水平无关，与临床分期显著相关。
结论 GPC3 及 PIVKA-Ⅱ检测对于 AFP 阴性肝癌尤其是Ⅰ期肝癌有较高的诊断价值，可用于 AFP 阴性肝癌术后疗效监测。

PO-0098

Logistic 回归结合 ROC 曲线分析标志物模型在肝硬化合并肝癌患者中的诊断价值

林莺莺、陈燕
福建省肿瘤医院

目的 评价血清异常凝血酶原（PIVKA-Ⅱ）、高尔基体蛋白 73（GP73）、甲胎蛋白（AFP）和甲胎蛋白异质体（AFP-L3）四种肝癌标志物不同检测模型在肝硬化合并肝癌患者中的诊断价值，建立最佳诊断模型。

方法 以治疗前 170 例肝硬化合并肝癌、60 例肝硬化、60 例慢性乙型肝炎患者和 60 例健康体检者为研究对象，检测 PIVKA-Ⅱ（化学发光酶免疫检测法）、GP73（酶联免疫法）、AFP（电化学发光法）和 AFP-L3（微量离心柱法）的血清水平，建立单项检测的 ROC 曲线，确立各指标的最佳诊断临界值（cutoff 值）。使用 SPSS 做多变量观察值的 ROC 曲线，建立 Logistic 回归方程，评价多变量检测模型的诊断指标，确定最佳诊断模型。

结果 单项检测时，PIVKA-Ⅱ的曲线下面积（AUCROC）最大（0.920），敏感性和特异性分别为 91.2%和 85.6%。多项联合检测时，PIVKA-Ⅱ和 AFP 联合检测的多变量检测模型曲线下面积（AUCROC）最大（0.951），敏感性和特异性分别为 87.6%和 91.1%，为乙肝肝硬化合并肝癌的最佳诊断模型。最佳诊断模型的肝癌风险概率值在早期肝癌患者中的敏感性为 66.7%，在小肝癌的敏感性为 67.7%。

结论 PIVKA-Ⅱ和 AFP 联合检测为乙肝肝硬化合并肝癌的最佳诊断模型，利用肝癌风险概率值可从乙肝肝硬化患者中及时诊断出早期肝癌和小肝癌，提高患者生存率。

PO-0099

Chi3L1 在肝纤维化诊断分期中的作用

刘爱平、胡尧、张弢、刘春芳
复旦大学附属华山医院

目的 研究 Chi3L1 水平在慢性肝脏纤维化诊断分期中的作用

方法 收集肝脏穿刺病人的血清进行 Chi3L1 的检测，并与传统肝纤维化指标 FIB4 和 APRI 进行比较，观察其在肝脏不同纤维化分期中的水平，计算其诊断价值。

结果 在区分慢性肝炎有无肝纤维化、S1 期与 S2-4 期，chi3L1 ROC 曲线下面积分别为 0.718 和 0.792，略高于 APRI 和 FIB4。但是在区分 S1、2 期和 S3、4 期时，Chi3L1 ROC 曲线下面积为 0.727，并不优于 APRI 和 FIB4.

结论 Chi3L1 在区分有无早期肝纤维化阶段有重要作用，在区分肝纤维化晚期分期中作用不显著。

PO-0100

新冠疫苗接种后新冠病毒 IgM 和 IgG 抗体检测结果分析

王宁、吕金娥、张丽晶
云南省曲靖市第二人民医院

目的 分析新冠疫苗接种后新冠病毒抗体检测结果。

方法 我院医务人员 152 人接种新冠疫苗（2 针）1 月后检测新冠病毒 IgM 和 IgG 抗体。

结果 IgM 抗体阳性 33 例，弱阳性 1 例，阳性率 22.36%，IgG 抗体阳性 133 例，弱阳性 5 例，阳性率 90.79%。

结论 新冠病毒抗体检测对于新冠肺炎诊断、病情监控具有辅助作用，疫苗接种后进行新冠病毒 IgM 和 IgG 抗体检测阳性率与中和抗体检测阳性率相符，若能用新冠病毒 IgM、IgG 抗体检测作为新冠疫苗接种成功的实验室检测依据，将大大提高广大人民群众对疫苗接种的积极性，为我国快速、有效推进疫苗接种工作起到积极的作用，同时尽快形成群体免疫，在国内甚至世界范围内筑起新冠肺炎免疫屏障，最终达到消除新冠病毒的终极目标。

PO-0101

GALAD 和 BALAD-2 模型在原发性肝细胞癌诊断及短期疗效评价中的临床意义研究

陈岩松、崔兆磊、陈燕
福建肿瘤医院

目的 探讨 GALAD 模型在原发性肝细胞癌患者诊断价值以及 BALAD-2 模型在肝细胞癌短期疗效评估中的价值。
方法 收集某院 2017 年 8 月—2018 年 2 月 87 例首诊肝癌（HCC）患者、53 例肝脏良性疾病（BLD）患者、49 例表观健康体检者(HC)血清，采用微流控免疫荧光电泳技术检测血清中 AFP、AFP-L3 和 DCP 水平，建立基于性别、年龄和血清中 AFP、AFP-L3 和 DCP 水平的 GALAD 模型，分析 GALAD 模型对于肝癌患者的诊断价值；采用溴甲酚紫法检测血清中白蛋白及重氮法检测血清中胆红素水平，建立基于 ALB、BIL、AFP、AFP-L3 和 DCP 的 BALAD-2 模型，对随访资料完整的 41 例原发性肝癌患者动态观察治疗前后 BALAD-2 模型变化，分析 BALAD-2 模型与肝癌患者短期疗效的关系。
结果 GALAD 模型评分与患者的性别和年龄显著相关，差异有统计学意义,多数肝癌患者伴有乙肝病毒感染，肝硬化是肝癌的高危因素；肝癌患者血清 AFP、AFP-L3、DCP 水平以及 GALAD 模型评分均显著高于肝脏良性疾病组(P<0.05)和表观健康对照组(P<0.05)，差异均有统计学意义；GALAD 的特异性（94.3%）和准确性（60.8%）均高于 AFP（分别为 85.1%和 55.7%）、AFP-L3(分别为 71.3%和 55.0%）、DCP（分别为 85.1%和 59.1%）,特异性(95.1%)低于 AFP-L3(97.1%)和 DCP(97.1%)，高于 AFP(90.2%),研究表明，GALAD 模型诊断肝癌优于单一指标；肿瘤控制组治疗后 AFP、AFP-L3、DCP 水平以及 BALAD-2 较治疗前均显著下降（P<0.05）差异有统计学意义；肿瘤进展组 AFP、AFP-L3、DCP 和 BALAD-2 均未显著下降（P>0.05）。
结论 GALAD 模型可提高原发性肝癌的早期诊断率，BALAD-2 模型有助于肝细胞癌患者短期疗效评估。

PO-0102

聚乙二醇沉淀法预处理甲状腺激素异常增高 1 例

胡家伦
复旦大学附属华山医院

聚乙二醇（Polyethylene glycol，PEG）是一种水溶性的非离子多聚物，最早用于提纯免疫球蛋白、沉淀一些细菌和病毒，近年来广发用于核酸和酶的分离提纯。PEG 试剂溶解度大，在水中占据大部分空间，由于空间和水的排斥作用，PEG 具有改变蛋白质溶解度的非特异性能力，因此能作为蛋白质沉淀剂。当血清中存在一系列蛋白质均可能干扰甲状腺激素的检测，而使测定结果出现假性增高，从而导致误诊和误治。本文以 PEG 沉淀法预处理甲状腺激素异常增高病例进行分析讨论。

PO-0103

分析 2808 例 7 种肿瘤相关抗原自身抗体联合检测在肺癌早期筛查中的诊断意义

孙璐璐
吉林大学第一医院

由于疾病的隐匿性和复杂性，北方地区的肺癌发病特点通常表现为：确诊肺癌的多数患者发现即处于晚期，远期存活率较低。除影像学检查和传统的肺癌血清学标志物检测外，即使是处于肺癌发病的高风险人群，可以提供肺癌的早期筛查诊断的检测手段仍很少。

目的 探讨联合检测 7 种肿瘤相关抗原自身抗体（p53、GAGE7、PGP9.5、CAGE、MAGEA1、SOX2、GBU4-5 抗体）在肺癌早期筛查患者中的检出水平，评估自身抗体检测在早期肺癌筛查策略中的诊断潜力。

方法 收集我院 2019 年 1 月至 2021 年 4 月期间，共 2808 例初次行 7 种肺癌相关抗原自身抗体检测的患者（包括肺癌患者、体检健康者、肺部良性疾病和患有其他疾病或癌症的患者）。用酶联免疫吸附法联合检测其血清中 7 种自身抗体的水平，对不同分组的患者进行敏感性、特异性、年龄和性别、不同病理特征的阳性率进行比较分析，绘制 ROC 曲线分析其对肺癌的诊断效能。

结果 7 种自身抗体联合检测可以区分肺部疾病的良、恶性病变，其结果与健康体检人群差异明显。对已确诊肺癌的患者，7 种自身抗体水平均高于健康体检人群、肺部良性疾病患者和其他疾病或癌症患者，差异均有统计学意义(P 均<0．05)。7 种自身抗体联合检测在确诊肺癌的患者中的敏感性为 69.00 %，特异性为 87.30 %，在肺癌患者血清中检测的 7 种抗体中，至少有 1 项抗体浓度显著升高，多表现为 2 至多项抗体浓度同时升高。对患者不同年龄或性别、不同病理特征、或同一疾病的不同进展阶段进行统计分析 7 种抗体浓度水平，其表现没有明显统计学差异。同时对全部受试群体中的 352 例进行影像学检查患者的结果比较，为影像学上发现的直径小于 8mm 的肺部结节的判断及后续治疗方案提供了一项新的辅助诊断方法。

结论 联合检测 7 种肿瘤相关抗原自身抗体可以提供较为灵敏和特异的血清学检查，弥补传统血清学标志物在肺癌早期诊断方面的限制，降低肺癌的早期筛查成本。临床患者对此类仅需采血即可实现的便捷检查方法的接受程度较高。同时，此类血清学检测方法可与放射影像学和其他诊断策略配合使用，促进早期临床干预，实现早发现早治疗，提高患者的远期存活率，并为评估肺癌患病风险和鉴别诊断提供有效参考信息。

PO-0104

2016 年 11 月~2018 年 4 月哈尔滨医科大学附属第一医院胃泌素释放肽前体在肺癌中的临床意义

史永胜、金英玉
哈尔滨医科大学附属第一医院

研究目的和背景肺癌是世界上各国家和地区发病率和死亡率最高的恶性肿瘤之一，在我国城市肺癌的发病率和死亡率占所有恶性肿瘤的第一位，而且在我国农村上升速度也很快，肺癌对我国人民健康危害最严重。肺癌又分小细胞肺癌和非小细胞肺癌，小细胞肺癌和少数非小细胞肺癌肿瘤细胞产生和分泌胃泌素释放肽前体(Pro-GRP)小细胞肺癌患者(SCLC)血清中胃泌素释放肽前体(Pro-GRP)浓度升高显著，胃泌素释放肽前体(Pro-GRP)对小细胞肺癌(SCLC)诊断灵敏性和特异性明显高于其他十一项肺癌相关肿瘤标志物，对可疑肺癌而不能获得病理的患者:胃泌素释放肽前体有助于鉴别诊断小细胞肺癌和非小细胞肺癌患者。对小细胞肺癌患者疗效监测和再次病发诊断都优于神经元特异性烯醇化酶(NSE)等

PO-0105

天花粉蛋白通过影响 Foxp3 的泛素化水平增强 CD4+Treg 的体外诱导的初步研究

宣彬彬[1]、丁旭苹[2]、侯亚菲[2]、王雪[2]、武娇祥[1]、孙寒晓[1]、谭美玉[1]、盛慧明[1]、路丽明[2]
1. 上海交通大学医学院附属同仁医院
2. 上海市免疫学研究所

目的 我们前期研究发现中药天花粉蛋白（Trichosanthin，Tk）具有负向免疫调节的特性，体外低浓度即可提高 CD4+CD25+Foxp3+Treg 细胞诱导比例，但分子机制不明。Foxp3 作为 Treg 细胞的特异性转录因子，驱动 Treg 细胞的分化和功能行使。最新研究显示 Foxp3 蛋白的表达和稳定性受控于泛素化水平的修饰，如去泛素化酶成员 USP7（Ubiquitin specific peptidase 7）在维持 Foxp3 蛋白稳定性方面发挥着重要作用。我们研究关注 Tk 提高 Foxp3+Treg 细胞诱导比例，发挥免疫调节作用是否与其对 Foxp3 蛋白的泛素化水平的作用相关，Tk 是否通过激动去泛素化酶 USP7 的活性促进 Foxp3 蛋白的稳定性，换言之，本部分论文旨在探讨 Tk 是否可通过激动 USP7 来抑制 Foxp3 蛋白的泛素化降解，进而诱导增强 Treg 细胞发挥免疫调节功能。
方法 1．将 C57BL/6 雌性小鼠脾脏取出并制备淋巴细胞悬液，并通过与 Anti-CD3 mAb、Anti-CD28 mAb、TGF-β、IL-2 以及 Tk 进行共培养，使用流式细胞术检测 Tk 在体外对 Treg 细胞诱导增殖的影响；2. 构建稳定表达 Foxp3 基因的 HEK293T 细胞系，使用 Western Blot 检测 Tk 对 Foxp3 蛋白表达以及泛素化水平的作用；3.使用蛋白芯片、BLI 和 SPR 分析检测 Tk 与 USP7 之间的分子互作，并进一步探究 Tk 对 USP7 酶活性的影响。
结果 1.体外 Treg 细胞诱导体系中，Tk 的加入使 Treg 细胞的诱导增殖比例显著提升，Foxp3 蛋白的表达量明显升高；2.蛋白芯片、BLI 和 SPR 亲和力检测结果表明 USP7 与 Tk 可在体外发生紧密结合，BLI 检出二者 KD 值为 2.59×10-11（2.59E-11），提示二者亲和力很强；3.酶和底物实验表明 Tk 可显著增强 USP7 的酶活性，从而降低 Foxp3 蛋白的泛素化降解水平。

PO-0106

基于纳米抗体和介孔碳的电化学免疫传感及其在 CP4-EPSPS 检测中的应用研究

孙倩[1]、沈艳飞[1,2,3]
1. 东南大学医学院
2. 东南大学附属中大医院临床检验医学中心
3. 东南大学江苏省重症医学重点实验室

转基因作物的商业化种植在提高农业生产力的同时也引发了一系列涉及环境安全、人类健康等方面的问题。农杆菌 CP4 株的 5-烯醇式丙酮酰莽草酸-3-磷酸合酶（CP4-EPSPS）对光谱高效除草剂草甘膦具有较高的天然抗性，被认为一种潜在的转基因作物筛选的生物标志物。因此，实现 CP4-EPSPS 的灵敏特异性检测对转基因作物种植工程具有重要意义。而传统的液相色谱质谱联用法、聚合酶链式反应、酶联免疫吸附法等 CP4-EPSPS 检测策略往往因灵敏度较低、耗时较长或需要昂贵的设备，不适合日常使用。电化学免疫传感具有检测限较低、灵敏度较高、特异性较好和操作简便等优点，是一种在高效灵敏检测分析领域颇具潜力的检测方式。本工作通过耦合纳米抗体、有序介孔碳（OMC）和硫堇（Th）成功构建了对 CP4-EPSPS 具有高灵敏度和高选择性的电化学免疫传感器。其中，以免疫的双峰驼中筛选出的纳米抗体作为捕获剂比传统抗体表现出更高的稳定性和更强的耐热性；OMC 为组装氧化还原探针 Th 提供了具有高表面积、导电性和生物相容性的平台，并进一步耦联了大量捕获纳米抗体。通过差分脉冲伏安法在 0.001 至 100 $ng \cdot mL^{-1}$ 的宽线性范围内对 CP4-EPSPS 进行测定，检测限低至 0.72 $pg \cdot mL^{-1}$，比先前报道的工作低了 3 个数量级。该

电化学免疫传感器在 CP4-EPSPS 的筛选和检测中表现出巨大的应用潜力并为食品安全检测领域开辟了新的前景。

PO-0107

一种基于微流控免疫磁珠法的新型快速 ELISA 检测平台建立

蔡栋昊[1,2]、段朝晖[2]、罗晓红[2]、周小棉[3,4]
1. 广东省第二中医院
2. 中山大学孙逸仙纪念医院
3. 广州市宝创微流控产业化研究院
4. 广州市宝创生物技术有限公司

目的 本研究以华支睾吸虫检测为对象，利用微流控与免疫磁珠的技术优势，建立一种新型快速 ELISA 分析平台，以期解决传统 ELISA 法步骤繁琐、检测时间长、自动化成本高等不足。
方法 利用 Solidwork 软件进行微流控芯片设计，采用“六连孔”设计，机械加工及化学封接方法进行生产组装。同时，通过化学偶联方式制备华支睾吸虫抗原包被免疫磁珠，以 HRP-TMB-H_2O_2 作为显色体系，利用抗原抗体特异结合原理检测华支睾吸虫 IgG 抗体。经过临床样本检测，初步建立基于微流控免疫磁珠检测平台，并从灵敏度、特异性、符合率等方面进行对比评价。
结果 经过条件优化和验证，初步建立了一种基于微流控免疫磁珠原理的华支睾吸虫 IgG 抗体检测平台，整个实验过程仅需少量试剂用量，耗时约 30min 即可完成检测。方法学评价显示，与粪检结果比较，自建微流控免疫磁珠检测平台符合率为 97.2%，满足定性检测方法要求。灵敏度、特异性分别达到 96.6%、97.9%。
结论 本研究初步建立了一种基于微流控磁珠免疫原理的新型 ELISA 检测平台。该方法具有操作简便、耗时短、试剂及样本用量少等特点，满足临床定性检测项目要求，解决了传统 ELISA 检测方法的不足，具有良好的市场应用前景。

PO-0108

PD-L1 exosomes as predictive markers of immunotherapy for head and neck squamous cell carcinoma

Juan Wang[1]、Qing Wang[1]、Guoqiang Du[2]
1. The Affiliated Hospital of Qingdao University
2. 青岛市市立医院东部院区

Objective Head and neck squamous cell carcinoma (HNSCC) seriously affects the life quality of patients. PD-1/PD-L1 immune checkpoint inhibitor therapy has become the first-line treatment for HNSCC, however, it is not effective for all patients. Study has reported that the upregulation of PD-L1 is associated with tumorigenesis and poor prognosis of gastric cancer. Thus, PD-L1 exosomes can be used as predictive markers for the choice of PD-1/PD-L1 immune checkpoint inhibitor treatment.
Method In the present study, the expression of PD-L1 in HNSCC was detected by immunohistochemistry staining and Western blot in clinical samples. The exosomes were extracted from the cultural supernatant of HNSCC cells. In addition, the expression of PD-L1 on the exosomes was detected by FCM flow cytometry.
Result The results showed that PD-L1 was overexpressed in HNSCC tissues. Moreover, PD-L1 was overexpressed on the exosomes extracted from the cultural supernatant of HNSCC cells.
Conclusion The detection of the expression of PD-L1 on the exosomes will provide predictive value for the treatment of HNSCC via immune checkpoint inhibitors, which will help us to identify the patient population more likely to benefit from the immune checkpoint inhibitors.

PO-0109

妊娠期糖尿病患者肠道菌群代谢产物 TMAO 的检测意义初探

乐江漫[1,2]、盛慧明[2]
1. 上海市嘉定区妇幼保健院
2. 上海交通大学医学院附属同仁医院

目的 探讨血浆氧化三甲胺（TMAO）水平与妊娠期糖尿病（GDM）的相关性。
方法 回顾性分析 2019 年 3 月至 12 月于上海市嘉定区妇幼保健院定期进行产前检查的单胎妊娠孕妇 272 例，其中妊娠期糖尿病组（GDM 组）178 例，正常孕妇组（non-GDM 组）94 例。分别记录两组的年龄、孕前 BMI 等一般特征、孕早期血糖、血脂等血清学检测指标和口服糖耐量试验（OGTT）0h、1h、2h 血糖水平。采用液相色谱质谱联用分析法检测血浆 TMAO 浓度，多因素 Logistic 回归分析血浆 TMAO 与妊娠期糖尿病的相关性。
结果 GDM 组与 non-GDM 组孕妇孕早期甘油三酯（TG）、空腹血糖（FBG）、孕中 TMAO 水平及 OGTT 0h、1h、2h 血糖水平分别为 1.56mmol/L（1.22,2.10）与 1.43mmol/L（1.08,1.68）（ t=2.995,p=0.003 ） 、 4.55mmol/L （ 4.25,4.91 ） 与 4.34mmol/L （ 4.14,4.59 ）（t=3.774,p=0.000）、1.35umol/L (1.01,1.86)与 1.14umol/L (0.82,1.67)（t=2.390,p=0.017）、4.74mmol/L (4.41,5.24)与 4.34mmol/L (4.17,4.60)（t=7.050,p=0.000）、9.88mmol/L (8.80,10.50)与 6.68mmol/L (5.68,7.82)mmol/L（t=11.100,p=0.000）、8.78mmol/L (8.13,9.56)与 6.12mmol/L (5.40,6.80)（t=11.219,p=0.000），差异均有统计学意义（p<0.05）。多因素 Logistic 回归分析结果显示，在校正了多个单因素变量后，TMAO（OR1.514,95%CI:1.079-2.125）水平高仍是 GDM 发病的独立危险因素。
结论 孕中期血浆 TMAO 水平与发生妊娠期糖尿病的风险呈正相关，肠道菌群有望成为 GDM 防治新靶点。

PO-0110

CX3CR1 肠道巨噬细胞通过平衡肠道菌群和调节免疫功能治疗溃疡性结肠炎的机制研究

田文杰、王学锋
上海交通大学医学院附属瑞金医院

目的 肠道巨噬细胞与肠道菌群之间的相互影响对平衡肠道稳态，预防溃疡性结肠炎（ulcerative colitis，UC）的发生至关重要。$CX3CR1^{high}$ 肠道巨噬细胞在抗炎、保护肠粘膜和吞噬菌群中都发挥着重要的作用，然而减少 $CX3CR1^{high}$ 肠道巨噬细胞是否能引起肠道菌群组成的改变进而影响 UC 的发生是未知的，因此本研究主要探讨了 $CX3CR1^{high}$ 肠道巨噬细胞是否能够改变肠道菌群组成以及这个改变对溃疡性结肠炎的作用。
方法 把 10 只正常 C57 小鼠平均分成 2 组，分别是实验组和对照组，实验组予以腹腔注射巨噬细胞耗竭剂氯氟松，对照组注射同等剂量的 PBS，24h 后予以处死，首先，留取结肠组织提取肠固有层淋巴细胞进行流式细胞术分析巨噬细胞耗竭情况；其次，留取粪便 DNA 进行 16SrRNA 测序分析肠道微生物多样性；最后，借助菌群敲除和粪便移植实验评估受 $CX3CR1^{high}$ 肠道巨噬细胞影响的菌群对葡聚糖硫酸钠（dextran sulphate sodium，DSS）诱导的肠炎的作用。
结果 在稳态下，$CX3CR1^{high}$ 肠道巨噬细胞对巨噬细胞耗竭剂较为敏感，耗竭效率约为 60%；$CX3CR1^{high}$ 巨噬细胞减少后，肠道菌群的多样性显著下降，菌群组成也发生了明显变化，主要表现为变形杆菌属、肠球菌属和葡萄球菌属等有害菌明显减少，拟杆菌属等有益菌明显增多；借助广谱抗生素敲除小鼠的肠道菌群，然后移植氟氯松处理 24h 后的小鼠的粪便，发现 DSS 诱导肠炎的症状明显减轻，肠道固有层淋巴细胞中 Th17 和 $IL\text{-}17A^{+}$ $INF\text{-}\gamma^{+}T$ 细胞的比例也明显下降。

结论 CX3CR1^{high}巨噬细胞耗竭有可能通过平衡肠道菌群，调节 Th17 和 IL-17A^{+} INF-γ^{+}T 细胞比例从而改善 DSS 肠炎。本研究为有效治疗肠炎提供了新的实验依据。

PO-0111

2016-2020 年南京地区住院患儿呼吸道合胞病毒感染的流行特点分析

温忠亭、徐静茹
南京医科大学第二附属医院

目的 回顾 2016-2020 年本院住院 14 岁以下儿童因合胞病毒（RSV）引发的呼吸道疾病的感染情况，分析南京地区儿童 RSV 的流行特点。为临床防治儿童 RSV 感染提供理论指导和科学依据。
方法 收集 2016 年 4 月-2020 年 4 月南京城区及周边江宁、浦口、六合郊区等地 14 岁以下因呼吸道感染住院患儿病例共 10625 例，用直接荧光法检测呼吸道分泌物中 RSV 抗体。应用 SPSS18.0 软件对 RSV 感染资料进行统计学分析。
结果 1. RSV 感染儿 533 例，感染率为 5.01%。男女感染率分别是 5.41%和 4.50%.有显著差异。
2. RSV 感染年龄分布于 0-14 岁之间，其中 0-28 天(新生儿组）、29 天-1 岁（婴儿组）、1-3 岁（幼儿组）、3-14 岁（儿童组）感染率分别为 4.12%、8.14%、4.45%、2.22%，婴儿组感染率最高，各年龄段有显著差异。
3. RSV 感染引发的疾病主要为肺炎、毛细支气管炎和哮喘。其中肺炎感染最多，占所有疾病的 71%，婴儿组感染率最高为 5.64%。
4. RSV 感染主要分布于秋冬两季,占全年感染人数的 75%，其中冬季感染率最高为 7.44%，其次是秋季，感染率为 6.03%。
5. 针对近四年南京流行季节气温研究，气温平稳 RSV 无明显变化,阳性率在较冷气温偏高。
6. 南京地区 RSV 感染符合华东、华中、华北地域流行特点，与东北、华南、西南、西北、台湾等地区的 RSV 感染有地域性差异。
结论 近年来南京地区 RSV 感染趋于平稳，儿童 RSV 感染的防治工作需要全年全区域进行，其重点是针对秋冬季节对 0-3 岁儿童（尤为男性）肺炎的防治。

PO-0112

流式荧光免疫法检测肝病相关自身抗体的评价及其对原发性胆汁性胆管炎的诊断价值

王战、王麟、姚远、刘静、孙桂荣、刘明军
青岛大学附属医院

目的 应用多重微球流式荧光免疫法（MBFFI）检测肝病相关自身抗体，将 MBFFI 定量检测肝病相关自身抗体的结果与免疫印迹法（IBT）进行比较与分析评价，进一步评估其对原发性胆汁性胆管炎（PBC）的诊断价值。
方法 选取 2018 年 8 月至 2020 年 12 月于青岛大学附属医院就诊并临床确诊的 PBC 患者 340 例。其他疾病组包括自身免疫性肝病（AIH）患者 81 例与系统性红斑狼疮（SLE）患者 62 例。健康对照组包括健康体检者 117 例。分别应用 MBFFI 与 IBT 两种检测方法检测 600 例受试者血清中五种肝病相关自身抗体，应用一致性检验比较检测结果的一致性；应用灵敏度、特异度、阳性预测值、阴性预测值、约登指数及 AUC 值等指标评估 MBFFI 检测 AMA-M2、gp210 与 sp100 抗体对 PBC 的诊断价值。

结果 总体样本中两种方法检测一致性最好的抗体为 AMA-M2（Kappa=0.895）。MBFFI 与 IBT 检测 PBC 患者血清 AMA-M2、gp210、sp100、SLA 与 LC-1 抗体的一致率分别为 95.00%，88.24%，92.05%，97.94%，96.76%；Kappa 值分别为 0.874，0.713，0749，0.393，0.361；AIH 组五种抗体的一致率分别为 85.19%，91.36%，91.36%，97.53%，96.30%；Kappa 值分别为 0.289，0.318，0.327，0.738，0.556。PBC 组患者检测 AMA-M2、gp210、sp100 抗体的一致性高于 AIH 组。AIH 组患者检测 SLA、LC-1 抗体的一致性高于 PBC 组。MBFFI 检测 PBC 组 AMA-M2、gp210 与 sp100 抗体的灵敏度分别为（72.06%、28.24%、22.35%）；gp210 与 sp100 两种抗体联合检测的灵敏度（44.71%）高于该两种抗体的单项检测，AMA-M2、gp210 与 sp100 三种抗体联合检测的灵敏度（82.65%）高于该 3 种抗体的单项检测。三种抗体联合检测诊断 PBC 的 AUC 值最大（0.9070）。
结论 MBFFI 检测 AMA-M2、gp210 与 sp100 抗体与 IBT 检测结果相比一致性较好。MBFFI 联合检测 AMA-M2、gp210 和 sp100 抗体对 PBC 的诊断价值更大。
MBFFI 可能成为 PBC 相关自身抗体的常用检测方法。

PO-0113

ZNF148 在儿童类风湿关节炎中的作用机制及信号通路研究

黄伟
江西省儿童医院

目的 本课题前期研究显示，ZNF148 对儿童类风湿关节炎的发生发展具有显著相关性并且 ZNFΔN 与 ZNF148FL 存在着功能的拮抗性。另有实验证实 TNF-α 可通过上调类风湿关节炎人滑膜肉瘤细胞系（SW982）细胞中的 miR-147 表达，miR-147 通过再调控转录因子 ZNF148 的表达，从而影响 SW982 细胞的凋亡。然而，类风湿关节炎有关 ZNF148 的下游信号通路并未十分明确，这使得我们研究探索 ZNF148 下游特异的靶基因变得更加有意义。
方法 通过分析 TCGA data，检测 ZEB-AS1 表达水平与儿童类风湿关节炎是否存在相关性。Q-PCR 分析儿童类风湿关节炎 SW982 细胞中 ZEB-AS1 和 SDHA、SDHB 的表达水平。
结果 Q-PCR 分析结果表明 ZEB-AS1 水平和 SDHA/SDHB 的表达水平均呈负相关，且 ZEB-AS1 水平与 SDHB 的相关性更高。在 ZEB1-AS1 高表达 SW982 细胞株中，转染 ZEB1-AS1 SiRNA, 然后利用 QPCR 分析 ZEB-AS1 表达水平降低后，细胞 SDHA 和 ZEB 的表达水平变化。结果表明 ZEB-AS1 表达水平降低后，SDHA mRNA 表达水平升高约 1.7 倍；ZEB-AS1 表达水平降低后，转录因子 ZEB1 mRNA 表达水平降低 90%（均 P<0.05）。
结论 RNA ZEB-AS1 通过调控转录因子 ZEB1 的表达，影响了线粒体三羧酸循环相关蛋白 SDH 的表达，引起细胞内琥珀酸含量升高；琥珀酸含量升高抑制了 TET 家族蛋白活性，细胞内 CIMP 水平升高，最终影响 SW982 细胞的凋亡可能是导致类风湿关节炎发生的重要原因。

PO-0114

The imbalance of TIGIT and CD226 on Treg in recurrent spontaneous abortion patients

段忠亮、应春妹
复旦大学附属妇产科医院

Objective To evaluate the role of TIGIT and CD226 on peripheral Treg cells in the patients of recurrent spontaneous abortion (RSA).
Methods Detecting the proportion of CD226 and TIGIT on Tregs in pregnant women and RSA patients, as well as cytokines TGF-β, IL-10 and IFN-γ in different Treg subsets, from 31 normal pregnant women and 26 RSA patients.

Results Compared with normal pregnant women, the expression of TIGIT on Tregs was lower in RSA patients (34.35±8.59% vs 47.52±9.52). The ratio of CD226 to TIGIT in RSA group (2.44±1.02) was higher than that in control group (1.56±0.95). TGF-β and IL-10 in TIGIT+ Treg were higher than that in TIGIT- Treg, and IL-10 in CD226+ Treg was higher, while IFN-γ in these subsets showed no significant difference. The TIGIT+CD226+ Treg cells subset was significantly higher in RSA patients.
Conclusions TIGIT and CD226 molecules may play a role in maintaining maternal-fetal immune tolerance through Treg, and there is an imbalance of TIGIT and CD226 on Treg in recurrent spontaneous abortion patients.

PO-0115

Non-neutralizing epitopes induce robust hepatitis C virus (HCV)-specific antibody-dependent CD56+ natural killer cell responses in chronic HCV-infected patients

Lu Long[1]、Tao Shen[2]
1. Shanghai Ninth People's Hospital, Shanghai JiaoTong University School of Medicine
2. 北京大学医学部基础医学院病原生物学系

Natural killer (NK) cell-mediated antibody-dependent cellular cytotoxicity (NK-ADCC) is of considerable interest in viral infection. However, little is known about NK-ADCC responses in chronic hepatitis C virus (HCV) infection. In this study, impaired non-specific antibody-dependent CD56+ NK cell responses were observed in chronic HCV infection, as shown by decreased degranulation (extracellular CD107a expression) and interferon (IFN)-γ production in response to antibody-bound P815 cells. A peptide pool composed of epitopes recognized by anti-HCV-E1/E2 antibodies could induce pronounced HCV-specific antibody-dependent NK cell responses in sera from approximately half the chronic HCV carriers. Additionally, HCV-specific epitopes with the capacity to induce robust NK-ADCC activity were identified. Five linear NK-ADCC epitopes (aa211-aa217, aa384-aa391, aa464-aa475, aa544-aa551 and aa648-aa659 of the HCV envelope) were identified and do not overlap with putative linear neutralizing epitopes. This study revealed the dysfunctional characteristics of antibody-dependent CD56+ NK cell responses in chronic HCV carriers. The key non-neutralizing NK-ADCC epitopes identified in this study may act as new targets for immunological intervention.

PO-0116

Comparison of analytic and clinical performance of two immunoassays for detecting thyroid-stimulating receptor antibody in the diagnosis of Graves' disease

Yao Hu、Ming Guan、Buyue Zhang、Yi Cen、Wenqing Wu、Mingying Huang
Department of Laboratory Medicine, Huashan Hospital, Shanghai Medical College, Fudan University

Objective Differentiate between Thyroid stimulating hormone (TSH) receptor (TSHR) autoantibodies (TRAbs) types and its heterogeneous molecular is essential for Graves' disease (GD) diagnosis. The aim of the present study was to evaluate the analytical and clinical performance of two immunoassay for diagnosis of GD, the Immulite thyroid-stimulating immunoglobulin (TSI) and Elecsys Anti-TSH receptor (TSHR) assay.
Methods Precision and analytical measurement range were assessed using pooled samples of patients. The comparison between the two methods was evaluated using 579 clinical samples (81 patients with untreated GD, 85 patients with treated GD, 79 patients with Hashimoto's thyroiditis,

103 patients with thyroid nodules, 96 patients with hypothyroidism, 59 patients with nontoxic goiter, and 56 patients with thyroid cyst and 20 euthyroid healthy subjects), and receiver operating characteristic (ROC) curves were drawn using the final diagnosis as reference. Clinical sensitivity and specificity, accuracy, positive predictive value (PPV) and negative predictive value (NPV) were calculated for the two tests. The inconsistent results of the two methods were investigated and confirmed by the clinical diagnosis.
Results The repeatability and intermediate imprecision coefficient of variation (CV%) of the TSI assay were 3.8% and 4.1% at 0.95 IU/L, and 3.5% and3.6% at 19.5IU/L, respectively. The assays were linear over a range of 0.27 to 38.5 IU/L. The Anti-TSHR assay had repeatability and intermediate imprecision 7.0% and 7.8% at 1.5IU/L, and 1.7% and 2.0% at 21.0 IU/L, respectively. The analytical measurement range was from 1.0 to 38.5 IU/L. There was a high correlation between the quantitative results of the two methods (correlation coefficient r= 0.930). The cut-off value obtained by ROC analysis for TSI assay was 0.7 IU/L with sensitivity of 93.7% and specificity of 85.1%, while it was 2.5 IU/L for Anti-TSHR assay with sensitivity of 92.5% and specificity of 86.7%. An overall qualitative agreement of 91.5% between two methods was observed. Among 44 patients with discordant qualitative results, the TSI assay provided more satisfactory results consistent with clinical diagnoses.
Conclusion The TSI assay showed excellent analytical performance and provided a high PPV for GD.

PO-0117

Establishment of reference intervals of monomeric prolactin to identify macroprolactinemia in Chinese patients with increased total prolactin

Yao Hu、Ming Guan、Jiajin Ni、Buyue Zhang、Wei Cheng、Huating Zhang
Department of Laboratory Medicine, Huashan Hospital, Shanghai Medical College, Fudan University

Background Macroprolactin is responsible for pseudohyperprolactinemia and is a common pitfall of the prolactin immunoassay. We aimed to determine the frequency of macroprolactinemia in Chinese hyperprolactinemic patients using monomeric prolactin discriminated by precipitation with polyethylene glycol (PEG).
Methods Post-PEG monomeric prolactin gender-specific reference intervals were established for the Elecsys immunoassay method (Roche Diagnostics) using sera from healthy female (n = 120) and male (n = 120) donors. The reference intervals were validated using 20 macroprolactinemic (as assessed by gel filtration chromatography (GFC)) sera samples, and presence of monomeric prolactin was discriminated by GFC. Patients with high total prolactin were then screened by PEG precipitation to analyze macroprolactin. The demographic and biochemical details of patients with true hyperprolactinemia and macroprolactinemia were compared.
Results Reference intervals for monomeric prolactin in females and males were 3.4–18.5 and 2.7-13.1 ng/mL, respectively. Among 1140 hyperprolactinemic patients, macroprolactinemia was identified in 261 (22.9%) patients while the other 879 (77.1%) patients were diagnosed with true hyperprolactinemia. Menstrual disturbances were the most common clinical feature in both groups. Galactorrhea, amenorrhea, and visual disturbances occurred more frequently in true hyperprolactinemic patients ($P < 0.05$).
Conclusions The prevalence of macroprolactin in Chinese patients with hyperprolactinemia was described for the first time. Monomeric prolactin concentration, along with a reference interval screening with PEG precipitation, provides a diagnostic approach for hyperprolactinemia with improved accuracy.

PO-0118

抗中性粒细胞胞浆抗体间接免疫荧光法和免疫印迹法不一致结果原因分析

刘婷、陈国敏、龙贵萍、彭潮燕、付正乾、苏蒙
贵州金域医学检验中心有限公司

目的 对中性粒细胞胞浆抗体的间接免疫荧光法和免疫印迹法不一致结果进行分析。
方法 采用间接免疫荧光法和免疫印迹法同时检测 10178 例临床样本的抗中性粒细胞胞浆抗体，并对不一致的结果进行回顾性分析。
结果 分析 10178 例样本结果，109 例 C-ANCA 和 PR3 结果不符合；628 例 P-ANCA 与 MPO 结果不符合。排除病人资料不全的病例，共 301 例不一致结果入选进行分析。301 例样本中男女比例为 1:2.46；疾病分类中血管炎疾病为 26 例，其中包含 ANCA 相关性血管炎 5 例，自身免疫性疾病 127 例，最常见为系统性红斑狼疮和类风湿性关节炎，其他非自身免疫疾病 148 例，其中慢性肾功能衰竭最常见。ANCA 结果不一致的分型四种中以第一型 C-ANCA(+)/PR3(-)（53/301,17.6%）和第三型 P-ANCA(+)/MPO(-)（209/301,69.4%）为常见。
结论 间接免疫荧光法和免疫印迹法两种方法学联合检测 ANCA 因方法学不同和检测原理需要根据临床病例情况和实际结果具体分析，对血管炎和相关疾病的诊断、分类和预后有重要意义。

PO-0119

AFP 和 PIVKAⅡ检测对肝癌的诊断价值及其与肝癌大小的相关性研究

张凤、司元全
山东第一医科大学附属省立医院

目的 探讨甲胎蛋白（AFP） 和异常凝血酶原Ⅱ（PIVKAⅡ）检测对原发性肝癌(PHC)的诊断价值以及二者浓度与肝癌肿瘤大小、病理分级的相关性。
方法 收集 77 例 PHC 患者和 80 例良性肝病患者的血清，分别进行 AFP 和 PIVKAⅡ的检测，采用受试者工作特性曲线(ROC)评估二者在 PHC 诊断的应用价值，同时分析二者含量与肝癌患者病理分级、癌灶大小的关系。
结果 经 Mann-Whitney U 检验，PHC 组与对照组比较，AFP 和 PIVKAⅡ二项指标检测结果差异均具有统计学意义（Z 值分别为 4.94、8.03，P 均<0.01）；AFP 和 PIVKAⅡ单独运用诊断 PHC 的 ROC 曲线下面积（AUC）分别为 0.728(95% CI，0.650～0.807)、0.871(95% CI，0.814～0.929)，血清 PIVKAⅡ用于诊断 PHC 的诊断价值优于 AFP（Z=1.75，P<0.05）；PHC 患者血清 AFP、PIVKAⅡ浓度与肿瘤切面积呈正相关(r 值分别为 0.310，0.686，P 均<0.01)；不同病理分级的 PHC 患者血清 AFP、PIVKAⅡ浓度差别具有统计学意义（P 均<0.05）。
结论 检测 PHC 患者血清 AFP 和 PIVKAⅡ对肝癌诊断具有重要意义，同时发现 PIVKAⅡ的诊断价值优于 AFP，且 AFP 和 PIVKAⅡ浓度对于判断癌灶的大小及病理分级具有重要临床价值。

PO-0120

血清 PIVKA-II 联合 FIB 对 AFP 阴性肝癌患者的预后监测价值

张永瑞[1]、孙娅红[2]
1. 云南省肿瘤医院
2. 昆明医科大学

目的 探讨 PIVKA-II、FIB 及其联合应用在 AFP 阴性肝癌中的预后价值，为肝癌患者的预后评估提供实验室依据。
方法 选取 2017 年 10 月至 2019 年 12 月期间云南省肿瘤医院收治的确诊为 AFP 阴性的原发性肝癌患者，回顾性收集其初诊时的肝功能及凝血指标检测值，并进行跟踪随访。运用 R 语言、SPSS22.0 统计分析，探讨 PIVKA-II 联合 FIB 在 AFP 阴性肝癌患者预后评估中的临床价值，评估单个指标、联合指标对 AFP 阴性肝癌患者预后之间的关系并对其进行验证。
结果 本研究共纳入研究对象 135 人。截止随访时间，失访 23 人（17%）根据随访结局分为存活组（48 例，占 42.9%）和死亡组（64 例，占 57.1%）。本研究结果表明年龄、FIB 与 AFP 阴性 PHC 预后独立相关，可作为 AFP 阴性 PHC 的预后因素。联合 PIVKA-II 和 FIB（AUC=0.728，95%置信区间 0.634-0.822, P=<0.001，最佳临界值 0.55，灵敏度 58.3%，特异度 87.5%）对 AFP 阴性肝癌患者的预后监测效果优于 PIVKA-II（AUC=0.625，95%置信区间 0.521-0.729,P=0.024<0.05，最佳临界值 156.825mAU/ml，灵敏度 91.7%，特异度 41%）、FIB（AUC=0.274，95%置信区间 0.180-0.368，P=<0.001，最佳临界值 3.245g/l，灵敏度 41.7%，特异度 12.5%）单个指标对 AFP 阴性肝癌患者的预后监测效果。基于患者年龄、性别、乙肝病史、FIB 与 PIVKA-II 联合建立 Cox 回归预测模型，对模型进行验证评估后，显示模型预测能力、准确性和临床实用性较好。
结论 本研究结果表明了年龄、FIB 与 AFP 阴性 PHC 预后的独立相关。可作为 AFP 阴性 PHC 的预后因素。联合 PIVKA-II 和 FIB 对 AFP 阴性肝癌患者的预后监测效果优于 PIVKA-II、FIB 单个指标对 AFP 阴性肝癌患者的预后监测效果。联合患者年龄、性别、乙肝病史、FIB 与 PIVKA-II 建立预测模型，并对模型进行验证评估后，显示模型预测能力、准确性和临床实用性较好。表明建立的 Cox 预测模型可作为监测 AFP 阴性 PHC 预后的工具。具有一定的临床使用价值。

PO-0121

第四代 HIV 诊断试剂在重组新型冠状病毒疫苗受试者中 HIV 抗体假阳性原因分析

许成新
上海交通大学附属第一人民医院嘉定分院

目的 与免疫印迹试验(WB)结果比较，分析第四代人类免疫缺陷病毒(HIV)抗体化学发光免疫分析(CLIA)诊断试剂筛查结果在重组新型冠状病毒疫苗受试者中 HIV 抗体阳性与免疫印迹试验(WB)结果不同，分析引起假阳性的原因，评估 CLIA 法 HIV 筛查在艾滋病诊断中的临床价值。
方法 CLIA 法对 2020 年 8 月－2021 年 5 月本院 5969 例患者进行 HIV 抗体初筛检测，其中选取接受 19 例重组新型冠状病毒疫苗受试者患者，HIV 第四代诊断试剂检测初筛阳性的标本，送 HIV 确诊实验室用 WB 法确证 HIV 抗体结果，记录结果并进行对比分析，探讨出现假阳性的原因。
结果 CLIA 法初筛阳性 19 例，WB 确证阳性 2 例，4 例 HIV 抗体不确定，13 例 HIV 抗体阴性。CLIA 初筛方法确证阳性率为 10.52%。WB 确证阳性患者 CLIA 法 S/CO 值为 303.20(146.50，645.68)，与确证阴性患者 S/CO 值［1.8(1.24，2.98)］和确证不确定患者 S/CO 值［1.48(1.20，3.36)］差异有统计学意义(P＜0.05)。比较 1＜S/CO≤10、10＜S/CO≤50 及 S/CO＞50 三组，WB

法获得的阳性率的差异有统计学意义(P＜0.05)。随着 S/CO 值的增高，初筛结果与确证结果阳性符合率也随之升高。

结论 重组新型冠状病毒疫苗受试者患者，CLIA 法筛查 HIV 抗体灵敏度较高，HIV 四代检测试剂存在较高的假阳性率，尤其是低 S/CO 值的标本，这与试剂同时检测 HIV 抗体和 P24 抗原有关。较高的 S/CO 值的患者 HIV 感染的风险较大，但是高 S/CO 值并不代表 HIV 感染，应进一步推进诊断试剂的研发和改进进程，助力临床精准医疗，当 1<S/CO≦10 时，实验室检测人员应依据实验检测结果，结合受检者相应病史和个体状况进行综合分析。

PO-0122

慢性乙型病毒性肝炎相关肝细胞癌患者免疫功能与性激素分泌关系的研究

袁梦娇、龚倩
复旦大学附属中山医院青浦分院

目的 探讨不同慢性乙型肝炎病毒（chronic hepatitis B virus，CHB）感染期男性患者及 CHB 相关肝细胞癌（Hepatocellular Carcinoma，HCC）患者免疫功能表达差异，及各组免疫功能与性激素分泌之间的关系，为疾病治疗监测、进展及后续治疗方面研究提供一定的临床数据。

方法 收集 CHB 患者 57 例，按照 2017 版欧洲肝病学会指南分为 4 个期：HBeAg+慢性感染期、HBeAg+慢性肝炎期、HBeAg-慢性感染期、HBeAg-慢性肝炎期，根据术中病理结果筛选出确诊为 HCC 的患者。利用检验科 FACS Canto II 流式细胞仪进行 T 淋巴、B 淋巴、Th 淋巴、NK 细胞亚群检测，HITACHI 7600 全自动生化分析仪检测补体 C3、C4，CobasE 801 全自动电化学发光分析仪采用竞争法、电化学发光法定量检测 E2、睾酮。非正态分布数据采用 t 检验非配对分析。

结果 1）病例中 HBeAg 阳性的慢性 HBV 感染和慢性 HBV 肝炎，HBeAg 阴性的慢性 HBV 感染和 HBV 肝炎各期患者年龄主要以 40 岁以上分布，其中大于 60 岁患者占 36.84%，50-59 岁患者占 29.82%，40-49 岁患者占 22.81%。2）淋巴细胞表达差异：HBeAg 阳性的慢性 HBV 感染和慢性 HBV 肝炎，HBeAg 阴性的慢性 HBV 感染和 HBV 肝炎各期各组间淋巴细胞表达，除 B 淋巴细胞外（p＜0.05），其余各组间无明显差异。3）CHB 与 CHB-HCC 患者补体、细胞因子表达差异：各组间 C3 表达差异明显（p＜0.01），各组 IL-2 表达有明显差异（p＜0.01）。4）CHB、CHB-HCC 患者性激素表达差异：CHB 与健康对照组间睾酮（TESTO）的表达有明显差异，CHB 患者 TESTO 表达高于健康对照组（p＜0.05）。

结论 随着疾病的进展，慢性 HBV 感染患者免疫状态发生变化，免疫指标可作为慢性 HBV 感染临床病情演变、治疗效果及疾病预后的参考依据。不同感染期 CHB 患者性激素睾酮表达有差异。

PO-0123

HBx 基因对 HepG2．2．15 细胞 MICA－A5．1 表达及侵袭、迁移的影响

李沛
南华大学附属第一医院

目的 探究 HBx 基因对 HepG2．2．15 细胞侵袭、迁移及主要组织相容性复合体(MHC) Ⅰ类链相关基因 A (MICA)－A5. 1 表达的影响。

方法 体外培养 HepG2．2．15 细胞系(插入 HBV 全基因组并持续表达的 HepG2 细胞) ，随机分为对照组、HBx 过表达质粒组、HBx 空载质粒组、HBx siＲNA 组、HBx siＲNA 阴性对照组，分

别转染质粒及 siRNA 后，以 CKK － 8 法分别检测 24 h、48 h 后细胞增殖情况，筛选合适药物作用时间; 以 Transwell 侵袭实验和细胞划痕实验检测各组细胞侵袭迁移能力; 以免疫印记法检测 HBx、MI- CA － A5． 1 蛋白和上皮间质转化标志蛋白 E － cadherin、Vimentin 的表达; 以酶联免疫吸附法检测各组细胞培养基中 sMICA 水平。计量资料多组间比较采用单因素方差分析，进一步两两比较采用 SNK q 检验。

结果 与对照组比较，24 h 后，HBx 过表达质粒组细胞活力升高，HBx siRNA 组细胞活力降低，差异均有统计学意义(q 值分别为 8． 268、4． 365，P 值分别为 ＜ 0． 001、0． 036) ; 48 h 后，HBx 过表达质粒组细胞活力升高，HBx siRNA 组细胞活力降低，差异均有统计学意义(q 值分别为 12. 680、7． 523，P 值均 ＜ 0． 001) 。与对照组比较，HBx 过表达质粒组细胞 HBx、MICA 及 Vimentin 蛋白表达、细胞培养基中 sMICA 水平、迁移细胞数目、侵出 Transwell 小室的细胞数目均升高，E － cadherin 表达降低(q 值分别为 9． 427、6． 697、10． 500、5． 042、22． 740、15． 720、5． 258，P 值均 ＜ 0． 05) ; HBx si R - NA 组细胞 HBx、MICA 及 Vimentin 蛋白表达、细胞培养基中 sMICA 水平、迁移细胞数目、侵出 Transwell 小室的细胞数目均降低，E － cadherin 表达升高(q 值分别为 8． 133、8． 828、7． 616、7． 673、5． 391、7． 694、6． 226，P 值均 ＜ 0． 05) 。

结论 HBx 基因调控 HepG2． 2． 15 细胞 MICA － A5． 1 表达及侵袭、迁移，上调该基因可促进 MICA － A5． 1 表达，增强 HepG2． 2． 15 细胞侵袭转移能力。

PO-0124

细胞焦亡在肿瘤发生发展及抗肿瘤免疫中的研究进展

李可馨、崔巍
中国医学科学院肿瘤医院

目的 细胞焦亡是一种不同于细胞凋亡和坏死性凋亡的促炎性细胞程序性死亡方式，研究发现细胞焦亡在肿瘤发生发展和抗肿瘤免疫反应方面均发挥一定作用。将细胞焦亡的分子机制其对肿瘤治疗中的作用，尤其是在抗肿瘤免疫中研究进展进行总结及展望，旨在为肿瘤联合免疫治疗提供新的思路。

方法 本文总结了近年来细胞焦亡在肿瘤发生发展尤其是抗肿瘤免疫中的作用，分析了基于细胞焦亡的抗肿瘤机制在肿瘤免疫治疗和联合治疗中的潜在价值。

结果 细胞焦亡主要特征为炎症小体和含半胱氨酸的天冬氨酸蛋白水解酶家族的活化及切割 Gasdermin 家族成员，从而使细胞膜出现孔洞并伴随炎性细胞因子的释放及一系列炎症反应。其中 Gasdermin 家族作为细胞焦亡发生的主要执行者。细胞焦亡在肿瘤的发生发展中常表现出促进和抑制肿瘤细胞生长的双重作用。一方面细胞焦亡可以抑制肿瘤生长，另一方面过度激活的焦亡途径也可引起大量炎症反应的发生，使正常组织或细胞长期处于炎症环境中，而增加肿瘤发生的风险，为肿瘤细胞提供适宜生存的微环境。细胞焦亡可通过促进抗肿瘤免疫反应而影响肿瘤免疫治疗的疗效。由于细胞焦亡能够激活抗肿瘤免疫反应，使肿瘤微环境由“冷”向“热”转变，因此可在免疫活性低或对免疫检查点抑制剂及其他免疫疗法无反应的肿瘤患者中诱导焦亡，或在表观遗传上沉默的肿瘤患者中诱导 GSDMD/GSDME 的表达从而促进焦亡途径的激活。T 细胞可能通过影响肿瘤细胞焦亡从而影响肿瘤免疫对肿瘤细胞的抑制作用。

结论 细胞焦亡参与肿瘤的发生发展中，并影响抗肿瘤免疫反应。通过合理的焦亡诱导剂联合免疫检查点抑制剂治疗可能增强抗肿瘤免疫活性，提高患者获益程度。

PO-0125

CCL15 在脓毒症免疫病理过程中的作用及机制研究

黄丽莉
重庆医科大学附属第一医院

目的 检测脓毒症中 CCL15 的含量，探究 CCL15 在脓毒症免疫病理中的作用和机制。
方法 ELISA 检测脓毒症患者和建立脓毒症模型后小鼠血清中 CCL15 含量；给脓毒症小鼠补充重组 CCL15 蛋白或者 PBS，探究 CCL15 对生存率的影响；通过 HE 染色和生化指标检测评估器官损伤；用流式细胞术检测吞噬细胞比例变化，用细菌感染巨噬细胞，探究 CCL15 对细胞吞噬杀伤的影响。
结果 脓毒症患者血清中 CCL15 含量较健康对照者显著增加，且脓毒症小鼠血清中 CCL15 水平也较对照小鼠显著升高；给脓毒症小鼠补充 CCL15 蛋白后，与对照组相比，小鼠生存率明显增加，生化及 HE 染色切片显示器官损伤显著改善，细菌载量降低，促进腹腔灌洗液中细胞募集。
结论 CCL15 在脓毒症中表达增加，通过促进细菌清除、改善器官损伤发挥免疫保护作用，从而改善生存率。

PO-0126

恶性肿瘤患者血清抗 Stathmin 自身抗体检测方法的建立及初步评价

陈曦、董轲
空军军医大学唐都医院

恶性肿瘤是引起患者死亡的主要诱因之一，且其发病率及死亡率呈逐年上升趋势。如能早期发现和治疗，恶性肿瘤的死亡率及预后将会大幅改善，因此探索适用于早期诊断和预防性筛查的新型肿瘤标志物至关重要。
目的 探讨不同类型肿瘤患者血清中是否存在癌蛋白 Stathmin 的自身抗体并对其检测方法进行初步评价。
方法 表达、纯化人源 Stathmin 蛋白并建立酶联免疫吸附实验（Elisa）检测血清 Stathmin 自身抗体的操作流程。应用新建立的 Elisa 方法检测 483 例恶性肿瘤患者血清和 230 例正常人血清中 Stathmin 自身抗体，统计学分析检测结果差异性。
结果 Elisa 分析显示 483 例肿瘤患者血清 1:50 稀释条件下，Stathmin 自身抗体阳性患者为 217 例，阳性率为 45%；230 例正常血清 1:50 稀释条件下，仅有 2 例为阳性，阳性率为 0.9%。不同肿瘤患者的结果如下：88 例胃癌患者血清有 48 例阳性，阳性率为 54%；96 例肝癌患者血清有 40 例阳性，阳性率为 42%；88 例直肠癌患者血清有 36 例阳性，阳性率为 41%；98 例乳腺癌患者有 35 例阳性，阳性率为 36%；113 例肺癌患者有 58 例阳性，阳性率为 51%。恶性肿瘤患者阳性率与正常人对照比较，均有统计学差异（$P<0.05$）。
结论 我们成功建立了血清 Stathmin 自身抗体检测方法，且 Stathmin 自身抗体在多种恶性肿瘤中高表达，为恶性肿瘤患者的诊断、治疗及预后判断提供了一种新型标志物。

PO-0127

First Case of Mixed Phenotype Acute Leukemia (B/T-lymphoid type) with t (9; 22) (q34; q11.2) BCR-ABL1 in a pediatric patient and review of the literature

Zie Wang
Shandong provincal hospital

Mixed phenotypic acute leukemia (MPAL) is a rare disorder with an incidence of less than 2% in all acute leukemia using the recent 2016 WHO criteria. Common subtypes are the B/myeloid and T/myeloid, B/T and trilineage MPAL being extremely rare. Here we discuss a case of a 9-year-old male child who presented with fever and skin ecchymosis. Peripheral blood smears showed 3% blast cells and bone marrow with 75% blasts. Immunophenotyping by multicolor flow cytometry showed two distinct populations: the major one with T-lineage (45.94％) and the minor one with B-lineage (25.02％). Conventional karyotyping done on bone marrow sample showed t(9;22)(q34;q11)(Ph+). BCR/ABL1 (P190) positive was confirmed by multiplex nested reverse transcription-PCR (RT-PCR). The case was diagnosed as MPAL with double Philadelphia chromosome Ph+. Mixed phenotype B/T acute leukemia is an extremely rare disease, particularly those with fusion gene BCR/ABL1 and clinically presents challenges in diagnosis and treatment.

PO-0128

流式细胞术检测巨球蛋白血症患者淋巴细胞亚群分析

王子娥
山东省立医院

目的 总结巨球蛋白血症患者采用流式细胞术检测淋巴细胞亚群的工作体会。

方法 取 500ul 全血+2ml PBS 震荡混匀，置于 37℃水浴箱中 10 分钟，然后 300g，5 分钟，离心，去上清后取细胞沉淀物再加 2mlPBS，5 分钟，300g，离心。去上清后取 50ul 处理后的细胞沉淀物用相应的荧光抗体去标记。
结果 温浴洗涤处理后的全血标本可以正常进行流式细胞术检测。
结论 巨球蛋白血症患者血清中存在大量单克隆免疫球蛋白 IgM，导致高粘滞血症，应予全血温浴洗涤处理后再做血液细胞成分荧光抗体标记。

PO-0129

SLE 患者慢性肾病的发生与血清抗核抗体特异荧光模型的相关性分析

胡冬
四川省绵阳市中心医院

目的 分析系统性红斑狼疮（systemic lupus erythematosus，SLE）患者发生慢性肾病（Chronic kidney disease，CKD）的风险程度与血清抗核抗体（antinuclear antibody，ANA）荧光模型特征的相关性，探讨特异性 ANA 荧光模型对 SLE 发生 CKD 的预测价值。
方法 回顾性分析 2019 年 1 月～2021 年 5 月绵阳市中心医院 SLE 患者 796 例，收集其性别、年龄、肾小球滤过率（glomerular filtration rate，GFR）、随机尿蛋白/肌酐比值（random urinary

albumin/creatinine ratio，UACR）和 ANA 检测结果；以血清 eGFR 值联合 UACR 值对受试者进展为 CKD 的风险程度进行评估，受试者按照风险高低分组，分析不同风险程度 SLE 患者荧光模型特征，筛选与 CKD 发生进展相关的特异荧光模型。
结果 1.受试者总共检出 ANA 荧光模型 13 种，累计 1564 次，按照进展为 CKD 的风险程度分 4 组：低风险组 319 例，中风险组 161 例，高风险组 186 例和极高风险组 130 例。2.SLE 患者进展为 CKD 的风险程度高低与性别、年龄不相关，与荧光模型叠加数量和滴度高低相关，叠加数量越多、滴度越大，进展为 CKD 的风险越高；核斑点型、核仁型和核均质型在不同 CKD 风险分组中的构成比差异有统计学意义。3.核均质型受试者进展为 CDK 的风险可能更高，单一荧光模型的受试者中，核均质型受试者的 eGFR 中位数最低，UACR 中位数最高，差异有统计学意义；混合荧光模型的受试者中，核均质型参与的混合模型受试者 eGFR 中位数最低，UACR 中位数最高，差异有统计学意义。
结论 SLE 患者 CKD 的发生和进展与抗核抗体荧光模型类别、叠加数量和滴度高低相关，核均质型 SLE 患者发生 CKD 风险更高，SLE 患者 CKD 的防治宜重视患者抗核抗体荧光模型特征的分析。

PO-0130

雅培 i4000SR 化学发光免疫分析仪检测乙肝五项的性能评价

史静
重庆医科大学附属第一医院

目的 评价雅培 i4000SR 化学发光免疫分析仪对乙型肝炎病毒血清标志物检测的分析性能。
方法 参考行业标准和规范文件，对 i4000 化学分析仪检测乙肝表面抗原（HBsAg）、乙肝表面抗体（HBsAb）、乙肝 e 抗原（HBeAg）、乙肝 e 抗体（HBeAb）、乙肝核心抗体（HBcAb）从精密度、临界值分析物浓度重复性、正确度、比对实验、分析测量范围、参考区间、分析灵敏度、携带污染和最大稀释度九个方面评价仪器分析性能。
结果 i4000 分析仪两个模块检测乙肝五项批内及批间不精密度均符合厂商要求；检测 HBeAg、HBeAb、HBcAb 临界值附近浓度标本阳性、阴性结果出现频率均大于 0.95。乙肝五项 2 个水平室间质评检测结果均与反馈结果相符。与 I2000SR 进行比对实验，结果一致性满足要求。HBsAg、HBsAb 项目两个模块间比较偏差均小于 1/2 Tea（15.0%）， HBsAg 携带污染量均小于允许误差范围。HBsAg、HBsAb 两个模块参考个体测定值均落在厂商提供的参考区间内。HBsAg 分析灵敏度为 0.03 IU/mL ，小于厂家给定的灵敏度 0.05 IU/mL；HBsAg 最大稀释度为 1：200，参考区间验证结果一致率 100% 。
结论 雅培 i4000 化学发光免疫分析仪检测乙型肝炎血清标志物的精密度、临界值分析物浓度重复性、正确度、比对实验、分析测量范围、 参考区间、分析灵敏度、携带污染和最大稀释度性能均达到质量文件和临床检验要求，可用于临床标本的常规检测。

PO-0131

35618 例 ANCA 检测患者就诊情况的分析

王丽
四川大学华医院

目的 分析抗中性粒细胞胞浆抗体（ANCA）检测在临床科室中的送检情况、阳性患者的基本情况、就诊症状、抗体谱分布及阳性结果疾病分布等，为进一步探讨 ANCA 在各种疾病中的临床意义奠定基础。
方法 通过四川大学华西医院信息系统，收集 2019 年 6 月-2020 年 10 月检测 ANCA（酶联免疫吸附法）的患者，记录其检测结果及其他临床信息。

结果 共收集 ANCA（ELASA）检测患者 35618 例，男女比例为 1：1.27，阳性者 2529 例，男女比例为 1：1.22，男女性都是随着年龄增长 ANCA 检出阳性率逐渐增高。阳性率最高的科室前三位依次是风湿免疫科（20.51％）、肾内科（17.03％）、呼吸内科（12.08％）；ANCA 阳性结果中除外常见的靶抗原 MPO 和 Pr3，其他靶抗原如 BPI、EL、LF、CAT 等阳性也很常见，各抗原相关的疾病除外大家熟知的 AAV 还有其他疾病也很常见如感染、炎症性肠病及类风关、干燥综合征、自身免疫性肝病等其他自免疾病。

结论 ANCA 阳性者多见于中老年人，且女多于男，ANCA 阳性者多就诊于肾内科，应与 ANCA 多累及肾脏有关，临床诊疗中遇肾损伤症状应考虑 ANCA 损害可能；此外，除 AAV 外，ANCA 阳性还可见于多个临床科室的多种疾病，其临床意义有待进一步明确。

临床诊断最多的前三类疾病依次为感染相关（20.92%）、ANCA 相关性血管炎相关（9.63%）、肺间质疾病相关（8.23%）；AAV 阳性 255 例，男女比例为 1：1.32，前三科室是肾脏内科（55.29%）、风湿免疫科（18.04%）、呼吸内科（9.80%）。

PO-0132

免疫球蛋白和临床实验室指标的综合分析鉴定免疫调节治疗的白塞病患者相关功能性关联和诊断标志物

程琳琳[1]、李阳[2]、吴子燕[1]、李柳冰[1]、刘晨曦[1]、刘建华[3]、代佳宇[2]、郑文洁[1]、张奉春[1]、唐刘军[2]、于晓波[2]、李永哲[1]

1. 中国医学科学院北京协和医院
2. 国家蛋白质科学中心(北京)，北京蛋白质组研究中心
3. 中国医科大学附属盛京医院检验科

背景 白塞病（BD）是一种全身复发性血管炎性/自身免疫性疾病。已经有大量关于 BD 的研究，然而尚未发现 BD 的实验室诊断标志物，且发病机制在很大程度上尚不清楚。此研究的目的是通过相关性分析来探索不同临床实验室变量之间的相互作用，以鉴定变量之间的功能性关联以及潜在的 BD 诊断标志物。

方法 我们测量了 66 名健康对照者和 63 名 BD 患者的免疫球蛋白蛋白质组（IgG，IgG1-4，IgA，IgA1-2）和 29 个临床实验室指标。我们进行了全面的临床变量关联分析并定义了指标间的生理，病理和药理学关联。为了能在临床中起到更好地指示作用，我们进一步计算了关联变量之间的相对变化。最终在包括 76 例 BD 患者、30 例健康对照、18 例大动脉炎和 18 例抗中性粒细胞胞浆抗体相关性血管炎的独立验证集中验证了潜在诊断标志物。

结果 在生理，病理和药理条件下，BD 患者中的临床变量协同而非单独执行功能。皮质类固醇和免疫抑制剂可以抑制免疫和炎症。对粒细胞，血小板和相关变量的综合分析可能会提供对疾病活动性、血栓形成风险以及组织损伤的更全面的了解。与对照组相比，BD 患者中总蛋白/平均红细胞血红蛋白，总蛋白/平均红细胞血红蛋白浓度，总蛋白/平均红细胞体积，血小板压积/单核细胞计数显著升高（在发现集和验证集中 $P<0.05$），这有助于 BD 的诊断和鉴别诊断。BD 中的慢性贫血与总蛋白增加可能导致这些生物标志物的水平升高，并且血小板与单核细胞之间的相互作用可能与血管受累有关。

结论 所有这些结果证明了我们的方法在阐明发病机理和鉴定自身免疫性疾病的新型生物标志物方面的实用性。

PO-0133

Association between 17-β-estradiol and IL-8 and visual field progression in postmenopausal women with primary angle closure glaucoma

Shengjie Li、wenjun cao
Eye & ENT Hospital, Shanghai Medical College, Fudan University

Purpose To investigate an association between sex hormones and inflammatory cytokines, and to determine whether baseline 17-β-estradiol (E2) and interleukin (IL)-8 are associated with visual field (VF) progression in postmenopausal women with primary angle closure glaucoma (PACG).
Methods A prospective cross-sectional and cohort study. The cross-sectional study enrolled 200 postmenopausal women with PACG and 151 healthy postmenopausal women as normal controls. A total of 105 postmenopausal women with PACG were included and followed up for at least 2 years in the cohort study. All participants were evaluated for levels of baseline sex hormones (follicle-stimulating hormone, prolactin, progesterone, testosterone, luteinizing hormone, and E2) and inflammatory cytokines (IL-1, IL-2, IL-6, IL-8, IL-10, and CRP) and underwent VF examinations. The cross-sectional study was conducted to establish risk factors for postmenopausal women with PACG using logistic regression analysis. The cohort study was designed to identify the factors, which could be used to predict VF progression in postmenopausal women with PACG using multivariate Cox regression analyses.
Results Decreased E2 (OR=0.88, 95% CI=0.78–0.99, p=0.007) and increased IL-8 (OR=1.12, 95% CI=1.01–1.23, p<0.001) levels were risk factors in postmenopausal women with PACG. A significant negative correlation was observed between IL-8 levels and E2 (r=-0.21, p=0.02). Multivariable regression analyses revealed a significant correlation between E2 levels and visual field mean deviation (MD) (B=-0.16, p=0.04, 95% CI=-0.09–-0.003), and between IL-8 levels and MD (B=0.36, p<0.001, 95% CI=0.01–0.02). During follow-up, 48 (45.71%) patients showed VF progression. Lower baseline E2 (hazard ratio [HR]=0.85, 95% CI=0.82–0.88, p=0.04) and higher baseline IL-8 levels (HR=1.01, 95% CI=1.00–1.02, p=0.004) were associated with progression of glaucoma. Patients with lower E2 levels had a significantly higher rate of PACG progression (log-rank test p<0.001), similar to those with higher IL-8 levels (log-rank test p=0.04).
Conclusions Decreased E2 and increased IL-8 levels at baseline are significant predictors of VF progression in postmenopausal women with PACG.

PO-0134

白塞病中红细胞参数的变化：与疾病严重程度和血管受累相关

程琳琳、李柳冰、刘晨曦、晏颂欣、陈海震、李昊隆、张奉春、陈华、李永哲
中国医学科学院北京协和医院

目的 白塞病（BD）是一种病因不明的全身性和慢性炎症性血管炎。通过临床症状进行诊断，然而由于缺乏特异性的实验室诊断标志物使 BD 的诊断更加困难。本研究的目的是确定 BD 患者血液学检查指标的变化，探究与 BD 临床特征的关系。
方法 本研究共纳入 48 位 BD 患者和 96 位健康对照。对每个 BD 患者的严重程度进行评分。评估了几项实验室检查指标在 BD 患者与健康对照之间的差异；研究了实验室指标与 BD 患者临床特征的关联；通过相关分析以揭示指标间的相互关联。
结果 与健康对照相比，BD 患者的 C 反应蛋白（CRP），平均红细胞血红蛋白（MCH），平均红细胞血红蛋白浓度（MCHC），中性粒细胞计数，血小板计数和血小板比容显着增加（P <0.05）。皮肤病变患者的 CRP 较高，血管受累患者的 MCH 和 MCHC 较低，皮肤病变和生殖器溃疡的患者

中性粒细胞计数较高。较高的 CRP，较低的 MCH 和 MCHC 与严重状况有关。此外，MCH 和 MCHC 与血小板计数，血小板计数和中性粒细胞计数呈负相关。
结论 这项研究表明，MCH 和 MCHC 是 BD 的有价值的实验室指标，有助于评估疾病的严重程度并指示 BD 存在的血管受累。

PO-0135

风湿性骨骼肌疾病中前白蛋白与 C 反应蛋白相关

程琳琳、李柳冰、刘晨曦、晏颂欣、陈海震、陈华、张奉春、李永哲
中国医学科学院北京协和医院

目的 前白蛋白检查可用于监测病人的营养状况，然而研究报道该评估受到炎症的影响。在这项研究中，我们旨在探究在五种炎性风湿性骨骼肌肉疾病（RMDs）中前白蛋白和 C 反应蛋白（CRP）以及其他免疫或炎性相关参数的关系：大动脉炎，抗中性粒细胞胞浆抗体相关性血管炎，系统性狼疮红斑，白塞氏病和多发性肌炎/皮肌炎。
方法 研究总共纳入 52 名健康对照者和 508 名 RMDs 患者的 3714 条记录。我们收集了患者从 2011 年 6 月至 2019 年 8 月临床和实验室信息，其中最长的随访期为 11 年。我们全面分析了 RMDs 患者和健康对照人群中前白蛋白与 CRP，球蛋白间隙，白蛋白与球蛋白之比以及 IgG 之间的关系。
结果 前白蛋白与 CRP 的相关系数高（r=-0.497，P<0.001），前白蛋白诊断 CRP 的曲线下面积高（AUC=0.777（95％CI 0.76-0.795）），并且前白蛋白水平与 CRP 随时间变化一致。前白蛋白和 CRP 之间的统计学关联不受性别，种族和年龄的影响，但是男性、中国非汉族和年轻患者人群中前白蛋白和 CRP 的相关性相对较高。在五种 RMDs 中，前白蛋白在与 CRP 的相关性大动脉炎患者人群中最强（r = 0.607，P <0.001）。另外，还观察到前白蛋白和 IgG，球蛋白间隙和白蛋白与球蛋白之比之间也存在中度的相关性。
结论 在患有五种慢性炎症性 RMD 的中国患者中，前白蛋白与 CRP 密切相关，这可能是由于疾病过程中慢性炎症的影响所致。

PO-0136

抗酿酒酵母抗体作为白塞病胃肠道受累诊断标志物的荟萃分析

程琳琳、李柳冰、刘晨曦、晏颂欣、李永哲
中国医学科学院北京协和医院

目的 由于在酒精和烘焙行业中普遍接触酵母，据报道，有胃肠道症状的白塞氏病(GIBD)患者的抗酿酒酵母抗体(ASCA)阳性率很高。我们进行了一项荟萃分析，以评估 ASCA 在区分 BD 患者与其他慢性炎症性肠病患者中的诊断价值。
方法 荟萃分析与流行病学检查表中系统评价和荟萃分析的首选报告项目和观察性研究的荟萃分析一起呈现。2019 年 7 月 12 日从 PubMed、EMBASE、Web of Science、SCOPUS 和 Cochrane 数据库检索了调查 BD 患者 ASCA 水平的相关研究；搜索于 2020 年 2 月 12 日重新运行。按 ASCA 的同种型分类，运用 Stata/SE V.12.0 和 Meta-DiSc V.1.4 用于执行荟萃分析和敏感性分析.
结果 九项研究被纳入荟萃分析。结果显示 ASCA 和 GIBD 之间有很强的关联，尤其是 ASCA-IgG(OR=5.50(95%CI 2.58~11.55),p=0.000) 和 ASCA-IgG+IgA(OR=5.36(95% CI 1.40~20.45)，p=0.014）。GIBD 中 ASCA 的阳性率明显高于溃疡性结肠炎（UC）：IgA（OR=2.13（95% CI 1.30 ～ 3.50 ）， p=0.003 ）； IgG+IgA （ OR=2.19 （ 95% CI 1.03~4.66 ）， p=0.042 ）； IgG/IgA((OR=2.03 (95% CI 1.30~3.17), p=0.002)。然而，克罗恩病患者的 ASCA-IgG 频率显着高

于 GIBD (OR=0.48 (95% CI 0.28~0.83)), p=0.009)。无胃肠道受累的 BD 与健康对照之间以及 GIBD 与肠结核(iTB)之间的 ASCA 阳性率无显着差异(p>0.05)。
结论 ASCA 可能在胃肠道受累的发病机制中起作用。当与克罗恩病相鉴别时，IgG 阴性结果有利于 GIBD/BD 的诊断。ASCA-IgA 在区分 GIBD 和 UC 方面表现出中等的诊断性能，与 IgG 联合使用的诊断性能更好。然而，ASCA 可能不是区分 GIBD 和 iTB 的有用血清学标志物。

PO-0137

端粒酶催化亚基在卵巢肿瘤中的表达研究

李牧
复旦大学附属中山医院青浦分院

目的 研究端粒酶催化亚基（human telomerase reverse transcriptase hTERT）在卵巢肿瘤中的表达及意义。
方法 应用免疫组织化学 SP 法检测 99 例恶性卵巢上皮肿瘤、12 例交界性卵巢上皮肿瘤、10 例良性卵巢上皮肿瘤和 7 例卵巢囊肿中 hTERT 的阳性表达率。
结果 hTERT 在癌、交界性肿瘤、良性肿瘤、囊肿不同类型肿瘤组织中阳性率分别为 79.8%(79/99)、91.7%（11/12）、70.0%（7/10）、57.1%（4/7），hTERT 在四种不同类型肿瘤组织中核表达强度有显著性差异(P<0.05)；hTERT 核表达水平与卵巢癌患者淋巴结转移情况、FIGO 分期、患者初诊年龄及绝经状况无关(P>0.05)，与肿瘤大小有关(P＜0.05)。
结论 hTERT 的表达与卵巢癌的发生发展有关。

PO-0138

Association between L-FABP and acute kidney injury in critically ill patients: an observational cohort study

Tao Sun、Shufang Qu、Ying Ping、Zhihua Tao
The Second Affiliated Hospital of Zhejiang University School of Medicine

Background Acute kidney injury was a common clinical complication in intensive care unit with high morbidity and mortality. We explored the clinical application of L-FABP, a renal tubular biomarker, early prediction for acute kidney injury.
Methods The concentration and concentration change rate of L-FABP were analyzed to explore the relationship with AKI. Logistic regression analysis and ROC curve analysis were used to predict the risk of AKI on 1 day before diagnosis, 2 days before diagnosis and 3 days before diagnosis Evaluating the role of L-FABP by comparing concentration change in different stages of AKI.
Results There were significant differences between AKI group and non-AKI group on the day of diagnosis, 1 day before diagnosis and 2 days before diagnosis, however, there were not significant differences on 3 days before diagnosis. The concentration and concentration change rate of L-FABP both were an excellent predictor for risk analysis of acute kidney injury. The predictive power of L-FABP was similar to CAF, NGAL, β2MG and CysC on 1 day before diagnosis and 2 days before diagnosis which was superior to other biomarkers on 3 days before diagnosis. Higher concentration of L-FABP was associated with increased risk of AKI. The closer time before AKI occurred, the better predictive value was. the concentration of L-FABP was increased with the higher stage which meant the higher risk. L-FABP had a good effect on the staging of AKI and could facilitate clinically early diagnosis.
Conclusion L-FABP was a potentially predictive biomarker of AKI and might provide benefit for clinical decision-marking for early intervention.

PO-0139

B 亚型 HIV-1 V3 区氨基酸变化与病毒感染能力及亲嗜性的研究

林春艳、蒋丽鑫
哈尔滨医科大学附属第一医院

目的 通过分析不同嗜性 B 亚型 HIV-1 感染者 V3 区氨基酸序列差异及感染实验，探讨 V3 区 11、22、25 位点与病毒感染能力及亲嗜性的关系。
方法 从 HIV 数据库中以 FASTA 格式下载 B 亚型 V3 区氨基酸序列，并将其分为 R5 亲嗜性组和 X4 亲嗜性组，利用 CLUSTAL W 软件分别对两组序列进行多重序列比对，计算每个位点氨基酸出现的频率，并进行降幂排列。对 HIV-1 HXB2 和 SF162 株包膜糖蛋白 V3 区进行修饰，并构建伪病毒及进行感染实验。
结果 研究结果显示 R5 亲嗜性和 X4 亲嗜性病毒中 V3 区 Consensus 序列在 11、22 和 25 位上具有差别。在 R5 亲嗜性毒株中这三个位点最常出现的氨基酸频率分别为 71.9% S，66.7% A 和 56.0% D；在 X4 亲嗜性毒株中这三个位点最常出现的氨基酸频率分别为 50.0% R，57.1% T 和 26.2% Q。V3 区 22 氨基酸残基与病人 CD4+T 细胞数具有明显的相关性。R5 亲嗜性或 X4 亲嗜性毒株 V3 区 11、22、25 位氨基酸残基的改变都使其感染能力降低，并且 SF162 的 11 位氨基酸残基 S 转变为 R 时，病毒由 R5 嗜性变为 R5X4 双嗜性。
结论 我们的研究结果发现在 B 亚型的 HIV-1 中 V3 区 22 位氨基酸残基与病毒的感染能力及病人的疾病进展具有明显的相关性。可以和 11、25 位氨基酸一起作为生物学表型预测的位点。

PO-0140

利用聚多巴胺-碳纳米管纳米复合物进行信号放大的酶联电化学免疫分析

尹斐[1]、张越[1]、潘登[1]、沈艳飞[1,2,3]
1. 东南大学医学院
2. 东南大学中大医院临床检验医学中心
3. 东南大学危重症医学江苏省重点实验室

开发灵敏、快速的生物分析方法对疾病早期诊断具有重要意义。[1,2] 酶联免疫分析是临床诊断、药物发现、食品安全检测和环境分析中最常用的方法之一。[3-4] 通过偶联酪氨酸酶（Tyr）和β-将半乳糖苷酶（Gal）转化为一种氧化还原循环方案，采用聚多巴胺功能化多壁碳纳米管（MWCNTs-PDA）纳米杂化修饰电极，构建了一种选择性和灵敏度均提高的酶级联型电化学免疫传感器。MWCNTs-PDA 纳米杂化物的抗体结合能力提高了 5 倍，这是信号放大的主要原因。在提出的酶级联方案中，Gal 被夹在免疫传感器的表面，通过催化苯基的免疫反应被捕获 β-D-半乳吡喃糖苷（P-GP）在苯酚的基础上发生水解反应。所得苯酚被用作酪氨酸的底物，酪氨酸被催化生成邻苯二酚，然后生成邻醌。然后将邻醌电化学还原为邻苯二酚，在邻苯二酚和邻醌之间形成氧化还原循环。基于酶级联的免疫分析不仅显著放大了电化学信号，而且具有很高的选择性。以 CEA 的检测为例，酶级联型电化学免疫传感器的检测范围为 10 pg ml-1 至 10 ng mL-1 最低检出限为 8.39 pg mL-1（S/N=3），这比以前报告中使用其他方法优越。酶级联免疫传感器的选择性比单一酶免疫传感器高 44-80%。这项工作显示了偶联酶级联在免疫诊断中的巨大潜力，提高了选择性和敏感性。

PO-0141

血清抗 PLA2R 抗体与特发性膜性肾病患者肾脏足细胞数及 Nephrin 的临床相关性分析

陈施晓、秦晓松
中国医科大学附属盛京医院

目的 了解肾组织中足细胞数及 Nephrin 在特发性膜性肾病（IMN）的变化与表达情况，探索血清中抗 M 型磷脂酶 A2 受体（PLA2R）抗体与足细胞损伤的关联。
方法 选取了我院肾脏内科经肾活检病理诊断为 IMN，且肾组织 PLA2R 免疫荧光染色阳性的 45 例住院患者作为 IMN 组，且收集其肾组织；同时收集 7 例癌旁组织作为正常组织对照组。使用免疫组化方法检测 WT1、Nephrin 在肾组织中的表达情况，以 WT1 阳性标记细胞计算足细胞数及密度。收集研究对象的临床资料、血清抗 PLA2R 抗体表达水平，比较足细胞数、Nephrin 在 IMN 及正常组织对照组的表达特点。并在抗 PLA2R 抗体阳性及阴性以及不同的尿蛋白水平分组下 IMN 患者足细胞密度、Nephrin 平均光密度值的差异，并探讨其相互关系。
结果 1、WT1 在肾小球足细胞胞核及胞浆内表达，且 IMN 组的 WT1 阳性细胞数较正常对照组明显减少，染色更浅，足细胞绝对数及足细胞密度均低于对照组（P＜0.05）。Nephrin 沿毛细血管襻分布，IMN 组 Nephrin 染色不均、呈弥漫、细颗粒状或团块状，多数染色线性消失；Nephrin 平均光密度值较对照组明显降低（P＜0.05）。2、抗 PLA2R 抗体阳性组的 TC、HDL-C、LDL-C、24h-UP、Urea 均显著高于阴性组（P＜0.05），Nephrin 平均光密度值、Alb 均显著低于阴性组（P＜0.05）；两组间足细胞密度不具有统计学差异（P＞0.05）。3、大量蛋白尿组的抗 PLA2R 抗体、Urea、Scr 水平显著高于少量蛋白尿组（P＜0.05），而肾组织 Nephrin 平均光密度值、足细胞密度、Alb、完全缓解比例显著低于少量蛋白尿组（P＜0.05）。4、Nephrin 平均光密度值与 24h-UP、不完全缓解呈负相关（P＜0.05），足细胞密度与不完全缓解呈负相关（P＜0.05），Nephrin 平均光密度值、足细胞密度与血清抗 PLA2R 抗体水平之间无显著相关性（P＞0.05）。
结论 IMN 患者肾组织存在足细胞损伤。血清抗 PLA2R 抗体与 IMN 肾脏足细胞数、Nephrin 表达之间无相关性，血清抗 PLA2R 抗体与 IMN 肾足细胞损伤程度并不完全一致。肾组织 Nephrin 及足细胞密度损失越少，足细胞损伤程度越轻，IMN 的预后越好。

PO-0142

IgG 亚型与甲状腺功能相关抗体检测对自身免疫性甲状腺疾病的诊断价值

刘珏
山东第一医科大学附属省立医院

目的 探讨 IgG 亚型与甲状腺功能相关抗体检测在自身免疫性甲状腺疾病的诊断价值。
方法 选取 2015 年 1 月至 2020 年 12 月于山东第一医科大学附属省立医院就诊的自身免疫性甲状腺疾病患者 294 例，其中 Graves 病患者 168 例作为 GD 组，年龄为 11~73 岁；桥本甲状腺炎患者 126 例作为 HT 组，年龄为 13~50 岁；选取健康志愿者 100 例作为对照 NC 组，年龄为 20~80 岁。分别检测各组的 TSH、FT4、FT3、TgAb、TPOAb 和 TRAb 以及 IgG 亚型水平。
结果 通过比较自身免疫性疾病患者分组与健康对照者血清中各项指标，发现 HT 组 TSH、TgAb 和 TPOAb 明显高于对照组（P＜0.05），FT4 和 FT3 明显低于对照组（P＜0.05）；GD 组 FT4、FT3、TgAb、TPOAb 和 TRAb 明显高于对照组（P＜0.05），TSH 明显低于对照组（P＜0.05）；GD 组 TSH、TgAb 和 TPOAb 明显低于 HT 组（P＜0.05），FT4、FT3 和 TRAb 明显高于 HT 组（P＜0.05）；GD 组 IgG1 水平为（8.11 ± 0.53）g/L，明显高于对照组和 HT 组（P＜0.05）；HT 组 IgG2 水平为（7.24 ± 0.60）g/L，明显高于对照组和 GD 组（P＜0.05）；HT 组和 GD 组 IgG3、

IgG4 水平分别为（0.26 ± 0.11）g/L 和（0.24 ± 0.12）g/L、（0.49 ± 0.21）g/L 和（0.47 ± 0.22）g/L，明显低于对照组（P＜0.05）；GD 组、HT 组患者 IgG1、IgG2、IgG3 和 IgG4 水平与 TSH、FT4、FT3、TgAb、TPOAb 和 TRAb 无显著性差异（P＞0.05）。
结论 不同自身免疫性疾病中甲状腺功能血清学检测指标水平存在明显不同，且不同 IgG 亚型有所差异，联合检测对鉴别诊断具有临床意义。

PO-0143

铁蛋白在 COVID-19 中的价值：系统评价和荟萃分析

程琳琳、李昊隆、李柳冰、刘晨曦、晏颂欣、陈海震、李永哲
中国医学科学院北京协和医院

目的 COVID-19 已迅速发展为大流行病。在严重的 COVID-19 患者中发现由于细胞因子风暴和继发性噬血细胞淋巴组织细胞增生症引起的铁蛋白水平升高。因此，本研究的目的是确定铁蛋白在 COVID-19 中的作用。
方法 从 PubMed、EMBASE、CNKI、SinoMed 和万方收集调查 COVID-19 中铁蛋白的研究。该荟萃分析比较不同患者组之间的铁蛋白水平：存活着与死亡者；严重患者与非严重患者；有合并症与无合并症；ICU 与非 ICU；机械通气与不机械通气。
结果 该荟萃分析共纳入 52 项研究，涉及 2019 年 12 月 25 日至 2020 年 6 月 1 日期间 10614 名 COVID-19 确诊患者，18 项研究纳入定性综合分析。与非重症患者相比，重症患者的铁蛋白水平显着升高 [WMD 397.77 (95% CI 306.51-489.02), P < .001]。与幸存者相比，非幸存者的铁蛋白水平显着更高 [WMD 677.17 (95% CI 391.01-963.33)，P < .001]。有一种或多种合并症（包括糖尿病、血栓并发症和癌症）的患者的铁蛋白水平显着高于没有合并症的患者（P < .01）。严重的急性肝损伤与高水平的铁蛋白显着相关，其水平与重症支持治疗相关，包括 ICU 转移和机械通气。
结论 铁蛋白与不良预后相关，可以预测 COVID-19 患者的恶化。

PO-0144

超敏肌钙蛋白 hs-cTnT 联合 NLR 诊断急性心肌梗死的研究

王琳
苏州市独墅湖医院（苏州大学附属独墅湖医院）

目的 随着检测技术灵敏度不断提高，一些非急性心肌梗死的病人包括老年人、不稳定型心绞痛、心肌损伤等，在实际临床检测中血浆 cTnT 水平也会增加，从而增加临床诊断急性心梗的难度，甚至导致过度治疗，因此寻求更加高效的诊断方案，是目前急性心梗的一项重要研究方向。本课题研究 hs-cTnT 联合 NLR 诊断 AMI 的效果，以及在众多 hs-cTnT 低水平升高患者中，鉴别出 AMI（actue myocardial infarction，急性心肌梗死）患者的能力。
方法 筛选苏大附一院 2019 年 10 月至 2020 年 5 月期间，收治的 236 例疑似心梗（胸痛、胸闷等）症状同时伴有 hs-cTnT 轻度增高的病人为观察组，同时并选 100 例同期非 AMI 患者为对照组。观察于入院 0 小时，hs-cTnT、中性粒细胞计数（Neutrophil，N）、淋巴细胞（Lymphocyte，L）以及中性粒细胞/淋巴细胞比 (Neutrophil lymphocyte ratio，NLR)水平。3 小时后以及治疗后，再次检测 hs-cTnT 和 NLR 的水平，观察其变化。
结果 在 hs-cTnT 低水平升高患者中，AMI 患者 hs-cTnT 水平明显高于非 AMI 患者，且该差异与年龄及性别无关。AMI 患者 NLR 水平明显高于非 AMI 患者，NLR 对 AMI 鉴别诊断有一定的临床应用价值。同时，AMI 患者 3 小时后 hs-cTnT 与 NLR 水平呈正相关，动态分析 hs-cTnT 与 NLR 水平变化，结果显示 NLR 随 hs-cTnT 升高而升高，降低而降低，表明 hs-cTnT 与 NLR 动态相关。

结论 NLR 以及 NLR 0/3h 比值可以有效预测急性心肌梗死，动态监测 NLR 0/3h 可以预测 AMI 的进展进程；NLR 联合 hs-cTnT 可用于鉴别诊断 AMI 和 UA 等心血管疾病。

PO-0145

HLA-B27 抗体剂量减半应用对临界值结果的影响

王子娥
山东省立医院

目的 研究 HLA-B27 抗体剂量减半在临床应用中的可行性
方法 用 EDTA 抗凝的真空采血管采集 2ml 外周血。取 50μl 抗凝全血，加入 15μlAnti-HLA-B27 FITC/ CD3 混匀，室温避光静置 15min。加入 2 m l用蒸馏水 1 : 9 稀释的溶血素，低速混匀，室温避光静置 10 min 后 300 g 离心 5 min，弃上清。加入 2 ml PBS，混匀，300 g 离心 5 min 后弃上清。加入 0. 5 m l PBS，低速混匀，上机检测。根据定标微球确定临界值，样本 FL1 平均荧光强度大于或等于临界值判断为阳性，小于临界值为阴性，见图 1，图 2。若样本 FL1 平均荧光强度处于 130 至 marker 之间，加 30ul Anti-HLA-B27 FITC/ CD3 重复检测此样本。
结果 实验组一 63 例中有 73.02%病例在加入 30ul 抗体后结果转为阳性，差异有统计学意义，P<0.01。实验组二加入 30ul 抗体，所测结果仍为阴性；实验组三加入 30ul 抗体，所测结果仍为阳性，结果无差异。实验组一中，加入 30ul 抗体后，HLA-B27 抗体荧光强度明显增强，差异有统计学意义（P<0.01）（见表 2）。实验组二和实验组三荧光强度虽增强，差异有统计学意义,但检测结果阴阳性判定无变化，阴性为阴性，阳性为阳性。
结论 HLA-B27 荧光抗体试剂量减半使用在临床应用中切实可行，但在遇到荧光强度在 140 至 marker 之间的临界值病例时，则应全量抗体重新检测，并以全量检测结果报告。遵循这个原则，即不影响临床检测结果，又可以有效降低损耗，节约支出。从而使 HLA-B27 的检测在相关疾病的诊断和预后判断等方面发挥更大的作用。

PO-0146

Elevated systemic immune inflammation index level is associated with disease activity in ulcerative colitis patients

Yiyi Xie、Tingting Zhuang、Yin Ping、Xiuzhi Duan
The Second Affiliated Hospital of Zhejiang University School of Medicine

Background It has been confirmed that high Systemic immune-inflammation index (SII) levels usually indicate poor outcomes in various diseases, especially on malignancies. However, the clinical significance of the SII in ulcerative colitis (UC) patients is remain unclear. Therefore, the purpose of our paper is to analyze the levels of SII in UC patients and assess the relationship between the SII and disease activity.
Materials and Methods We studied 187 consecutive patients with UC and 185 age- and sex-matched healthy controls retrospectively. The Mayo scoring system was adopted to evaluate disease activity in UC patients. We collected clinical characteristics and laboratory parameters from hospital electronic medical records.
Results The SII levels were significantly higher in UC patients than those in healthy subjects (P<0.001). Higher SII levels were observed in moderate and severe UC subgroups compared to mild or remission subgroups. Correlation analysis displayed that the SII levels were positively relatived with Mayo score (r = 0.469, P <0.001), C reactive protein (CRP) (r = 0.480, P <0.001), and erythrocyte sedimentation rate (ESR) (r = 0.336, P <0.001), but negatively with haemoglobin

(Hb) (r = -0.271, P <0.001). A multiple linear regression analysis suggested that there was an independent correlation between Mayo score and SII (beta = 0.324, t = 4.241, P <0.001). The receiver operating characteristic (ROC) curve revealed that the maximum area under the curve (AUC) was 0.711 (95% CI, 0.630–0.791, P < 0.001), and the cut-off value for diagnosing active UC was 485.95, the sensitivity was 0.641, and the specificity was 0.75.
Conclusions We demonstrated that the SII was elevated significantly in UC patients and was closely related to the UC disease activity. In addition, the SII had a high discriminative capacity for active UC.

PO-0147

甲状腺刺激素受体兴奋抗体在 Graves 病中的应用评价及检测策略优化

童明宏、盛慧明
上海交通大学医学院附属同仁医院

目的 评价甲状腺刺激素受体兴奋抗体(TSI)检测对 Graves 病检测策略的优化作用。
方法 采集 2019 年 8 月至 2020 年 4 月上海市同仁医院检验科 544 份明确诊断的血清样本。血清样本分别是 52 例未治疗 GD 患者、155 例已治疗 GD 患者、83 例桥本甲状腺炎患者、70 例甲状腺结节患者、83 例甲状腺癌患者和 101 例健康受试者。所有样本均检测 TSI 和 TSH 受体自身抗体(TRAb)。此外，对 23 例首次就诊时未明确诊断甲状腺疾病的患者进行 6 个月的监测以作出最终诊断。
结果 TSI 和 TRAb 检测的临床敏感性分别为 98.10%和 94.20%，临床特异性分别为 92.30%和 96.70%。以 UT-GD(新诊断 GD 患者)血清为基础进行 ROC 曲线分析，TSI 检测的曲线下面积(AUC)为 0.974。最佳临界值为 0.58 IU/L(敏感度 98.0%，特异性 92.8%)。TRAb 检测的 AUC 为 0.961。结合 TSI 和 TRAb 结果，曲线下面积为 0.981。在对 23 例初始诊断不确定的患者进行的试点研究中，随访结果显示，23 例患者中有 22 例临床诊断与 TSI 检测结果一致，1 例与 TRAb 检测结果一致。
结论 TSI 检测具有良好的临床应用前景，可提高 GD 的诊断水平。TSI 检测在 GD 与其他甲状腺疾病的初步鉴别诊断中可能优于 TRAb 检测。

PO-0148

Research on the CD3 × CD155 Bispecific Antibody Targeted T Cells for Gastric Cancer

Wanru Ma
Affiliated Hospital of Xuzhou Medical University

China is a country with a high incidence of gastric cancer, accounting for about 50% of the world's morbidity and deaths. The disease burden is very serious, which seriously endangers the health of our residents. Due to its characteristics of recurrence and drug resistance, the therapeutic effects of surgery, radiotherapy and chemotherapy are limited. Therefore, the development of a new treatment method, immunotherapy, is very important for patients with bladder cancer. Anti-CD155 antibody is an effective target for mediating the immunotherapy of tumors expressing CD155. Using anti-CD155 antibody to target tumor cells overexpressing CD155 can inhibit tumor growth. This subject takes gastric cancer as the research object, and analyzes the expression of CD155 in gastric cancer cells by flow cytometry; constructs a CD3 × CD155 bispecific antibody (CD155Bi-Ab) by chemical coupling method; and performs flow cytometry, LDH, ELISA, and fluorescence detection The killing effect of T cells bound to bispecific

antibodies on gastric cancer cells was analyzed. In addition, an animal model was established to analyze the inhibitory effect of CD155Bi-Ab-modified ATC on gastric cancer cells.

PO-0149

结核感染 T 细胞 IFN-γ 释放实验临床应用分析

张培莉
山东第一医科大学附属省立医院

目的 探讨结核感染 T 淋巴细胞 γ 干扰素释放实验（IGRAs）在临床检测结核病中的应用价值。
方法 利用 IGRAs 方法检测 2013-2016 年 11968 例门诊及住院结核筛查患者。按科室分布分析，同时对检测阳性病例按性别、年龄进行分析比较，并对不确定结果进行分析，不同方法进行比较。
结果 11968 例筛查者中，2048 例阳性，阳性率为 17.11%，不确定结果 107 例，占总检测数的 0.89%。2013-2016 年检测阳性率分别为 19.65%，21.35%，15.82%，13.56%。 肺内及肺外结核检测筛查中，呼吸科、消化科、肿瘤科、神经科、妇科阳性率分别为 22.07%、20.27%、23.38%、12.84%、11.86%。阳性筛查者中，男性占 62.11%，女性占 37.89%，男性明显高于女性。按年龄分组，≤15 岁、16～25 岁、26～45、46～65、≥66 岁，各年龄段阳性率分别为 1.96%、18.51%、16.54%、21.25%、25.73%。分析不确定结果数据，风湿免疫科、血液科比例最高，分别占 1.99%、2.35%。与其它实验室检测方法对比，IGRAs 方法具有明显优势。
结论 结核好发于全身各个器官，结核菌感染存在性别、年龄差异。IGRAs 是灵敏和特异的快速检测结核分枝杆菌感染的方法，虽不能作为确诊指标，但为进一步确诊疾病，在结核疑似患者筛查中具有较大临床应用价值。

PO-0150

桥本氏甲状腺炎 Fas 系统表达水平的研究

徐兆珍、郭欣
哈尔滨医科大学附属第一医院

目的 为了研究 Fas/FasL 介导的细胞凋亡在桥本氏甲状腺炎发病机制中的作用，评价其在治疗中的意义。
方法 采用流式细胞仪、双抗体夹心 ELISA 法及免疫组化方法分别测定桥本氏甲状腺炎(HT)及正常对照组外周血 T 淋巴细胞 Fas 抗原表达情况，血浆中 sFas 水平及甲状腺腺泡细胞 Fas 抗原及 Fas 配体的表达情况。
结果 发现 HT 组甲状腺细胞 Fas 和 FasL 表达强度显著高于正常对照组(P<0.01)，血浆 sFas 水平(2.05±0.54ng/ml)明显低于正常组(3.59±0.68ng/ml，P<0.001)，HT 外周血 T 淋巴细胞 Fas 抗原阳性细胞数(79.99%±16.08%)显著高于正常对照组(57.22%±11.57%，P<0.001)。
结论 Fas 系统与桥本氏甲状腺炎发病密切相关。

PO-0151

靶向人类自然杀伤细胞活性化合物的筛选——瑞香素增强 IFN-γ 分泌

阳青兰、邓亚飞、彭红艳、吴舒婷、王莉莉、张树菊、李梨平
湖南省儿童医院儿科医学研究所

目的 寻找具有增强 NK 细胞效应功能的活性化合物作为新的候选抗癌药物。
方法 单个核细胞(PBMCs)，在 IL-12 或 IL-15 (10 ng/ml)存在的条件下，化合物（287 个）处理 18 小时后，通过流式细胞仪评估 NK 细胞中 IFN-γ 蛋白的胞内染色情况，发现 5 个候选化合物；进一步通过 ELISA 确定候选化合物处理后 PBMCs 上清分泌的干扰素含量；通过流式细胞分选从 PBMCs 得到纯化的原代人类 NK 细胞，用以区分候选化合物是否直接或间接促进了 NK 细胞 IFN-γ 的产生；利用流式细胞术检测候选化合物处理后 NK 细胞 CD107a 变化以及 NK 细胞中激活和抑制受体 NKp46、NKp30、NKp44、NKG2D、2B4、CD16、TRAIL、DNAM-1、NKG2A 和 FasL 的表达用以确定其杀伤作用；最后通过 RNA-测序找到候选化合物增强 NK 细胞分泌 IFN-γ 的信号通路，进一步使用信号分子抑制剂处理后，通过免疫印迹法确定信号通路。
结果 筛选 287 个化合物后，我们发现 5 个化合物，包括瑞香素、MK-8617、LW6、JIB-04 和 IOX1，增加了 NK 细胞中 IFN-γ+的比例。进一步研究发现瑞香素直接促进 NK 细胞中 IFN-γ 的产生，而其他 4 种化合物则间接作用于 NK 细胞。瑞香素还能提高 NK 细胞对肿瘤细胞的直接细胞毒性。通过 RNA 测序，我们发现 PI3K-Akt 信号通路是介导 NK 细胞活化的中心通路。进一步发现，PI3K-Akt 抑制剂及其主要下游信号通路 mTOR、LY294002 和雷帕霉素能分别逆转瑞香素增加的 IFN-γ 生成。
结论 我们鉴定了一种天然产物——瑞香素，具有通过 PI3K-Akt-mTOR 信号促进人类 NK 细胞活化的能力。

PO-0152

基于流式细胞平台的淋巴细胞交叉配型实验方法研究

王琳[1]、尹利民[2]
1. 眉山市人民医院
2. 昆明市第一人民医院

目的 提高抗供体 HLA 抗体检测灵敏度，建立基于流式细胞平台的淋巴细胞交叉配型（Flow Cytometry Crossmatch, FCXM）实验方法。
方法 采集 2 例 AB 型男性血清作为阴性对照，采集 30 例供体全血并使用免疫磁珠特异性分离供体淋巴细胞，加入荧光抗体对 B 淋巴、T 淋巴及抗供体 HLA 抗体进行识别，通过流式细胞仪采集荧光信号，使用 FLOWJO 软件对数据进行分析建立 FCXM 实验方法。采集 14 例供体全血及 48 例受体血清，进行 57 次 FCXM 实验及补体依赖的细胞毒（Complement Dependent Cytotoxicity, CDC）实验，通过 Wilcoxon W、McNemar 检验及 Kappa 检验进行统计学分析。
结果 FCXM 实验 T 淋巴细胞 anti-IgG-FITC Cutoff 值为 226.6，B 淋巴细胞 anti-IgG-FITC Cutoff 值为 214.4。FCXM 与 CDC 两种方法的一致性极低（McNemar 检验 P 值<0.01；Kappa 值<0.01）。
结论 FCXM 是一种灵敏度更高的检测方法，可用于临床低浓度抗供者 HLA 抗体检测。

PO-0153

抗原特异性 T 细胞数量检测微孔反应板的研制

张雷、金岳心子、徐娟、孙子微、林明鑫、魏嘉、陈文秀
江苏省人民医院（南京医科大学第一附属医院）

目的 创建一种简单易行、可对抗原特异性 T 细胞进行数量检测的新方法。
方法 利用商品化的 H-2Kb-Ig/OVA257-264 二聚体作为靶向抗原,包被在直径 4.5 微米的磁珠表面制成磁珠式人工抗原提呈细胞（aAPC-beads）,以 OT-1 转基因鼠脾淋巴细胞群中的 OVA 抗原特异性 T 细胞作为待检的靶细胞,建立了磁性人工抗原提呈细胞微孔反应板技术（aAPC-microplate）,并进行方法学论证。
结果 准确性分析显示，磁珠分选所得细胞数与接种的淋巴细胞数之间呈现了良好的数量依赖关系和线性关系,R2 值达到 0.99 以上。特异性分析显示：用无关抗原肽的 Kb/TRP2-beads 同步分选 OT-1 鼠脾淋巴细胞群时,阳性细胞比例降为 0.45%左右；经 Kb/OVA-beads 磁珠分选后所得细胞群中的 OVA 抗原特异性 T 细胞比例经 H-2Kb-Ig/OVA257-264 二聚体荧光染色及流式分析为 89.80%，而分选前的比例为 10.13%。重复性分析显示：在 5 个检测数量组之间,阳性细胞比例的平均批内 CV 值为 4.4%；对同一份 OT-1 鼠脾淋巴细胞群进行三次重复实验时,批间 CV 值为 13.5%,阳性细胞比例分别为 9.40%、9.77%和 9.47%；R2 值分别为 0.9959、0.9970 和 0.9960。
结论 aAPC-microplate 检测方案具有较高的特异性、准确性和重复性以及与传统检测方法的相关性,提示了该技术检测抗原特异性 T 细胞数量的可行性。

PO-0154

前列腺小体外泌蛋白在慢性前列腺炎诊断中的临床价值研究

徐燕萍
上海交通大学医学院附属仁济医院

目的 通过检测尿液中前列腺小体外泌蛋白(prostatic exosomal protein,PSEP)评估 PSEP 再慢性前列腺炎（CP）诊断中的临床价值。
方法 纳入对象为仁济医院泌尿外科门诊的 CP 患者 156 例，体检中心的正常健康男性 82 例，采用前列腺小体外泄蛋白检测试剂盒（酶联免疫法）定量检测尿液标本中的 PSEP 含量。评价 PSEP 诊断慢性前列腺炎的灵敏度、特异度和临床总符合率等指标，绘制受试者工作曲线（ROC），比较 PSEP 与临床诊断结果的一致性。
结果 慢性前列腺炎患者 PSEP 检测结果为 2.316(1.306～3.247)ng/mL,明显高于健康体检者的 0.765(0.342～1.158)ng/mL, 两组存在显著差异(P＜0.001)。根据 ROC 计算 PSEP 的最佳临界值为 1.185 ng/mL, ROC 曲线下面积(the area under the ROC curve, AUC)为 0.873,对慢性前列腺炎的诊断敏感度为 80.15％,特异度为 81.03％。
结论 PSEP 用于慢性前列腺炎的临床诊断具有客观、无痛，简便、无创的特点，可作为诊断慢性前列腺炎的潜在分子标志物。

PO-0155

Hepatitis B virus protein preS2 promotes angiogenesis in hepatocellular carcinoma via its transcriptional activation of VEGFA promoter

Fang Luan
Department of Clinical Laboratory, Shandong Provincial Hospital affiliated to Shandong First Medical University, PR China

Background Angiogenesis is closely related to the development and progression of hepatocellular carcinoma (HCC) development. The overexpression of the angiogenic factors has been demonstrated in HCC. Hepatitis B virus protein preS2 is a transactivator that plays an important role in hepatitis B virus (HBV) related HCC. In this study, we investigated the potential of preS2 in inducing angiogenesis in HCC.
Methods Totally Sixty-three cases of HCC, aged 34-79, who were surgically treated and pathologically confirmed were enrolled. Levels of preS2, CD34 and vascular endothelial growth factor A (VEGFA) in HCC samples were evaluated by immunohistochemistry. The proliferation of vascular endothelial cells was detected by CCK-8. VEGFA was analyzed by Western blot in HCC cells. Luciferase reporter assays were used to measure the effect of preS2 on VEGFA promoter.
Results Microvascular density (MVD) and VEGFA were significantly higher in preS2-positive HCC samples than preS2-negative HCC samples. PreS2 over-expression upregulated VEGFA expression in HepG2 and activated vascular endothelial cell proliferation. While blocking preS2 expression reduced VEGFA expression in HepG2.2.15 and inhibited vascular endothelial cell proliferation. Furtherly, dual-luciferase assay showed that preS2 activated VEGFA promoter activity.
Conclusion The expression of preS2 protein promotes angiogenesis by transactivating VEGFA promoter in HCC.

PO-0156

正常成人粒细胞集落刺激因子动员外周血内皮祖细胞的生物学特性

白丽萍
天津市肿瘤医院（天津医科大学肿瘤医院）

目的 观察粒细胞集落刺激因子动员的外周血中内皮祖细胞的生物学特性。
方法 获取粒细胞集落刺激因子动员正常人的外周血单个核细胞，同时获取 8 例正常成人外周血单个核细胞作为对照。将获取的细胞接种在预铺纤维连接蛋白的培养皿中进行体外培养。FACS 和免疫组化法检测获取细胞的免疫表型；采用 MTT 比色法和黏附能力测定实验检测内皮祖细胞的增殖和黏附能力；实时定量 PCR 检测血管形成相关细胞因子的表达；荧光标记的乙酰化低密度脂蛋白(Dil-acLDL)吞噬实验鉴定内皮功能；将获取的细胞接种在含有血管内皮细胞生长因子和碱性成纤维细胞生长因子的基底膜胶中诱导血管生成。
结果 动员后外周血和未动员外周血内皮祖细胞具有相似的细胞形态和免疫表型，FACS 和免疫组化检测结果显示上述两种内皮祖细胞都表达内皮细胞特异性抗原 CD34、CD31、FLK-1、ve-Cadherin、vWF 和 CD133。内皮细胞生长因子和基质细胞衍生因子 1 在动员后外周血内皮祖细胞中的表达水平增加；两种来源的内皮祖细胞都具有吞噬 Dil-acLDL 和在体外诱导血管生成的能力。但是，动员的外周血中内皮祖细胞的数量和增殖能力明显强于未动员外周血中的内皮祖细胞。结果可见动员后的外周血中可以分离出具有内皮祖细胞特性的细胞群体，该群体具有体外诱导血管生成

的能力；与未动员的外周血内皮祖细胞相比，动员后外周血内皮祖细胞数量明显增加并具有更好的增殖能力。
结论 粒细胞集落刺激因子动员的外周血中内皮祖细胞具有更好的增殖能力

PO-0157

缺陷型金属有机骨架应用脂质探针高效无损分离细胞外囊泡

潘炜伦、李博、冯俊杰
南方医科大学南方医院

细胞外囊泡（EVs）在疾病治疗中具有巨大的临床应用前景，但目前仍缺乏快速有效的 EVs 分离平台。本文报道了一种以缺陷型金属有机框架（MOF）为载体，脂质探针 PSDC 为捕获元件的 EVs 高效分离平台 MOF@PSDC。该平台中的脂质探针能嵌入 EVs 的脂质双分子层中完成快速捕获及分离。我们首先合成了 MOF UiO-66-NH2 并在此基础上构建 MOF@PSDC，动态光散射结果显示其粒径增大，电位降低，证明了 MOF@PSDC 的成功合成。接下来，我们利用共聚焦成像技术与超分辨显微镜分别在细胞水平与 EVs 水平验证了所设计的脂质探针具有高效脂质双分子层识别能力，能够用于 EVs 的快速识别和分离。其次，通过投射电镜与原子力显微镜可知，MOF@PSDC 能够高效捕获 EVs，且所分离的 EVs 结构典型，背景杂质干扰少。进一步通过条件优化，MOF@PSDC 可在 10 分钟内实现 EVs 的富集，效率达到 77%，且通过常规表征证明所分离的 EVs 粒径、结构、蛋白表达皆符合国际细胞外囊泡学会发布的《细胞外囊泡最低研究标准 2018》中的定义。进一步，超分辨显微镜成像技术证明，平台所分离的 EVs 仍然保持活性，可应用于下游检测分析。综上所述，我们成功构建了一个基于脂质探针和缺陷型 MOF 的通用 EVs 分离平台 MOF@PSDC。其中，脂质探针可高效嵌入 EVs 的脂质双分子层中，而 MOF 载体可通过低速离心即可将 EVs 从繁杂溶液体系中分离出来，且保持 EVs 的结构完整性与生物学性质。本方法与传统金标准超速离心法相比，具有快速、高效、无损和杂质少的优点，而不需要昂贵的设备。本研究为发展临床适用的 EVs 快速分离平台提供了理论基础。

PO-0158

血清 2019-nCoV IgM、IgG 抗体阳性与其相关性分析

唐丽红、韩晓丽
乌鲁木齐市友谊医院

目的 分析血清 2019-nCoV IgM、IgG 抗体阳性与其相关性。
方法 本次研究收集 2020 年 3 月 9 日至 4 月 22 日收治我院采用新型冠状病毒 2019-nCoV 抗体检测试剂盒（胶体金法）进行检测 IgM 和 IgG 抗体的患者共 699 人。
结果 本次研究共检测了 699 人，IgM 检测阳性率为 1.89%；IgG 检测阳性率为 0.199%。研究结果显示，同一民族的不同性别间、同一性别的不同民族间患者的血清 2019-nCoV IgM 表达，不同性别间的阳性率及不同民族间阳性率差异均无统计学意义（P>0.05）。血清 2019-nCoV IgM 抗体检测阳性组白细胞、中性粒细胞百分比、中性粒细胞计数、单核细胞计数、血小板、血小板压积、血小板分布宽度、C-反应蛋白等值高于阴性组，而血清 2019-nCoV IgM 抗体检测阳性组淋巴细胞百分比、嗜碱性粒细胞百分比、红细胞、血红蛋白、红细胞压积等值低于阴性组，差异均具有统计学意义（P<0.05）。
结论 血清学检测有简便、快捷、经济的优点。特异性抗体阳性可以提示临床需对这些患者核酸检测样本的采样更加关注，此时需考虑进一步复查核酸检测。

PO-0159

ICOS 和 PD-1 协同刺激信号在四氯化碳致小鼠肝纤维化中的动态变化

丁海涛、王波、肖伟利、贺娟、李媛
内蒙古自治区人民医院

目的 探讨可诱导共刺激分子（inducible costimulatory molecular， ICOS）和程序性死亡受体 1（programmed cell death protein 1，PD-1）蛋白在四氯化碳致小鼠肝纤维化中的动态变化。
方法 将 80 只雄性 BALB/c 小鼠按随机数字表法分为正常对照组和肝纤维化模型组，每组 40 只。酶联免疫吸附测定法 （enzyme-linked immunosorbent assay，ELISA）检测小鼠不同周期脾淋巴细胞培养上清中的相关细胞因子白细胞介素（interleukin，IL）-21 /IL-33/转化生长因子-β1（transforming growth factor-β，TGF-β1）的分泌水平及小鼠血清中 PCⅢ的含量；流式细胞仪分析测定不同阶段滤泡辅助性 T 细胞（follicular helper cells，Tfh）群 ICOS 及 PD-1 的动态表达趋势及特征；并分析 PD-1+ CD4+ CXCR5+ T 细胞、ICOS+ CD4+ CXCR5+ T 细胞与肝纤维化标志物Ⅲ型前胶原肽（Procollagen type Ⅲ， PCⅢ）的相关性。
结果 与正常对照组相比，纤维化模型组中 CXCR5+ CD4+ T 细胞表面 PD-1 的表达比例均明显升高，并在 13 W 达到峰值，组间差异有统计学意义{（2.77±0.92）% 比[8 W：（6.53±2.12）%，13 W：（27.47±5.15）%，20 W：（19.20±6.64）%]， t 值分别为 4.60、13.35、6.93 ，P 值均<0.05}；CXCR5+ CD4+ T 细胞表面 ICOS 的表达比例亦逐渐升高，13 W 达到峰值，组间差异有统计学意义{（1.13±0.44）% 比[（8 W：（13.28±3.85）%，13 W：（33.62±6.28）%，20 W：（21.50±5.83）%]，t 值分别为 8.87、14.60、9.85 ，P 值均<0.05 }。随着病程进展，肝纤维化小鼠组 CD4+ CXCR5+ T 细胞群 IL-33，IL-21，TGF-β1 的表达从 8 W 开始上调，13 W 达到峰值，20 W 仍维持较高水平，且均显著高于对照组（P 值均<0.05）。PD-1+ CD4+ CXCR5+ T、ICOS+ CD4+ CXCR5+ T 细胞表达水平与 PCⅢ的水平成正相关（r 值分别为 0.6278 和 0.6036，P 值均<0.05）。
结论 肝纤维化慢性期 ICOS+ 和 PD-1+ 的循环 Tfh 细胞可能促进肝纤维化发病，IL-21 和 IL-33 作为主要的细胞因子参与炎症进展。

PO-0160

单细胞代谢调节组分析来表征代谢调节的单细胞以及他们的表型特征

马智颖
山东大学第二医院

目的 细胞代谢调节免疫细胞的激活、分化和效应功能，但目前的代谢方法缺乏单细胞分辨和同时表征细胞表型。在这里，我们开发了一种方法来表征代谢调节的单细胞以及他们的表型特征。生物组织具有很大的异质性，因此需要利用单细胞平台进行深入研究。技术进步正在从多个层面推动单细胞分析的前沿，包括基因组、转录组、表观基因组和蛋白质组。在这里，我们提出了 scMEP，一种利用基于抗体的检测结合单细胞水平上的细胞身份来分析代谢调节的方法。对代谢调节的关注使我们能够直接从有限的、离体的人体物质中定义代谢状态。
方法和结果 代谢调节体的靶向定量区分人类免疫群体。代谢调节体的靶向定量区分人类免疫群体。T 细胞激活的整合模型识别了代谢转换的检查点。组织特异性代谢调节组定义了人类 T 细胞亚群。人体组织隔间的细胞代谢与空间组织有关。肿瘤免疫边界代表一种独特的代谢生态位。

该方法，单细胞代谢调节组分析(scMEP)，使用高维抗体为基础的方法定量蛋白质调节代谢途径的活性。通过重建体外激活的原始和记忆性 CD8+ T 细胞的代谢重构，我们使用细胞计数仪(CyTOF)将 scMEP 作为整体代谢检测的基准。我们将该方法应用于临床样本，并在人类结直肠癌中鉴定出组织受限、代谢抑制的细胞毒性 T 细胞。将我们的方法与成像质谱(MIBI-TOF)相结合，我们发现了代谢程序的空间组织，这表明从肿瘤免疫边界排除了代谢抑制的免疫细胞。总的来说，我们的方法使单个细胞的代谢和功能状态的稳健近似。

结论 我们在这里提出了一个稳健的方法来研究使用基于抗体的多重技术的单细胞代谢。scMEP 的应用将有助于更好地理解人类免疫细胞生物学，有助于识别与疾病相关的代谢改变，这可能作为各种人类疾病的潜在生物标记物和治疗靶点。

PO-0161

ICOS 阻断后肝纤维化小鼠体内 IL-33/ST2 表达的动态变化及意义

王波、丁海涛、李媛、肖伟利、贺娟
内蒙古自治区人民医院

目的 探讨可诱导共刺激分子 （Inducible costimulator, ICOS）阻断后，四氯化碳诱导肝纤维化小鼠白细胞介素 33(interleukin-33，IL-33)/白细胞介素 1 受体样 1 (interleukin 1 receptor like 1，ST2) 表达的动态变化。

方法 将 80 只雄性 BALB/c 小鼠按随机数字表法分为正常对照组和肝纤维化模型组，每组 40 只。流式细胞术分别检测 ICOS 阻断组和未阻断组肝纤维化小鼠脾淋巴细胞中 T 细胞表面 ICOS 表达的动态变化；酶联免疫吸附测定法 （enzyme-linked immunosorbent assay，ELISA）检测小鼠不同周期脾淋巴细胞培养上清中 IL-33/ST2 水平；并分析小鼠血清中 AST 和 ALT 的水平以及 IL-33 的表达水平与 ICOS 的相关性分析。

结果 与未阻断组相比，阻断 ICOS 组纤维化模型组中 CD4+ T 细胞表面 ICOS 表达水平明显下调，差异有统计学意义{[6 W：（25.29±4.87）% 比（2.81±0.82）%，13 W：（41.62±7.10）%比（5.33±2.05）%，16W：（30.42±4.51）%比（4.95±1.98）%]， t 值分别为 12.88、13.89、14.63，P 值均<0.05}；ICOS 阻断组与未阻断组相比，6 周后 IL-33、ST2 的表达水平均明显下降，差异有统计学意义（t 值分别为：IL-33：5.52、5.70、4.57；ST2：3.68、6.11、4.50，P 值均<0.05）。阻断 ICOS 后，AST 和 ALT 的水平在肝纤维化的 6 周后均明显下调，差异有统计学意义（t 值分别为：AST：4.53、5.53、2.31；ALT：4.16、3.28、3.86，P 值均<0.05）。另外，肝纤维化模型组脾淋巴细胞培养上清中 IL-33 的水平与 ICOS 的表达成正相关（r=0.2170，P=0.0385）。

结论 肝纤维化慢性期 ICOS 可能促进肝纤维化发病，IL-33/ST2 作为主要的细胞因子参与炎症进展。

PO-0162

霉酚酸酯预处理对小鼠肝脏缺血/再灌注损伤的保护作用

杜振东[1]、熊丞[2]
1. 上海交通大学医学院附属仁济医院南院
2. 上海交通大学医学院附属瑞金医院

目的 霉酚酸酯(mycophenolate mofetil，MMF)是一种免疫抑制药，在缺血/再灌注损伤过程中对器官发挥抗炎作用。然而，MMF 在肝脏缺血/再灌注损伤中的确切作用仍然是个未知数。本研究旨在探讨 MMF 在肝脏缺血/再灌注损伤中的保护作用及其可能机制。

方法 用 MMF 或生理盐水腹腔注射雄性野生型(WT)和 TLR4 基因敲除(KO)小鼠。动物肝脏行局部缺血 90min，再灌注 1h、6h 或 24h。肝组织学、血清转氨酶、炎性细胞因子、肝细胞凋亡和肝细胞自噬检测评估肝脏损伤。
结果 MMF 治疗显著减少肝脏缺血/再灌注损伤，血清氨基转移酶水平降低，Suzuki 评分降低，总体坏死程度降低。MMF 处理显著抑制 TLR4 活化。MMF 还能显著抑制 NF-κB 通路的激活和促炎细胞因子的表达。在 TLR4 KO 的 鼠中，MMF 仍然对肝脏缺血/再灌注损伤有保护作用。MMF 处理可抑制肝细胞凋亡，表现为 TUNEL 染色减少，及裂解 Caspase-3 的表达增加。MMF 通过增加 LC3-II，P62，和 Beclin-1 的表达，在肝再灌注前后诱导自噬，增加自噬通量。MMF 诱导的自噬可能与 TLR4 激活有关。
结论 结果表明，MMF 治疗可以改善肝脏缺血/再灌注损伤。其作用机制可能与 MMF 在诱导细胞自噬的同时降低细胞凋亡和炎症反应有关。

PO-0163

新型冠状病毒感染者咽拭子病毒载量与抗体水平的动态分析

胡金曹、沈瀚、陶月
南京大学医学院附属鼓楼医院

目的 分析新型冠状病毒肺炎（COVID-19）患者的咽拭子病毒载量与其血清特异性抗体水平的相关性。
方法 选取 2020 年 1 月到 3 月期间在南京市第二医院汤山分院收治的 COVID-19 患者 19 例，包括 7 例重症感染者和 12 例非重症感染者。通过实时荧光逆转录聚合酶链反应动态监测其咽拭子 SARS-CoV-2 核酸病毒载量。利用新冠病毒的四种蛋白（NP、S1、RBD 和 ECD）作为包被抗原，ELISA 方法检测患者体内针对 RBD、S1、ECD 和 NP 蛋白的特异性 IgM 和 IgG 抗体水平，并分析病毒载量与抗体之间的动态变化模式。
结果 利用 ELISA 发现，72.2%～93.1%的 COVID-19 血清标本为阳性，且在 COVID-19 发病进程中，所有患者体内均能产生了针对新冠病毒抗原的特异抗体。COVID-10 重症患者和非重症患者的病毒载量和抗体的动态变化模式呈多样化。
结论 研究 COVID-19 患者的病毒载量和抗体水平的动态变化水平，将为新冠病毒的抗体检测、基于抗体的治疗策略以及 COVID-19 疫苗的研发提供参考。

PO-0164

ANCA 相关性血管炎的中医证型与实验室指标的相关性分析

马明坤[1]、刘晟铭[2]、朱黎娜[1]、武广晔[1]、温学红[1]
1. 天津中医药大学第二附属医院
2. 天津医科大学

目的 探讨 ANCA 相关性血管炎的中医证型与其实验室指标间的相关性
方法 选择我院 2016 年 1 月～ 2021 年 1 月间疾病诊断为 ANCA 相关性血管炎(ANCA associated vasculitis，AAV)患者的检验数据共 186 份作为研究对象。中医辨证分型大致分为脾肾亏虚证、痰浊瘀阻证、痰热癍肺证、湿热内蕴证四种证型。同时收集病人中性粒细胞胞浆抗体检测项目、C 反应蛋白（C-reactive protein，CRP）、D-二聚体（D-Dimer）、血小板（platelet，PLT）等实验室检测指标结果，结合中医辨证分型进行分组，比较其是否具有统计学意义。
结果 脾肾亏虚、痰浊瘀阻、痰热癍肺、湿热内蕴这四种 AAV 中医证型中，D-Dimer 和 PLT 均没有统计学意义（$p>0.05$），而在 CRP 这一指标中，脾肾亏虚证与痰热癍肺证（$p<0.05$），痰浊瘀阻证与痰热壅肺证（$p<0.05$）具有统计学意义。在 pANCA 和 cANCA 两项指标下，脾肾亏虚证、痰

浊瘀阻证、痰热瘫肺证、湿热内蕴证四种不同证型 AAV 患者的组间阴阳性没有统计学意义；在抗 MPO 抗体和抗 PR3 抗体两项指标下四组中医证型阴阳性具有统计学意义（$p<0.05$）。

结论 痰热瘫肺证 AAV 患者的 CRP 平均水平高于痰浊瘀阻证证 AAV 患者的 CRP 平均水平；痰热瘫肺证 AAV 患者的 CRP 平均水平高于脾肾亏虚证 AAV 患者的 CRP 平均水平。抗 MPO 抗体与抗 PR3 抗体在四组间的对比具有统计学意义，其中痰浊瘀阻证两项指标阳性占比最高。其他选取指标间比较结果无统计学意义。

PO-0165

布鲁氏菌感染中巨噬细胞极化通过 PD-1/PD-L2 途径对 T 细胞亚群的调控作用研究

李智伟[1]、王昌敏[1]、丁剑冰[2]
1. 新疆维吾尔自治区人民医院
2. 新疆医科大学

目的 布鲁氏菌病慢性程度高，免疫机制不清。研究为明确布病时巨噬细胞极化特点并阐明 M2 型巨噬细胞通过 PD-1/PD-L2 途径变化调控 Th 细胞的机制。

方法 收集 2017.9 -2019.6 就诊于新疆自治区人民医院的布病患者 126 例和健康对照 120 例。通过流式细胞术检测外周血 M1 和 M2 型巨噬细胞以及 PD-L2 的表达；Th1，Th2，Th17，Treg 细胞及其上 PD-1 的表达。qRT-PCR 和 Western Blot 检测 T-bet、GATA-3、IFN-γ、IL-4、iNOS、Arg-1、TNF-α、IL-1RA 的 mRNA 和蛋白表达。检测血清中 TNF-α、IL-1RA、IFN-γ 和 IL-4 水平。通过分选布病患者的 M2 细胞和对照组的 CD4+T 细胞，进行体外试验。分别对 PD-L2 进行增强或阻断，以及对 PD-1 阻断，观察 T-bet、GATA-3、IFN-γ、IL-4 的 RNA 和蛋白表达以及 IFN-γ 和 IL-4 的变化情况。

结果 布病组的 M2 细胞增加，且 M2 细胞上的 PD-L2 表达下调。iNOS、TNF-α、Arg-1 和 IL-1RA 增加，血清中 TNF-α 增高，IL-1RA 显著增高。布病组 Th1 降低，Th2 增多，Treg 增高，PD-1 在 Th1、Th2、Treg 细胞上的表达增高。血清中 IL-4 增加。T-bet 的 mRNA 和蛋白水平无明显变化，GATA-3 和 IL-4 的 mRNA 和蛋白水平则升高，IFN-γ 的 mRNA 和蛋白水平升高。体外试验结果发现，在加入了 PD-L2 后，M2 型巨噬细胞会上调 T-bet 和 IFN-γ 的表达水平，并下调 GATA-3 和 IL-4 的表达水平。在加入了 Anti-PD-L2 后，M2 型巨噬细胞会进一步下调 T-bet 的表达水平，并上调 GATA-3 和 IL-4 的表达水平，阻断 PD-L2 后则会得到相反的结果。加入 PD-L2 使 T-bet 和 IFN-γ 的表达水平升高后，进一步加入 Anti-PD-L2 阻断 PD-L2 可以下调 T-bet 和 IFN-γ 的表达水平。在加入 PD-L2 并阻断 PD-L2 后，T-bet、GATA-3、IFN-γ 和 IL-4 的表达水平恢复到与 M2 组相同的水平。在阻断 PD-L2 或者阻断 PD-1 后 T-bet、GATA-3、IFN-γ 和 IL-4 的表达水平无明显差异。

结论 布鲁氏菌病患者体内巨噬细胞以 M2 型极化占优势，且 M2 上的 PD-L2 表达下调。同时 Th1 降低，Th2 增多，Treg 增多。Th1、Th2 和 Treg 上的 PD-1 增高，PD-1 参与了 CD4+T 亚群的调控。体外试验表明 M2 型巨噬细胞通过 PD-1/PD-L2 途径影响 Th1/Th2 平衡参与布鲁氏菌病的发生发展。

PO-0166

Human Amniotic Mesenchymal Stem Cells Inhibit aGVHD in Humanized NPG Mice by Suppressing Effector T Cells

Ya Gao 、weiru Li、xiaoyin Bu、shengchun Cai、xiumei Hu、Lei Zheng、baohong Ping
Nanfang Hospital, Southern Medical University

Background Acute graft versus host disease (aGVHD) occurs when immunocompetent T cells in the donated tissue recognize the recipient as foreign after allo-HSCT, which can severely affect the quality of life.The aim of this study was to explore the therapeutic efficacy and underlying mechanisms of human amniotic mesenchymal stem cells (hAMSCs) transplantation for the humanized aGVHD mouse model.
Methods We established a humanized aGVHD mouse model by transplanting human peripheral blood mononuclear cells (PBMCs) into NOD-PrkdcscidIL2rγnull (NPG) mice. Mice were divided into control group (untreated), aGVHD group, and hAMSCs treatment group, the hAMSCs labeled with GFP were administered to aGVHD mice to explore the homing ability of hAMSCs. T effector and Treg cell levels and cytokines of each group in target organs were detected by flow cytometry and cytometric bead array (CBA) respectively.
Results We successfully established a humanized aGVHD mouse model using NPG mice. The hAMSCs have the ability to inhibit aGVHD in this mouse model. hAMSCs suppressed xenogenesis CD3+CD4+ T and CD3+CD8+ T cell proportion and increased the number of Treg cells, and besides, hAMSCs can reduce the levels of IL-17A, INF-γ, TNF, and IL-2 in aGVHD target organs.
Conclusions The NPG murine environment was capable of activating human T cells to produce aGVHD pathology to mimic aGVHD as in humans. The hAMSCs controlled aGVHD by decreasing inflammatory cytokine secretion within target organs by modulating the balance of Treg and T effector cells in humanized mice.

PO-0167

Serological characteristics of patients with rheumatoid arthritis carrying anti-SSA/Ro

Wei Wang 、Siyu Wu
Department of Clinical Laboratory, Xiangya Hospital, Central South University,

Objectives To analysis the serological characteristics of anti-SSA/Ro positive RA patients and to evaluate the associations between the serological characteristics observed in RA and synovitis.
Methods 971 RA patients were screened from the Xiangya Hospital’s original database for the availability of anti-ENA antibody data. The prevalence of each anti-ENA antibody in 971 RA patients was analyzed and the serological characteristics of anti-SSA/Ro positive RA patients were concluded. Among the 971 RA patients, 380 RA patients performed the ultrasound imaging to judge about synovitis. Binary logistic regression analysis was performed to evaluate the associations between the serological characteristics observed in RA and synovitis.
Results The prevalence of anti-SSA/Ro60 and anti-SSA/Ro52 in 971 RA patients were 12.26 % and 12.15 %. Anti-SSA/Ro60 positivity was associated with high titers of other autoantibodies (RF, ACPA, anti-SSA/Ro52 and anti-SSB), and anti-SSA/Ro52 positivity was associated with anti-SSA/Ro60 and anti-SSB. Levels of CRP, C4, ANC and PLT were showed lower, and levels of IgG and IgA showed higher in anti-SSA/Ro60-positive group. And levels of CRP and ANC were showed lower, and levels of IgG showed higher in anti-SSA/Ro52-positive group. Further logistic regression analysis revealed that anti-SSA/Ro60 antibody may be a protective factor for synovitis in RA.

Conclusions Anti-SSA/Ro-positive RA patients might be a distinct subset with high titers of other autoantibodies and low acute phase reactive proteins. And anti-SSA/Ro60 antibody might be a protective factor for synovitis in RA, which provide new insights into the association between anti-SSA/Ro and the pathogenesis of RA.

PO-0168

Anti-citrullinated protein antibodies are associated with neutrophil extracellular trap formation in rheumatoid arthritis

Wei Wang 、Siyu Wu
Department of Clinical Laboratory, Xiangya Hospital, Central South University,

Objectives We evaluated the associations of anti-citrullinated protein antibodies (ACPAs) and serological and cytological levels of neutrophil extracellular trap (NET) formation in rheumatoid arthritis (RA) patients.
Methods Serum levels of myeloperoxidase-DNA and elastase-DNA complexes (NET remnants) were examined in 51 patients with RA and 40 healthy controls using a modified enzyme-linked immunosorbent assay. Neutrophils were isolated by density gradient centrifugation. IgG antibodies were purified by affinity chromatography.NET formation in RA and control neutrophils was assessed by microscopy in vitro.NETs were purified and co-incubated with fibroblast-like synoviocyte (FLS) cells.Interleukin (IL)-6 and IL-8 mRNA expression and protein levels in FLS cells were determined by real-time polymerase chain reaction and enzyme-linked immunosorbent assay, respectively.
Results In RA patients, NET remnants in the peripheral circulation were higher in extremely high ACPA titers when compared to in moderate ACPA titers. And IgG antibodies containing ACPA can stimulate neutrophils to form NETs in a concentration-dependent manner. Furthermore, significantly higher expression of the pro-inflammatory cytokines IL-6 and IL-8 is detected after FLS cells interacted with NETs which derived from neutrophils stimulated with ACPA-containing IgG antibodies.
Conclusions Anti-citrullinated protein antibodies may enhance NET formation and contribute to inflammation development in RA by stimulating NET formation, such as by subsequent activation of FLS cells by NETs.

PO-0169

Human Amniotic Mesenchymal Stem Cells Inhibit Acute Graft versus Host Disease in Humanized Mice by Regulating the Balance of T cells and Treg Cells

Ya Gao、Baohong Ping、Xiaoyin Bu、Shengchun Cai、Xiumei Hu、Lei Zheng
Department of Hematology, Nanfang Hospital, Southern Medical University

Background Acute graft versus host disease (aGVHD) occurs when immunocompetent T cells in the donated tissue recognize the recipient as foreign after allo-HSCT, which can severely affect the quality of life.The aim of this study was to explore the therapeutic efficacy and underlying mechanisms of human amniotic mesenchymal stem cells (hAMSCs) transplantation for the humanized aGVHD mouse model.
Methods We established a humanized aGVHD mouse model by transplanting human peripheral blood mononuclear cells (PBMCs) into NOD-PrkdcscidIL2rγnull (NPG) mice. Mice were divided into control group (untreated), aGVHD group, and hAMSCs treatment group, the hAMSCs labeled

with GFP were administered to aGVHD mice to explore the homing ability of hAMSCs. T effector and Treg cell levels and cytokines of each group in target organs were detected by flow cytometry and cytometric bead array (CBA) respectively.
Results We successfully established a humanized aGVHD mouse model using NPG mice. The hAMSCs have the ability to inhibit aGVHD in this mouse model. hAMSCs suppressed xenogenesis CD3+CD4+ T and CD3+CD8+ T cell proportion and increased the number of Treg cells, and besides, hAMSCs can reduce the levels of IL-17A, INF-γ, TNF, and IL-2 in aGVHD target organs.
Conclusions The NPG murine environment was capable of activating human T cells to produce aGVHD pathology to mimic aGVHD as in humans. 肺癌七项自身抗体与相关肿瘤标志物联合检测对肺癌诊断的价值

高慎霞
天津市胸科医院

目的 分析七种自身抗体（seven autoantibodies，7-AABs，包括 PGP9.5、GBU4-5、p53、GAGE7、MAGE A1、SOX2、CAGE）和相关肿瘤标志物（CEA+NSE+CYFRA21-1）单独及联合检测对肺癌诊断的价值，并探究 7-AABs 的阳性率及表达水平在不同肺癌病理分型及临床 TNM 分期间的差异，为临床诊断提供新思路。
方法 选取天津市胸科医院 2020 年 9 月至 2021 年 1 月的肺癌患者 186 例，并选取同期就诊的肺良性病变患者 74 例作为对照组，采用酶联免疫吸附法检测两组患者血清中 7-AABs 含量，收集患者 CEA、NSE、CYFRA21-1 三种肿瘤标志物数据，比较两组患者 7-AABs 阳性率和表达水平的差异，同时比较肺癌组中不同病理分型及不同 TNM 分期患者中 7-AABs 的差异，通过 ROC 曲线判断 7-AABs 和肿瘤标志物（CEA+NSE+CYRFRA21-1）单独及联合检测对肺癌的诊断效能。统计学分析采用统计学软件 SPSS 进行。若 P<0.05，则认为差异有统计学意义。
结果 肺癌组 7-AABs 阳性率高于肺良性疾病组。p53 与 PGP9.5 在 III 期+IV 期组中的表达水平高于 I 期+II 期组；7-AABs 在小细胞肺癌组及鳞癌组中的阳性率高于腺癌组。在 ROC 曲线中，7-AABs+肿瘤标志物联合检测 AUC 值为 0.777，灵敏度为 0.919，特异度为 0.635，联合检测的灵敏度较 7-AABs 单独检测提升了 0.419，较肿瘤标志物单独检测提升了 0.209（P<0.05）。
结论 7-AABs 与相关肿瘤标志物联合检测可提高肺癌诊断的灵敏，可为临床上肺癌的辅助诊断提供新思路。

PO-0171

Soluble POSTN as a potential biomarker for early chemotherapy efficacy monitoring in breast cancer

Dong Dong
Tianjin Medical University Cancer Institute and Hospital

Background The limitations of the current use of imaging for and chemotherapy efficacy monitoring in BCa are high costs, time-consuming, side effects from exposure to radiation and contrast agents, and potential delays in therapy reorientation. Noninvasive biomarkers for the early assessment of tumor response in breast cancer (BCa) are essential for optimized therapeutic decision-making. The most commonly used blood markers in BCa management, CA153 and CEA, provide incompetent performances due to limited sensitivity and specificity.

Therefore, there is an urgent need to explore other novel and reliable non-invasive biomarkers. POSTN is a secreted extracellular matrix (ECM) glycoprotein, which was originally identified in osteoblasts. Overexpression of POSTN have been implicated in several types of human cancer. And recent studies have indicated that POSTN was involved in cancer cell survival, ECM degradation, invasion, metastasis and chemoresistance. In BCa, immunohistochemistry results indicated that POSTN was overexpressed mainly in cancer-associated stroma and/or slightly in cancer cells, usually associated with poor clinical outcomes. Moreover, there was a trend of increasing POSTN expression in metastatic lymph nodes, as well as other tissues and organs. However, the clinical significance of circulating POSTN in BCa remains to be fully assessed. The aim of this study is to evaluate the potential of soluble POSTN in circulating as a biomarker for early chemotherapy efficacy monitoring in BCa.

Experimental Design：

In prevalence assessment, the correlation between the level of soluble POSTN and tumor volume, as well as TNM stages of BCa was verified. And in longitudinal assessment, BCa patients receiving conventional or Her2-targeted chemotherapy were enrolled. Soluble POSTN, together with CA153 or CEA, were determined in serum collected at different time points (C0, C1 and C2) by enzyme linked immunosorbent assay (ELISA) or electrochemiluminescence immunoassays. Then we compared the performances of markers in recapitulating the early chemotherapy efficacy assessed by imaging.

Results Serum levels of soluble POSTN were significantly increased in BCa patients compared with benign disease and healthy controls. Its levels were significantly associated with tumor volume and TNM stages of BCa, and its dynamics could recapitulate the early chemotherapy efficacy much better than that of CA153 and CEA. A strong consistency of POSTN response was observed in all four cases with progressive disease at both C1 and C2. Moreover, further analysis indicated that, for partial response, the monitoring efficiency of soluble POSTN with high baseline (above 17.05 ng/mL) at C2 was significantly higher than that of with low baseline (below 17.05 ng/mL, $P < 0.05$), and the baseline levels were significantly correlated with the change ratios of POSTN in the fourteen consistent cases ($r = 0.684$, $P = 0.007$). Moreover, response of soluble POSTN after the first cycle of chemotherapy (at C1) could predict the early efficacy of chemotherapy assessed by CT (at C2). Finally, overall survival analysis showed that patients experienced a significant early decrease of POSTN at C1 and C2 tended to obtain more benefits from the treatments.

Conclusions The current study suggests that soluble POSTN is an informative serum biomarker to complement the current clinical approaches for early chemotherapy efficacy monitoring in BCa, and performing soluble POSTN analysis to complement the current clinical approaches for early chemotherapy efficacy monitoring may be beneficial to patients with breast cancer.

PO-0172

基于三维石墨烯水凝胶复合材料的电化学免疫传感器的研发及其对分泌型自噬小体的检测

张越[1]、王立新[2]、沈艳飞[2]、周成林[1]
1. 泰州市人民医院
2. 东南大学

目的 肿瘤细胞释放分泌型自噬小体(TRAP)通过多种途径影响肿瘤生长，且 TRAP 可释放入外周血，提示外周血 TRAP 有望反映肿瘤进程。目前尚未有方法直接定量检测 TRAP，且外周血 TRAP 含量较少，因此，建立 TRAP 富集与定量检测的新方法有重要意义。基于此，我们研发 TRAP 特异性纳米磁珠用于外周血 TRAP 的纯化富集，同时利用免疫传感器的高灵敏度和高特异性以及纳米材料三维石墨烯水凝胶的优良特性，设计研发新型免疫传感器，用于 TRAP 富集后定量检测，为探究外周血 TRAP 含量与肿瘤疾病的关系提供新思路。

方法 1、扫描电镜、紫外-可见吸收光谱分析 Fe_3O_4-Au；Fe_3O_4-Au 偶联 LC3B 特异性抗体制备 TRAP 特异性纳米磁珠，激光共聚焦显微镜鉴定其合成并分析性能。
2、扫描电镜、紫外-可见吸收光谱验证三维石墨烯水凝胶-亚甲基蓝(GH-MB)合成，循环伏安法分析 GH-MB 性能；循环伏安法监测免疫传感器的构建；通过差分脉冲伏安法检测免疫传感器修饰富集所得 TRAP 前后的电流相对变化值定量检测 TRAP，并分析免疫传感器性能。
3、免疫传感器检测癌症患者与健康人外周血 TRAP 含量，分析其与肿瘤疾病的相关性。
结果 1、Fe_3O_4-Au 合成成功；TRAP 特异性纳米磁珠制备成功且性能优异。
2、GH-MB 合成成功，可放大电信号；免疫传感器构建成功，检测 TRAP 的线性范围为 60 pg/mL-600 ng/mL 且性能较好。
3、癌症患者与健康人外周血均含有 TRAP，且癌症患者外周血 TRAP 含量明显高于健康人。
结论 1、TRAP 特异性纳米磁珠与基于氧化石墨烯水凝胶复合材料的电化学免疫传感器研发成功，可用于 TRAP 的富集与定量检测。
2、免疫传感器 TRAP 检测法可应用于癌症患者外周血 TRAP 含量的检测，且初步发现癌症患者外周血 TRAP 含量明显高于健康人。

PO-0173

Dynamic observation of antibody responses in COVID-19 convalescents and vaccinated individuals by five surrogate neutralization assays

Ruiwei Jiang、Min Li、Enyun Wang、Jiwen Hu、Dan Xiong、Xiaowen Dou、Xiuming Zhang
Medical Laboratory Center of Luohu Hospital Group

Background The ongoing severe acute respiratory syndrome coronavirus (SARS-CoV-2) infection has persisted for approximate to one half and a year. Resistance to SARS-CoV-2 persists in infected people and whether antibodies produced against natural infection provide protective immunity, it is crucial for prevent reinfection risk and vaccine development to assess how long immunity. To investigate the changes of serum antibody levels in participants vaccinated with COVID-19 vaccine and those recovered with COVID-19, and to compare the performance of five neutralizing antibody (Nab) kits against SARS-CoV-2.
Patients and Methods In this study, a total of 164 healthy participants were enrolled for a two-dose procedure of inactive vaccination, and 10 COVID-19 convalescent patients. Venous blood was drawn at different time point, for assessing SARS-CoV-2 IgM, IgG and Nab. The seroconversion rate of different antibodies was calculated at different time points. Dynamic changes of antibody levels were observed at different time points. Besides, the correlation of antibody level were evaluated with three SARS-CoV-2 chemiluminescent assays (Axceed, iFlash and Ecl) and one enzyme-linked immunosorbent (ELISA) assay (Yaneng) compared directly the cPass ELISA neutralization test.
Results The antibody levels changed significantly with time extension after vaccination. The seroconversion of Nabs on day 28 after the first vaccination schedule was 13%, while the result increased to 85% in one week after the second dose. Whereas at day 28 after completely immune seroconversion was seen in 97%. The levels of Nabs increased steadily after vaccination, and enhanced sharply after the second dose of vaccine and the peak value was 6.67 AU/mL on day14, that's 14 times the base value (median 0.44AU/mL). The correlation between cPass and yaneng was the strongest ($r = 0.917$), followed by Ecl, Axceed ($r = 0.726$ and $r = 0.723$, respectively), the medium correlation was iFlash ($r = 0.565$).After, a total of 25 different levels of samples were separated for the "gold standard" - VNT. The results of VNT test showed that the positive rate of Nabs was 32% (n=8/25), whereas the test results of Axceed was 76% (n=19/25).The correlation between the SARS-CoV-2 chemiluminescent assays kit (Axceed) and VNT was r=0.57. Besides, The level of Nabs induced by vaccine was 7.41 AU/mL (95%CI：

5.02~9.8AU/mL, n=120,60days), which was 0.14 times higher than that of 52.47 AU/mL (95%CI：45.18~59.76AU/mL, n=33, 30-60days) in COVID-19 convalescent patients.
Conclusion Inactivated vaccines induce a strong humoral immunity response. Rapid detection method can be used to effectively evaluate the change of Nabs in humoral immune response products of vaccinators and recovered patients.

PO-0174

可溶性共刺激分子 B7-H3 在结直肠癌中的表达及临床意义

王蕾
上海市第八人民医院

目的 检测结直肠癌（CRC）患者血清可溶性 B7-H3（sB7-H3）的水平，探讨其在 CRC 中的临床应用价值。
方法 选取 CRC 患者 232 例，结直肠良性疾病患者 87 例，以及健康体检者 59 例（正常对照组）。分别测定 sB7-H3、癌胚抗原（CEA）、糖类抗原 19-9（CA19-9）、糖类抗原 72-4（CA72-4）及糖类抗原 50（CA-50）水平。采用受试者工作特征（ROC）曲线评价 B7-H3 对 CRC 的诊断效能；探讨 CRC 患者血清 B7-H3 水平与肿瘤部位、浸润深度、淋巴结转移状态、远处转移状态及肿瘤分期的相关性。
结果 （1） CRC 组、结直肠良性疾病组和正常对照组三组间两两比较，sB7-H3 水平差异均有统计学意义（P<0.001）。（2）在 CRC 组中，B7-H3 与 CA-50、CEA、CA72-4 均呈正相关（r 值分别为 0.220、0.217、0.142，P<0.05），而与 CA19-9 无相关性。（3）ROC 曲线显示，B7-H3 的曲线下面积最大，为 0.862，cut-off 值为 20.50，此时的敏感度为 0.850，特异度为 0.759。（4）免疫组化显示，CRC 组阳性率为 58.6%，炎症息肉组阳性率为 6.7%，二组的阳性率比较差异有统计学意义（P<0.01）。（5）CRC 患者血清 B7-H3 水平与肿瘤远处转移状态及病理学分期相关（P<0.05），而与肿瘤患者的性别、年龄、肿瘤部位及淋巴结转移状态无关（P 均>0.05）。
结论 B7-H3 对于 CRC 具有较好的辅助诊断价值，且与肿瘤远处转移状态及病理学分期相关，有助于临床早期诊断。

PO-0175

Diagnostic value of anti-citrullinated α-enolase peptide 1 in patients with rheumatoid arthritis: A meta-analysis

Haolong Li
Department of Clinical Laboratory, Peking Union Medical College Hospital, Peking Union Medical College and Chinese Academy of Medical Sciences, Beijing, China

Objective Rheumatoid arthritis (RA) is a common systematic autoimmune disorder which is mainly characterized by inflammatory arthritis. In this study, we evaluated the diagnostic value of anti-citrullinated α-enolase peptide 1 (anti-CEP 1) in patients with RA by performing systematic review and meta-analysis.
Medthods Five electronic databases were searched for relevant studies published by February 29,2020, including PubMed, Web of Science, Embase, Scopus and Cochrane Library. The bivariate mixed-effects model was used to calculated the diagnostic indexes from primary data of eligible studies by using STATA 15.0 software. The included articles were assessed with Quality Assessment of Diagnostic Accuracy Studies 2 tool. Subgroup analysis and meta-regression were also performed.

Results Twenty articles that met inclusion criteria were performed meta-analysis, there were a total of 13,864 RA patients and 6459 control participants. The pooled sensitivity, specificity, and positive and negative likelihood ratios for anti-CEP 1 were 44% (95% CI, 39%-55%), 97% (95% CI, 95% -98%), 14.44 (95% CI, 10.50-20.75), and 0.57 (95% CI, 0.52-0.61), respectively. The area under summary receiver operator characteristic curve was 0.81. The meta-regression indicated that the detection method for anti-CEP 1 may be the source of heterogeneity. The subgroup analysis showed that the group detected anti-CEP 1 using a commercial ELISA kit shows the sensitivity was 59% (95% CI: 50%-68%), the specificity was 93% (95% CI: 85%-97%).
Conclusion In conclusion, anti-CEP 1 has a moderate diagnostic value of diagnosing RA with relatively low sensitivity and high specificity, but using the commercial ELISA kit may increase the sensitivity of diagnosing RA.

PO-0176

严重急性呼吸综合征冠状病毒 2 抗体检测及临床应用概述

李昊隆
中国医学科学院北京协和医院

目的 从严重急性呼吸综合征冠状病毒 2（SARS-CoV-2）特异性抗体的产生、抗体检测方法的建立及其临床应用价值等方面做一综述。
方法 检索 PubMed、Web of Science、Scopus、Embase、中国知网以及万方数据库中已发表的 SARS-CoV-2 抗体产生、检测方法的建立、临床应用价值的相关文献，对已发表的文献进行总结。
结果 SARS-CoV-2 IgM 抗体主要出现在发病早期，而 IgG 抗体主要出现在发病的中后期。各厂商多选择 S 蛋白或 N 蛋白作为抗体检测试剂盒的靶抗原。SARS-CoV-2 抗体检测方法有酶联免疫吸附试验、化学发光免疫分析技术、胶体金免疫层析技术、荧光免疫分析技术。SARS-CoV-2 IgM 抗体诊断的灵敏度约为 68.2%-93.1%，IgG 抗体的灵敏度约为 64.7%-96.1%。抗体检测是核酸检测的重要补充手段，可在疑似病例的诊断中与核酸检测联合应用或作为核酸检测阴性的疑似病例的补充检测指标。COVID-19 患者 SARS-CoV-2 抗体水平的变化可以反映患者的病情进展。SARS-CoV-2 抗体检测还可用于疫苗效果的评估及病毒感染的血清流行病学调查。
结论 SARS-CoV-2 抗体检测是核酸检测手段重要的方法学补充，对于 COVID-19 患者的辅助诊断具有重要意义，与核酸检测联合应用可减少 COVID-19 患者漏检的情况。

PO-0177

The Value of Hematological Indexes in Evaluating the Risk of Hip Involvement in Patients with Ankylosing Spondylitis

Sihui Li、xi li、wei zhou、yanting jiang、min jin、jian wang
First Affiliated Hospital of Guangxi Medical University

Objective To analyze the laboratory data of ankylosing spondylitis (AS) patients with hip involvement, and explore the value of neutrophil to lymphocyte ratio (NLR) and monocyte to lymphocyte ratio (MLR) in evaluating the risk of hip involvement in patients with AS.
Methods Retrospective analysis was performed on a total of 188 patients with AS. According to BASRI score, 84 AS patients with hip radiology score ≥2 were selected as hip involvement group, and 104 AS patients with hip radiology score<2 as non-hip involvement group. During the same period, 173 patients with osteoarthritis (OA) and 181 healthy people by age and sex were selected. The characteristics of hematological indexes of the three groups were compared, and the levels of NLR and MLR in hip involvement group and non-hip involvement group were observed.

Results The values of NLR and MLR in AS group were significantly higher than those in OA group and healthy controls (each P<0.05). The values of NLR and MLR in hip joint involvement group were significantly higher than those in non-hip involvement group (P<0.05). The diagnostic efficiency of combined detection of NLR and MLR in AS-hip involvement group was significantly higher than that in AS-non-hip involvement group and OA group (AUC-AS-hip involvement group=0.863, P<0.001; AUC-AS-non-hip involvement group=0.746, P<0.001; AUC-OA group=0.669, P<0.001).
Conclusion NLR and MLR have certain value in the evaluation of AS patients with hip involvement, and the combined diagnosis of them has higher value.

PO-0178

A Novel Prognostic Model for patients with Hemophagocytic Lymphohistiocytosis

Jun Zhou、Hua-Guo Xu
First affiliated Hospital of Nanjing Medical University / Jiangsu Provincial people's Hospital

PURPOSE Hemophagocytic Lymphohistiocytosis (HLH) is a type of rare disease with low survival rate. We aimed to develop a clinical prediction model to evaluate the six-month prognosis in HLH patients.
METHODS The post-treatment data for newly diagnosed HLH patients was collected and a stepwise regression analysis was performed to select independent prognostic variables for inclusion in the model.
RESULTS Three laboratory markers were confirmed to be the independent risk factors (ferritin: hazard ratio (HR) 0.101, 95% confidence interval (CI) 0.036-0.282, P＜0.001; platelets: HR 4.799, 95% CI 1.884-12.223, P=0.001; alanine aminotransferase (ALT): HR 0.423, 95% CI 0.180-0.997, P=0.049). These were included in the final clinical prediction model. Receiver operating characteristic (ROC) curves disclosed that this model had a better discrimination (area under the curve (AUC)=0.842, 95% CI 0.773 -0.910, P<0.001) than each of them alone and the calibration curves aligned completely with the model predictions and actual observations. Kaplan-Meier curves revealed a significant difference in the overall survival (OS) in patients stratified by the model with higher values associated with a better OS.
CONCLUSION These results point out that serum ferritin, platelets and ALT levels are independent elements of OS in patients with HLH, and that the proposed model have a better prognostic value than any of these markers alone.

PO-0179

自身免疫性肝病患者血清 Linc00324 和 Th17 细胞因子的表达及意义

王芳
山东大学第二医院

目的 检测自身免疫性肝病患者血清辅助性 T 细胞 17(Th17)因子和长链非编码 RNA 00324(Linc00324)的表达情况,探讨其在自身免疫性肝病发病中的作用及关系.
方法 选取自身免疫性肝病患者 86 例，选取同期 52 例体检健康者作为健康对照组。采用实时荧光定量 PCR 法(qRT-PCR)检测各组血清 Linc00324 表达水平;采用流式细胞仪对 Th17 细胞因子白细胞介素-4(IL-4)、白细胞介素-10(IL-10)水平进行检测;采用 Pearson 法分析自身免疫性肝病患者血清 Linc00324 及 Th17 细胞因子 IL-4、IL-10 表达水平的相关性.

结果 自身免疫性肝病患者血清 Linc00324 水平、Th17 细胞因子 IL-4、IL-10 水平均显著高于对照组(P<0.05)，自身免疫性肝病患者血清 Linc00324 表达水平与 Th17 细胞因子 IL-4、IL-10 水平呈明显正相关(r=0.528、r=0.508,P<0.05).
结论 Linc00324 在自身免疫性肝病患者血清中明显高表达,Th17 细胞因子 IL-4、IL-10 水平在自身免疫性肝病患者中明显高表达，提示 Linc00324 在自身免疫性肝病早期诊断及病情评估具有重要的临床意义。

PO-0180

Comprehensive characteristics of lymphocyte subsets alterations in COVID-19 patients

Wei Dai、Xinyi Xia
Jinling Hospital

Objectives Coronavirus disease 2019 (COVID-19) is a respiratory disorder caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), which had rapidly spread all over the world and induced public health emergency. Although the diagnosis and treatment for COVID-19 have been well defined, the immune cell characteristics and the key lymphocytes subsets alteration in COVID-19 patients have not been thoroughly investigated.
Methods In this study, the level of immune cells including T cell, B cell, and natural killer (NK) cell in 548 hospitalized COVID-19 patients, and 30 types of lymphocytes subsets in 125 COVID-19 patients admitted in Wuhan Huoshenshan Hospital of China were measured by flow cytometry. The relationship with cytokines Interleukin- 6 (IL-6), and the characteristics of lymphocytes subsets in single-cell RNA sequencing (scRNA-seq) data obtained from peripheral blood mononuclear cell (PBMC) were also analyzed in COVID-19 patients.
Results Our results indicated that patients with critical COVID-19 exhibited an overall decline of lymphocytes including CD4+ T cell, CD8+ T cell, total T cell, B cell, and NK cell compared to mild and severe patients. Whereas the number of lymphocytes subsets including CD21 low CD38 low B cell, effector T4 cell, and PD1+ depletes T8 cell were moderately increased in critical COVID-19 patients in comparison to mild cases. Notably, except for effect memory T4 cell, plasmablast and Treg, the number of all lymphocytes subsets were remarkably declined in COVID-19 patients with IL-6 levels over 30 fold than normal. Moreover, scRNA-seq data showed obvious differences in distribution and numbers of lymphocytes subsets between COVID-19 patients and healthy person, subsets-specific marker genes of lymphocyte subsets including CD4, CD19, CCR7, and IL7R in COVID-19 patients were remarkable decreased than those in health.
Conclusion Our investigation indicated that the comprehensive decrease of immunity cells and lymphocytes subsets in critical patients with COVID-19 infection, peripheral lymphocyte subsets alteration showed a clear association with the clinical characteristics. Targeting inflammation such as IL-6 is a promising tool for the treatment of COVID-19 and provides an evidence of the biological mechanism to the clearance of COVID-19 infection.

PO-0181

IL35 通过诱导淋巴细胞转化维持妊娠期免疫耐受

刘佳、李亚丽
山东大学第二医院

目的 妊娠早期的母体中存在大量免疫耐受淋巴细胞与抑制性细胞因子，并抑制母胎界面 Th17 细胞的免疫效应。我们先前的研究表明，妊娠早期滋养细胞可表达并分泌免疫抑制细胞因子 IL-35，并且早孕妇女外周血中 IL-35 水平显著升高。考虑到 IL-35 的免疫抑制作用及其在滋养层细胞中的表

达，我们推测母胎界面中 IL-35 可能通过诱导 iTR35 细胞分化参与维持母胎耐受,此外，作为抑制性免疫细胞的重要组成部分，Breg 细胞可通过调节外周免疫应答在自身免疫性疾病和感染中发挥调节作用。由于 B 淋巴细胞很少存在于母胎界面，因此我们主要研究了 Breg 细胞在妊娠期间外周免疫耐受中的调节作用。

方法 1．构建自然流产小鼠模型 CBA/J XDBA/2J 和正常妊娠小鼠模型 CBA/J XBALB/c。

2．通过 WB 的方法检测孕鼠母胎界面 IL-35 含量。

3．将小鼠重组 IL-35 细胞因子及 IL-35 中和性抗体分别对不同组孕鼠进行腹腔注射治疗，观察其对流产的影响以及母胎界面 iTR35 含量变化。

4. 通过 WB 的方法检测妊娠相关激素及 IL-35 诱导产生 B10 和 IL-35Breg 的相关信号通路和转录因子。

结果 1.自然流产孕鼠胚胎丢失率明显高于正常妊娠孕鼠。

2．自然流产孕鼠母胎界面 IL-35 水平和 iTR35 细胞的比例显著低于正常妊娠孕鼠。

3．IL-35 治疗显著提高了母胎界面 iTR35 含量并抑制流产的发生；

4.IL-35 和 hCG 均能抑制小鼠脾脏 B 细胞的增殖，hCG 可促使小鼠 B 细胞内的 STST3 磷酸化，诱导其转化生成 B10。

结论 IL-35 可分别在母胎界面和母体外周诱导抑制性 iTR35 细胞和 IL-35Breg 细胞产生，从而促进了母胎局部及妊娠期外周的免疫耐受形成。妊娠相关激素 hCG 也在外周 B10 细胞的诱导中发挥着重要作用。我们的研究为 IL-35 在治疗复发性流产中的应用提供了新的依据，具有重要的临床应用价值。

PO-0182

TK1 及 CA153 联合检测在乳腺癌诊断中的应用

郭信蓉
滨州医学院烟台附属医院

目的 探讨血清胸苷激酶 1（TK1）和血清糖类抗原 153（CA153）联合检测在乳腺癌诊断中的应用价值。

方法 选取 40 名乳腺癌患者作为乳癌组，40 名乳房良性疾病患者为良性疾病组，40 名女性健康体检者为健康对照组，采用电化学发光的方法测定血清 CA153 的含量，应用免疫印迹增强化学发光法测定 TK1 含量。

结果 乳癌组血清 TK1、CA153 的水平以及阳性率明显高于良性疾病组和健康对照组，差异均有统计学意义（P＜0.05）。联合检测 TK1 和 CA153 灵敏度提高到 87.50%，准确性上升到 88.33%，特异性变化不明显。

结论 与单项检测相比，联合检测 TK1 和 CA153 能有效提高乳腺癌诊断的灵敏度，使乳腺癌的检出率大幅增加，在乳腺癌早期诊断中有一定的临床价值。

PO-0183

血清鳞状上皮细胞癌抗原在银屑病患者皮损及疗效评估中的临床价值

魏彬
四川大学华西医院

目的 本研究旨在探讨 SCCA 在银屑病患者辅助诊断及疗效评估的临床应用价值。

方法 纳入 2020 年 6 月至 2021 年 1 月我院临床确诊 401 例皮肤疾病患者，包括银屑病 187 例，天疱疮 147 例，湿疹 28 例，特发性皮炎 27 例，红皮病 12 例，另外选取同期 660 例健康体检正常人群作为对照组，检测血清 SCCA 水平，采用 SPSS 统计软件分析数据。
结果 SCCA 测定结果显示，SCCA 在银屑病、天疱疮、湿疹、特应性皮炎、红皮病、对照组中的阳性率分别为 66.84%、17.00%、28.57%、62.96%、91.67%、2.42%，中位数分别为 4.49 (2.05-11.30) ng/ml、0.89 (0.62-1.53) ng/ml、1.96 (0.90-2.80) ng/ml、5.31 (1.54-13.90)ng/ml、22.05 (9.26-37.70)ng/ml、1.16 (0.91-1.47) ng/ml。各组间 SCCA 定量比较有统计学差异，红皮病患者最高，其次为特应性皮炎和银屑病患者。进一步针对银屑病亚类分析，未分类银屑病阳性率 73.68%，寻常型银屑病（含点滴型和斑块状银屑病）阳性率 63.16%，各银屑病亚类间血清 SCCA 水平无显著性差异（P>0.05）。银屑病患者治疗前皮损面积和严重程度指数(Psoriasis area and severity index, PASI)及体表受累面积(body surface area, BSA)与 SCCA 水平呈指数相关（PASI R=0.675，BSA R=0.609），治疗后皮损好转者 SCCA 显著降低（P<0.001）。
结论 血清 SCCA 水平可因皮损等原因在银屑病、红皮病及特异性皮炎中明显增加；血清 SCCA 检测可有效评估银屑病患者皮损受累程度和治疗效果。

PO-0184

血清 25-羟基维生素 D3 检测在儿童社区获得性肺炎中的应用价值分析

陆媛
西安市第一医院

目的 探讨血清 25-羟基维生素 D3[25-（OH）D3]在儿童社区获得性肺炎中的变化及临床意义。
方法 选择 2018 年 1 月-2018 年 6 月间我院儿科收治的 128 例社区获得性肺炎患儿为研究对象，根据病情程度分为轻症组（n=80）及重症组（n=48），选择同期在我院体检的健康儿童 50 例纳入对照组。比较不同组别研究对象血清 25-（OH）D3、超敏 C 反应蛋白（hs-CRP）水平，以及维生素 D 充足组（n=51）及维生素 D 缺乏组（n=77）患儿临床疗效。
结果 社区获得性肺炎（轻症组及重症组）患儿血清 25-（OH）D3 水平分别为（73.45±12.63）nmol/L、（68.36±11.74）nmol/L，均明显低于对照组的（81.64±11.52）nmol/L，血清 hs-CRP 水平分别为（11.28±3.36）mg/L、（16.61±4.54）mg/L，均高于对照组的（3.67±1.17）mg/L，差异有统计学意义（P＜0.05）；重症组患儿血清 25-（OH）D3 水平低于轻症组，血清 hs-CRP 水平则高于轻症组，差异有统计学意义（P＜0.05）；维生素 D 充足组患儿临床症状体征消退时间、住院时间分别为（7.16±2.14）d、（9.24±3.25）d，明显短于维生素 D 缺乏组的（9.93±3.29）d、（12.26±4.42）d，差异均有统计学意义（P＜0.05）。
结论 血清 25-（OH）D3 的缺乏与儿童社区获得性肺炎的发生关系密切，并且 25-（OH）D3 水平可以反映疾病的轻、重程度，且可以影响临床疗效。

PO-0185

乙肝病毒感染采用 HBV DNA 定量与乙肝血清学标志物定量联合检测的效果分析

赵棉
西安市第一医院

目的 探讨乙肝病毒（HBV）感染采用 HBV DNA 定量与乙肝血清学标志物定量联合检测的效果。
方法 回顾性分析 2017 年 1 月~2017 年 12 月我院 988 例乙型肝炎患者的临床资料，根据 HBV 血

清学标志物定量检测水平将其分为三组，即大三阳组 285 例、小三阳组 358 例与其他模型组 245 例。所有患者均行乙肝血清学标志物定量与 HBV DNA 定量检测。观察并分析 HBV DNA 对 HBV 感染的检测结果，血清标志物与 HBV DNA 检测的阳性率，以及不同血清学标志物定量模式与不同 HBV DNA 定量水平的检测结果。

结果 三组对 HBV DNA 检测的阳性率对比差异具有统计学意义（P<0.05），即大三阳组 HBV DNA 检测的阳性率>小三组>其他模型组。三组 HBV DNA 定量检测水平对比差异具有统计学意义（P<0.05），即大三阳组>小三阳组>其他模型组。490 例 HBV DNA 阳性样本中，HBeAg 检出率为 48.98%（240/490），HBsAg 检出率为 96.94%（475/490）。HBV DNA 水平>7 lg copies/ml 时，以大三阳组居多，占 77.24%；5~7 lg copies/ml 时，以大三阳组居多，占 66.04%；2.7~5lg copies/ml 时，以小三阳组居多，占 44.66%；<2.7lg copies/ml 时，以其他模型组居多，占 55.83%。

结论 HBV DNA 定量与乙肝血清学标志物定量联合检测能够有效增强 HBV 的诊断准确率，为评价 HBV 传染性与感染程度提供了有效的参考，适于临床应用。

PO-0186

MDSC 外泌体诱导小鼠结直肠癌细胞 EMT 的实验研究

蔡婧姗、王胜军
江苏大学附属人民医院

研究 MDSCs 来源 exosomes（MDSC-exo）对小鼠结直肠癌细胞上皮间质转化（EMT）和肿瘤转移的影响，并对其中的分子机制进行探讨。结果发现，与对照组相比，MDSC-exo 处理组的 CT26 细胞中 E-cadherin 蛋白表达降低，N-cadherin 的蛋白表达增高；转录因子 Snail1、Snail2、Zeb1 和 Twist1 的 mRNA 水平增加（P<0.05）。为了探讨 MDSC-exo 通过 ROS 诱导 EMT 的可能性，我们首先通过 FCM 证实 MDSCs 胞内 ROS 水平高于 CT26 细胞，并且 MDSC-exo 处理 CT26 细胞后，CT26 细胞 ROS 水平明显增加（P<0.01）。利用 ROS 清除剂 NAC 预处理 MDSCs 后，MDSCs 胞内 ROS 水平降低（P<0.05），外泌体中 ROS 水平也明显降低（P<0.05）。将 MDSC-exo 和 MDSCNAC-exo 分别处理 CT26 细胞，MDSCNAC-exo 组 CT26 细胞胞内 ROS 水平低于 MDSC-exo 组（P<0.05），并与对照组无明显差异（P>0.05）。经 MDSC-exo 处理 CT26 细胞 E-cadherin 和 Claudin-1 的蛋白表达低于对照组（P<0.001），Vimentin、Snail1 和 Zeb1 的蛋白表达高于对照组（P<0.001）；而当抑制 MDSC-exo 中 ROS 水平后，MDSCNAC-exo 处理组中 CT26 细胞的 Claudin-1、Vimentin 和 Zeb1 的蛋白表达低于 MDSC-exo 组（P<0.05），Snail1 的蛋白表达高于 MDSC-exo 组（P<0.01），E-cadheirn 表达无明显差异（P>0.05）。MDSC-exo 具有诱导 CT26 细胞 EMT 的作用，同时 MDSC-exo 能够增强肿瘤细胞迁移和侵袭，其作用机制可能部分依赖于 MDSC-exo 中携带的 ROS。

PO-0187

Netrin-1 对肿瘤髓源性抑制细胞功能的影响及机制研究

夏雪莉、王胜军
江苏大学附属人民医院

目的 肿瘤细胞常分泌多种分子调节 MDSCs 的分化发育与功能，我们探究结直肠癌细胞分泌的 Netrin-1 对 MDSCs 功能的作用及机制。

方法 ①检测小鼠结肠癌细胞系的 Netrin-1 表达情况，体外用 Netrin-1 重组蛋白处理 MDSC，检测 MDSC 对 T 细胞增殖的抑制能力以及多种免疫抑制效应分子的 mRNA 和蛋白水平。②qRT-PCR 验证 Netrin-1 及其受体 在 MDSC 上的表达，筛选可能的 Netrin-1 受体。在体外用 Netrin-1 重组蛋

白，受体拮抗剂和受体激动剂处理 MDSC，检测 MDSC 免疫抑制功能变化。 ③利用慢病毒载体敲减 Netrin-1 的稳转结肠癌细胞株，监测小鼠移植瘤的生长情况。

结果 利用 Netrin-1 重组蛋白处理 MC38 荷瘤小鼠脾脏 MDSCs，关键的免疫抑制分子活性氧（ROS）产生显著增多，Arg1 活性增强，但没有改变 NO 产生水平。MDSC 培养上清中分泌的 IL-10 和 TGF-β1 升高。对 MDSCs 上不同的 Netrin-1 受体的分析表明，A2BR 高表达，而 UNC5H 家族受体，DCC，neogenin 或 DSCAM 低表达或不表达。Netrin-1 诱导的 MDSC 免疫抑制活性被 A2BR 选择性拮抗剂 PSB1115 显著减弱，证实了 A2BR 在 Netrin-1 信号转导中的作用。为了进一步研究 Netrin-1 调节 MDSC 免疫抑制功能的机制，我们发现 Netrin-1 通过受体 A2BR 激活 cAMP-PKA-pCREB 信号通路。磷酸化的 CREB 直接与 C /EBP-β 启动子的 CREB 响应元件结合，并随后增强 Arg1，IL-10 和 TGF-β1 的表达。

结论 肿瘤细胞衍生的 Netrin-1 通过 MDSC 表面的 A2BR 受体，进一步激活了 MDSCs 中的 cAMP / PKA / CREB 信号通路，促进 Arg1，IL-10 和 TGF-β1 的产生，从而增强 MDSCs 的免疫抑制功能。

PO-0188

Silencing of PRDX2 Inhibits the Proliferation and Invasion of Non-Small Cell Lung Cancer Cells

xu jing
The Second Hospital of Shandong University

Peroxiredoxin 2 (PRDX2), a member of the peroxiredoxin family of antioxidant enzymes, has been revealed to be an important player in cancer progression. However, the biological role of PRDX2 in the progression of non-small cell lung cancer (NSCLC) is poor reported. In the present study, the loss-of-function experiments were performed to investigate the specific role of PRDX2 in the growth and invasion of NSCLC. The results revealed that knockdown of PRDX2 by siRNA interference significantly suppressed the proliferation, migration, and invasion of A549 and H1299 cells, as well as diminished the activity of MMP9. Additionally, the decrease in PRDX2 expression significantly promoted apoptosis in NSCLC cells by downregulating expression of Bcl-2 and upregulating the expression of Bax, cleaved caspase 3 and cleaved caspase 9, but had no significant effect on the apoptosis of normal lung epithelial cells BEAS-2B. Moreover, PRDX2 inhibitor also inhibited the proliferation, migration, and invasion of A549 cells and promoted apoptosis. Further, our data demonstrated that silencing of PRDX2 markedly reduced the phosphorylation of Akt and mTOR and expression of downstream proteins Cyclin D1 and p70S6k. In conclusion, our findings

indicate that PRDX2 exerts a prooncogenic role in the progression of NSCLC and might be a potential therapeutic target for NSCLC treatment.

PO-0189

Signaling lymphocytic activation molecule regulates Tfh-like cells in allergic rhinitis patients

Jun Yang、Shengjun Wang
The Affiliated People's Hospital, Jiangsu University

Background Allergic rhinitis (AR) is characterized by type I hypersensitivity that is mediated by IgE-induced humoral responses. Follicular helper T cells (Tfh) comprise the key helper T cell (Th) subset that promotes antibody production. Signaling lymphocytic activation molecules (SLAMs) participate in regulation of the differentiation and function of Tfh cells, but whether this regulation is involved in the pathogenesis of AR is unknown.

Methods CD4+CXCR5+ Tfh-like cells from peripheral blood were detected by flow cytometry. The IL-21 and IgE levels in serum were measured by an ELISA. Blood CD4+CXCR5+ Tfh-like cells were sorted and cultured with anti-SLAM mAb in vitro.
Results The frequencies of circulating CD4+CXCR5+ Tfh-like cells appeared virtually unchanged in AR patients, but the expression of SLAMs and SLAM-associated protein (SAP) on circulating Tfh-like cells was significantly decreased. Meanwhile, the level of serum IL-21 was increased in AR patients, and a negative correlation was found between the IL-21 level and SLAM or SAP expression on CD4+CXCR5+ T cells. Treatment with anti-SLAM mAb resulted in reduced IL-21 production by Tfh-like cells in vitro. Additionally, SLAM expression on B cells was significantly decreased, although the percentages of B cells were increased in AR patients.
Conclusions SLAMs negatively regulate IL-21 production in CD4+CXCR5+ Tfh-like cells, which contributes to the pathogenesis of AR

PO-0190

The Landscape of Immune Cells Infiltrating in Prostate Cancer

Zhicong Wu[1]、Hua Chen[2]、Wenyang Luo[2]、Hanyun Zhang[1]、Guihuan Li[2]、Fangyin Zeng[3]、Fan Deng[2]
1. Department of Clinical Laboratory, Nanfang Hospital, Southern Medical University
2. 南方医科大学基础医学院
3. 南方医科大学第五附属医院

Background This study was to explore the infifiltration pattern of immune cells in the prostate cancer (PCa) microenvironment and evaluate the possibility of specifific infifiltrating immune cells as potential prognostic biomarkers in PCa.
Methods Infifiltrating percentage of 22 immune cells were extracted from 27 normalized datasets by CIBERSORT algorithm. Samples with CIBERSORT p-value < 0.05 were subsequently merged and divided into normal or tumor groups. The differences of 22 immune cells between normal and tumor tissues were analyzed along with potential infifiltrating correlations among 22 immune cells and Gleason grades. SNV data from TCGA was used to calculate the TMB score. A univariate and multivariate regression were used to evaluate the prognostic effects of immune cells in PCa.
Results Ten immune cells with signifificant differences were identifified, including seven increased and three decreased infifiltrating immune cells from 190 normal prostate tissues and 537 PCa tissues. Among them, the percentage of infifiltration of resting NK cells increased the most, whereas the percentage of infifiltration of resting mast cells decreased the most. In normal tissues, CD8+ T cells had the strongest infifiltrating correlation with monocytes, while activated NK cells and naive B cells were the highest in PCa tissues. Moreover, the infifiltration of fifive immune cells was signifificantly associated with TMB score and mutations of immune gene change the infifiltration of immune cells. The Area Under Curve (AUC) of the multivariate regression model for the fifive- and 10-year survival prediction of PCa reached 0.796 and 0.862. The validation cohort proved that the model was reproducible.
Conclusions This study demonstrated that different infifiltrating immune cells in prostate cancer, especially higher infifiltrating M1 macrophages and neutrophils in PCa tissue, are associated with patients' prognosis, suggesting that these two immune cells might be potential targets for PCa diagnosis and prognosis of treatment.

PO-0191

脑脊液肿瘤标志物联合检测对肺癌脑转移诊断的临床价值

张爱敏
天津医科大学肿瘤医院

目的 探讨脑脊液中肿瘤标志物癌胚抗原(CEA)、神经元特异性烯醇化酶（NSE）、细胞角蛋白 19 片断（CYFRA21-1）和鳞状上皮细胞癌抗原（SCC）联合检测对肺癌脑膜转移辅助诊断的临床价值。
方法 用电化学发光免疫分析法(ECLIA)和微粒子酶联免疫测定法（MEIA）检测 45 例肺癌脑膜转移患者、30 例脑部良性肿瘤患者血清和脑脊液中 CEA、NSE、CYFRA21-1 和 SCC 含量。
结果 肺癌脑膜转移患者血清和脑脊液中 4 项肿瘤标志物含量均明显高于脑良性肿瘤组，有显著性差异(P <0.01)，肺癌脑膜转移患者脑脊液中肿瘤标志物水平与血清中比较，无显著性差异(P 0.01)，CEA、NSE、CYFRA21-1 和 SCC 的敏感性为 92.3%，90.8%，52.9%和 49.8%，特异性分别为 95.7%、85.3%、95.2 和 94.3%。脑脊液肿瘤标志物的联合检测组合中，4 项指标任意 1 项阳性的诊断敏感性 100%，三项指标同时阳性的诊断特异性 100%。
结论 脑脊液中 4 项肿瘤标志物联合检测对于肺癌脑膜转移的诊断，具有重要的临床意义。

PO-0192

CD38 表达对 T 细胞功能及 HIV 感染治疗后疾病转归影响机制的研究

宋成博、张子宁、尚红
中国医科大学附属第一医院

AIDS 是由 HIV 感染引起的一种传染性疾病，感染可导致免疫缺陷和多种相关并发症。随着 ART 疗法的出现，HIV 感染的发病率及死亡率已大大降低，但 ART 治疗仍不能完全恢复免疫状态，部分感染者免疫功能恢复和临床转归较差。CD38 是机体主要的 NAD 水解酶，NAD 是细胞代谢过程中的重要辅酶，负责传递电子辅助 ATP 的合成，其的稳态对调节细胞代谢和线粒体功能起到重要作用。NAD 也是胞内重要的组蛋白去乙酰化酶 SIRT 的底物并影响细胞的蛋白修饰、转录调控、代谢等。CD38 对 HIV 疾病较强的预测能力提示它可能在感染者疾病进程中发挥重要作用，然而，HIV 感染者 T 细胞 CD38 的生物学功能尚不明确。

本研究通过流式检测发现 HIV 感染者 T 细胞上 CD38 表达均显著升高，且 ART 治疗后 CD38 表达水平无法完全恢复。我们还发现 HIV 感染者外周血 CD8+T 细胞的衰老水平与 CD38 的表达比例呈正相关，且 CD38 在 PD1+的耗竭 T 细胞上呈较高水平表达，CD38+T 细胞的 IFN-γ 分泌能力也明显降低，说明 CD38 会促进 T 细胞的衰老与耗竭并抑制 T 细胞功能；通过转录组分析发现 CD38 抑制 T 细胞功能、发育及细胞毒性相关的基因，并影响细胞线粒体平衡，且流式检测发现 CD38 能够促进线粒体损伤和 ROS 累积；本研究还使用 CD38 抑制剂处理细胞，发现 CD38 抑制剂能够提高 HIV 感染者 T 细胞的 NAD 浓度和 SIRT 酶活性，减少线粒体损伤、延缓 T 细胞衰老，提高 T 细胞的细胞因子分泌功能及增殖能力。这些结果为明确 CD38 在 HIV 感染中的生物学功能及 CD38 抑制类药物对 T 细胞的影响提供了新线索，也为改善 HIV 的免疫恢复和疾病转归提供新策略。

PO-0193

IL-18 诱导的单核细胞对肺癌细胞的影响

聂兆超
山东大学第二医院

目的 探讨外源性白介素 18 对单核细胞的活化作用以及 IL-18 激活诱导的单核细胞对肺癌细胞增殖、迁移和侵袭的影响。
方法 通过白介素 18 体外诱导单核细胞模拟激活体内肿瘤微环境中的肿瘤相关巨噬细胞的作用。应用 Transwell 法检测白介素 18 对单核细胞的趋化作用；外源性白介素 18 刺激后，流式细胞术检测 M1、M2 型肿瘤相关巨噬细胞的比例；白介素 18 激活诱导的单核细胞和肺癌细胞共培养，分别以克隆形成实验、细胞划痕实验、细胞侵袭实验检测共培养后肺癌细胞的增殖、迁移和侵袭的变化。
结果 IL-18 对单核细胞具有显著的趋化作用；外源性白介素 18 刺激后的细胞表型向 M2 型肿瘤相关巨噬细胞方向分化；克隆形成实验显示其克隆形成能力具有显著的统计学差异；两因素方差分析结果表明愈合率上有显著差别，随着时间增加，各组愈合率均增加，结果有统计学差异 ；刺激后，各组的侵袭能力具有显著的统计学差异，IL-18 诱导单核细胞促进了肺癌细胞增殖、迁移和侵袭能力。
结论 IL-18 可以诱导单核细胞并促进其活化，活化后的单核细胞促进肺癌细胞的增殖、迁移和侵袭。

PO-0194

Exosomal Cripto-1 serves as a potential biomarker for perihilar cholangiocarcinoma

Xin Zhang
Qilu Hospital of Shandong University

Background Perihilar cholangiocarcinoma (PHCCA) has a poor prognosis, mainly due to diagnosis at an advanced stage. Cripto-1 functions as an oncogene and is highly expressed in several human cancers, however, its clinical application in PHCCA is poorly understood.
Method Whether Cripto-1 can be secreted with exosomes from PHCCA cells was examined in vitro and in vivo. An ELISA method was developed to detect exosomal Cripto-1 in the serum of 115 PHCCA patients, 47 cholangitis patients and 65 healthy controls. Cripto-1 expression was detected in PHCCA tissues using immunohistochemistry.
Results We identified that Cripto-1 was released by PHCCA cells via exosomes in vitro and in vivo. Exosomal Cripto-1 was increased in sera of PHCCA patients and associated with metastasis. Compared with traditional serum tumor markers, CA19-9 and CEA, exosomal Cripto-1 demonstrated a larger area under ROC curve for PHCCA diagnosis. The cutoff value of exosomal Cripto-1 was 0.82, achieving a sensitivity of 79.1% and a specificity of 87.5%. As expected, exosomal Cripto-1 levels in immunohistochemically Cripto-1-high cases were significantly elevated compared to in Cripto-1-low cases. When measured 1-week postoperatively, Cripto-1 levels decreased on average from 1.25(0.96-3.26) to 0.85(0.62-1.82). Immunohistochemistry analysis showed Cripto-1 expression was negatively correlated with E-cadherin and was an independent prognostic biomarker for poor survival in PHCCA patients.
Conclusion Exosomal Cripto-1 in sera can reflect its expression in the tissue of PHCAA patients and has the potential be a non-invasive biomarker for diagnosis and prognosis of PHCCA.

PO-0195

肝细胞癌患者 TIM-3+ TIGIT+CD4+ T 细胞和 TIM-3+ TIGIT+CD8+ T 细胞免疫耗竭及其与疾病进展的关系

袁润林、陈正徐
合肥市第二人民医院

目的 探讨肝细胞癌（HCC）患者外周血中 $CD4^+$、$CD8^+$T 细胞免疫耗竭及其与疾病进展的关系。
方法 收集 30 例 HCC 患者，同时收集健康体检者(HC)20 例，利用流式细胞术检测外周血 $CD4^+$、$CD8^+$T 细胞表面抑制性受体 PD-1、TIGIT、TIM-3 以及胞内 IL-10 表达比例。
结果 HCC 患者组外周血 $TIM\text{-}3^+CD4^+$、$TIGIT^+CD4^+$、$PD\text{-}1^+CD4^+$、$TIM\text{-}3^+CD8^+$、$TIGIT^+CD8^+$、$PD\text{-}1^+CD8^+$T 细胞比例高于 HC 组(P<0.01)。$TIM\text{-}3^+TIGIT^+CD8^+$T 细胞比例高于 HC 组($P$<0.001)，$IL\text{-}10^+CD4^+$、$TIM\text{-}3^+TIGIT^+CD4^+$T 细胞比例高于 HC 组($P$<0.0001)。HCC 患者组 $PD\text{-}1^+TIM\text{-}3^+TIGIT^+CD4^+$、$PD\text{-}1^+TIM\text{-}3^+TIGIT^+CD8^+$T 细胞比例高于 $PD\text{-}1^+TIM\text{-}3^-TIGIT^-$ $CD4^+$、$PD\text{-}1^+TIM\text{-}3^-TIGIT^-CD8^+$T 细胞比例($P$<0.0001)。ROC 曲线分析 $TIM\text{-}3^+TIGIT^+CD8^+$、$TIM\text{-}3^+TIGIT^+CD4^+$T 细胞在 HCC 的诊断效能大于单分子阳性细胞。高 $TIM\text{-}3^+TIGIT^+CD8^+$、高 $TIM\text{-}3^+TIGIT^+CD4^+$T 细胞比例组 NLR 结果高于低 $TIM\text{-}3^+TIGIT^+CD8^+$、低 $TIM\text{-}3^+TIGIT^+CD4^+$T 细胞比例组($P$< 0.05)。
结论 HCC 患者外周血 $TIM\text{-}3^+TIGIT^+CD4^+$及 $TIM\text{-}3^+TIGIT^+CD8^+$T 细胞比例高于对照者，上述细胞高表达 PD-1；高 $TIM\text{-}3^+TIGIT^+CD4^+$及 $TIM\text{-}3^+TIGIT^+CD8^+$T 细胞比例与 HCC 疾病进展加快和不良预后有关，提示 HCC 患者 $CD4^+$、$CD8^+$T 细胞存在免疫耗竭，且有意义的双分子靶向治疗可能会为 HCC 提供了更新颖、更有效的治疗靶点，促进了 HCC 患者免疫检查点靶向治疗的发展。

PO-0196

Longitudinal transcriptome analyses show robust T cell immunity during recovery from COVID-19

Cuixian Yang 、mi zhang 、xingqi dong
Yunnan Infectious Diseases Hospital

Understanding the processes of immune regulation in patients infected with the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) is crucial for improving treatment. Here, we performed longitudinal whole-transcriptome RNA sequencing on peripheral blood mononuclear cell (PBMC) samples from 18 patients with coronavirus disease 2019 (COVID-19) during their treatment, convalescence, and rehabilitation. After analyzing the regulatory networks of differentially expressed messenger RNAs(mRNAs), microRNAs (miRNAs) and long non-coding RNAs (lncRNAs) between the different clinical stages, we found that humoral immunity and type I interferon response were significantly downregulated, while robust T-cell activation and differentiation at the whole transcriptome level constituted the main events that occurred during recovery from COVID-19. The formation of this T cell immune response might be driven by the activation of activating protein-1 (AP-1) related signaling pathway and was weakly affected by other clinical features. These findings uncovered the dynamic pattern of immune responses and indicated the key role of T cell immunity in the creation of immune protection against this disease.

PO-0197

High-throughput sequencing-based serum exosomal differential miRNAs in high-grade gliomas and intracranial lymphomas

Shun Wang
Department of Clinical Laboratory, The Second Hospital, Cheeloo College of Medicine, Shandong University

Objective At present, there is no effective non-invasive method for the differential diagnosis of high-grade glioma and intracranial lymphoma. This study aims to use high-throughput sequencing technology to screen microRNA markers in serum exosomes for differential diagnosis of high-grade gliomas and intracranial lymphoma.
Methods Patients with intracranial lymphoma or high-grade glioma, and healthy controls were included in this study (training cohort n =10; validation cohort: intracranial lymphoma n =10, high-grade glioma n =32, healthy controls n =20). After extracting the RNAs of serum exosomes, the high-throughput sequencing technology was used to determine the serum exosome free microRNA expression profiles and screened for differential microRNAs. RT-qPCR was used to verify the expression of the selected microRNAs. The differences of microRNA expression levels between groups were measured by Kruskal-Wallis test. Analyzed the diagnostic value using the receiver operating characteristic (ROC) curve.
Results High-throughput sequencing demonstrated that 170 miRNAs, 109 of which were up-regulated and 61 down-regulated, were differentially expressed in serum exosomes between patients with intracranial lymphoma and high-grade glioma. While comparing with healthy controls, the differential serum exosomal miRNAs number of high-grade glioma and intracranial lymphoma patients were 130 and 173 respectively. RT-qPCR proved both miR-766-5p and miR-376b-5p of serum exosomes were significantly down-regulated in high-grade gliomas and intracranial lymphomas patients compared with healthy controls (all $p<0.001$), and serum exosomal miR-766-5p expression of intracranial lymphomas was lower than high-grade gliomas ($p<0.05$). The areas under ROC curve (AUCs) of serum exosomal miR-766-5p and miR-376b-5p for the diagnosis of gliomas were 0.8883 ($p<0.001$) and 0.7688 ($p=0.001$) respectively, and for the diagnosis of intracranial lymphoma were 0.9271 ($p<0.001$) and 0.8542 ($p<0.001$) respectively. The AUC value of serum exosomal miR-766-5p for the differential diagnosis for glioma and intracranial lymphoma was 0.7201 ($p=0.026$).
Conclusion MiR-766-5p and miR-376b-5p in serum exosomes might be used as auxiliary diagnostic indicators for high-grade gliomas and intracranial lymphomas, and miR-766-5p might be used as a differential diagnostic marker for both.

PO-0198

调节性 B 细胞及其相关分子在脓毒症小鼠中的作用

张英辉
中国人民解放军北部战区总医院

目的 探讨调节性 B 细胞（Regulatory B cells, Breg）及其相关分子在脓毒症小鼠中的作用机制，为脓毒症的免疫靶向药物研发及治疗奠定基础。
方法 建立小鼠脓毒症模型，收集小鼠脾脏和外周血，流式细胞术检测小鼠脾脏中调节性 B 细胞的表达，流式液相多重蛋白定量技术（Cytometric Beads Array, CBA）检测小鼠外周血中 IL-10、TGF-β1、IL-1β、TNF-α、IL-4、IFN-γ 的表达。Western blot 检测小鼠脾脏中（Toll Like Receptor 4, TLR4）的表达。
结果 小鼠建立脓毒症模型后 2 天，脾脏中 Breg 的表达明显升高（$P<0.05$ vs 对照组），外周血中 IL-1β、TNF-α、IFN-γ 的分泌明显升高（$P<0.05$ vs 对照组），IL-4、IL-10 和 TGF-β1 的水平明显

降低（P<0.05 vs 对照组），7 天后 Breg 的表达所有下降，但与对照组相比，差异具有统计学意义；外周血中 IL-1β、TNF-α、IFN-γ 的分泌有所下降，IL-4、IL-10 和 TGF-β1 的水平明显升高。15 天后，Breg 的表达明显下降，外周血中 IL-1β、TNF-α、IFN-γ 的分泌明显下降，IL-4、IL-10 和 TGF-β1 的水平明显升高。小鼠脾脏中 TLR4 的表达在建立模型后 2 天明显升高（P<0.05 vs 对照组），7 天仍然高表达，15 天时表达明显下降。

结论 脓毒症时，调节性 B 细胞明显抑制小鼠免疫反应，维持 Th1/Th2 细胞平衡；而 Breg 的调控作用可能是通过调控 TLR4 基因实现的。

PO-0199

HMGB1 与乳腺癌患者临床特征和免疫指标的相关性研究

张小艳[1]、李清祥[1]、刘勇[1]、李航[1]、仇丽娟[1]、封欣然[1]、谭立明[2]
1. 南昌市第三医院
2. 南昌大学第二附属医院

背景与目的 高迁移率族蛋白 B1(high mobility group box1,HMGB1) 参与 DNA 复制、转录及翻译过程，与恶性肿瘤的发生、发展、浸润及转移密切相关，并参与炎症、免疫、增殖、转移和自噬多种信号通路的调节。本研究旨在探究高迁移率族蛋白 B1（HMGB1）与乳腺癌患者临床病理特征、免疫功能以及新辅助化疗疗效的相关性。

方法 选取 2020 年 6 月至 2021 年 10 月南昌市第三医院收治并接受新辅助化疗的乳腺癌患者 120 例，酶联免疫吸附（ELISA）法测定患者空芯针穿刺活检物中 HMGB1 水平，以及调节性 T(Regulatory cells,Tregs)细胞相关指标 IL-10、TGF-β 含量；流式细胞术检测 CD3+、CD4+、CD8+ 和 NK T 淋巴细胞亚群百分比；速率散射比浊法检测免疫球蛋白(IgG、IgA、IgM)和补体(C3、C4)含量；按照 95%置信区间（95%CI）下限水平将研究对象分为高水平组（HMGB1>22.98ng/ml）和低水平组（HMGB1≤22.98ng/ml）；新辅助化疗方案疗程结束后，根据 Miller-Payne 病理反应性分级标准评价术后病理疗效，分析 HMGB1 水平和病理疗效的关系。

结果 HMGB1 和乳腺癌肿瘤临床分期、淋巴结是否发生转移相关（P<0.05）；HMGB1 和 Treg 细胞相关指标 IL-10、TGF-β 显著相关（r=0.734，P=0.000；r=0.686，P=0.000）；HMGB1 高水平组 CD4/CD3 低于低水平组，CD8/CD3 高于低水平组（P<0.05）；高水平 HMGB1 患者术后病理疗效差。

结论 HMGB1 水平和乳腺癌分期、淋巴结转移以及细胞免疫功能有关，并有助于预测新辅助化疗病理疗效。

PO-0200

基于新型免疫金纳米团簇的电化学发光免疫分析新方法

苏灿平[1,2]、邹志艳[1,2]、洪国裟[1,2]
1. 厦门大学附属第一医院
2. 福建医科大学

目的 基于新型免疫金纳米团簇，提出一种新的电化学发光免疫传感器构建策略，研制一种简单方便、灵敏特异的电化学发光免疫传感器，并探讨其在临床检验中的应用价值。

方法 在本研究中，我们提出了一种基于“二合一”免疫球蛋白修饰的金纳米团簇（IgG-AuNCs）的电化学发光免疫传感平台。得益于 IgG 生物分子独特的组成和功能，IgG-AuNCs 兼具识别和发光功能，不仅被用作生物识别元件，而且可以作为电化学化学发光（ECL）发光体，表现出较高的 ECL 信号、良好的水溶性、稳定性及低毒性。作为概念性验证，我们首次将该探针应用到一种竞争型免疫传感平台用于检测 IgG。

结果 在最佳条件下，检测 IgG 抗原的线性范围为 0.5 ~ 50000 ng/mL，检测限为 0.06 ng/mL，比先前构建的荧光方法低 4 个数量级。此外，已建立的 ECL 方法还具有样品体积小、制备简单、稳定性好等显著优点，适用于实际临床样品中 IgG 分子的高通量检测。
结论 相比传统的 ECL 免疫传感器，该平台具有更加省时、直接、节省生物样本等优势。该策略避免了添加蛋白质等非导电材料作为发光探针和抗体之间的连接器，这不仅简化了抗体标记探针的制备，而且无疑减少了传感界面的空间障碍，提高了电子转移和免疫识别的有效性，对其他 ECL 免疫探针的设计和应用具有重要的参考意义。我们认为，该策略可为设计制备其他特异性抗体功能化的纳米材料提供有力研究基础，并有望拓展到其他肿瘤标记物的高效检测、细胞检测和 ECL 成像等其他应用，在临床检验中有广阔的应用前景。

PO-0201

三阴性乳腺癌 4T1 细胞中过表达鼠白介素-10 对宿主抗肿瘤免疫应答的影响

王晓琴[1]、王晓倩[1]、贺龙梅[2]、马运峰[3]
1. 西安交通大学第一附属医院检验科
2. 陕西省中医医院检验科
3. 西安交通大学基础医学院病原生物学与免疫学系

目的 研究鼠白介素-10（mIL-10）在三阴性乳腺癌发生发展中的作用，为临床三阴性乳腺癌患者的诊疗提供新的思路。
方法 将重组质粒 pLenti-CMV-mIL-10-GFP-puro 以及 pLenti-CMV-GFP-puro 分别与慢病毒包装质粒（ΔR9、pVSVG）共转染 293T 细胞，收集细胞培养上清离心并感染小鼠三阴性乳腺癌 4T1 细胞，经药物 Puromycin 筛选后，构建过表达 mIL-10 的稳转细胞系即 4T1/ mIL-10（实验组）以及 4T1/GFP（对照组）；利用酶联免疫吸附实验、流式细胞术检测两组细胞 GFP 的表达情况以及 mIL-10 的表达水平。将 4T1/ mIL-10 以及 4T1/GFP 细胞皮下注射 BALB/c 小鼠，建立皮下移植瘤模型，利用流式细胞术检测肿瘤微环境中免疫细胞功能的变化。
结果 成功构建 4T1/ mIL-10、 4T1/GFP 稳转细胞系。结果表明，药物筛选后 4T1/GFP 的阳性率为 94.59%，4T1/mIL-10 的阳性率为 93.71%。与对照组相比，实验组 mIL-10 的表达水平显著增加（$P<0.05$）。小鼠荷瘤模型表明，与对照组相比，mIL-10 能够促进肿瘤组织中 CD8+T 分泌 IFN-γ，减少骨髓来源的抑制性细胞 MDSCs 的浸润（$P<0.05$），对肿瘤组织中 CD4+T 细胞 IFN-γ 的分泌、CD4+T 细胞以及 CD8+T 细胞颗粒酶 B 的分泌无显著影响（$P>0.05$）。与对照组相比，4T1/mIL-10 组荷瘤小鼠肿瘤于第 13 天开始逐渐减小，并于第 19 天时两组肿瘤大小具有统计学意义（$P<0.05$）。
结论 mIL-10 能够增强肿瘤组织中 CD8+T 细胞的活性，减少 MDSCs 细胞的浸润，增强宿主杀伤肿瘤的能力，抑制肿瘤的生长，从而为乳腺癌的诊疗提供理论与实验基础。

PO-0202

TNF-α 与 IFN-γ 协同诱导肝癌细胞表达 B7-H1 分子

李娜
山东大学第二医院

目的 B7-H1 是一种重要的免疫负调控分子，可以抑制 T 细胞功能，促进肿瘤细胞的免疫逃逸。所以，研究肝癌细胞中 B7-H1 升高的机制对于肝癌的治疗具有重要意义。本实验旨在研究肝癌微环境中细胞因子 IFN-γ、TNF-α 对于肝癌细胞表面 B7-H1 分子表达的影响及其机制的探究。
方法 本实验按照研究目标分成四大部分：

（1）选择四种不同的肝癌细胞系，采用实时荧光定量 PCR、流式细胞术和 Western-blot 方法检测 IFN-γ 对于肝癌细胞 B7-H1 分子表达的影响。
（2）采用实时荧光定量 PCR 以及流式细胞术方法检测 TNF-α 与 IFN-γ 是否可以协同诱导肝癌细胞在 RNA 以及蛋白质水平表达 B7-H 分子。
（3）进一步运用信号通路抑制剂和小干扰实验检测 TNF-α 与 IFN-γ 协同诱导肝癌细胞表达 B7-H1 分子的机制。
（4）采用动物实验以及肿瘤细胞与 T 细胞的共培养实验证明二者协同诱导的 B7-H1 分子是否具有免疫抵抗作用。
结果 在四种肝癌细胞中 IFN-γ 都可以诱导 B7-H1 分子的表达，并且 TNF-α 与 IFN-γ 可协同诱导肝癌细胞 B7-H1 分子的表达，二者协同诱导的机制是 TNF-α 通过 NF-κB 信号通路增强 IFNGR1 和 IFNGR2 的表达，进一步促进 IFN-γ 信号通路的活化。动物实验以及肿瘤细胞与 T 细胞共培养实验证明 TNF-α 与 IFN-γ 协同诱导肝癌细胞表达的 B7-H1 分子具有免疫抵抗作用，可以促进肿瘤细胞的免疫逃逸。
结论 肝癌微环境中 TNF-α 与 IFN-γ 可以协同诱导肝癌细胞表达 B7-H1 分子，诱导表达的 B7-H1 分子具有免疫抵抗作用。所有实验研究可能提供一些靶分子，针对这些靶分子的治疗可以减少肿瘤微环境中 TNF-α 和 IFN-γ 诱导的肝癌细胞中 B7-H1 分子的表达，进而有助于临床肝癌的治疗。
胞。

PO-0203

Nrf2 介导自噬缺陷对氧化低密度脂蛋白诱导巨噬细胞焦亡的影响

刘家汝、关秀茹
哈尔滨医科大学附属第一医院

目的 本实验旨在探 究 Nrf2 如何参与自噬缺陷对氧化低密度脂蛋白导致的巨噬细胞焦亡的调节，以期为 AS 的防治提供新靶点。
方法 本研究中，人类 THP-1 单核细胞在体外用药物诱导后形成巨噬细胞。 过量 ox-LDL 处理巨噬细胞构建实验模型。Western Blot 用以测定自噬和焦亡过 程的标志蛋白，同时测定 Nrf2 及其下游分子的蛋白量；通过细胞存活率检测、 LDH 释放试验和流式细胞术分别确定不同处理组的细胞活性以及细胞膜的完整 性；各组上清液中白细胞介素-1β（IL-1β）和白细胞介素-18（IL-18）用酶联免 疫吸附试验测定。综合以上多种 方法所得的结果对 Nrf2 在自噬缺陷调控 ox-LDL 诱导的巨噬细胞焦亡中的作用 进行全方位、多角度剖析。
结果 （1）ox-LDL 以浓度依赖性方式诱导 THP-1 源巨噬细胞焦亡。 （2）当细胞自噬过程受阻、自噬缺陷时，ox-LDL 处理的巨噬细胞焦亡程度 增加。（3）ox-LDL 和自噬抑制剂同时暴露于细胞时，胞核中 Nrf2 水平上调，其 下游效应蛋白 HO-1 含量也剧增。 （4）自噬受损时，在 Nrf2 促进剂或抑制剂的作用下，ox-LDL 处理的巨噬 细胞细胞焦亡程度分别增加或减轻。 （5）自噬缺陷时，在 Nrf2 促进剂或抑制剂作用下，ox-LDL 处理的巨噬细 胞自噬活性分别进一步降低或升高，这表明 Nrf2 可反馈性调节自噬活性。
结论 本研究证明， 在吞噬了 ox-LDL 的巨噬细胞中，Nrf2 分子因自噬缺陷而被激活，促进细胞焦亡， 进而影响 AS 斑块的不稳定性。

PO-0204

Elevated Serum IgG4 Was Found in Eosinophilic Granulomatosis With Polyangiitis

Ziyan Wu
Peking Union Medical College Hospital

Objective The aim was to determine the levels and clinical impact of immunoglobulin G4 (IgG4) and other IgG subclasses in a Chinese population with eosinophilic granulomatosis with polyangiitis (EGPA).
Methods We enrolled 49 patients who had EGPA, 27 who had granulomatosis with polyangiitis (GPA), 31 who had microscopic polyangiitis (MPA), and 30 healthy controls (HCs). Serum IgG subclasses were measured using commercial immunonephelometric assays and compared among different groups.
Results Fifteen EGPA patients (30.61%) had elevated IgG4 levels, based on a cutoff value of 135 mg/dL. In addition, 2 GPA patients (7.40%) and 1 MPA patient (3.33%) had elevated IgG4 levels. The EPGA group had a higher IgG4 level (65.60 mg/dL) than the GPA group (32.70 mg/dL, $p = 0.0021$), the MPA group (30 mg/dL, $p = 0.0021$), and the HC group (28.55 mg/dL, $p = 0.0002$). The EPGA group also had a higher IgG4/IgG ratio (0.0644) than the GPA group (0.0322, $p = 0.13$), the MPA group (0.0289, $p = 0.0055$), and the HC group (0.0212, $p < 0.0001$).
Conclusions Our results indicate that Chinese patients with EGPA have increased levels of serum IgG4. Further study is needed to determine the pathogenic role of IgG4 and IgG4 antineutrophil cytoplasmic antibodies in EGPA.

PO-0205

Antibodies to phosphatidylserine/prothrombin (aPS/PT) enhanced the diagnostic performance in Chinese patients with antiphospholipid syndrome

Shulan Zhang
Peking Union Medical College Hospital

Background Increasing evidence has highlighted the role of non-criteria antiphospholipid antibodies (aPLs) as important supplements to the current criteria aPLs for the diagnosis of antiphospholipid syndrome (APS). In this retrospective study, we evaluated the clinical relevance of antibodies to phosphatidylserine/prothrombin (aPS/PT) in Chinese patients with APS.
Methods A total of 441 subjects were tested, including 101 patients with primary APS (PAPS), 140 patients with secondary APS (SAPS), 161 disease controls (DCs) and 39 healthy controls (HCs). Serum IgG/IgM aPS/PT was determined by ELISA.
Results The levels of IgG/IgM aPS/PT were significantly increased in patients with APS compared with DCs and HCs. IgG and IgM aPS/PT were present in 29.7% and 54.5% of PAPS, and 42.1% and 53.6% of SAPS, respectively. For diagnosis of APS, IgG aCL exhibited the highest positive likelihood ratio (LR+) of 21.60, followed by LA (13.84), IgG aβ2GP1 (9.19) and IgG aPS/PT (8.49). aPS/PT was detected in 13.3% of seronegative PAPS patients and 31.3% of seronegative SAPS patients. LA exhibited the highest OR of 3.64 in identifying patients with thrombosis, followed by IgG aCL (OR, 2.63), IgG aPS/PT (OR, 2.55) and IgG aβ2GP1 (OR, 2.33). LA and IgG aCL were correlated with both arterial and venous thrombosis, whereas IgG aPS/PT and IgG aβ2GP1 correlated with venous or arterial thrombosis, respectively.
Conclusions Our findings suggest that the inclusion of IgG/IgM aPS/PT may enhance the diagnostic performance for APS, especially in those in whom APS is highly suspected, but conventional aPLs are repeatedly negative. In addition, IgG aPS/PT may contribute to identify patients at risk of thrombosis.

PO-0206

Antibodies against glycoprotein 2 display diagnostic advantages over ASCA in distinguishing CD from intestinal tuberculosis and intestinal Behçet's disease

Shulan Zhang
Peking Union Medical College Hospital

Objectives There is an increasing need to identify reliable biomarkers for distinguishing Crohn's disease (CD) from other gastrointestinal disorders sharing similar clinical and pathological features. This study aimed at evaluating the diagnostic potential of antibodies to zymogen granule glycoprotein GP2 (aGP2) in a large, well-defined Chinese cohort with a special focus on their role in discriminating CD from intestinal Behçet's disease (BD) and intestinal tubercolosis (ITB).
Methods A total of 577 subjects were prospectively enrolled, including 171 patients with CD, 208 patients with ulcerative colitis (UC), 71 with BD, 57 with ITB and 70 healthy controls (HC). aGP2 and anti-Saccharomyces cerevisiae antibodies (ASCA) were determined by ELISA. Perinuclear antineutrophil cytoplasmic antibodies were tested by indirect immunofluorescent assay.
Results aGP2 IgG and IgA levels were significantly elevated in patients with CD compared with those in patients with UC, intestinal BD, and ITB and HC. Conversely, ASCA IgG levels were not different between CD and intestinal BD patients, whereas ASCA IgA levels did not discriminate CD from intestinal BD and ITB patients. aGP2 IgA and IgG displayed a better assay performance (larger areas under the curve) over ASCA IgA and IgG in differentiating CD from disease controls ($P<0.05$). ASCA IgA did not discriminate CD from disease controls. aGP2 IgA and/or IgG was significantly associated with penetrating disease (B3) and ileal CD (L1) ($P<0.05$), whereas ASCA IgA and/or IgG was not.
Conclusions In comparison with ASCA, aGP2 distinguishes CD from intestinal BD or ITB as disease controls more efficiently, aiding in the differential diagnosis of IBD.

PO-0207

Correlation between cytokines and coagulation-related parameters in patients with coronavirus disease 2019 admitted to ICU

Dong Zhang
PUMCH

Background The novel SARS-CoV-2 caused a large number of infections and deaths worldwide. Thus, new ideas for an appropriated assessment of patients' condition and clinical treatment are of utmost importance. Therefore, in this study, the laboratory parameters of patients with coronavirus disease 2019 (COVID-19) were evaluated to identify the correlation between cytokine expression and other laboratory parameters.
Methods A retrospective and single-center study was performed in Wuhan, involving 83 severe or critical COVID-19 patients admitted to the intensive care unit (ICU). Laboratory parameters in ICU patients with laboratory-confirmed infection of SARS-CoV2 were collected. The association between parameters was assessed by Spearman's rank correlation.
Results Patients' median age was 66 years (IQR, 57-73), and 55 (66%) were men. Among the 83 patients, 61 (73%) had 1 or more coexisting medical condition. The median concentration of IL-2R, IL-6, IL8, IL10, and TNFα were above the normal range, without IL-1β. A significant negative correlation between IL-6 and platelet count was discovered ($r2 = -0.448$, $P < 0.001$) as well as a significant correlation between IL-6 and other platelet parameters. Finally, a correlation between multiple cytokines and coagulation indicators was found, pro-inflammatory factors were

found to be more associated to coagulation parameters, with the highest correlation between IL-6 and the International normalized ratio (INR) ($r2 = 0.444$, $P < 0.001$).
Conclusions Our results suggested that cytokines play an important role in the pathogenesis of COVID-19. In addition, IL-6 seems more relevant in the evaluation of the condition of COVID-19 patients.

PO-0208

Identification of novel serological autoantibodies in Takayasu arteritis patients using HuProt arrays

Xiaoting Wen
Peking Union Medical College Hospital

To identify novel autoantibodies of Takayasu arteritis (TAK) using HuProt array-based approach, a two-phase approach was adopted. In Phase I, serum samples collected from 40 TAK patients, 15 autoimmune disease patients, and 20 healthy subjects were screened to identify TAK-specific autoantibodies using human protein (HuProt) arrays. In phase II, the identified candidate autoantibodies were validated with TAK-focused arrays using an additional cohort comprised of 109 TAK patients, 110 autoimmune disease patients, and 96 healthy subjects. Subsequently, the TAK-specific autoantibodies validated in phase II were further confirmed using western blot analysis. We identified and validated eight autoantibodies as potential TAK-specific diagnostic biomarkers, including anti-SPATA7, -QDPR, -SLC25A2, -PRH2, -DIXDC1, -IL17RB, -ZFAND4, and -NOLC1 antibodies, with AUC of 0.803, 0.801, 0.780, 0.696, 0.695, 0.678, 0.635, and 0.613, respectively. SPATA7 could distinguish TAK from healthy and disease controls with 73.4% sensitivity at 85.4% specificity, while QDPR showed 71.6% sensitivity at 86.4% specificity. SLC25A22 showed the highest sensitivity of 80.7%, but at lower specificity of 67.0%. In addition, PRH2, IL17RB, and NOLC1 showed good specificities of 88.3%, 85.9%, and 86.9%, respectively, but at lower sensitivities (<50%). Finally, DIXDC1 and ZFAND4 showed moderate performance as compared with the other autoantibodies. Using a decision tree model, we could reach a specificity of 94.2% with AUC of 0.843, a significantly improved performance as compared with that by each individual biomarker. The performances of three autoantibodies, namely anti-SPATA7, -QDPR, and -PRH2, were successfully confirmed with western blot analysis. Using this two-phase strategy, we identified and validated eight novel autoantibodies as TAK-specific biomarker candidates, three of which could be readily adopted in a clinical setting.

PO-0209

Antiphospholipid Antibodies in Critically Ill Patients With COVID-19

Shulan Zhang
Peking Union Medical College Hospital

Objective Coagulopathy is one of the characteristics observed in critically ill patients with coronavirus disease 2019 (COVID-19). Antiphospholipid antibodies (aPLs) contribute to coagulopathy, though their role in COVID-19 remains unclear. This study was undertaken to determine the prevalence and characteristics of aPLs in patients with COVID-19.
Methods Sera collected from 66 COVID-19 patients who were critically ill and 13 COVID-19 patients who were not critically ill were tested by chemiluminescence immunoassay for anticardiolipin antibodies (aCLs), anti-β2 -glycoprotein I (anti-β2 GPI) (IgG, IgM, and IgA), and IgG anti-β2 GPI-domain 1 (anti-β2 GPI-D1) and IgM and IgG anti-phosphatidylserine/prothrombin (anti-PS/PT) antibodies were detected in the serum by enzyme-linked immunosorbent assay.

Results Of the 66 COVID-19 patients in critical condition, aPLs were detected in 31 (47%). Antiphospholipid antibodies were not present among COVID-19 patients who were not in critical condition. The IgA anti-β2 GPI antibody was the most commonly observed aPL in patients with COVID-19 and was present in 28.8% (19 of 66) of the critically ill patients, followed by IgA aCLs (17 of 66, or 25.8%) and IgG anti-β2 GPI (12 of 66, or 18.2%). For multiple aPLs, IgA anti-β2 GPI + IgA aCLs was the most common antibody profile observed (15 of 66, or 22.7%), followed by IgA anti-β2 GPI + IgA aCL + IgG anti-β2 GPI (10 of 66, or 15.2%). Antiphospholipid antibodies emerge ~35-39 days after disease onset. A dynamic analysis of aPLs revealed 4 patterns based on the persistence or transient appearance of the aPLs. Patients with multiple aPLs had a significantly higher incidence of cerebral infarction compared to patients who were negative for aPLs (P = 0.023).
Conclusion Antiphospholipid antibodies were common in critically ill patients with COVID-19. Repeated testing demonstrating medium to high titers of aPLs and the number of aPL types a patient is positive for may help in identifying patients who are at risk of developing cerebral infarction. Antiphospholipid antibodies may be transient and disappear within a few weeks, but in genetically predisposed patients, COVID-19 may trigger the development of an autoimmune condition similar to the antiphospholipid syndrome (APS), referred to as "COVID-19-induced APS-like syndrome." Long-term follow-up of COVID-19 patients who are positive for aPLs would be of great importance in understanding the pathogenesis of this novel coronavirus.

PO-0210

Association between genetic variants in the human leukocyte antigen-B/MICA and Takayasu arteritis in Chinese Han population

Xiaoting Wen
Peking Union Medical College Hospital

Aim Takayasu arteritis (TA) is a rare autoimmune disease with ethnic differences. Genome-wide association studies (GWAS) showed novel genetic variants in the human leukocyte antigen (HLA) region were associated with TA. The present study aimed to investigate the linkage between these single nucleotide polymorphisms (SNP) and TA in a Chinese Han population.
Methods Four hundred and twelve patients from multiple centers and 597 healthy controls were genotyped using the Sequenom MassArray iPLEX platform. The association between these SNPs and various clinical symptom of TA was also investigated.
Results Our study showed a higher risk allele frequency of rs12524487 in TA patients compared to healthy controls (26.6% vs. 21.7%, odds ratio [OR] 1.31, 95% CI 1.06-1.61). The other SNP rs9366782 in HLA-B/MICA (major histocompatibility complex class I polypeptide-related sequence A) showed association with TA ischemic brain disease (OR: 1.78, 95% CI: 1.16-2.73, Pc = 0.03). However, rs3763288 and rs114202986 in MICA were negatively related to TA either as a whole or in any clinical features. Meanwhile, ATGT(rs9366782, rs12524487, rs3763288 and rs114202986) were the risk haplotypes (Pc = 2.48 × 10-10).
Conclusions Our findings indicated that rs12524487 in HLA-B/MICA was a genetic risk factor for TA in a Chinese Han population and rs9366782 in this region was associated with ischemic brain disease in TA but not TA susceptibility.

PO-0211

Assessing serum IgG4 glycosylation profiles of IgG4-related disease using lectin microarray

Chaojun Hu
Peking Union Hospital

Objectives IgG4 related disease (IgG4-RD) is a multiorgan fibroinflammatory disorder. Lectin microarray is a high-throughput glycosylation analysis technology. The aim of our study was to investigate glycosylation profiling of serum IgG4 from IgG4-RD patients and controls.
Methods A large cohort of 167 IgG4-RD patients, 130 disease controls (DCs) and 86 healthy controls (HCs) were included in the current study. The glycan level of serum IgG4 of all participants was determined by lectin microarray. A verification assay of lectin microarray and lectin blot were used to clarify the relationship between the serum IgG4 and purified IgG4 glycosylation.
Results The results revealed that the glycan level of mannose (binding MNA-M, VVA mannose, ConA) was significantly increased and that the glycan level of fucose (binding LTL), GlcNAc (binding DSL), GalNAc (binding HPA) was significantly decreased in IgG4-RD patients compared to DCs and HCs. We further found that the glycan level of GlcNAc was positively correlated with that of complement 3 (C3), and that the reduced level of GlcNAc was associated with damage to multiple organs. In addition, the mannose level (binding MNA-M and VVA mannose) was negatively correlated with C3 and complement 4 (C4) levels.
Conclusions Serum IgG4 of IgG4-RD patients exhibits different glycosylation levels. This study demonstrated that there is important clinical value in identifying aberrant GlcNAc levels as a potential diagnostic index for multi-organ involvement. Furthermore, the mannose level of serum IgG4 may reflect the degree of inflammation of IgG4-RD.

PO-0212

Serum Protein Profiling Reveals a Landscape of Inflammation and Immune Signaling in Early-stage COVID-19 Infection

Xin Hou
Peking Union Medical College Hospital

Coronavirus disease 2019 (COVID-19) is a highly contagious infection and threating the human lives in the world. The elevation of cytokines in blood is crucial to induce cytokine storm and immunosuppression in the transition of severity in COVID-19 patients. However, the comprehensive changes of serum proteins in COVID-19 patients throughout the SARS-CoV-2 infection is unknown. In this work, we developed a high-density antibody microarray and performed an in-depth proteomics analysis of serum samples collected from early COVID-19 (n = 15) and influenza (n = 13) patients. We identified a large set of differentially expressed proteins (n = 132) that participate in a landscape of inflammation and immune signaling related to the SARS-CoV-2 infection. Furthermore, the significant correlations of neutrophil and lymphocyte with the CCL2 and CXCL10 mediated cytokine signaling pathways was identified. These information are valuable for the understanding of COVID-19 pathogenesis, identification of biomarkers and development of the optimal anti-inflammation therapy.

PO-0213

Metabolomic alterations associated with Kallmann syndrome

Ye Guo
Peking Union Medical College Hospital

Background This study was conducted to identify potential seminal plasma metabolic markers associated with disease activity in Kallmann syndrome (KS).
Methods We collected medical records and seminal plasma samples from 17 KS patients and 20 age-matched healthy controls (HC) and performed metabolomics analysis using the UPLC-QTOF-MS method.
Results Partial least squares discriminant analysis (PLS-DA) showed that the metabolomics profile of KS patients was clearly separated from HC. Statistical analysis of the data indicates that there are differential metabolites between KS patients and HC. The main metabolic pathways focus on linoleic acid (LA) metabolism, Glycerophospholipid metabolism.
Conclusions The seminal plasma metabolomics profile of KS patients has changed. Glycerophospholipids and LA are promising biomarkers for KS diagnosis.

PO-0214

Imbalance of the CD226/TIGIT Immune Checkpoint Is Involved in the Pathogenesis of Primary Biliary Cholangitis

Chuiwen Deng
Peking Union Medical College Hospital,

The relationship between the cluster of differentiation 226 (CD226)/T cell Ig and ITIM domain (TIGIT) immune checkpoint and primary biliary cholangitis (PBC) pathogenesis is unknown. Herein, PBC patients (n = 42) showed significantly higher proportions of peripheral CD8+ T and CD4+ T cells expressing either CD226 or TIGIT than disease (n = 25) and healthy (n = 30) controls. The percentage of CD8+TIGIT+ T cell was negatively associated with total bilirubin, direct bilirubin, total bile acid, γ-glutamyl transpeptidase, and alkaline phosphatase, but positively correlated with platelet count; alkaline phosphatase was positively associated with the frequency of CD8+CD226+ T cell; and the CD226/TIGIT ratio of CD8+ T cell was positively associated with total bilirubin, direct bilirubin, total bile acid, γ-glutamyl transpeptidase, alkaline phosphatase, and aspartate aminotransferase to platelet ratio, but negatively correlated with albumin and platelet count. The effector function of CD8+CD226+ T cells was more robust than the CD8+CD226- counterparts. CD226 blockade reduced CD107a+, IFN-γ+, and TNF-α+ proportions among CD8+CD226+ T cells, inhibiting CD8+ T cell proliferation. In conclusion, CD226/TIGIT immune checkpoint imbalance is involved in the pathogenesis of PBC. The CD226/TIGIT ratio of CD8+ T cell is a potential biomarker for evaluating the disease status and the prognosis of PBC patients. Moreover, CD8+CD226+ T cells represent a possible therapeutic target for PBC, and blocking CD226 could inhibit the activity of this cell subset in vitro.

PO-0215

Risk factors for mortality due to COVID-19 in intensive care units: a single-center study

Yu Chen
Peking Union Medical College Hospital

Background Many studies have revealed several risk factors associated with the prognosis of patients with coronavirus disease 2019 (COVID-19), but the risk factors associated with death in critically ill COVID-19 patients still needs to be fully elucidated. Therefore, we analyzed clinical characteristics and laboratory data of ICU patients to identify risk factors associated with COVID-19 death.
Methods Patients with COVID-19 from the ICU in the Sino-French New City Branch of Tongji Hospital Wuhan, China, between February 4 and February 29, 2020, were enrolled in this study. The final date of follow-up was April 4, 2020. Clinical manifestations, laboratory tests, treatment, and outcome of participants before and during the ICU stay were retrospectively collected and analyzed.
Results A total of 92 patients were admitted or transferred to the ICU from February 4 to February 29, 2020. Compared to survivors, the majority of non-survivors (73.8%) presented with dyspnea. A random forest classifier and ROC curve were used to develop a predictive model. IL-6, D-dimer, lymphocytes, and albumin achieved good performance with AUCs of 0.9476, 0.9165, 0.8994, and 0.9251, respectively, which were consistent with clinical observations, such as inflammation, lymphopenia, and coagulation dysfunction. Combining IL-6 and D-dimer improved the performance of this model with an excellent AUC (0.997).
Conclusions Mortality in COVID-19 was not rare in critically ill patients. The model that combined IL-6 and D-dimer was valuable for predicting the mortality of patients with COVID-19 with excellent performance. This model needs to be further optimized by adding more indicators and then evaluated with a multicenter study.

PO-0216

Association between the BANK1 rs3733197 polymorphism and polymyositis/dermatomyositis in a Chinese Han population

Si Chen
Department of Clinical Laboratory, Beijing Anzhen Hospital, Capital Medical University, Beijing, China.

The aim of our study was to investigate the association between single nucleotide polymorphisms (SNPs) in the BANK1 gene and polymyositis/dermatomyositis (PM/DM) in a Chinese Han population. In total, 363 PM patients, 654 DM patients, and 1280 healthy controls were recruited and genotyped using the Sequenom MassArray system. A significant allele association was observed in rs3733197 among the PM/DM patients (OR 0.81, 95%CI 0.70-0.94, Pc = 1.83 × 10-2). Notably, rs3733197 was associated with DM and PM/DM patients with ILD involvement (Pc = 0.026; Pc = 6.0 × 10-3, respectively). However, no statistically significant difference was observed in the allele or genotype frequencies of three SNPs (rs4522865, rs17266594, and rs10516487) among the DM, PM, and PM/DM patients and healthy controls (all Pc > 0.05). This study was the first to demonstrate that a BANK1 gene SNP (rs3733197) could confer genetic predisposition in PM/DM patients and PM/DM patients with ILD in a Chinese Han population.

PO-0217

The optimization of isolation and characterization method of exosomes based on ultracentrifugation

Zilong Yu[1]、Lifu Wang[2]、Xi Sun[2]
1. Guangdong second provincial general hospital
2. 中山大学中山医学院

Exosomes are small vesicles with diameter of 30-150 nm secreted by most cell types in vivo or in vitro and represent an important mode of intercellular communication by mediating cell signaling, immune response modulation, apoptosis induction. However, the lack of availability and purity of exosomes is an obstacle that seriously affects the follow-up research process currently and is a key factor that restricts the continuation of research. There is a need to determine a simple and reliable method for purifying exosomes. In this case, we optimize the traditional and commonly use ultracentrifugation (UC) extraction and perform a comparison to assess three protocols based on UC through negative-staining transmission electron microscopy, NanoSight, concentration and western blotting. Given that the third protocol (protocol 3) displays similar cup-shaped vesicles with diameters of 30-150 nm and express higher levels of exosomes protein, the third protocol outperforms the other two protocols. In summary, the optimized method can be effectively to harvest exosomes for downstream research and variety of immune study.

PO-0218

The expression and significance of TIPE2 in peripheral blood mononuclear cells from Children with Henoch-Schönlein purpura

Guang Shi
The first affiliated hospital of Zhengzhou University

Objective To explore the expression of TIPE2 and the relationship between TIPE2 and HSP related laboratory inflammatory parameters including blood WBC, serum IgA, complements C3 and C4, ESR, anti-streptolysin O, HSP symptom scores in peripheral blood mononuclear cells (PBMCs) from HSP patients.
Methods TIPE2 expression was detected in PBMCs from 40 HSP patients and 36 healthy individuals by western blotting. The correlation between TIPE2 and laboratory parameters including blood WBC, serum IgA, C3 and C4, ESR, anti-streptolysin O, HSP symptom scores was analyzed by Spearman's rank.
Results The TIPE2 expression level was significantly up-regulated in PBMCs from HSP patients compared with healthy individuals ($P < 0.01$). Furthermore, TIPE2 protein expression levels were positively correlated with IgA ($r = 0.3413$, $P = 0.0360$), complement C4 ($r = 0.5112$, $P = 0.0006$), ASO ($r = 0.6275$, $P < 0.0001$), clinical symptom scores ($r = 0.5134$, $P = 0.0010$). However, no statistically significant correlation was found between TIPE2 protein expression and ESR, WBC, C3 ($P > 0.05$, respectively).
Conclusion Increased expression of TIPE2 was correlated with IgA, complement C4 and ASO, but not with ESR, WBC, complement C3. TIPE2 may participate in the pathogenesis of children HSP. However, further studies are needed to definite the role of TIPE2 in the pathogenesis of HSP.

PO-0219

Combination of iron metabolism indexes and tuberculosis-specific antigen/phytohemagglutinin ratio for distinguishing active tuberculosis from latent tuberculosis infection

Ying Luo、Feng Wang、Ziyong Sun
Department of Laboratory Medicine, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Background Discriminating active tuberculosis (ATB) from latent tuberculosis infection (LTBI) remains challenging. The aim of this study was to investigate a diagnostic model based on the combination of iron metabolism and TB-specific antigen/phytohemagglutinin ratio (TBAg/PHA ratio) in T-SPOT.TB assay for differentiation between ATB and LTBI.
Methods A total of 345 participants with ATB (n = 191) and LTBI (n = 154) were recruited based on positive T-SPOT.TB results at Tongji hospital between January 2017 and January 2020. Iron metabolism analysis was performed simultaneously. Diagnostic model for distinguishing ATB from LTBI was established according to multivariate logistic regression.
Results TBAg/PHA ratio showed 64.00% sensitivity and 90.10% specificity in distinguishing ATB from LTBI when a threshold of 0.22 was used. All iron metabolism biomarkers in ATB group were significantly different from those in LTBI group. Specifically, serum ferritin and soluble transferrin receptor in ATB were significantly higher than LTBI. On the contrary, serum iron, transferrin, total iron binding capacity, and unsaturated iron binding capacity in ATB were significantly lower than LTBI. The combination of iron metabolism indicators accurately predicted 60.00% of ATB cases and 91.09% of LTBI subjects, respectively. Moreover, the combination of iron metabolism indexes and TBAg/PHA ratio resulted in a sensitivity of 88.80% and specificity of 90.10%, respectively. Furthermore, the performance of models established in Qiaokou cohort was confirmed in Caidian cohort.
Conclusions Our data suggest that the combination of iron metabolism indexes and TBAg/PHA ratio could serve as a biomarker to distinguish ATB from LTBI in T-SPOT-positive individuals.

PO-0220

Low-density granulocytes down regulate the positive rate of T-SPOT.TB assay via PD-L1/PD-1 pathway

Junming Li、Jiayue Rao、Rigu Su、Zikun Huang、Yang Guo、Qing Luo
the First Affiliated Hospital of Nanchang Universtiy

Background T-SPOT TB (T-SPOT) assay is the most commonly used clinical test worldwide for screening of MTB infection, which actually detects the quantity of IFN γ-secreting T cells in the condition of stimulation with MTB antigens. The purity and quality of PBMCs is one of the key factors impacting the detection of T-SPOT. However, high frequencies of low-density granulocytes (LDGs) were found recently in the peripheral blood of patients with tuberculosis and some other diseases at high risk of tuberculosis activation. These LDGs are located in PBMCs layer after density gradient centrifugation due to decreased density. Whether these LDGs in PBMCs will affect the detection of T-SPOT has not been investigated.
Objective To investigate the impact of LDGs on T-SPOT assay and related mechanism, and explore a method to improve the reliability of T-SPOT assay.
Methods T-SPOT assay and the frequencies of LDGs were detected with PBMCs collected from patients with tuberculosis, and the correlations between the frequencies of LDGs and the positive rate of T-SPOT assay and the amount of IFN γ-secreting cells (ISCs) represented by positive

spots in T-SPOT assay were analyzed. To explore the impact of LDGs on T-SPOT assay, LDGs in PBMCs was removed by immunomagnetic method, and purified LDGs was obtained from PBMCs by negative immunomagnetic sorting, followed by T-SPOT assay with LDGs removed PBMCs or PBMCs with exogenous addition of purified LDGs. Furthermore, the impact of LDGs on IFN-γ production in T cells was verified by FCM. The possible molecular mechanism of LDG's influence on T-SPOT assay was explored by detecting the levels of negative immune regulatory molecules expressed or secreted by LDG and confirmed by function blocking with neutralizing antibody against candidate target.
Results The positive rates of T-SPOT assay and ISCs in tuberculosis patients with low LDGs frequency were significantly higher than those with high LDGs frequency (100.00% vs 76.92%, P=0.015). After removing LDGs from PBMCs, the number of ISCs in the same number of PBMCs increased significantly, and the positive rate of T-SPOT assay also increased (from 77.78% to 94.44%，P=0.148), but the difference was not significant. After exogenous LDGs was added, the number of ISCS in the same number of PBMCs decreased significantly, and the positive rate of T-SPOT assay decreased significantly (from 100.00% to59.09%, P=0.0008). The results of flow cytometry showed that LDGs significantly suppressed the production of IFN-γ in T cells in response to MTB antigen stimulation. Further studies showed that the negative costimulatory molecule PD-L1 was highly expressed on the surface of LDGs. Compared with the untouched LDGs, the effect of LDGs pretreated with anti-PD-L1 McAb on T-SPOT assay significantly decrease. Treating PBMCs with anti-PD-L1 McAb during the T-SPOT assay can significantly increase the number of ISCs and the positive rate of T-SPOT, achieve the similar effect with LDG removal.
Conclusions LDGs can inhibit the production of IFN - γ in T cells and the positive rate of T-SPOT assay through PD-L1/PD-1 pathway. Blocking PD-L1 signal on LDGs can improve the positive rate of T-SPOT assay.

PO-0221

Tumor necrosis factor (TNF)-α and myoglobin (MYO) associated with long-term recovery time of coronary artery lesions in Kawasaki disease patients

Chaochao Tan
Hunan provincial hospital

Aim To assess the relationship between clinical parameters and long-term recovery time of Coronary artery lesions (CALs).
Methods In total, 344 KD patients were screened and 311 KD patients were included and followed-up for the next two years. Clinical records, clinical parameters and inflammatory biomarkers were collected for all subjects.
Results Results revealed that Tumor necrosis factor (TNF)-α and myoglobin (MYO) levels in patients without recovery from CALs were significantly higher than those without CALs and with recovery from CALs. Kaplan-Meier survival analysis showed that in the high-TNF-α group, the estimated median time to recovery (5.0 months, 95% CI 1.436–8.564) is significantly longer than the low-TNF-α group (2.00 months, 95% CI: 0.633–3.367, P = 0.044). Also, the estimated median time (5.0 months, 95% CI: 1.836–8.164) in the high-MYO group is significantly longer than the low-MYO group (2.00 months, 95% CI: 0.405–3.595, P = 0.002). Cox regression analysis showed independent factors for recovery of CALs included age, left coronary artery to aortic annulus ratio, TNF-α and MYO levels.
Conclusions These findings suggest that clinical parameters such as age, left coronary artery to aortic annulus ratio, TNF-α and MYO levels associate with long-term recovery time of CALs and could help in the design of a clinical strategy for the surveillance and prevention of late cardiovascular events.

PO-0222

新型冠状病毒 IgM 抗体阳性疑似病例的排查策略研究

高会霞、李雅楠、刘玉珍、黄颖、许怡、张志、戴二黑
石家庄市第五医院

目的 比较不同原理抗体检测试剂对新冠疑似病例诊断的准确性，对 IgM 抗体阳性疑似病例提出高效的排查方案，进一步为建立高风险人群的临床筛查路径提供科学依据。
方法 对 76 例由于 IgM 抗体初检阳性被转入定点医院隔离观察的新冠疑似病例，进行鼻咽拭子核酸检测，血清微量病毒中和抗体和三种市售不同原理抗体检测试剂检测，以及肺部 CT 检查，结合临床症状等信息，综合判断新冠确诊或排除情况，并将三种血清学抗体检测试剂与临床判断结果进行对比分析，比较三种检测方法结果的差异。
结果 通过综合判断，76 例疑似病例中有 3 例为确诊病例，73 例为排除病例。与临床确诊/排除结果比较，三种血清学抗体检测方法中，化学发光总抗体检测灵敏度 100%，特异性 97.26%，检测准确性高于化学发光法 IgM/IgG 和胶体金法 IgM/IgG 单独检测（入院第 1 天特异性均为 73.97%）。
结论 化学发光法检测新冠总抗体具有高灵敏度和高特异性，可以用于疑似病例抗体检测的初筛。针对重点人群筛查，应首先进行 2019-nCoV 核酸检测，若核酸检测阴性，则采用检测血清总抗体为主要指标的筛查路径。

PO-0223

Whole Exome Sequencing to Identify of Potential Rare Variants for Chinese Han Systemic Sclerosis

Chenxi Liu、yongzhe li
Peking Union Medical College Hospital

Objective Whole-exome sequencing (WES) studies in systemic sclerosis (SSc) patients of American ancestry have identified variants in the ATP8B4 gene and enrichment of variants in genes in the extracellular matrix (ECM)-related pathway increasing SSc susceptibility. Our goal was to evaluate the association of several genes of these two studies with SSc in a cohort of Chinese Han. And then to performed WES in Chinese Han SSc patients to identify rare variants predicted to be deleterious, and characterized their aggregate effects based on enrichment in specific genes and pathways.
Method Functional variants in genes reported in the two WES studies in American ancestry SSc were selected for gene association testing using the real-time PCR allelic discrimination technology. We performed whole-exome sequencing of 40 Chinese Han systemic sclerosis patients including 20 patients without scleroderma renal crisis (SSc-SRC-) and 20 patients with SRC (SSc-SRC+), and 20 healthy controls. Validation genotyping was performed in an independent sample of 363 controls.
Results We examined the association of individual genes that were previously reported in American systemic sclerosis, and none remained significant in Chinese Han SSc patients. Whole-exome sequencing and validation genotyping identified five variants in Chinese Han systemic sclerosis. The mutations in the genes CTDSP2, RPL23A, RGMA, ABCA3, and WRN were rare mutations that may potentially cause the onset of SSc. It is speculated that these genes mutations have a greater impact on gene function and can be used as important target genes for subsequent research.
Conclusion This study demonstrates the value of WES for the identification of novel gene variants and pathways that may contribute to scleroderma risk and/or severity. The candidate genes we discovered are potential targets for in-depth functional studies.

PO-0224

C60@PCN-224 给体-受体长程有序体系在脑损伤标志物检测中的应用研究

杨二利[1]、孙倩[1]、沈艳飞[1,2,3]
1. 东南大学医学院
2. 东南大学附属中大医院临床检验医学中心
3. 东南大学江苏省重症医学重点实验室

光电化学（PEC）免疫分析法因具有背景信号低和灵敏度高等优点，在生物标志物检测领域受到人们的广泛关注。光电活性材料的光电转换效率对 PEC 免疫分析法的灵敏度具有至关重要的影响。C60 作为非金属半导体材料，具有独特的光电特性和电子结构，是潜在的新型光电活性材料。然而，C60 在生理水溶液体系较差的电子离域和积累能力以及生物结合界面的缺乏限制了其在 PEC 生物检测方面的应用。因此，本工作通过卟啉基金属-有机框架（PCN-224）与 C60 非共价偶联构成 C60@PCN-224 纳米复合物，改善了 C60 的光电化学性能和生物界面活性：PCN-224 的羧基末端为生物分子的高效结合提供了丰富的结合位点；PCN-224 与 C60 通过 p-p 相互作用构成了长程有序的电子供体-受体体系加快了光生电子的转移，协同提高了 PEC 生物传感的灵敏性，使 C60@PCN-224 在 PEC 生物传感方面表现出巨大潜力。此外，我们以 C60@PCN-224 为光电化学探针，纳米抗体为识别单元构建了 PEC 免疫传感器并成功用于脑损伤生物标志物 S100 钙结合蛋白 B（S100B）的检测，表现出较高的灵敏度、优异的选择性和良好的稳定性。这项工作可能为具有生物友好界面和高光电转换效率的 C60 基光电极在早期疾病诊断中的应用开辟新的道路。

PO-0225

Vitamin D Deficiency May Not Be an Independent Risk Factor for Peripheral Arterial Disease in Middle-Aged and Elderly Patients with Type 2 Diabetes in China

王彦[1]、张平[1]、冯同保[2]、周洪兴[2]、鲁科峰[2]
1. 南京医科大学附属常州第二人民医院
2. 南京医科大学附属常州第二人民医院

The purpose of our study was to explore the relationship between 25(OH)D levels and PAD in middle-aged and elderly type 2 diabetes mellitus (T2DM) patients in China. Pearson analysis and multivariable logistic regression analysis were used. The parameters including age, HbA1c, and disease duration between two groups showed significantly different. In addition, the frequency of smoking was significantly less and the frequency of well-controlled HbA1c was significantly higher. However, HbA1c significantly differed between groups with vitamin D deficiency and insufficiency in the T2DM patients with PAD. The findings demonstrate that the deficiency of vitamin D level is not related to PAD, but HbA1c may be linked to the presence of PAD in middle-aged and elderly patients with T2DM in China.

PO-0226

The mechanism of IL-17 in rats with acute gouty arthritis

Guozhen Wang、Yongtong Cao
China-Japan Friendship Hospital

Objective To investigate the role of IL-17 and its downstream inflammatory factors in the onset of gouty arthritis by using gouty arthritis rat model.
Methods Animal gouty arthritis model were used to explore the effect of IL-17 on the tissue damage of gouty arthritis. We injected purified IL-17, Urate crystal(MSU), MSU + IL-17 inhibitor or normal saline into the ankle joint of rats respectively, and observed the diameter of the joint, the inflammatory pathological changes of the soft tissue around the joint cavity, the pathological changes of the synovium and bone tissue, the main blood inflammatory and biochemical indexes, so as to clarify the role of IL-17 in the pathogenesis of gouty arthritis.
Results The results showed that the injection of purified monosodium urate (MSU) crystal or IL-17 into the ankle joint of rats could induce the local swelling of the joints, a large number of inflammatory cells infiltration, and the level of serum inflammatory factors significantly increased, which could be used to establish the gouty arthritis rat model. In the MSU + IL-17 inhibitor group, the local swelling of the joints of the rats was significantly reduced, the histopathology showed that the inflammatory response was lighter, and the levels of various inflammatory factors (such as PGE2, MPO, C-reactive protein, IL-6, IL-8 and TNF-α) were significantly lower than those in the MSU group alone ($P<0.05$). The inflammatory response of the rats injected with IL-6 inhibitor, IL-8 inhibitor or TNF-α inhibitor and IL-17 inhibitor were significantly weaker than that of the rats injected with IL-17 alone.
Conclusion IL-17 plays an important role in promoting the inflammation of gouty arthritis, and it may promote the expression and secretion of IL-6, IL-8, TNF - α and participate in the pathogenesis of gouty arthritis.

PO-0227

Circulating levels of IL-33 are elevated by obesity and positively correlated with metabolic disorders in Chinese adults

Haoneng Tang、Ning Liu、Xiaojing Feng、Yanyi Yang、Meilian Liu、Lingli Tang
Department of Laboratory Medicine，The Second Xiangya Hospital，Central South University

Background Interleukin-33 (IL-33) plays a pivotal role in regulating innate immune response and metabolic homeostasis. However, whether its circulating level is correlated with obesity and metabolic disorders in humans remains largely unknown. We aimed to address this gap by determining IL-33 serum level and its downstream type 2 inflammatory cytokines interleukin-5 (IL-5) and interleukin-13 (IL-13) in overweight/obese population, and analyzing the specific associations between IL-33 and obesity metabolic phenotypes.
Methods 217 subjects were enrolled and divided into three groups: healthy control (HC) subjects, metabolically healthy overweight/obese (MHOO) subjects and metabolically unhealthy overweight/obese (MUOO) subjects. Circulating levels of IL-33, IL-5 and IL-13 were measured using ELISA analyses. Multivariate regression analyses were further performed to determine the independent association between IL-33 and obesity metabolic phenotypes.
Results Circulating levels of IL-33 were significantly elevated in subjects of MUOO group compared with HC group and MHOO group, while no significant difference was observed between the latter two groups in IL-33 levels. Consistent with this, serum levels of IL-5/13 were higher in the MUOO group compared with HC and MHOO groups. In different multivariable models, MUOO phenotype was significantly associated with increased IL-33 serum levels

(OR=1.70; 95%CI: 1.09–2.64; p = 0.019). With the MHOO group as the reference population, higher circulating level of IL-33 was also positively associated with MUOO phenotype after adjusting for confounders (OR=1.50; 95%CI: 1.20–1.88; p =2.91E-4). However, there was no significant association between MHOO phenotype and IL-33 levels (p =0.942). Trend test further confirmed the positive correlation between MUOO phenotype and IL-33 level (p for trend =0.019). Additionally, IL-33 was significantly and positively correlated with diastolic blood pressure (DBP), total cholesterol (TC), alanine aminotransferase (ALT), aspartate aminotransferase (AST), white blood cell (WBC), neutrophil and IL-5 only in MUOO group, while inversely correlated with high density lipoprotein cholesterol (HDL-C) in MHOO subjects.
Conclusion Circulating levels of IL-33 were significantly elevated in overweight/obese Chinese adults with metabolic disorders. Increased levels of IL-33 were positively associated with metabolically unhealthy overweight/obese phenotype and several metabolic syndrome risk factors.

PO-0228

Establishment and clinical significance of T lymphocyte detection method

Chen Chen、Yanmei Liu、Shuxia Xuan、Weiguo Yin
The Sixth Affiliated Hospital of Guangzhou Medical University, Qingyuan People's Hospital

Objective Establish and verify the method for detecting the immune phenotype of peripheral blood T lymphocytes by cellular immune chip technology, analyze the cellular immune function of different populations in Qingyuan area, and discuss its clinical diagnostic value.
Methods First, select the samples for performance verification, use the cellular immune chip to detect peripheral blood T lymphocytes, and perform flow cytometry detection and verification; after the method is established, a total of 8389 cases of physical examination and inpatients from Qingyuan People's Hospital are selected, blood samples are collected, and cells are used. Immunochip technology detects the expression of T lymphocyte subsets CD3+, CD4+, CD8+ and CD4/CD8, and analyzes the differences in cellular immune function among people with physical examination, inflammation and cancer, as well as different cancer types and genders.
Results The cell immunochip method and flow cytometry method have the same accuracy and precision in detecting specimens; the CD3+, CD4+, and CD8+ T cell counts of inflammatory and cancer populations are significantly lower than those of the physical examination population, and the CD4/CD8 ratio is significantly higher than that of the physical examination population (P< 001), there is a statistical difference between inflammation and cancer (P＜0.001 or P＜0.01); there are statistics on the CD3+, CD4+, CD8+ T cell counts and the CD4/CD8 ratio of lung cancer, bowel cancer and liver cancer Differences in science (P<0.01 or P<0.05); there are certain differences in CD3+, CD4+, CD8+ T cell counts and CD4/CD8 ratios between male and female groups in physical examination, inflammation and cancer.
Conclusion The cellular immune chip method for T cell phenotype detection is simple and practical, and can be used for immune function monitoring and treatment prognosis evaluation of people with different diseases.

PO-0229

重组结核分枝杆菌 Hsp16.3 的纳米金免疫传感器检测 Hsp16.3 抗体

袁仕善[3]、贺靖[1]、郭婧玮[2]、谭云洪[2]
1. 湖南师范大学医学院医学检验系
2. 湖南省胸科医院检验科
3. 湖南师范大学医学院医学检验系

目的 结核分枝杆菌抗体检测是结核病诊断的有效辅助方法。热休克蛋白 16.3（Heat shock protein 16.3，Hsp16.3）在结核分枝杆菌感染早期大量分泌，其免疫原性强，能诱发机体产生特异性抗体，在结核病的诊断中具有一定价值。金纳米棒具有局部表面等离子体共振（LSPR）性质，将金纳米棒与 MTB 抗原连接后建立纳米金免疫传感器，通过检测金纳米棒纵向等离子体峰波长（LPW）的红移来反映抗原抗体的结合情况，可辅助诊断结核病。本文克隆和表达结核分枝杆菌热休克蛋白 16.3（Hsp16.3），建立 Hsp16.3 的纳米金免疫传感器检测结核病患者血清 Hsp16.3 抗体，为结核病诊断提供有益的参考。
方法 PCR 扩增 hsp16.3 基因，构建重组表达质粒 pQE30-hsp16.3，表达和纯化 Hsp16.3，Western blot 分析其反应原性；晶种生长法制备金纳米棒并连接 Hsp16.3，建立纳米金免疫传感器检测血清 Hsp16.3 抗体，接受者操作特性（ROC）曲线评价其灵敏度和特异性。
结果 成功构建重组表达质粒 pQE30-hsp16.3，纯化 Hsp16.3 具有良好的反应原性；Hsp16.3 的纳米金免疫传感器分别检测 50 例结核病患者、42 例非结核肺病患者和 50 例体检健康者血清，红移值大于 3.5 的例数分别为 42、7、1 例；ROC 曲线显示，曲线下面积 0.888（P<0.01），界值 3.5，灵敏度 82%，特异度 98%。
结论 Hsp16.3 的纳米金免疫传感器可用于检测结核病血清 Hsp16.3 抗体。

PO-0230

Plasma heat shock protein 90alpha as a biomarker for the diagnosis of liver cancer: in patients with different clinicopathologic characteristics

Yueting Han、Li Ren
Tianjin Medical University Cancer Institute and Hospital

Purposes The purposes of this study were to assess the correlation between the plasma level of Hsp90α and the clinicopathological characteristics of patients with liver cancer and compare the diagnostic efficacy of Hsp90α, AFP, CEA, and CA199 in HCC. Experimental design: A total of 200 individuals, including 140 patients with liver cancer or benign liver diseases and 60 healthy people, were enrolled for quantitative measurement of plasma Hsp90α by ELISA.
Results The plasma level of Hsp90α was significantly different between patients with liver cancer or benign liver diseases and healthy controls (P < 0.001). The sensitivity, specificity, and AUC (95% CI) of Hsp90α were 93.2%, 85.4%, and 0.931% (0.891–0.972%), respectively, when Hsp90α was applied to differentiate liver cancer patients and healthy controls. Significant positive correlations between the plasma Hsp90α level and clinicopathological characteristics such as the history of basic liver disease (P = 0.038), active stage of hepatitis (P = 0.039), Child-Pugh score (P < 0.001), size of focal liver lesions (P = 0.004), and extrahepatic metastasis (P < 0.001) were observed. AFP + Hsp90α was the best combination strategy for the auxiliary diagnosis of HCC, with a sensitivity of 95.7%, a specificity of 97.5%, and an AUC of 0.990 (0.976–1.000). The level of plasma Hsp90α decreased significantly (P < 0.001) after resection of tumor tissue.

Conclusions This study demonstrated that plasma Hsp90α levels are useful as a diagnostic biomarker in liver cancer and may predict the responses of patients with liver cancer to surgery. Some clinicopathological characteristics could affect the plasma Hsp90α levels.

PO-0231

Clinical characteristics of immune responce in severe and asymptomatic COVID-19 patients

Bin Liu[1]、feihu yan[2]
1. Second affiliated hospital of south China universit
2. 军事科学院长春研究所

The worldwide pandemic of coronavirus disease 2019 (COVID-19) is the prime challenge facing global public health. A comprehensive understanding of clinical characteristics in cellular and humoral immune responses against severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), the emerging virus causing COVID-19, is of great significance to the prophylactic and therapeutic countermeasures of COVID-19. Features of cytokine and antibody responses among COVID-19 patients has been reported but few consensus has been reached, especially the differences in patients with different severity as well as the relationship between these key indicators. Here, we investigated 29 individuals infected with SARS-CoV-2 in Hunan Province, China, including 12 asymptomatic carriers, and 17 severe COVID-19 patients based on nucleic acid test and clinical symptoms. Sera were collected from these people for cytokine and antibody responses based on RBD or N protein of SARS-CoV-2 respectively. Our retrospective observational study enriched and verified clinical characteristics of COVID-19. In terms of cytokine, difference are also observed between groups in our study. Virus-specific antibody is IgG1 baised in COVID-19 patients, IgG and IgG1 behaves the same tendency in both group. Dispite discrete, VNA titers of asymptomatic carriers is comparble to that of severe COVID-19 patients. The above information is of immediate relevance and would assist COVID-19 clinical diagnosis, prognosis and vaccine design.

PO-0232

液基细胞学技术的临床应用价值初探

文金润
昆明市中医医院

液基薄层细胞技术（(ThinPrep Cytology Test， TCT）是细胞工程专家推出的一种重大革新的细胞制片新技术，通过该技术去掉非诊断性杂质，制成观察清晰的薄层细胞片，克服了传统方法取材时细胞的丢失及涂片质量差的缺陷，薄层细胞经自动单片独立染色，使细胞学的诊断准确性明显提高。所有传统的涉及病理科细胞学的检测项目均适用于液基薄层细胞学检查。液基细胞学与 1996 年开始应用于临床，为临床细胞病理学诊断提供可靠参考。目前液基细胞学广泛应用于妇科宫颈癌筛查工作，但因其取材简单、制片简便、处理过程系统程序化，现在泌尿、呼吸、胃肠、外科等非妇科领域发挥重要作用[1]。

PO-0233

金标法与免疫比浊法检测 C 反应蛋白结果的可比性分析

田元琴
昆明市中医医院

目的 对本科室检测 C-反应蛋白（CRP）的金标法与胶乳免疫比浊法进行比较。
方法 采集 30 例门诊患者全血样本，并将其分为血浆组和全血组，每组均为 30 份。血浆组采用 AU5800 型全自动生化仪，全血组采用 FIA8600 免疫定量分析仪进行 CRP 的测定，对结果进行统计分析。 其检测结果金标法与免疫比浊法之间差异无显著性（P>0.05），且相关性好。
结论 金标法适用于单个样本快速检测，比浊法适用于批量检测。

PO-0234

IL-17 and IL-21 polymorphisms in relation to HBV related hepatocellular carcinoma in Chinese Han population

Wennan Wu、Qishui Ou
The First Affiliated Hospital of Fujian Medical University, Fuzhou, China

Objective Inflammatory cytokine gene polymorphisms may influence the hepatic and extrahepatic HBV-related disease. In this study, we aimed to investigate the relationship between polymorphisms of IL-17, IL-21 gene and HBV related hepatocellular carcinoma in Chinese Han population.
Methods We performed a multi-center study comprised 866 HBV-related hepatocellular carcinoma (HCC) patients and 1086 unrelated patients with a diagnosis of chronic hepatitis B (CHB) as control to evaluate the effects of IL-17 (rs4711998), IL-21 SNPs (rs12508721, rs13143866 and rs2221903) and the susceptibility of HCC. MassARRAY technology was utilized to genotype. Enzyme-linked immunosorbent assay (ELISA) was used to detect the serum IL-17 and IL-21 level. Quantitative real time polymerase chain reaction (qRT-PCR) was used to analyze the serum viral loads.
Results In logistic regression analysis, our results showed the frequency of rs4711998 allele G in CHB group was significantly higher than that in HCC group (P = 0.042, 0.859(0.743-0.994)), and it is present only among females. Compared to HCC group, rs13143866 A allele was more likely to appear in HCC group (P = 0.015, 1.268 (1.049-1.532)). The frequency of AA also showed different between HCC group and CHB groups (P = 0.011, 3.135 (1.292-7.603)), which showed strong sex-specific relationships. ELISA showed a higher serum IL-17 and IL-21 expression in HCC patients compared to CHB patients (P all <0.05). Haplotype rs12508721C/rs13143866A/rs2221903T in male HCC group was statistically higher than in male CHB group(P = 0.013) but not in females (P > 0.05).
Conclusion We suggested rs4711998 allele A as risk factors for women to develop HBV related-HCC in Chinese Han population. rs13143866 allele A as risk factors to develop HBV related-HCC in Chinese male population. Male patients with haplotype rs12508721C/rs13143866A/rs2221903T may with 1.3-fold risk for HBV-related HCC.

PO-0235

构建 CHB 患者 IFN-α 疗效预测的列线图模型

荀振、欧启水
福建医科大学附属第一医院

目的 慢性乙型肝炎（CHB）患者干扰素-α（IFN-α）疗效预测问题一直困扰临床。本文旨在筛选预测 IFN-α 疗效的独立因素，运用 R 语言构建预测 IFN-α 疗效的列线图模型。
方法 首先收集 116 例经 IFN-α 治疗的 HBeAg 阳性 CHB 患者（包含经 IFN-α 治疗应答者和应答不佳者）详细的临床资料，包括患者基本信息如年龄、性别、用药情况，实验室指标如血常规、肝功能、血脂、HBV DNA、乙肝“两对半”等，以及影像学检查。其次采用 SPSS 22.0 软件，对每个临床变量进行单因素 logistic 回归分析，以筛出治疗反应的独立预测因子；利用 R 4.0.2 软件，将 logistic 回归分析得出的独立预测因子引入 R 代码，并因此应用 rms 包建立列线图预测模型；最后，利用受试者工作（ROC）曲线评估列线图模型的预后性能，并通过 Bootstrap 重抽样对模型进行内部验证。
结果 单因素 logistic 回归分析结果提示：HBV DNA、HBsAg、HBeAg、白蛋白、白蛋白-胆红素（ALBI）评分、ALT、AST、总胆汁酸（TBA）、总胆固醇与 CHB 患者 IFN-α 疗效相关（P<0.05）；以统计学上重要的影响因素作为自由变量进行单变量筛选，进行多因素 logistic 回归分析显示，HBeAg 和 TBA 是 CHB 患者 IFN-α 药效反应的独立风险因素；成功建立预测 CHB 患者 IFN-α 疗效的列线图模型，该预测模型的预测效能较好，其 ROC 曲线下面积 AUC 为 0.871（95%CI：0.795～0.926），在经过 1000 次 Bootstrap 重采样内部验证后，预测模型的一致性指数（C-index 值）为 0.839，校准曲线显示该列线图所预测的治疗应答率与实际观察情况具有很好的一致性。
结论 成功构建基于 HBeAg、ALBI、ALT、TBA 的可预测 IFN-α 疗效的列线图模型，该模型的指标易得、预测效能较好。

PO-0236

Taurocholic acid inhibits the response to interferon-α therapy in patients with HBeAg-positive chronic hepatitis B by impairing CD8+ T and NK cell function

Zhen Xun 、Qishui Ou
The First Affiliated Hospital of Fujian Medical University, Fuzhou, China

Pegylated interferon-alpha (PegIFNα) therapy has limited effectiveness in hepatitis B e antigen (HBeAg)-positive chronic hepatitis B (CHB) patients. However, the mechanism underpinning this failure is poorly understood. We aimed to investigate the influence of bile acids (BAs), especially taurocholic acid (TCA), on the response to PegIFNα therapy in CHB patients. Here, we used mass spectrometry to determine serum BA profiles in 110 patients with chronic HBV infection and 20 healthy controls (HCs). We found that serum BAs, especially TCA, were significantly elevated in HBeAg-positive CHB patients compared with HCs and patients in other phases of chronic HBV infection. Moreover, serum BAs, particularly TCA, inhibited the response to PegIFNα therapy in HBeAg-positive CHB patients. Mechanistically, expression levels of IFN-γ, TNF-α, granzyme B and perforin were measured using flow cytometry to assess the effector functions of immune cells in patients with low or high BA levels. We found that BAs reduced the number and proportion, and impaired the effector functions of CD3+CD8+ T cells and natural killer (NK) cells in HBeAg-positive CHB patients. TCA in particular reduced the frequency and impaired the effector functions of CD3+CD8+ T and NK cells in vitro and in vivo, and inhibited the immunoregulatory activity of IFN-α in vitro. Thus, our results show that BAs, especially TCA,

inhibit the response to PegIFNα therapy by impairing the effector functions of CD3+CD8+ T and NK cells in HBeAg-positive CHB patients. Our findings suggest that targeting TCA could be a promising approach for restoring IFN-α responsiveness during CHB treatment.

PO-0237

The Immune Imbalance of T-Lymphocyte Subsets：the key to the pathogenesis of unexplained recurrent spontaneous abortion

Yizhi Peng
Department of Laboratory Medicine, the Second Xiangya Hospital of Central South University

The etiologies of recurrent spontaneous abortion (RSA) were varied, but the etiology of 50% of patients with recurrent abortion was unknown, known as unexplained recurrent spontaneous abortion (URSA). The occurrence of URSA was related to maternal-fetal immune tolerance imbalance, especially the imbalance of various T-lymphocyte subsets, including Th1 cells, Th2 cells, Th17 cells, Treg cells and NKT cells. In this paper, the latest research progress of T-lymphocyte subsets and URSA occurrence in the world was reviewed, especially the research progress of T lymphocyte subsets in URSA occurrence in the aspects of immune mechanism, immune imbalance and the interaction between different subsets.

PO-0238

A new interpretation of TB-IGRAs quantifies peripheral blood IFN-γ in the progression of lung cancer

Yizhi Peng
Department of Laboratory Medicine, the Second Xiangya Hospital of Central South University

Objective To explore the value of TB-IGRAs quantification of peripheral blood IFN-γ in immune checkpoint inhibitors (ICI) resistance against various cancers and the progression of lung cancer.
Methods A total of 389 patients and 127 healthy volunteers admitted to the Second Xiangya Hospital from June 2018 to April 2021 were recruited, including 259 patients with lung cancer, 27 patients with liver cancer, and 103 patients with hematologic tumors. The TB-IGRAs test was performed within 24 hours after 10mL of heparin sodium was taken for anticoagulant vessels. SPSS version 26.0 software was used to analyze the results of each group.
Results The concentrations of IFN-γ in healthy control group, lung cancer group, liver cancer group and hematological malignancy patients were 517.91(352.83-750.75), 1022.61(253.41-2872.23), 2764.87(953.23-7084.61) and 11106.41(259.41-3326.28)pg/ mL, respectively, the ability of peripheral T cells to secrete IFN-γ in patients with lung cancer was higher than that in healthy control group, while the ability of peripheral T cells to secrete IFN-γ was lower in patients with liver cancer and hematologic tumor than that in healthy control group. The concentrations of IFN-γ in the non-metastatic group and the metastatic group were 2893.57(1092.94-7592.89) pg/mL and 1554.63(308.43-4927.04)pg/mL, respectively, the concentrations of IFN-γ in the non-metastatic group were higher than those in the metastatic group.
Conclusion The quantification of IFN-γ produced by peripheral T cells after stimulation with PHA by TB-IGRAs test may reflect the response of cancer to ICI, which may be closely related to the progress of lung cancer, and may reflect the immune status of patients to a certain extent. Monitoring lung cancer patients may help to judge whether they have a tendency to further metastasis.

PO-0239

The value of a new interpretation of the QFT-GIT test in the diagnosis of active and latent tuberculosis after clinical transplantation

Yizhi Peng
Department of Laboratory Medicine, the Second Xiangya Hospital of Central South University

Objective To evaluate the application and value of QFT-GIT test in the diagnosis of active and latent tuberculosis.
Methods 142 patients admitted to the Second Xiangya Hospital from July 2018 to April 2019 were collected, including 12 patients with Active Tuberculosis(ATB), 45 patients with Latent Tuberculous Infection(LTBI) and 85 patients without Tuberculosis (TB). The Quantiferon-TB Gold In-Tube Test(QFT-GIT) and T-Spot.TB Blood Test (T-SPOT) were performed within 24 hours after 10mL of heparin sodium was taken for anticoagulant vessels.
SPSS version 26.0 software was used to analyze the Results of each group, and the AUC and ROC of each variable were further calculated and analyzed.
Results The concentrations of IFN-γ in ATB group, LTBI group and control group were 68.45(7.77-425.53), 5.30(0-179.50) and 2.30 (0-17.94) pg/mL, respectively. The concentration of IFN-γ in TB group was higher than that in LTBI group and control group. When Cut-offIFN-γ was 15.205pg/ml, the specificity and negative predictive value of differentiating TB patients from other populations were 0.74 and 0.71, respectively. When Cut-offIFN-γ was 90.365pg/ml, the specificity and negative predictive value of differentiating LTBI from healthy population were 0.88 and 0.77, respectively.
Conclusion The quantitative determination of IFN-γ concentration in the QFT-GIT test can effectively determine the presence of Mycobacterium tuberculosis infection, and the new interpretation of the QFT-GIT test is expected to solve the problem of differential diagnosis of latent infection and active tuberculosis.

PO-0240

NKT-like 细胞在系统性硬化症患者中的意义

周新华[1]、李燕[2]、李英妮[3]
1. 南昌市第三医院
2. 晋中市第一人民医院
3. 北京大学人民医院

目的 研究外周血 NKT- like 细胞在系统硬化症（SSc）患者中的表达，探索 NKT-like 细胞与系统性硬化症实验室指标和临床指标之间的相关性，进而探讨 NKT-like 细胞在系统性硬化症疾病发生发展中的提示作用。
方法 选取 2018 年 12 月到 2019 年 12 月在北京大学人民医院风湿免疫科门诊和住院就诊的 46 例 SSC 患者（SSc 组），年龄性别与之匹配的 30 例健康体检者，作为健康对照组（HC 组）。采用流式细胞术收集 SSc 组和 HC 组外周血 NKT-like 细胞和其他淋巴细胞亚群的细胞数量和百分比。同时采用相应实验方法测定其他实验室指标。利用统计软件 SPSS24.0 对 NKT-like 细胞及其他临床和实验室指标进行相关统计分析。
结果 与 HC 组相比，SSc 组外周血中 NKT-like 细胞数量明显减少，差异具有统计学意义 (P<0.05)。相关性分析可见，NKT-like 细胞数目与总 T 淋巴细胞(r=0.562，P<0.0001)、CD4+T 细胞(r=0.418，P=0.004)、CD8+T 细胞(r=0.605，P<0.001)、B 淋巴细胞(r=0.503，P<0.0001)及 NK 细胞(r=0.332,P=0.024)存在明显正相关；NKT-like 细胞所占淋巴百分比与 CD8+T 细胞所占百分比呈明

显正相关(r=0.342，P=0.020)，与其他淋巴细胞百分比的相关性不明显(P>0.05)。NKT-like 细胞与血沉（ESR）具有明显负相关性(r=-0.344，P=0.019)。
结论 SSc 患者外周血 NKT-like 细胞存在数量和比例的明显减低，，与多种淋巴细胞正相关，而且与反映病情的 ESR 具有负相关关系。NKT-like 细胞可作为 SSC 患者病情评估的指标之一。

PO-0241

抗核抗体荧光核型在自身免疫性肝病筛查中的作用评估

张炜、王之青、郑冰
上海交通大学医学院附属仁济医院

目的 探讨 HEp-2 细胞为底物的间接免疫荧光法（IFA）荧光法检测抗核抗体（ANA）在自身免疫性肝病（ALD）筛查中的作用。
方法 分析国际抗核抗体荧光核型共识（ICAP）所定义的 30 种荧光核型在 6226 例 ALD 筛查人群，106 例原发性胆汁性肝硬化（PBC）和 138 例自身免疫性肝炎（AIH）患者中的检出率。比较抗线粒体抗体、AMA-M2 和 M2-3E 在胞浆网状/线粒体样型（AC-21）和其他胞浆颗粒型（AC-18/19/20）中检出率；抗 Sp100 和 PML 抗体在核多点型（AC-6）和核少点型（AC-7）中检出率；抗 gp210 抗体在点状核膜型(AC-12)和光滑核膜型（AC-11）中检出率以及抗平滑肌抗体、抗 F-肌动蛋白抗体在胞浆线性/肌动蛋白型（AC-15）和其他胞浆纤维型（AC-16/17）中检出率。
结果 ALD 筛查人群、PBC 和 AIH 患者荧光核型检出率最高的分别是：细颗粒型[16.4%（1023/6226）]、胞浆网状/线粒体样型[50.9%（54/106）]和细颗粒型[23.9%（33/138）]。抗线粒体抗体、AMA-M2 和 M2-3E 在 AC-21 中检出率分别为 80.7%（385/477）、72.8%（347/477）和 82.4%（393/477），明显高于其他胞浆颗粒型（AC-18/19/20）中检出率（7.5~23.1%）；抗 Sp100 和抗 PML 抗体在 AC-6 核型中检出率分别为 90.7%和 16.1%，明显高于其在 AC-7 中检出率 9.4%和 1.9%；抗 gp210 抗体在 AC-12 中检出率为 82.0%，在 AC-11 中检出率为 0%；抗 ASMA 和抗 F-肌动蛋白抗体在 AC-15 中检出率分别为 54.6%和 16.1%，明显高于其他胞浆纤维型中检出率。
结论 胞浆网状/线粒体样型、点状核膜型、核多点型和胞浆线性/肌动蛋白型荧光核型在 ALD 筛查中有重要意义，实验室应重视上述核型判读。

PO-0242

胃蛋白酶原、胃泌素-17、CA19-9、CA72-4 检测在不同类型胃炎及胃癌中的临床应用价值

杨淑娴、娄鉴芳
江苏省人民医院（南京医科大学第一附属医院）

目的 探讨胃蛋白酶原、胃泌素 17、CA19-9、CA72-4 在胃部相关疾病中的临床应用价值。
方法 选取 2016 年 8 月至-2019 年 3 月在南京医科大学第一附属医院初次就诊并确诊为浅表性胃炎、萎缩性胃炎，胃癌的患者纳入研究。检测各组胃蛋白酶原、胃泌素 17、CA-199、CA72-4 水平，并进行比较。
结果 PGI 水平浅表性胃炎组（中位水平 122.4μg/L）显著高于胃癌组（中位水平 69.05 μg/L）和萎缩性胃炎组（中位水平 68 μg/L）。PGII 水平浅表性胃炎组（中位水平 13.9 μg/L）显著高于胃癌组（中位水平 9.2μg/L）和萎缩性胃炎组（中位水平 7.6μg/L），胃癌组显著高于萎缩性胃炎组。G-17 水平浅表性胃炎组（中位水平 3.7 pmol/L）、胃癌组（中位水平 3.5 pmol/L）、萎缩性胃炎组（中位水平 2.4 pmol/L）之间无显著差异。CA19-9 水平在胃癌组（36.93±17.84 U/mL）显著高于萎缩性胃炎组（22.04±14.33 U/mL）与浅表性胃炎组（18.87±11.36 U/mL），CA72-4 水平在胃

癌组（8.686±5.42 U/mL）显著高于萎缩性胃炎组（8.016±2.18 U/mL）与浅表性胃炎组（3.91±2.2 U/mL）。PGI 阳性率胃癌组显著高于浅表性胃炎组（P<0.05）而萎缩性胃炎组显著低于浅表性胃炎组（P<0.05）；PGII 阳性率胃癌组（P<0.05）、萎缩性胃炎组（P<0.05）显著低于浅表性胃炎组；CA19-9 阳性率胃癌组显著高于萎缩性胃炎组（P<0.05）和浅表性胃炎组（P < 0.05）。PGR、G-17、CA72-4 在三组之间无显著差异（P>0.05）。

结论 同时进行胃蛋白酶原、胃泌素-17、CA-199、CA72-4 多种指标的检测，可对胃部相关疾病的鉴别诊断提供帮助。

PO-0243

Immune cells and cytokines in patients with COVID-19 or cancer

Xiaojiao Zeng [2]、Xianghu Jiang[1]、Liu Yang[1]、Yunbao Pan[1]、Yirong Li[1]
1. Department of Laboratory Medicine, Zhongnan Hospital of Wuhan University
2. Zhongnan Hospital of Wuhan University

Objective This study explored the consistency and differences in the immune cells and cytokines between patients with COVID-19 or cancer. We further analyzed the influencing factors and correlations between the two types of inflammatory disease.

Methods This retrospective study involved 167 COVID-19 patients and 218 cancer patients. COVID-19 and cancer were each further divided into two subgroups. Quantitative and qualitative variables were measured by one-way ANOVA and chi-square test, respectively. Multivariate logistic regression analysis was used to explore the factors that influence various diseases. Herein, we carried out a correlation analysis between immune cells and cytokines, and used receiver operating characteristic (ROC) curves to discover the optimal diagnostic index.

Results COVID-19 and cancers were associated with lymphopenia and high levels of monocytes, neutrophils, IL-6, and IL-10. IL-2 was the optimal indicator to differentiate the two types of inflammation. Compared with respiratory cancer patients, COVID-19 patients had lower levels of IL-2 and higher levels of CD3+CD4+ T cells, 4/8 ratio, and CD19+ B cells, and there was no difference in IL-6 and IL-10 between the two groups. In the subgroup analysis, there was no significant difference in cytokines between severe and non-severe COVID-19 patients, while patients with severe COVID-19 had lower levels of lymphocyte subsets (CD3+ T cells, CD3+CD4+ T cells, CD3+CD8+ T cells, CD19+ B cells) and CD16+CD56+ NK cells and higher level of neutrophils. There were no significant differences in immune cells or cytokines between the metastatic and the non-metastatic cancer patients. Moreover, IL-6, CD3+CD8+ T cells, and lymphocytes were risk factors for severe COVID-19. Additionally, IL-6 was the optimal differential diagnostic parameter that had the ability to identify if COVID-19 patients would be severely affected. Age, CD16+CD56+ NK cells, and neutrophils were risk factors for distant metastases in cancer patients. There were higher correlations between IL-2 and IL-4, TNF-α and IL-2, TNF-α and IL-4, TNF-α and IFN-γ, and CD16+CD56+ NK cells and various subsets of T cells in COVID-19 patients. There was a higher correlation between CD3+CD4+ T cells and CD19+ B cells in cancer patients.

Conclusion As representatives of fatal acute and chronic inflammation, consistencies, differences, and satisfactory correlations were found to exist among immune cells and cytokines between patients with COVID-19 and those with cancers, and these inflammatory indexes played a crucial role in COVID-19 and cancers.

PO-0244

KLF4 乙酰化在系膜增生型 IgA 肾病炎性因子分泌中的作用机制及其临床应用初探

谢梦晓
江苏省人民医院（南京医科大学第一附属医院）

目的 探讨 KLF4 乙酰化在系膜增生型 IgA 肾病炎性病变中的作用及其调控机制，并初步评估其在 IgA 肾病中的应用价值。
方法 1）复制大鼠 Thy-1 肾炎（Thy-1N）模型，或利用 C5b-9 刺激大鼠肾小球系膜细胞（GMC）。2）RNA、抗体芯片以及 IB 等进行分析并验证。3）ELISA 及报告基因等分析相应基因或蛋白对 IL-23/IL-36α 表达的影响与调控机制。4）免疫共沉淀及质谱等分析相应乙酰基转移酶乙酰化修饰转录因子对 IL-23/IL-36α 表达及其转录调控的作用。5）采用慢病毒肾动脉灌注的方式沉默上述基因以观察 Thy-1N 大鼠病变的改善。6）免疫组化检查 IgA 肾病患者及对照的肾组织中相应蛋白的表达水平。
结果 1）成功复制 Thy-1N 的动物与细胞模型。2）乙酰基转移酶 PCAF、转录因子 KLF4 以及炎症因子 IL-23/IL-36α 的表达显著升高。3）PCAF 和 KLF4 均能上调 IL-23/IL-36α 的表达，KLF4 能够直接结合于 IL-23/IL-36α 启动子区域，而该过程受 PCAF 影响。4）PCAF 乙酰化修饰 KLF4 赖氨酸 224 位点是促进其调控 IL-23/IL-36α 表达的关键位点。5）沉默上述基因能显著改善 Thy-1N 大鼠病变。6）PCAF、KLF4 和 IL-23/IL-36α 在系膜增生型 IgA 患者肾组织中的表达水平显著升高。
结论 C5b-9 能通过调控 PCAF 乙酰化修饰 KLF4 促进 IL-23/IL-36α 表达，进而导致系膜增生型 IgA 肾病炎性病变。PCAF、KLF4、和 IL-23/IL-36α 的表达在系膜增生型 IgA 患者的肾组织中显著升高，提示其在该疾病的诊断中具有潜在的应用价值。

PO-0245

系统性红斑狼疮患者外周血不同形式循环游离 DNA（cfDNA）的水平和免疫活性比较

黄建军、冯钢
皖南医学院弋矶山医院

目的 检测分析不同形式循环游离 DNA（cfDNA）在系统性红斑狼疮（SLE）患者外周血含量和对巨噬细胞和树突状细胞的刺激活性。
方法 58 例 SLE 患者、66 例非 SLE 病患者（non-SLE）和 60 例正常对照，提取血浆总 cfDNA、外泌体 cfDNA 和免疫复合物 cfDNA，检测 cfDNA 含量，cfDNA 总甲基化水平。体外诱导巨噬细胞和树突状细胞，分别与外泌体或免疫复合物共培养，检测巨噬细胞炎性蛋白 1a（MIP1a）、MIP-1b、白细胞介素 4（IL-4）、IL-1β、IL-2、白细胞介素 1 受体拮抗剂（IL-1ra）、单核细胞趋化蛋白 1(MCP-1)、IL-6、IL-9、IL-10、IL-12、IL-8、肿瘤坏死因子 α(TNF-α）、α 干扰素（IFN-α）和 IFN-γ 分泌以及细胞表面 CD40、CD80 和 CD86。
结果 SLE 组、non-SLE 组外泌体 cfDNA 和免疫复合物 cfDNA 水平显著增加，SLE 患者组也显著高于 non-SLE 组，单纯 cfDNA 在三组间无明显变化。SLE 患者 cfDNA 甲基化水平均显著低于 non-SLE 组和健康组。处理后的外泌体和免疫复合物刺激分泌的 MIP1a、MIP-1b、IL-4、IL-1β、IL-2、IL-1ra、MCP-1、IL-6、IL-9、IL-8、TNF-α 和 IFN-α 水平显著低于未经处理的刺激物，DNASE1L3 酶处理后的外泌体和免疫复合物刺激后分泌的细胞因子量也显著低于 IgG 酶消理后刺激物。与处理前相比经 DNASE1L3 酶处理后，对 CD80、CD86 和 CD40 在巨噬细胞和树突状细胞刺激反应性均降低（CD86 在巨噬细胞上的反应性无明显改变）；IgG 特异性降解酶降解处理前后的刺激对 CD80、CD86 和 CD40 在两种细胞的反应性表现不一，总体呈下降趋势。

结论 SLE 患者血浆外泌体和免疫复合物 cfDNA 水平显著升高，可刺激巨噬细胞和树突状细胞产生较强应答。

PO-0246

T3/rT3 对妊娠高血压类疾病的早期诊断价值研究

高谦、聂志文、段玉萍、洪茂、厉倩
上海市宝山区吴淞中心医院

目的 甲状腺功能障碍在生殖年龄相对常见，并与母亲和儿童的不良健康结果有关。探讨甲状腺功能相关指标与妊娠高血压类疾病诊断及严重程度的关系，为此类疾病早期诊断及预防提供参考。
方法 选取 2017 年 2 月至 2019 年 9 月来本院就诊的正常妊娠 85 例，妊娠高血压 87 例，轻度子痫 33 例，重度子痫 36 例，采用化学发光法检测四组在妊娠 12-16 周血清中的游离甲状腺素(FT4)、促甲状腺激素(TSH)、游离三碘甲腺原氨酸（FT3）、总三碘甲状腺原氨酸（TT3）、总甲状腺素（TT4）、抗甲状腺球蛋白抗体（TGAB）、抗甲状腺过氧化物酶抗体（TPOAB）、促甲状腺激素受体抗体（TRAb）和血清反三碘甲状腺原氨酸（rT3）水平；采用 ROC 曲线分析有差异指标对妊娠高血压类疾病的诊断价值，并与 24 小时蛋白尿，收缩压，舒张压进行相关性分析，logstic 二元回归分析妊娠高血压疾病发病的影响因素。
结果 正常妊娠组 rT3 水平显著低于其他三组（P＜0.01），T3/rT3 显著高于其他三组（P＜0.01）。 Pearson 相关分析结果显示，T3/rT3 与收缩压负相关（r＝0.278，P＜0.01），与舒张压负相关（r＝0.325，P＜0.01），与 24 蛋白尿无显著相关性。
ROC 曲线的评估结果显示，预测子痫前期 T3/rT3 的临界值为 2.416，曲线下面积 0.7200,敏感性 0.5652，特异性 0.8235；妊娠高血压预测 T3/rT3 的临界值为 2.625，曲线下面积：0.7393，敏感性 0.8721，特异性 0.5059。多因素 logistic 回归模型分析显示 T3/rT3 是妊娠高血压早期诊断的独立预测因子（Adjusted OR=0.077(0.007-0.89),P=0.04）。
结论 妊娠期妇女甲状腺功能指标 T3/rT3 可能是在妊娠高血压疾病早期诊断有价值的生物标志物。

PO-0247

青蒿琥酯对肺癌患者 CD8+T 细胞亚群免疫功能的影响

邢应如、胡东
安徽理工大学医学院

目的 研究青蒿琥酯对肺癌患者 T 淋巴细胞免疫功能的影响，探讨 ART 体内抗肿瘤的作用机制。
方法 采集肺癌患者和健康体检者外周血，分离 PBMC。确定 ART 的 IC50，检测 ART 刺激培养前后 CD8+ T 细胞的免疫治疗相关分子 CD39、CD279，活化相关分子 CD38，共刺激分子 CD28，细胞杀伤功能相关因子 GrzB 和 PerF，功能相关细胞因子 IFN-g 和 IL-2，以评价 T 细胞免疫功能变化情况。
结果 ART 的 IC50 浓度为 522μM；肺癌组 CD8+ T 细胞的 CD279 基线表达显著高于健康对照组；促进 ART 诱导 CD8+T 细胞 CD39 表达的临床因素有：未放疗；促进 ART 诱导 CD8+T 细胞 CD279 表达的因素有：年龄>60 岁、淋巴细胞数>1.26×109/L、NLR<5、放疗、0.29×109/L≤单核细胞数≤0.95×109/L，NLR 与淋巴细胞绝对值呈显著负相关。经 ART 刺激培养后，CD8+T 细胞的 CD38、CD28、IFN-g 和 PerF 等表达未见显著变化，IL-2 表达显著降低(P<0.05)，GrzB 表达显著增强(P<0.01)。
结论 肺癌患者 T 淋巴细胞 CD279 高表达可能与肿瘤免疫抑制相关，高剂量的 ART 诱导颗粒酶 B 表达上调，且不影响肺癌患者 CD8+T 细胞亚群的免疫活性， ART 可能增强肺癌患者 CD8+T 细胞亚群抗肿瘤的免疫功能。

PO-0248

miR-455 Inhibits the Viability and Invasion by Targeting RAB18 in Hepatocellular Carcinoma

Chenghong Wang
Department of Laboratory Medicine, Yantaishan Hospital, Yantai, Shandong

Aim Hepatocellular carcinoma (HCC) has been regarded as the fifth most common cancer worldwide with a low prognosis. miR-455 usually played the role of a tumor suppressor in multiple cancers. The aim of this study was to investigate the roles of miR-455 in HCC.
Materials and Methods Cell viability and invasion were measured by CCK8 and Transwell assays. Luciferase reporter assay was performed to verify that miR-455 directly binds to the 3′-noncoding region (UTR) of RAB18 mRNA in Huh7 cells.
Results The expression of miR-455 was lower in HCC tissues and cell lines than in nontumor tissues and normal cell line, and downregulation of miR-455 was connected with worse outcome of HCC patients. miR-455 suppressed cell proliferation in vitro and in vivo, and it inhibited the abilities of cell invasion and EMT in HCC. RAB18 was upregulated in HCC tissues and cell lines, and the expression of RAB18 was regulated by miR-455. RAB18 reversed partial roles of miR-455 on cell viability and invasion in HCC.
Conclusion miR-455 inhibited cell viability and invasion by directly targeting the 3′-UTR of RAB18 mRNA of hepatocellular carcinoma.

PO-0249

化学发光法检测 SARS-CoV-2 特异性 IgM、IgG 抗体的假阳性结果的分布特征分析

卢小岚、王强
川北医学院附属医院

目的 分析化学发光法检测 SARS-CoV-2 特异性 IgM、IgG 抗体假阳性结果的分布特征。
方法 应用 LIS 系统，计算机检索 2020 年 3 月至 2021 年 1 月川北医学院附属医院和南充市中心医院门诊及住院部进行 SARS-CoV-2 IgM、IgG 检测的病例，收集检测结果≥1.0 的病例，对 SARS-CoV-2 核酸检测结果及病人信息及进行回顾性分析。
结果 回顾性分析发现，单 SARS-CoV-2 IgM(+)的假阳性率最高，为 95.88%，明显高于单 SARS-CoV-2 IgG(+)的 67.50% ($\chi2$ =20.981, P<0.0001)、SARS-CoV-2 IgM & IgG(+)的 29.55% ($\chi2$ =71.368, P<0.0001)。单 SARS-CoV-2 IgM(+)、单 SARS-CoV-2 IgG(+)及 SARS-CoV-2 IgM & IgG(+)的假阳性结果在不同性别间比较差异无统计学意义(P>0.05)；在不同年龄段人群间比较无统计学差异(P>0.05)。单 SARS-CoV-2 IgM(+)的假阳性结果分布在 1.0~32.0 之间，多数结果集中在 1.0~3.0 之间；单 SARS-CoV-2 IgG(+)的假阳性结果分布在 1.0~40.0 之间，多数结果集中在 1.0~2.0 之间。SARS-CoV-2 特异性抗体动态监测发现，假阳性病例血清 SARS-CoV-2 IgM 抗体水平呈降低趋势，或者保持不变；SARS-CoV-2 IgG 抗体水平呈降低趋势。
结论 SARS-CoV-2 特异性抗体存在较高的假阳性，SARS-CoV-2 特异性 IgM、IgG 抗体假阳性结果的分布特征为临床医生鉴别真假性提供参考依据。

PO-0250

PDCD5 对子宫内膜癌的作用及其作用机制

高梦
山东大学第二医院

目的 子宫内膜癌是女性生殖系统最常见的恶性肿瘤之一。程序性细胞死亡 5 (PDCD5)是新近发现的与细胞凋亡相关的基因，在一些人类肿瘤的发生发展中发挥着重要作用。然而，PDCD5 对子宫内膜癌的作用及其机制尚未被研究。
方法 在本研究中，我们在体外分别过表达和干扰子宫内膜癌细胞中 PDCD5 的表达，检测子宫内膜癌细胞增殖、迁移、侵袭的变化。同时探究可能影响细胞增殖、迁移、侵袭的通路分子。同时通过体内动物实验验证体外的结果。
结果 PDCD5 过表达抑制子宫内膜癌细胞的增殖、迁移和侵袭，而其下调促进子宫内膜癌细胞的增殖、迁移和侵袭。同时，动物实验验证了我们的结果。
结论 我们的实验数据为 PDCD5 调控子宫内膜癌细胞生长提供了新的见解，并提示 PDCD5 可能是子宫内膜癌治疗中一个有吸引力的治疗靶点。

PO-0251

The role of procalcitonin dynamic monitoring in the early diagnosis of infection and prognostic evaluation after cardiac surgery

Qiang Miao[1]、Shengnan Chen[2]、Haojing Zhang[2]、Shan Huang[2]、Bei Cai[1]、Junlong Zhang[1]、Qian Niu[1]
1. West China Hospital, Sichuan University
2. 四川大学华西临床医学院

Objective To evaluate the usefulness of procalcitonin (PCT) levels and PCT clearance at different time points as biomarkers for the early diagnosis of postoperative infections and the short-term prognosis of patients through the dynamic monitoring of PCT levels after cardiac surgery.
Methods Include 210 adults and 42 children after cardiac surgery in West China Hospital of Sichuan University. They were divided into infection and non-infection groups, poor and good prognosis groups according to whether infection occurred after the operation and whether the hospital stay exceeded 28 days. The patient's serum PCT level was dynamically monitored on the first 1, 3, and 5 days after the operation, and the change value (△PCT) and clearance rate (△PCTc) of the patient's postoperative PCT were recorded. Compare the differences of PCT, △PCT, and △PCTc between the different groups of adult and pediatric patients on the first 1, 3, and 5 days after the operation, and use the ROC curve to analyze the PCT, △PCT, and △PCTC at different time points for the early diagnosis and short-term evaluation of postoperative infection Prognostic value.
Results The levels of PCT, △PCT, and △PCTc in the infected group of adult patients were significantly different from those in the non-infected group at 1, 3, and 5 days after surgery (P<0.05). The PCT level of children in the infected group was significantly higher than in the non-infected group only on the 3rd and fifth days after the operation (P<0.05). There was no significant difference between △PCT and △PCTC between the two groups (P<0.05). The PCT levels of the adult patients with poor prognosis were 7.31 (3.07, 23.14) ng/ml and 2.44 (0.82, 9.64) ng/ml on the 3rd and fifth day after the operation, and the levels of children were 47.98 (3.5, 79.02) ng/ml, 13.34 (1.41, 19.97) ng/ml was significantly higher than the good prognosis group (P<0.05). ROC curve analysis showed that the PCT level on the third day after surgery has the highest AUC of 0.806 and 0.804 for the diagnosis of early infection and poor prognosis in adults,

the threshold was 3.63 ng/ml and 2.28 ng/ml, the sensitivity was 73.17% and 93.33%, and the specificity was 81.66% and 58.97%. The highest diagnostic value for early infection and poor prognosis in children is the PCT level on the 5th day after surgery, and the threshold for both was 10.2 ng/ml. The AUC, sensitivity and specificity were 0.756, 61.11%, 91.67% and 0.721, 66.67%, 88.89%, respectively.
Conclusion This study shows that dynamic monitoring of PCT levels after cardiac surgery can be an effective clinical means for early diagnosis of postoperative infection and short-term prognosis evaluation. The PCT level on POD 3 in adult patients has the highest clinical value for postoperative infection and short-term prognosis evaluation. In contrast, the PCT level on POD 5 has the highest clinical value in minor patients.

PO-0252

Epac1 下调在体内和体外通过抑制 AKT/CyclinD1/CDK4 信号通路抑制卵巢癌细胞增殖

高梦
山东大学第二医院

目的 卵巢癌是妇科恶性肿瘤中最主要的死亡原因，高级别浆液性卵巢癌是最常见和最具侵袭性的亚型。最近的研究表明，cAMP 通过 Epac (cAMP 直接活化的交换蛋白)蛋白介导蛋白激酶 A 非依赖性途径。Epac 蛋白，包括 Epac1 和 Epac2，涉及多种不同的细胞作用，如胰岛素分泌、胞吐、细胞钙处理和细胞间连接的形成。有多篇报道表明，Epac1 在促进某些癌细胞的增殖、侵袭和迁移方面具有重要作用。然而，Epac1 在卵巢癌中的表达水平和作用尚未被研究。
方法 在本研究中，我们检测了 Epac1 mRNA 和蛋白在 SKOV3、OVCAR3 和 CAOV3 3 种卵巢癌细胞中的表达水平。此外，我们还在体内外研究了下调 Epac1 对 SKOV3 和 OVCAR3 细胞增殖和凋亡的影响。
结果 Epac1 mRNA 和蛋白在 SKOV3 和 OVCAR3 细胞中表达较高。在体外和体内，Epac1 表达下调抑制 SKOV3 和 OVCAR3 细胞的增殖。细胞增殖抑制可能是由于 AKT/CyclinD1/CDK4 信号通路失活导致 Epac1 下调诱导的 G1 期阻滞，而不是由于 MAPK 通路或细胞凋亡的改变。
结论 我们的实验数据为 Epac1 调控卵巢癌细胞生长提供了新的见解，并提示 Epac1 可能是卵巢癌治疗中一个有吸引力的治疗靶点。

PO-0253

NT-proBNP、sST2 在心力衰竭诊断中的价值研究

彭亮、黄路遥、王京京、侯彦强
上海市松江区中心医院

目的 探讨血清 NT-proBNP、sST2 水平在心力衰竭诊断中价值，为提高临床诊疗水平提供参考依据。
方法 选取 2020 年 1 月至 2020 年 12 月年在上海市松江区中心医院住院治疗心衰患者 111 例作为观察组，另随机选取 20 例同一时期收住心内科无心衰患者作为对照组。检测血清 NT-proBNP、sST2 和常规生化指标，比较两组血清 NT-proBNP、sST2、临床资料及常规生化指标的差异，绘制 ROC 曲线分析血清 NT-proBNP、sST2 水平对心衰的诊断价值，比较心衰患者不同 NYHA 心功能分级 NT-proBNP、sST2 水平。
结果 观察组 NT-proBNP、sST2、BUN、Cr 水平高于对照组（$p<0.05$）；血清 NT-proBNP、sST2 水平诊断心衰 ROC 曲线分析显示曲线下面积(AUC)分别是 0.973、0.744($P<0.05$)；心衰组患者 NT-proBNP、sST2 水平在不同 NYHA 心功能级别中比较差异有统计学意义（$p<0.05$）。

结论 血清 NT-proBNP、sST2 水平对诊断心衰有一定价值，两者浓度均随着心功能分级的升高而升高，能够反应患者病情的严重程度。在心衰诊断方面 sST2 的应用价值虽然不如 NT-proBNP，但由于心衰患者易合并肾功能异常，而 sST2 具备不受肾功能的影响的特性，可以为临床提供更多有用的信息。

PO-0254

人补体因子 H 相关蛋白（BTA）在膀胱癌的诊断、病理分级及临床分期中的应用价值

刘杨、张志平、彭道荣、邢瑞青、李静、赵媛、刘家云
空军军医大学西京医院

目的 探讨尿液中人补体因子 H 相关蛋白（BTA）在膀胱癌的诊断、病理分级和临床分期中的应用价值。
方法 回顾性分析 2020 年 4 至 12 月我院收治的 69 例膀胱癌患者、30 例泌尿系良性病变患者及 30 例体检健康者，采用微孔板化学发光法检测各组尿液 BTA 水平。分析其与膀胱癌各临床病理参数的关系，ROC 曲线分析其诊断膀胱癌的临床价值。
结果 膀胱癌组、良性疾病组及健康人对照组尿液 BTA 中位浓度及阳性率逐渐下降，差异有统计学意义（H=73.17，P<0.001；c2=60.14.0，P<0.001）。BTA 水平及阳性率随着膀胱癌患者的 WHO 病理组织学分级，TNM 分期及肿瘤大小的升高而升高（P<0.01）。尿液 BTA 诊断膀胱癌的 ROC 曲线下面积（AUCROC）为 0.922，cut-off 值为 89.03 U/mL，敏感性为 76.80%，特异性为 95.00%。
结论 尿液 BTA 可用于膀胱癌的早期筛查，其水平与疾病的严重程度密切相关，具有较高的临床诊断价值。

PO-0255

多巴胺通过 DRD5 受体抑制金黄色葡萄球菌感染引起的巨噬细胞炎症反应作用研究

吴昱青[1]、胡颖超[1]、王冰微[2]、李晟[1]、马春梅[1]、刘雪[1]、Paul N. Moynagh[3]、周嘉伟[4]、杨硕[1]
1. 南京医科大学
2. 南京中医药大学
3. 爱尔兰梅尔努斯大学
4. 中国科学院脑科学与智能技术卓越创新中心

目的 DA（Dopamine，多巴胺）是一种重要的儿茶酚胺类神经递质，其缺失与帕金森氏病发生密切相关，此外，在调节机体免疫功能中 DA 也发挥着重要的作用。然而，目前 DA 在调控免疫炎症反应中的具体作用机制尚不明确。本研究旨在探索 DA 在控制金黄色葡萄球菌感染引起的炎症反应中的作用及分子机制，为临床脓毒症、脑膜炎等感染性炎症疾病防治提供新的线索。
方法 1）用模拟金黄色葡萄球菌病原分子的 TLR2（Toll-like receptor 2，Toll 样受体 2）受体配体 Pam3（Pam3CSK4，三酰脂肽）和金黄色葡萄球菌刺激小鼠 BMDMs（Bone marrow derived-macrophages，骨髓来源的巨噬细胞）细胞，检测 DA 处理后炎症因子的表达情况。2）用 RNA 测序分析 Pam3 和 DA 刺激后 BMDMs 细胞内与炎症相关通路的变化，并通过 Western blot 验证相关通路变化。3）通过体内脓毒症和脑膜炎小鼠模型检测相关多巴胺信号通路分子在感染性炎症反应中的作用。
结果 1）DA 处理后 Pam3 和金黄色葡萄球菌感染激活的炎症因子表达降低。2）RNA 测序结果提示主要通过抑制 NFkB（Nuclear transcription factor-kB，核转录因子 kB）信号通路来抑制炎症反

应。3）DRD5（Dopamine receptor 5，多巴胺受体 5）敲除后，DA 抑制炎症作用消失，表明 DA 通过其受体 DRD5 发挥抑制炎症作用。
结论 DA 激活 DRD5 后，通过 DRD5 受体 EFD 和 IYX(X)I/L 结构基序将负调节蛋白 ARRB2/ PP2A 招募入 TLR2 信号中的 TRAF6-IKK 复合物中，进而控制 NFkB 炎症信号，抑制金黄色葡萄球菌引起的脓毒症和脑膜炎。因此，本研究结果提示 DA-DRD5 信号轴可作为今后相关炎症疾病的潜在干预靶标。

PO-0256

炎症性肠病中 EB 病毒感染的价值分析

陈健康
空军军医大学西京医院

目的 探讨 EB 病毒感染在炎症性肠病的表达分析。
方法 回顾性分析我院收治的 628 例炎症性肠病患者临床资料，利用酶联免疫试剂盒检测分析患者的 EB 病毒抗体谱指标（抗 EBV 衣壳抗体 IgM、抗 EBV 早期抗体 IgG、抗 EBV 衣壳抗体 IgG、抗 EBV 核抗体 IgG）的表达水平。
结果 共收集的 628 例炎症性肠病患者中，EBV-CAIgM 的阳性率为 16.7%（105/628）；在 CD 组中 EBV-CAIgM 的阳性率为 22.2% (55/247)；在 UC 组中 EBV-CAIgM 的阳性率为 13.1% (50/381)，两者差异具有统计学意义（c2= 8.99，P =0.003）。在不同性别间比较中， UC 组男性 EBV-CAIgM 阳性率为 9.9%（23/232），女性 EBV-CAIgM 阳性率为 18.1%（27/149）。男女性别间 EBV-CAIgM 阳性率有统计学差异（c2= 5.36，P =0.021）。在本研究中，患者中既往感染占比最大，抗体表达谱（EBV-CAIgG、EBNA-IgG 均阳性）占比为 71.9%（452/628）；现症感染中抗体谱 EBV-CAIgM、EBV-CAIgG、EBNA-IgG 均阳性占比次之（22.2%）。
结论 炎症性肠病患者中 EB 病毒感染率明显高于正常人群，具有高的既往感染率以及现症感染率，临床应加强对炎症性肠病患者中 EB 病毒感染的筛查和监测，为炎症性肠病的诊疗提供有价值的思路。

PO-0257

Serum Macrophage Inhibitory Cytokine-1 Serves as a Novel Diagnostic Biomarker of Early-Stage Colorectal Cancer

戴春阳、李明、马艳玲、陈兆武、陈少华、张扬
中国科学技术大学附属第一医院（安徽省立医院）西区

Patients with colorectal cancer usually have a poor prognosis because of the absence of suitable biomarkers for asymptomatic patients. We screened 2759 subjects with risk factors. Endoscopic and histopathological analyses revealed that 19 and 47 subjects had CRC or precancerous lesions. We randomly selected 24 subjects with normal colonoscopies as healthy controls. The optimal thresholds of MIC-1 levels with precancerous lesions or CRC were 314.12 pg/mL and 357.64 pg/mL. Moreover, MIC-1 levels distinguished precancerous lesions better than CEA, CA19-9, or CA24-2 (AUC: 0.760 vs 0.529, 0.624, and 0.585) or CRC (AUCs: 0.821 vs 0.743, 0.657, and 0.688) from the healthy controls. Serum MIC-1 levels increased the sensitivity of detection CRC and can be used to improve screening.

PO-0258

Tripartite Motif-Containing 22 Genotype is Correlated with the IFN-α Therapy Response in Hepatitis B e Antigen-Positive Chronic Hepatitis B

long wang、Qishui Ou
The First Affiliated Hospital of Fujian Medical University, Fuzhou, China

Background Interferon-α (IFN-α) plays an important role in the treatment of chronic hepatitis B (CHB), but its limited response rate and side effects limit its clinical application. We intend to explain the factors affecting the efficacy of IFN-α from the perspective of host SNPs and clarify the relevant mechanism.
Methods One hundred and twenty-four patients diagnosed CHB was enrolled in this study. Patients received IFN-α for 48 weeks. Response was defined as an HBV DNA <500 IU/mL at 12 months post-treatment. DNA samples are genotyped by Asian Screening Array (ASA) chip.
Results CHB patients were genotype into 483500 loci with ASA chip, of which we focused on TRIM family including TRIM15, TRIM22, TRIM26, TRIM31, TRIM38, TRIM39. Among them, we found that the expression of TRIM22 mRNA in patients with rs10838543 CT and CC genotypes was significantly higher than that in patients with TRIM22 rs10838543 TT genotypes, while other TRIM SNPs did not show significant statistical difference. During the 48-week follow-up, there was no significant difference in the distribution of different TRIM22 rs10838543 genotypes in the decrease of HBV DNA and HBsAg. However, the genotype of TRIM22 rs10838543 TT was positively correlated with the negative conversion of HBeAg. In vitro experiments showed that TRIM22 was one of the significantly upregulated TRIM members and HBV inhibits the expression of TRIM22 after IFN-α treatment. The level of HBV-related serological markers in the supernatant of HepAD38 cell lines overexpressing TRIM22 was consistent with that of microarray and in vitro experiments.
Conclusion TRIM22 involves in the anti-HBV of IFN-α and its polymorphism rs10838543 may affect the therapeutic responses to chronic HBV infection. These findings may provide new insight into choosing the optimal candidates and improving the therapeutic effect for anti-HBV treatment with IFN-α.

PO-0259

慢性乙型肝炎患者外周血 T 淋巴细胞 HLA-DQ 表达变化及其临床意义

曾星月[1]、阿衣包它[1]、布丽地尔新[1]、刘天赐[1]、郑墨涵[2]、陆松松[1]、宋英[1]、刘忱[1]
1. 北京大学人民医院
2. 北京大学医学部基础医学院

背景 人类白细胞抗原-DQ（HLA-DQ）和颗粒溶素（Granulysin，GNLY）的单核苷酸多态性被报道会影响 CHB 的发生和 HBV 的清除，然而它们在 CHB 患者外周血 T 细胞的表达和意义尚不明确。本研究旨在研究 T 细胞 HLA-DQ 和颗粒溶素表达和功能，分析他它们在 HBV 感染中的临床意义。
方法 收取 25 例 CHB 患者，21 例 HBV 非活动性携带者和 25 例健康对照者外周血，分析 Treg, Tfh, Tfr, Tfc 等 T 细胞亚群中 HLA-DQ 和颗粒溶素的表达。功能方面，通过体外培养检测 HLA-DQ+和 HLA-DQ-的 T 细胞分泌 IFN-γ 以及 Treg 细胞分泌 IL-10 的能力，通过 CD45RA 和 CCR7 的表达，将 T 细胞分为 Tnaive，Teff，Tcm 和 Tem，将 Treg 细胞分为 CD45RA-FoxP3hi 活化型 Treg，CD45RA+FoxP3lo 静息型 Treg 等亚群，再分别检测 HLA-DQ+和 HLA-DQ-细胞中上述各个亚群的比例差异。在此基础上分析各细胞亚群和 HBV 感染指标的相关性。

结果 CHB 患者 T 细胞 HLA-DQ 表达上调，而颗粒溶素则表达下降。CHB 患者 Tfh、Tfr 和 Tfc 中 HLA-DQ+的比例上调，但 Treg 中 HLA-DQ+ 比例下调。HLA-DQ+的 CD4+T 细胞分泌 IFN-γ 增加，HLA-DQ+ Treg 细胞分泌 IL-10 增加。HLA-DQ+T 细胞中 CD4+Teff, CD4+Tnaive, CD4+Tem, CD8+Tem 和 CD8+Tcm 显著升高，HLA-DQ+Treg 中 CD45RA-FoxP3hi 活化型 Treg 比例显著升高。HLA-DQ+的 CD4+T 细胞与感染指标正相关，而 HLA-DQ+ Treg 细胞与感染指标负相关。
结论 HLA-DQ 表征抑制能力，而颗粒溶素则表征较强的抗病毒免疫能力。HLA-DQ 和颗粒溶素对 CHB 患者的免疫状态评估具有潜在应用价值。

PO-0260

TCF1 通过对线粒体的适应性的调节影响 HIV 感染者的 T 细胞的功能

蔡红娇[1]、石珏[1]、殷林波[2]、郑杰夫[1]、张子宁[1]
1. 中国医科大学附属第一医院
2. 辽宁省人民医院

目的 分析 TCF1 在健康人群及 HIV 感染者中的表达情况， 及其与疾病进展的关系，并探讨其影响疾病的进展的可能机制。
方法 选取 HIV 感染未治疗者（包括快速进展者，长期不进展者），抗逆转录治疗者（ART）及 HIV 阴性对照者分离 PBMC，CD4+T 细胞，CD8+T 细胞进行 TCF1 mRNA 的检测，并分析其与疾病进展的关系。同时应用流式细胞仪对三组人群细胞中的 TCF1 表达情况进行分析，明确 TCF1 表达的特点。最后，应用 si-RNA 技术，下调细胞中 TCF1 的表达情况，并分析其对细胞功能的影响极其可能原因。
结果 与 HIV 阴性对照组相比，TCF1 在 HIV 感染者中的表达明显降低，且与 CD4 计数成正相关(r2=0.381，P=0.043)，与病毒载量呈负相关(r2=0.541，P=0.010)。流式结果显示，TCF1 在 NAIVE 及 TCM 细胞中的表达高于 TEM 及 TEMRA,此表达特点无人群特异性，但与 HIV 阴性人群相比，TCF1 在 HIV 感染者中的表达下调，且该下调在 CD4+T 细胞中主要集中在 TCM,TEM 及 TEMRA 中，而在 CD8+T 细胞中，该下调主要发生于 NAÏVE,TCM 和 TEM 细胞亚群中 。通过 si-RNA 技术下调 TCF1 后，可看到细胞分泌的效应因子 IL2 的水平明显下降，增殖能力明显降低。同时线粒体染色的结果表明，下调 TCF1 后，线粒体膜电位下降，去极化线粒体水平明显升高，线粒体功能受损。
结论 TCF1 在 HIV 感染者中表达下调，影响线粒体的适应性，进而影响了 HIV 感染者中 T 细胞的功能。

PO-0261

Toll-like receptors, long non-coding RNA NEAT1, and RIG-I expression are associated with HBeAg-positive chronic hepatitis B patients in the active phase.

Yongbin Zeng 、Qishui Ou
The First Affiliated Hospital of Fujian Medical University

Background Innate immunity plays a crucial role in host-virus interactions and greatly influences viral replication including HBV infection. However, few studies have investigated the possible antiviral immune roles played by TLRs, RIG-I, and long no-coding RNA NEAT1 in chronic HBV infection (CHB) patients in clinical samples and their relationships among immune responses. In

this study, we sought to investigate the mRNA expression levels of TLR1-10, RIG-I, and NEAT1 expression in HBeAg-positive CHB treatment-naïve patients with the active phase.
Methods The expression levels of TLR1-10, RIG-I, and NEAT1 of CHB patients with the active phase and healthy controls were measured by qPCR. Serum HBV DNA and routine liver biochemistry including ALT, etc were also measured to evaluate the impaired physiological function of the liver affected by CHB.
Results The expression levels of TLR1 and TLR6 in CHB with active phase were remarkably lower than that in healthy controls. The levels of TLR3 in CHB patients with active phase were remarkably higher than that in healthy controls. The total NEAT1 expression was abnormally decreased in CHB patients as compared with healthy controls. The levels of RIG-I were significantly decreased in CHB patients in the active phase when compared to healthy controls. The expression of TLR6 and RIG-I was closely correlated with NEAT1 expression. TLR6 level was positively correlated with RIG-I level.
Conclusion Chronic HBV infection can alter the innate immune response by downregulating functional expression of TLR1, TLR6, NEAT1.

PO-0262

Serum Cyr61 is Associated With Clinical Disease Activity and Inflammation in Patients With Systemic Lupus Erythematosus

Jinpiao Lin、Qishui Ou
the First Affiliated Hospital of Fujian Medical University

Our previous studies have shown that secreted extracellular matrix-associated protein Cysteine rich angiogenic inducer 61 (Cyr61), a novel proinflammatory factor, is involved in the pathogenesis of rheumatoid arthritis (RA). However, whether Cyr61 has any effect in systemic lupus erythematosus (SLE) remains unknown. This study aims to assess the level of serum Cyr61 and to investigate the association of serum Cyr61 and clinical disease activity in SLE. We found the level of serum Cyr61 in patients with SLE was significantly higher than healthy controls ($P < 0.001$), and Cyr61 was high expressed in renal tubule of lupus nephritis compared to control. The sensitivity of Cyr61 in diagnosis of SLE was 47.3%. In receiver operating characteristic (ROC) curve analysis, the area under the curve (AUC) was 0.830, with a 95% confidence interval (CI) from 0.776 to 0.885. Cyr61 was present in 60.0%, 54.5%, and 41.5% of anti-double stranded DNA (dsDNA), anti-antinuclear antibodies (ANA), and anti-Sm negative SLE patients, respectively. Serum Cyr61 levels were significantly higher in high systemic lupus erythematosus disease activity index (SLEDAI) group than that in low SLEDAI group ($P = 0.003$). Correlation analyzes showed a significant negative correlation between serum Cyr61 and complements (C3) ($P = 0.015$), C4 ($P = 0.04$). Moreover, increased Cyr61 level in SLE was associated with serum level of TNF-α, interleukin 6 (IL-6), and IL-17. In conclusion, serum Cyr61 was increased in patients with SLE which was associated with clinical disease activity and inflammation in SLE, suggesting Cyr61 may be a novel potential auxiliary marker for the diagnosis of SLE.

PO-0263

T 细胞活化、分化、记忆及耗竭检测指标参考区间的建立及其临床意义

王悦、熊璇、唐甜、付帅、张子宁
中国医科大学附属第一医院

目的 建立辽宁地区健康成人外周血 T 淋巴细胞表面活化、分化记忆、耗竭相关分子的参考区间，分析两性别间是否有差异，相关指标随年龄变化趋势及两主流仪器平台结果是否有差异，判断是否需按性别、年龄、仪器单独建立参考区间。
方法 选择 70 例健康成人，用流式细胞仪检测 $CD4^+$、$CD8^+$T 细胞表面活化、分化记忆、耗竭相关分子表达水平；分析上述指标在不同年龄、性别及仪器平台间差异。
结果 1）研究对象分为三组。青年组（24～30 周岁）10 例，年龄 28±2 周岁，中年组（31～49 周岁）34 例，年龄 41±6 周岁，老年组（50～86 周岁）26 例，年龄 62±11 周岁；男女各 35 例，采用 robust method 建立上述 14 项指标的参考区间；
2）在 BD FACSCanto Ⅱ上测得 $CD4^+PD\text{-}1^+$、$CD8^+CD38^+$T 细胞百分比在性别间差异有统计学意义；在 Beckman Navios 上测得 $CD8^+CD28^-CD57^+$、$CD8^+CD38^+$T 细胞百分比在性别间差异有统计学意义；
3）在两平台分析中 $CD8^+CD38^+$T 细胞百分比均随年龄增长而降低；$CD4^+CD38^+$T 细胞百分比在老年组略低于中年组；$CD4^+HLA\text{-}DR^+$T 细胞百分比随年龄增长而增加；
4）$CD4^+PD\text{-}1^+$、$CD8^+PD\text{-}1^+$、$CD4^+CD45RA^-RO^+$、$CD4^+CD45RA^+RO^-$、$CD4^+CD38^+$T 细胞的百分比在两个平台间差异有统计学意义。
结论 1、本研究首次建立了 T 细胞表面耗竭相关分子 PD-1 的参考区间。2、首次建立适用于辽宁地区和其他具有相似人口统计学特征的健康成年人群的临床常用的外周血 T 淋巴细胞 $CD4^+$、$CD8^+$T 细胞表面活化分子 HLA-DR、CD38，分化及记忆相关分子 CD45RA、CD45RO、CD28、CD57 的参考区间。3、首次对 BD FACSCanto Ⅱ、Beckman Navios 两平台上测定的 T 细胞相关指标进行对比。

PO-0264

Correlation between albumin to fibrinogen ratio, C-reactive protein to albumin ratio and Th17 cells in patients with rheumatoid arthritis

Yujue He、Jinpiao Lin
the First Affiliated Hospital of Fujian Medical University

Background The albumin to fibrinogen ratio (AFR) and the C-reactive protein to albumin ratio (CAR) have been served as inflammatory markers. However, their roles in RA remain unclear. We investigated the association of AFR/CAR with the concentration of autoantibodies and Th17 cells in RA.
Methods A total of 196 RA patients, 200 patients with systemic lupus erythematosus (SLE), and 200 healthy donors (HD) who were admitted to the First Affiliated Hospital of Fujian Medical University were enrolled. The results of FIB, ALB, CRP, anti-cyclic citrullinated peptide antibodies (anti-CCP), rheumatoid factor (RF) and erythrocyte sedimentation rate (ESR) from RA patients and SLE patients were retrospectively analyzed. The percentage of Th17 cells in peripheral blood of RA patients was detected by flow cytometry, and the relative expression of TNF-α, IL-6 and IL-17A was detected by RT-qPCR. Correlation analysis of AFR/CAR and Th17 cells, CRP, ESR, TNF-α, IL-6 and IL-17A in RA was conducted.

Results Compared with SLE patients and healthy donors (HD), AFR concentration was significantly lower (P < 0.01) in RA patients, while CAR concentration was significantly increased (P < 0.01) in RA patients. AFR showed negative correlation with CRP (r = -0.7103), ESR (r = -0.6542), RF (-0.2219), Th17 cells (r = -0.5952) and IL-17A (r = -0.4681). CAR was positively correlated with CRP (r = 0.9899), ESR (r = 0.605), RF (0.1867), Th17 cells (r = 0.6818), TNF-α (r = 0.3388), and IL-17A (r = 0.2046).
Conclusions The concentration of AFR in RA patients was reduced, while CAR concentration was increased. AFR and CAR are associated with CRP, ESR, RF, and Th17 cell ratios in RA patients, which can be used as potential indicators for determining RA inflammation.

PO-0265

一种新型的超高灵敏度的免疫检测技术的分析探讨

代艳文、吴大富
三峡大学附属仁和医院

目的 通过阐述免疫检测技术的发生发展，比较分析各种检测的优缺点以及临床应用情况，以期为进一步开发超高灵敏度免疫诊断检测方法及其临床应用提供理论基础。
方法 回顾性分析免疫检测技术从放射免疫、酶联免疫、免疫胶体金到化学发光、流式荧光技术，再到单分子免疫检测技术等各种检测的优缺点以及临床应用情况，并着重比较分析目前市场主导技术化学发光技术和拥有超高免疫检测灵敏度的单分子免疫检测技术。
结果 化学发光具有自动化程度高、灵敏度高、准确率高、特异性好、精密度好，检测时间短等优势，因此在临床上迅速推广，市场占有率超过 70%。但在快速的发展过程中，其检测原理却始终利用的是抗原抗体结合后的发光反应，然后将待测样本的发光强度与标准曲线比较进而实现定量分析。在当今设备高度自动化前提下，其检测灵敏度已达到理论上的极限。而单分子免疫检测则是通过免疫标记的方法，利用抗体捕获和识别抗原，进行信号分子标记或是酶联标记的形式，通过单分子荧光信号检测或单分子酶促反应实现的单分子级别蛋白分子的检测，是一种新型的超高灵敏度的检测技术。经过十几年的发展，其可在极小体积内（10-21L）对待测分子信号进行检测，是传统免疫检测技术检测灵敏度的数万倍，从而能在更早期识别蛋白分子，满足大部分标志物检测的需求。
结论 虽然化学发光检测灵敏度理论上已达到极限，但是就现有的检测技术来讲，其临床诊断市场在很长时间内都无法被取代。单分子免疫检测技术作为一种新型的超高灵敏度的检测技术，但其检测操作流程繁琐复杂，耗时长，成本高，这些因素很大程度的限制了其临床推广和使用。因此研发成本低，操作简单，更加高效和成熟的单分子免疫检测平台，将有助于推动单分子免疫检测技术的临床应用，为临床疾病早诊断，早发现，早治疗提供新的手段。

PO-0266

A novel diagnostic model in early hepatitis B virus related hepatocellular carcinoma diagnosis

Qiang Wang
Affiliated Hospital of North Sichuan Medical college

Objectives We used protein induced by vitamin K absence or antagonist-II (PIVKA-II) and alpha-fetoprotein (AFP) combined with aspartate aminotransferase (AST), alanine aminotransferase (ALT), and total bilirubin (T-Bil) to establish a novel diagnostic model for early-stage hepatitis B virus (HBV)-related HCC.
Methods The serum levels of PIVKA-II, AFP, AST, ALT, and T-Bil were measured in 148 patients with early-stage HBV-related HCC and 940 patients with chronic hepatitis B. The receiver

operating characteristic (ROC) curves were used to verify the diagnostic efficacy of the novel diagnostic model in early-stage HBV-related HCC diagnosis.
Results The mathematical model of [1.5 × PIVKA-II / (AST × T-Bil) + AFP / (ALT × T-Bil)] was selected as the novel diagnostic model. The areas under ROC curves (AUROCs) of the novel diagnostic model in detection of early-stage HBV-related HCC were significantly higher than those of PIVKA-II, AFP, and PIVKA-II combined with AFP (HCC ≤ 5cm: 0.925 vs 0.826, 0.666, and 0.821; HCC < 3cm: 0.896 vs 0.741, 0.651, and 0.765, respectively) (all P < 0.001). The novel diagnostic model had the highest AUROC values of 0.960 (HCC ≤ 5cm, 89 cases) and 0.933 (HCC < 3cm, 40 cases) in diagnosis of early-stage HBV-related HCC with serum level of AFP > 20 ng / ml; the sensitivity were 83.15% and 77.50%, respectively, while the specificity were 95.34% and 90.69%.
Conclusion The novel diagnostic model is superior to PIVKA-II and AFP in the diagnosis of early-stage HBV-related HCC, especially for early-stage HBV-related HCC with abnormal serum result of AFP.

PO-0267

Longitudinal single-cell immune profiling reveals distinct immune response in asymptomatic COVID-19 patients

Erhei Dai
The Fifth Hospital of Shijiazhuang,

While some individuals infected by SARS-CoV-2 present mild to severe disease, many SARS-CoV-2-infected individuals are asymptomatic. We sought to identify the distinction of immune response between asymptomatic and moderate patients. We performed single-cell transcriptome and T-cell/B-cell receptor (TCR/BCR) sequencing in 38 longitudinal collected peripheral blood mononuclear cells from asymptomatic, moderate, and severe patients with healthy controls. Asymptomatic patients displayed increased CD56briCD16– natural killer (NK) cells and upregulation of IFNG in effector T cells and NK cells. They showed robust TCR clonal expansion but did not have strong BCR clonal expansion. Moderate patients display robust TCR clonal expansion and moderate BCR expansion and they declined with disease progression. Moderate patients also showed higher expression of the interferon-stimulated gene across multiple cell populations compared to asymptomatic patients but lower than in a severe patient. Our data suggest that early activation of NK cells and type I immunity may contribute to the asymptomatic infection.

PO-0268

Distribution of Serum Thrombospondin-2, a Novel Tumor Marker , in General Population and Cancer Patients in China

seyin zou[1]、jinhong xu[2]、donglin cao[1]
1. Guangdong Second Provincial General Hospital
2. 广东医科大学

Purpose Distribution of serum thrombospondin-2 in general population and cancer patients in China have not been reported. Methods. This study evaluated the expression level of serum thrombospondin-2 in general population and various cancer patients, the 95% confidence interval was used for the derivation of reference range.
The comparison of the expression levels in controls for age and gender was performed. The associations between candidate biomarkers (thrombospondin-2 [THBS2]) expression and tumor

metastasis status were also explored. Results.125 healthy controls and 193 various cancer patients were enrolled. The mean ± SD in serum THBS2 levels in general population was 42.37±12.24ng/ml, there was no significant sex and age difference, the reference range is 18.37-66.36ng/ml. Most cancer patients present a decreased serum THBS2 level except hepatoma and lymphoma which most patients showed a relatively high level of THBS2. There was no statistical difference of serum THBS2 level between metastasis and non-metastasis group in breast, lung, cervical, colorectal cancer, nasopharyngeal carcinoma and hepatoma (P >0.05) while a significant negative correlation was observed in ovarian cancer (P = 0.0209).
Conclusions The distribution of serum THBS2 displayed an obvious heterogeneity among various cancers comparing to health controls, ovarian cancer patients detected with low THBS2 expression may be more prone to develop metastasis in China.

PO-0269

Efficacy and safety of pregnant women with chronic hepatitis B receiving nucleos(t)ide analogs therapy: a network meta-analysis

Bo Zhu、Erhei Dai
The Fifth Hospital of shijiazhuang, Shijiazhuang, China

Objective Reducing mother-to-child transmission (MTCT) of hepatitis B virus(HBV) is one of the key ways to eliminate hepatitis B. Although many studies have proved that nucleos(t)ide analogs(NAs) were more effective and safer than no treatment, there is still a lack of comparison between drugs.The network meta-analysis aims to comprehensively compare and summarize the efficacy and safety of the three drugs (Lamivudine(LAM), Telbivudine(TBV) and Tenofovir(TDF)), providing a basis for drug selection.
Methods A comprehensive search of studies published by PubMed (Medline), Web of Science, Cochrane Library, EMBASE, CNKI and SinoMed as of December 2019 on oral NAs for pregnant women with high HBV DNA road to prevent HBV MTCT .We performed pair-wise meta-analysis and Bayesian network meta-analysis to compare the efficacy and safety of LAM , TDF and TBV.
Results A total of 35 studies with involving a total of 6,109 pregnant women who infencted HBV were selected. The results of traditional meta analysis show that , the HBsAg positive rate and HBV DNA positive rate of newborns and infants from 6 ~12 months in the LAM group, TBV group and TDF group were lower than those of the control group, and the differences were statistically significant（$p<0.05$）. The HBV DNA levels of the three groups of pregnant women at delivery were lower than those of the control group, the differences were statistically significant ($p<0.05$).The cesarean section rate, postpartum hemorrhage rate and CK increase rate of the three groups of pregnant women, as well as the infant's birth weight, birth length and Apar score were not statistically different from those of the control group ($p>0.05$).The results of the network meta-analysis show that the HBsAg positive rates of infants aged 6 ~12 months in the LAM, TBV and TDF groups were lower than that of the control group, and the differences were statistically significant. However, the pairwise comparison did not show statistical differences. The probability of the three drugs in reducing the positive rate was ranked from low to high as LAM<TBV<TDF, and the probability of being in this ranking is 72%、42% and 47%.
Conclusion Pregnant women who infected HBV with high viral load （HBV DNA≥2×105IU/mL） taking LAM, TBV and TDF during pregnancy can effectively prevent HBV MTCT and reduce the level of HBV DNA at delivery. Their safety is good. LAM may be the drug with the worst effect in reducing the positive rate of infants aged 6~12 months, and TDF may be the drug with the best effect.

PO-0270

探讨 CA125 在慢性心衰患者中危险评估的价值

胡广梅
中山大学孙逸仙纪念医院

目的 研究血清 CA125 水平对慢性心衰患者的危险评估价值。
方法 收集 2014.1~2018.7 医院收治的慢性心衰患者 284 例，记录各患者半年内再入院次数和原因、本次入院天数、血清 CA125、Nt-proBNP、肌酐和心动图参数。
结果 NYHA III/IV 级患者 CA125 浓度以及阳性率显著高于 NYHA I/II 级；CA125 异常升高组相较于 CA125、Nt-proBNP 正常组以及单独 Nt-proBNP 异常升高组，其住院天数、LA、RVDd 和 LVDd 明显增高，而 EF%明显降低，同时患者表现出更高的半年内再入院风险（因心脏疾病）。胸腹水或心包积液阳性的患者 CA125 浓度显著高于阴性者，P<0.05。
讨论与结论 慢性心衰患者中，CA-125 异常升高表明更严重的心肌重塑状态，更低 EF%，较差的心功能代偿，预示更长的住院天数以及高风险的半年内再入院概率（因心脏疾病），比单独 Nt-proBNP 更有利于临床对慢性心衰进行危险分级以及预后风险评估。

PO-0271

血清 ProGRP、HE4、NSE 在肺癌中诊断价值

徐少华
四川省三台县人民医院

目的 探究胃泌素释放肽前体（ProGRP）、人附睾蛋白 4（HE4）、神经元特异性烯醇化酶（NSE）在肺癌中的诊断价值。
方法 选择 39 例肺癌患者、7 例肺部良性肿瘤患者和 100 例健康体检者，分别作为肺癌组、肺部良性肿瘤组及健康对照组，检测各组研究对象的血清 ProGRP、HE4、NSE 水平；比较肺癌组中小细胞癌、腺癌、鳞状细胞癌等不同病理类型患者的 ProGRP、HE4、NSE 水平。绘制受试者工作特征（ROC）曲线，分析血清 ProGRP、HE4、NSE 单项检测和联合检测在肺癌中的诊断价值。
结果 肺癌组患者的血清 ProGRP、HE4、NSE 水平均高于肺部良性肿瘤组和健康对照组，差异均有统计学意义（P < 0.05）；肺部良性肿瘤组和健康对照组的血清 ProGRP、HE4、NSE 水平比较，差异均无统计学意义（P > 0.05）；小细胞癌患者的血清 ProGRP 水平高于腺癌和鳞状细胞癌患者（P < 0.05）。ROC 曲线分析结果显示，血清 ProGRP、HE4、NSE 单独检测诊断肺癌的曲线下面积（AUC）分别为 0.817、0.705 及 0.871，均低于三者联合诊断的 0.893。
结论 血清 ProGRP、HE4、NSE 联合检测利于肺癌的早期筛查及诊疗；高水平的 ProGRP 和 HE4 与肺癌的不良表型有关，可以作为肺癌的生物标志因子。

PO-0272

Caspase 依赖的氧化应激对脓毒症肾小管上皮细胞损伤的作用机制研究

孙林春
南京市儿童医院（南京医科大学附属儿童医院）

目的 氧化应激是脓毒症肾损伤的重要机制，而 ROS 爆发可能涉及线粒体 Caspase 途径的细胞凋亡，但氧化应激和 Caspase 途径细胞凋亡与脓毒症肾细胞损伤的研究较少。本研究利用免疫印记技术、流式细胞术、MTT 法酶联免疫检测等免疫检验技术，观察 Caspase 依赖的氧化应激对肾小

管上皮细胞损伤的调节作用，研究氧化应激通过线粒体 Caspase 途径参与脓毒症肾小管上皮损伤的机制。

方法 LPS 处理 HK-2 细胞建立脓毒症细胞模型，用 H_2O_2 和 Caspase 3 抑制剂单独或联合干预细胞，随机分为 H_2O_2 组、Caspase 抑制剂组、Caspase 抑制剂+H_2O_2 组、阴性对照组和空白对照组。免疫印记技术检测 Cleaved-Caspase 3 和 Cleaved-PARP 蛋白表达，MTT 法检测细胞增殖，流式细胞术检测细胞 ROS 水平、细胞凋亡和细胞周期。

结果 H_2O_2 组 Cleaved-Caspase 3 和 Cleaved-PARP 蛋白较阴性对照组和空白对照组升高（$p<0.05$）。和空白对照组相比，脓毒症组细胞 ROS 升高，增殖率降低，凋亡率升高，G1 期细胞所占比例升高（p 均<0.05）。和阴性对照组相比，H_2O_2 组 ROS 升高，增殖率降低，凋亡率升高，处于 G1 周期的细胞比例升高（p 均<0.05）。Caspase 抑制剂+ H_2O_2 组 ROS 较 H_2O_2 组降低（$p<0.05$），但仍高于阴性对照组（$p<0.05$）。Caspase 抑制剂+H_2O_2 组增殖率较 H_2O_2 组升高（$p<0.05$），凋亡率降低（$p<0.05$），处于 G1 周期细胞比例减少（$p<0.05$）。

结论 脓毒症肾小管上皮细胞存在异常升高的氧化应激反应，氧化应激产生的大量 ROS 通过线粒体-Caspase 凋亡途径，抑制细胞增殖、促进细胞凋亡和引起细胞 G1 期阻滞。抑制 Caspase 对 ROS 引起的脓毒症肾小管上皮细胞损伤有保护作用。

PO-0273

Antiphospholipid Antibodies in Critically Ill Patients With COVID-19

Meng Xiao、Yan Zhang、Shulan Zhang、Xuzhen Qin、Yongzhe Li、Shuyang Zhang
Peking Union Medical College Hospital

Objective Coagulopathy is one of the characteristics observed in critically ill patients with coronavirus disease 2019 (COVID-19). Antiphospholipid antibodies (aPLs) contribute to coagulopathy, though their role in COVID-19 remains unclear. This study was undertaken to determine the prevalence and characteristics of aPLs in patients with COVID-19.

Methods Sera collected from 66 COVID-19 patients who were critically ill and 13 COVID-19 patients who were not critically ill were tested by chemiluminescence immunoassay for anticardiolipin antibodies (aCLs), anti–β2-glycoprotein I (anti-β2GPI) (IgG, IgM, and IgA), and IgG anti-β2GPI–domain 1 (anti-β2GPI–D1). IgM and IgG anti–phosphatidylserine/prothrombin (anti-PS/PT) antibodies were detected in the serum by enzyme-linked immunosorbent assay.

Results Of the 66 COVID-19 patients in critical condition, aPLs were detected in 31 (47%). Antiphospholipid antibodies were not present among COVID-19 patients who were not in critical condition. The IgA anti-β2GPI antibody was the most commonly observed aPL in patients with COVID-19 and was present in 28.8% (19 of 66) of the critically ill patients, followed by IgA aCLs (17 of 66, or 25.8%) and IgG anti-β2GPI (12 of 66, or 18.2%). For multiple aPLs, IgA anti-β2GPI + IgA aCLs was the most common antibody profile observed (15 of 66, or 22.7%), followed by IgA anti-β2GPI + IgA aCL + IgG anti-β2GPI (10 of 66, or 15.2%). Antiphospholipid antibodies emerged ~35–39 days after disease onset. A dynamic analysis of aPLs revealed 4 patterns based on the persistence or transient appearance of the aPLs. Patients with multiple aPLs had a significantly higher incidence of cerebral infarction compared to patients
who were negative for aPLs ($P = 0.023$).

Conclusion Antiphospholipid antibodies were common in critically ill patients with COVID-19. Repeated testing demonstrating medium to high titers of aPLs and the number of aPL types a patient is positive for may help in identifying patients who are at risk of developing cerebral infarction. Antiphospholipid antibodies may be transient and disappear within a few weeks, but in genetically predisposed patients, COVID-19 may trigger the development of an autoimmune condition similar to the antiphospholipid syndrome (APS), referred to as “COVID-19–induced APS-like syndrome.” Long-term follow-up of COVID-19 patients who are positive for aPLs is of great importance in understanding the pathogenesis of this novel coronavirus.

PO-0274

NSun2 regulates aneurysm formation by promoting autotaxin expression and T cell recruitment

Yang Zhao、Li-yan Cui
Department of Laboratory Medicine, Peking University Third Hospital

Abdominal aortic aneurysm (AAA) is characterized by inflammatory cell infiltration and aggravated by hyperhomocysteinemia (HHcy). It is unknown whether the homocysteine (Hcy)-activated RNA methyltransferase NOP2/Sun domain family member 2 (NSun2) is associated with AAA. Here, we found that NSun2 deficiency significantly attenuated elastase-induced and HHcy-aggravated murine AAA with decreased T cell infiltration in the vessel walls. T cell labeling and adoptive transfer experiments confirmed that NSun2 deficiency inhibited the chemotaxis of vessels to T cells. RNA sequencing of endothelial cells showed that Hcy induced the accumulation of various metabolic enzymes of the phospholipid PC-LPC-LPA metabolic pathway, especially autotaxin (ATX). In the elastase-induced mouse model of AAA, ATX was specifically expressed in the endothelium and the plasma ATX concentration was upregulated and even higher in the HHcy group, which were decreaseddramatically by NSun2 knockdown. In vitro Transwell experiments showed that ATX dose-dependently promoted T cell migration. HHcy may upregulate endothelial ATX expression and secretion and in turn recruit T cells into the vessel walls to induce vascular inflammation and consequently accelerate the pathogenesis of AAA. Mechanistically, secreted ATX interacted with T cells by binding to integrin α4, which subsequently activated downstream FAK/Src-RhoA signaling pathways and then induced T cell chemokinesis and adhesion. ATX overexpression in the vessel walls reversed the inhibited development of AAA in the NSun2-defcient mice. Therefore, NSun2 mediates the development of HHcy-aggravated AAA primarily by increasing endothelial ATX expression, secretion and T cell migration, which is a novel mechanism for HHcy aggravated vascular inflammation and pathogenesis of AAA

PO-0275

化学发光免疫法快速监测新冠疫苗接种后及 COVID-19 康复者血清抗体谱

李敏[2]、豆小文[1]、王恩运[1]、姜瑞伟[1]、熊丹[1]、张秀明[1]
1. 深圳市罗湖医院集团医学检验实验室
2. 深圳市罗湖医院集团医学检验实验室

目的 探讨新冠疫苗接种者和康复者体内随接种和康复时间不同血清抗体的变化规律，辅助免疫应答效果评价。

方法 招募疫苗接种志愿者 195 例（其中男 86 例，女 109 例，平均 39 岁。完成 2 个月随访的志愿者 37 例），完成灭活疫苗接种程序（0，28 天）以及新冠康复期患者 10 例。研究采取单中心、随机、双盲试验，在受试者接种首剂疫苗前、接种后 14 天和 28 天、接种第二次后 7 天、14 天和 28 天分别采集静脉血（3mL）编码处理。分离血清，采用化学发光法测定 SARS-CoV-2 中和抗体、SARS-CoV-2 RBD IgG 抗体、SARS-CoV-2 RBD 总抗。计算不同采血点的抗体阳转率，考察不同时间、抗体和配对样本的结果差异及相关分析。

结果 中和抗体与 RBD IgG 诊断结果无差异（P＞0.05），中和抗体、RBD IgG 与 RBD 总抗诊断结果存在差异（P＜0.05）；化学发光法 CLIA 定量检测中和抗体、RBD IgG 和 RBD 总抗抗体水平相关系数 R＞0.90；与 cPass ELISA 法测定的中和抗体水平 R＞0.60。疫苗接种后抗体水平呈现“S 型”变化，第一次接种后 14 天三种抗体阳转率≤11.1%，第二次接种后 7 天各抗体阳转率剧增至 81%以上，完成接种程序后中和抗体阳转率稳定在 91%。相比基础值 1.272AU/mL（95%CI：

0.832~1.712AU/mL），接种完 14 天抗体水平最高升至 104.1AU/mL（95%CI：76.54~131.6AU/mL），升高达 81 倍。疫苗诱导的中和抗体水平是新冠康复者的中和抗体水平的 0.2 倍。

结论 采用 CLIA 可快速评估疫苗接种者和康复者的体液免疫应答产物中和抗体、RBD IgG 与 RBD 总抗变化规律，持续性抗体水平的动态监测将有助于评价体液免疫的保护作用。

PO-0276

血清 PlGF 联合多普勒超声在预测子痫前期的价值分析

刘文渊、周碧华、杨秀萍
宁波市妇女儿童医院

目的 研究孕妇血清 PlGF 联合多普勒超声在预测子痫前期中的价值。

方法 选择 2019 年 7 月至 2020 年 4 月在宁波市妇女儿童医院行常规产前检查并确诊妊娠期高血压疾病的孕妇，分为子痫前期组 82 例、妊娠高血压组 85 例、对照组 170 例。于 15～20 周、24～28 周采用免疫荧光分析法检测 PlGF 水平，孕 20～24 周行子宫动脉多普勒超声，获得子宫动脉搏动指数 PI、阻力指数 RI。计算血清指标和超声指标及其并联和串联组合对子痫前期的敏感度和特异度。

结果 孕 15～20 周血清 PlGF，子痫前期组（132±78μg/L）、妊娠高血压组（146±65μg/L）与对照组（76±59μg/L）比较，差异均无统计学意义（P>0.05）。孕 24～28 周血清 PlGF，子痫前期组（42±23μg/L）、妊娠高血压组（355±87μg/L）与对照组（454±90μg/L）比较，差异均有统计学意义（P<0.05）。孕 20～24 周子宫动脉搏动指数 PI、阻力指数 RI，子痫前期组（1.5±0.4，0.7±0.1）、妊娠高血压组（1.2±0.3，0.6±0.1）、 对照组（0.7±0.2，0.5±0.1）三组差异有统计学意义。PlGF 截断值选择 256 μg/L 时，预测子痫前期的灵敏度和特异度分别为 80.3%和 90.2%；子宫动脉搏动指数 PI 截断值选择 0.710 时，灵敏度和特异度分别为 71.3%和 89.2%。子宫动脉阻力指数 RI 截断值选择 1.39 时，灵敏度和特异度分别为 76.3%和 91.2%。PlGF、子宫动脉搏动指数及阻力指数并联预测子痫前期的灵敏度为 94.3%，特异度为 63.4%，串联灵敏度为 62.1%，特异度为 95.8%。

结论 孕妇血清 PlGF 联合多普勒超声在预测子痫前期中具有较好的临床价值。

PO-0277

A novel autoantibody specific for the Annexin A2 on podocyte in primary nephrotic syndrome

qing ye
The Children's Hospital, Zhejiang University School of Medicine

In recent years, it has been found that B-cell dysfunction plays an important role in the pathogenesis of primary nephrotic syndrome (PNS). B cells play a pathogenic role by secreting antibodies against their target antigens after transforming into plasma cells. Therefore, this study aims to screen the autoantibodies caused PNS and to explore their pathogenic mechanisms. Western blotting and mass spectrometry were employed to screen and identify the autoantibody against podocytes of PNS children. Then, both animal experiments and cell experiments were used to study its pathogenic mechanism. This finding was also confirmed in a large multicenter clinical study in children. We found that Annexin A2 autoantibody is highly expressed in PNS children with a pathological type of minimal change disease (MCD) or focal segmental glomerulosclerosis (FSGS) without genetic factors. The mouse model demonstrated that anti-annexin A2 antibody could induce proteinuria in vivo. The research on mechanism showed that the effect of Annexin A2 antibody on Rho signaling pathway was realized by promoting Tyr24

phosphorylation of Annexin A2 on podocytes by reducing its binding to Protein Tyrosine Phosatase 1B (PTP1B), which then led to the cytoskeleton rearrangement and damage to podocytes, and eventually caused proteinuria and PNS. In conclusion, Annexin A2 autoantibody may be responsible for some PNS children with MCD/FSGS.

PO-0278

基于大数据探讨 MMP11 在肿瘤的诊断及预后中的价值

钱凯、高峰
江苏省中医院

目的 基于大数据分析基质金属蛋白酶 11（MMP11）在肿瘤的诊断及预后中的作用。
方法 运用 TIMER2.0、GEPIA 2、UALCAN 分析 MMP11 在肿瘤及周围正常组织中的表达水平，运用 GEPIA 2 的生存分析模块分析不同 MMP11 水平的肿瘤患者生存期差异。
结果 1.使用基于 TGCA 数据库的 TIMER2.0 分析发现膀胱尿路上皮癌、乳腺浸润癌、宫颈鳞癌和腺癌、胆管癌、结肠癌、食管癌、多形性胶质瘤、头颈鳞状细胞癌、肾透明细胞癌、肾乳头状细胞癌、肝细胞肝癌、肺腺癌、肺鳞癌、嗜铬细胞瘤和副神经节瘤、前列腺癌、直肠腺癌、胃癌、甲状腺癌、子宫内膜样腺癌中 MMP11 基因表达水平明显高于正常组织（p＜0.05）；使用基于 TCGA 和 GTEx 数据库的 GEPIA 2 分析发现肾上腺皮质癌、弥漫性大 B 细胞淋巴瘤、卵巢浆液性囊腺癌、胸腺癌、子宫癌肉瘤基因表达明显高于正常组织（p＜0.05）。2.UALCAN 分析发现 MMP11 蛋白表达在子宫内膜样腺癌、肺腺癌中明显高于正常组织（p＜0.05）。3. GEPIA 2 生存分析发现肾嫌色细胞癌、脑低级别胶质瘤、葡萄膜黑色素瘤 MMP11 高表达组的总生存期和无病生存期均较低表达组短（p＜0.05）；多形性胶质瘤、间皮瘤、胰腺癌高表达组较低表达组总生存期短（p＜0.05）；前列腺癌高表达组较低表达组无病生存期短（p＜0.05）；子宫内膜样腺癌高表达组较低表达组无病生存期长（p＜0.05）。
结论 基于大数据分析发现 MMP11 在多种肿瘤中均高表达，且其表达水平与患者预后明显相关，可作为肿瘤筛查和预后判断的分子标志物。

PO-0279

Matrix metalloproteinase 3: a novel effective biomarker for predicting the mortality and the severity of pneumonia

Shuo Yang、Fei Wang、Chong Liu、Zhen Xu、Keke Jia、Jiansuo Zhou、Liyan Cui
Peking University Third Hospital

BACKGROUND Matrix metalloproteinase 3 (MMP3) is known as an inflammatory factor, however, the effectiveness of MMP3 for diagnosis of pneumonia and predicting outcomes is unclear. We evaluated the diagnostic and prognostic value of serum MMP3 in patients with pneumonia.
METHODS 185 patients with pneumonia and 52 healthy controls were enrolled. Serum MMP3, neutrophil gelatinase-associated lipocalin (NGAL), interleukin 6 (IL-6), procalcitonin (PCT), C-reactive protein (CRP) concentrations at admission were measured. The patients were followed up for 90 days.
RESULTS Compared with healthy controls, the concentrations of MMP3, NGAL and IL-6 at admission were significantly higher in patients with pneumonia (P<0.05). The median concentrations of MMP3, NGAL and IL-6 were significantly higher in the patients with severe pneumonia than the group of non-severe pneumonia (P<0.05). Compared with PCT (AUC=0.778), CRP (AUC=0.719), and IL-6 (AUC=0.726), MMP3 (AUC=0.846) and NGAL (AUC=0.826) had significantly higher AUC value for distinguishing the severity of pneumonia. The ROC of the combination of MMP3, neutrophil to lymphocyte ratio (NLR), and D-dimer showed the best

performance of predicting pneumonia severity, which gave an AUC of 0.956. The AUC of MMP3 (0.950) for predicting mortality was highest, followed by NLR (AUC=0.945), D-dimer (AUC=0.938) and NGAL (AUC=0.913). Multivariable logistic regression analysis showed MMP3, D-dimer and NLR were the independent predictors of hospital mortality in patients with pneumonia. Patients with MMP3 concentration >124.3 ng/mL had a significantly higher risk of mortality (P<0.05).
CONCLUSIONS MMP3 is a valuable biomarker in assessment of the severity and prediction of mortality in patients with pneumonia.

PO-0280

血清半胱氨酸蛋白酶抑制剂 1 的检测及其对食管鳞状细胞癌早期诊断的价值

王建伟[1,3]、余丽丽[2,3]、章良铭[2,3]、黄毅[2,3]
1. 福建省立金山医院
2. 福建省立医院
3. 福建医科大学省立临床医学院

目的 血清半胱氨酸蛋白酶抑制剂 1（CST1）与恶性肿瘤的相关性近来引起关注，我们通过免疫组织化学技术（IHC）的检测发现 CST1 蛋白在食管鳞状细胞癌（ESCC）早期患者癌组织中存在异常高表达。在此基础上，我们拟构建用于血清 CST1 检测的化学发光免疫分析（CLIA）法，并进行系统的方法学评价；基于 CLIA 法检测 CST1 在 ESCC 早期患者血清的表达水平，探讨血清 CST1 检测对 ESCC 的早期诊断价值。
方法 构建用于血清 CST1 检测的 CLIA 法，并通过线性范围、最低检出限、准确度、精密度、干扰实验、样本稳定性、试剂稳定性，评价其对血清 CST1 的检测性能。采用构建的 CLIA 法检测 112 例 ESCC 早期患者、107 例食管良性病变（EBL）及 151 例健康对照（HC）的血清 CST1 水平，评价血清 CST1 检测对 ESCC 早期患者的诊断性能。
结果 构建的 CLIA 法检测血清 CST1 的线性范围为 6.25~400 Pg/ml；最低检出限 1.35 Pg/ml；平均回收率 102.65％；本方法的低、高水平批内精密度分别为 4.43％、1.94％，均<1/4TEa；批间精密度分别为 1.39％、1.90％，均<1/3TEa；血红蛋白、类风湿因子对本方法无显著干扰，重度脂血和黄疸对低浓度 CST1 的检测存在一定的干扰；样本的 4℃保存稳定性良好；试剂的 25℃、37℃热稳定性与 4℃效期稳定性良好。以 68.33 Pg/ml 为 cutoff 值，CLIA 法的检测结果显示，ESCC 早期患者组血清 CST1 的水平与阳性率均明显高于 EBL、HC 组（P<0.05）；血清 CST1 检测对 ESCC 早期患者的诊断敏感性 31.25%（特异性 92.64%），AUC 达 0.654。
结论 构建的 CLIA 法具有良好的检测线性、灵敏度、准确度、精密度、特异性与稳定性，对血清 CST1 的检测性能良好；血清 CST1 检测对 ESCC 具有理想的早期诊断价值。

PO-0281

血清白细胞介素-26 水平与肝功能指标相关指标对慢性丙型肝炎预后相关性分析

朱建光
咸宁市中心医院

目的 通过检测慢性丙型肝炎患者血清中白细胞介素-26（IL-26）、C-反应蛋白（CRP）、总胆红素（TBIL）、谷丙转氨酶（ALT)、天冬氨酸氨基转移酶（AST）等水平，探讨血清 IL-26 与肝功能相关指标对慢性丙型肝炎预后的相关性和存在的潜在意义。

方法 选取 2018 年 1 月-2019 年 12 月于本院就诊的慢性丙型肝炎患者 140 例，其中高病毒载量慢性丙型肝炎患者 68 例（高病毒组），低病毒载量慢性丙型肝炎患者 72 例（低病毒组）；慢性丙型肝炎患者进展为肝硬化、失代偿肝硬化、肝衰竭或肝癌的患者 55 例为不良预后组，未发生进展的患者 85 例非不良预后组。另随机选取同期于本院进行体检的健康人群 140 例为对照组。采用全自动生化分析仪检测血清天冬氨酸氨基转移酶（AST）、丙氨酸转氨酶（ALT）及总胆红素（TBIL）水平；采用免疫比浊法测定 CRP 水平；采用酶联免疫吸附（ELISA）法检测血清 IL-26 水平；采用 Logistic 回归分析影响慢性丙型肝炎患者发生不良预后的危险因素。
结果 高病毒组与低病毒组慢性丙型肝炎患者血清 IL-26 水平均显著高于对照组，且高病毒组显著高于低病毒组（P＜0.05）；不良预后组血清 CRP、TBIL、ALT、AST 及 IL-26 水平均显著高于非不良预后组（P＜0.05）；Logistic 回归分析结果显示，血清 CRP、ALT、AST 及 IL-26 水平均是影响慢性丙型肝炎患者发生不良预后的独立危险因素（P＜0.05）。
结论 慢性丙型肝炎患者血清 IL-26 水平升高，且随患者病毒载量升高而升高，血清 CRP、ALT、AST 及 IL-26 均与患者预后存在一定相关性，可能是评估慢性丙型肝炎患者预后的潜在参考指标。

PO-0282

糖尿病合并肾病患者的尿脂联素、炎症因子与血脂水平变化与临床分期相关性

冯奕习、陈日寿、李汉秋
广州中医药大学东莞医院

目的 探讨糖尿病肾病患者的血液和尿液生物标志物在临床上的应用价值。
方法 纳入健康对照、单纯 2 型糖尿病正常蛋白尿、2 型糖尿病合并微量白蛋白尿及 2 型糖尿病合并大量白蛋白尿病人各 30 例，检测研究对象的血糖、及血液、尿液生物标志物。
结果 随着疾病病情加重，炎症因子的检出水平逐渐升高，尿液的生物标志物水平逐渐升高（所有 P 值均<0.05）。其中估算的肾小球滤过率（eGFR）随着病情加重逐渐下降，血肌酐、血同型半胱氨酸、血胱抑素 C 和 24 小时微量白蛋白尿检出水平逐渐升高（所有 P 值均<0.05）。尿脂联素水平在正常对照组和白蛋白尿组水平逐渐下降，但在微量和大量白蛋白尿组突然增高（P<0.001）。Logistic 回归分析结果显示，高血压、白细胞计数、中性粒细胞、淋巴细胞比率、单核细胞计数、血清淀粉样蛋白 A 水平、甘油三酯水平以及同型半胱氨酸水平异常增高，高密度脂蛋白胆固醇水平降低等均是糖尿病肾病的独立危险因素（所有 P 值均<0.05）。与正常的糖化血红蛋白相比，水平在 6.5%-7.5%之间的患者其糖尿病肾病的危险程度增加（P 值均<0.05）。进一步分析尿脂联素水平与糖尿病肾病的相关性，显示脂联素的四分位数间距水平与 eGFR、24 小时微量白蛋白尿、血肌酐和胱抑素 C 的水平间均存在显著性差异（所有 P 值均<0.001）。
结论 炎症因子及尿脂联素水平在糖尿病各亚组间的分布存在差异性，血液增高的新型生物标志物单核细胞计数/高密度脂蛋白胆固醇、尿液高脂联素水平的患者患有更严重的蛋白尿和肾脏功能不全，提示血液单核细胞计数/高密度脂蛋白胆固醇以及尿液脂联素可作为糖尿病肾病风险及预示临床分期的替代指标。

PO-0283

E3 泛素连接酶 CBL，CBL-B 和 CBL-C 在乳腺癌发生发展中的作用及其分子机制的初步研究

宋筱羽、肖斌、李林海
广州医科大学附属第六医院，清远市人民医院检验医学部

目的 探讨 E3 泛素连接酶 CBL，CBL-B，CBL-C 对乳腺癌细胞增殖和转移的影响，高通量筛选其相互作用蛋白，初步研究其介导相互作用蛋白泛素降解的分子机制。
方法 通过免疫组化染色观察 CBL，CBL-B，CBL-C 在乳腺癌及癌旁组织中的表达水平；构建稳定过表达 CBL，CBL-B，CBL-C 细胞株并进行细胞表型相关实验，观察它们过表达对乳腺癌细胞增殖、迁移和侵袭能力的影响；通过免疫沉淀结合质谱分析筛选 CBL，CBL-B，CBL-C 的相互作用蛋白，利用免疫共沉淀、免疫荧光共定位实验鉴定它们与各自候选蛋白的相互作用；通过 qPCR、Western-blot 实验检测过表达 CBL，CBL-B，CBL-C 对各自相互作用蛋白表达的影响；通过稳定性和泛素化实验验证过表达 CBL，CBL-B，CBL-C 对各自相互作用蛋白的稳定性及泛素化降解的影响。
结果（1）乳腺癌组织中 CBL，CBL-B，CBL-C mRNA 表达水平显著低于癌旁组织（P <0.05）；（2）细胞表型实验结果显示过表达 CBL，CBL-B，CBL-C 均明显抑制了乳腺癌细胞的增殖、迁移及侵袭能力；（3）通过 COIP、免疫共沉淀和激光共聚焦技术、稳定性和泛素化实验证实了 CBL 可促进 NCK2 的泛素化降解、 CBL-B 可促进 SNX-18 的泛素化降解、CBL-C 可促进 CTTN 的泛素化降解。
结论 CBL，CBL-B，CBL-C 均为乳腺癌的抑癌基因，在乳腺癌组织中低表达且与预后密切相关。CBL，CBL-B，CBL-C 的过表达均抑制乳腺癌细胞的增殖，迁移和侵袭。 CBL，CBL-B，CBL-C 可能分别通过促进 NCK2、SNX-18、CTTN 蛋白的泛素化降解而在乳腺癌中发挥抑制作用，这些研究为乳腺癌患者的治疗和预后评估提供了新的治疗靶点。

PO-0284

CXCL13/CXCR5 在食管癌中的表达及其意义

龙思琪、郭晓兰、祝静、刘文、李英、唐茜
川北医学院附属医院

目的 探讨食管癌患者手术前后外周血趋化因子 CXCL13 及其受体 CXCR5 水平的变化及意义。
方法 收集食管癌患者 50 例（其中食管癌术前患者 29 例，食管癌术后患者 21 例）、健康对照 24 例，采用流式细胞术检测研究对象外周血中 CXCR5+ 细胞、CD4+CXCR5+T 细胞、CD19+CXCR5+T 细胞、CD4+CD25+CD127lowTreg 及 Treg+CXCR5+T 细胞水平，酶联免疫吸附试验（ELISA）检测研究对象血浆中 CXCL13 水平，并将各指标进行统计学分析。
结果 食管癌患者 CD4+CXCR5+T 细胞、Treg 细胞及 CXCL13 水平均明显高于健康对照组（P<0.05，P<0.05，P<0.01）；食管癌术后患者 CD4+CXCR5+T 细胞、Treg+CXCR5+T 及 Treg 细胞水平较食管癌术前患者显著降低（P<0.05，P<0.01，P<0.01），而血浆 CXCL13 水平在食管癌患者手术前后变化无统计学意义。
结论 食管癌患者免疫功能可能处于抑制状态；CXCL13 可能通过与 CD4+T 细胞表面 CXCR5 作用参与了食管癌的发病。

PO-0285

全血抗病毒蛋白 MxA 在儿童呼吸道感染鉴别诊断的临床应用研究

叶辉铭[1]、陈自敏[2]、杨智过[3]、宋浏伟[2]、朱敏[1]、葛胜祥[3,4]
1. 厦门市妇幼保健院（厦门大学附属妇女儿童医院）
2. 厦门万泰凯瑞生物技术有限公司
3. 厦门大学公共卫生学院实验医学系
4. 国家传染病诊断试剂与疫苗工程技术研究中心（厦门大学）

目的 评估全血抗病毒蛋白 MxA 在儿童呼吸道细菌、病毒、肺炎支原体及其混合感染的鉴别诊断价值。
方法 应用自主研发的全血抗病毒蛋白 MxA 酶联免疫检测试剂盒检测 215 例儿童呼吸道感染患儿及 168 例健康体检儿童的全血 MxA 蛋白水平，比较呼吸道病毒、细菌、肺炎支原体及混合感染患儿全血 MxA 水平，受试者工作曲线分析评价全血 MxA 与 C 反应蛋白、白细胞计数等传统感染指标对呼吸道病毒感染和细菌感染的诊断效率。
结果 呼吸道病毒、细菌、混合感染和肺炎支原体感染患儿全血 MxA 水平的中位数分别是结果分别为 17.09ng/ml、1.51ng/ml、10.24ng/ml 和 8.76ng/ml，健康体检儿童全血 MxA 水平的中位数为 0.74ng/ml。病毒感染 、混合感染和肺炎支原体感染患儿全血 MxA 蛋白与健康体检儿童之间的差异具有统计学意义（P<0.0001），细菌感染患儿与健康体检儿童全血 MxA 无统计学差异（P=0.0912）。 ROC 曲线分析了全血 MxA、 C 反应蛋白、白细胞数、淋巴细胞数、中性粒细胞数、淋巴细胞比率、中性粒细胞比率对于儿童呼吸道病毒感染诊断价值， 其中 MxA 指标的 AUC 为 0.9562，说明对于病毒感染鉴别诊断效果最佳。
结论 全血 MxA 蛋白对于儿童呼吸道感染的病因具有良好的鉴别诊断价值，对于抗生素合理使用具有一定的指导价值。

PO-0286

原发免疫性血小板减少症患者血清细胞因子水平变化与血小板参数的相关性研究

李傲航
首都医科大学附属北京友谊医院

目的 探讨原发免疫性血小板减少症（ITP）患者血清细胞因子水平变化与血小板参数的相关性。
方法 选取 2018 年 10 月至 2019 年 10 月我院收治的 ITP 患者（60 例）为研究组，并选取同一时期的健康人（60 例）为对照组。比较两组患者血清中白介素-33（IL-33）、白介素-9（IL-9）、γ 干扰素（IFN-γ）、转化生长因子-β（TGF-β）的水平；比较两组血小板参数：血小板计数（PLT）、血小板比积（PCT）；采用 Pearson 法分析 ITP 患者血清细胞因子水平变化与血小板参数的相关性。
结果 研究组 IL-33、IL-9、IFN-γ 水平均明显高于对照组（P<0.05），研究组 TGF-β 水平明显低于对照组（P<0.05）；研究组 PLT、PCT 均明显低于对照组（P<0.05）；Pearson 及多重性回归分析表明 ITP 患者 IL-33、IL-9、IFN-γ 水平与 PLT 及 PCT 呈负相关（P<0.05），TGF-β 水平与 PLT 及 PCT 呈正相关（P<0.05）。
结论 ITP 患者 IL-33、IFN-γ、IL-9 水平升高，而 TGF-β 水平降低，ITP 患者机体内 IL-33、IFN-γ、IL-9、TGF-β 水平与血小板参 数密切相关。

PO-0287

Ureaplasma urealyticum Cysteine Desulfurase Promotes Th1-Biased T Cell Immune Response via TLR4-Mediated Activation of Dendritic Cells

Fangyi Guo[1,2]、Guozhi Dai[1,2]
1. The First People's Hospital of Chenzhou
2. 南华大学附属郴州医院

Ureaplasma urealyticum(U.urealyticum, Uu), the motive agent of a sexually transmitted illness, is a very successful microorganism with a complex ability to regulate the host immune response. Insights into the U.urealyticum factors modulating host response are needed to get vaccine antigen targets and higher perceived dynamic interactions between microorganism and host cells. Iron-sulfur [Fe-S] cluster are one of the foremost ancient and versatile inorganic cofactors because of their intrinsic chemical properties in biology. In prokaryotes, [Fe–S] clusters are protein cofactors. They are needed for crucial biological processes such as catalyst activity, leptontransfer, organic process, substrate binding/activation, iron/sulfur storage, organic phenomenon regulation, and chemical action. Cysteine desulfurase could be a scaffold supermolecule of the [Fe-S] cluster that is important for changing sulfur into biomolecules, together with [Fe-S] clusters and changed nucleotides. We have got shown that the U.urealyticum cysteine desulfurase(Uu-IscS) will induce each body substance and cellular immunologic response once intramuscular injection into BALB/c mice. Uu-IscS-immunized mice made a T-lymphocyte response once re-stimulation with immunogen Uu-IscS in vitro, which showed a Th1-biased cytokine spectrum with high levels of IFN-γ. A powerful body substance immune response was additionally detected within the immunized mice with high titers of specific serum IgG antibodies at an equivalent time. However, the direct result of Uu-IscS on antigen-presenting cells, which are essential for t cell activation, is not apparent. In this study, we tend to exploit the useful role of Uu-IscS in promoting naïve $CD4^+$/$CD8^+$ T cell differentiation toward Th1-type T-cell immunity through an interaction with dendritic cells (DCs). Uu-IscS functionally induced DC maturation by up-regulating the expression of cell surface molecules (CD40, CD80, CD86, and MHC class I and II) and production of many pro-inflammatory cytokines (IL-12p70, TNF-α, IL-1β and IL-6) in DCs. These effects of Uu-IscS in DC activation were initiated upon binding to Toll-like receptor 4 (TLR4) followed by activation of downstream MyD88-, MAPK-, and NF-κB-dependent signalling pathways. Uu-IscS-activated DCs displayed a superb capability to effectively polarise naïve $CD4^+$and $CD8^+$ T cells toward Th1-type T-cell immunity with the dose-dependent secretion of IFN-γ and IL-2 at the side of increased levels of CXCR3 expression. Notably, Uu-IscS-stimulated DCs induced the proliferation of Ag-specific Th1-type effector/memory $CD44^{high}CD62L^{low}$ T cells from the spleen Uu-infected mice in a TLR4-dependent manner. Conjointly, these results demonstrate that Uu-IscS is an immune matter that interacts with DCs, specifically via TLR4, to get Th1-biased memory T cells in an antigen-specific manner. Uu-IscS could contribute to the improved understanding of host-pathogen interactions and supply a rational basis for the invention to develop an efficient U.urealyticum vaccine.

PO-0288

全光谱流式细胞术检测 T 淋巴细胞亚群百分比和绝对计数的结果分析

张静文[1,2]、潘建华[1,2]、兰山卉[1]、郑倩[1]、李明敏[1]
1. 广州金域医学检验中心有限公司
2. 广州医科大学金域检验学院

目的 探讨全光谱流式细胞仪体积法和微球法检测 T 淋巴细胞百分比和绝对值结果与传统流式检测结果的差异。
方法 应用全光谱流式细胞仪体积法和微球法对 25 例外周血样本进行 T 淋巴细胞亚群绝对计数，分析全光谱流式细胞仪体积法和微球法检测结果与传统流式微球法检测 CD3+，CD3+CD4+,CD3+CD8+细胞百分比和绝对计数的结果差异，并用 t 检验，比较全光谱流式细胞仪两种方法和传统流式微球法间结果是否具有统计学差异。
结果 与传统流式细胞仪单平台法检测 T 淋巴细胞亚群绝对计数结果相比，光谱流式细胞仪体积法检测结果偏低，CD3+，CD3+CD4+,CD3+CD8+绝对计数平均偏差分别为-22.60%、-24.83%、-20.57%；光谱流式细胞仪微球法检测结果偏高，CD3+，CD3+CD4+,CD3+CD8+绝对计数平均偏差分别为 9.54%、7.77%、13.51%；其中体积法检测 CD3+，CD3+CD4+绝对计数结果与传统流式微球法检测结果具有统计学差异（P<0.05）。光谱流式仪检测 T 淋巴细胞亚群百分比结果均低于传统流式仪，CD3+，CD3+CD4+,CD3+CD8+百分比平均偏差分别为-3.20%、-3.48%、0.00%，无统计学差异（P>0.05）。
结论 使用全光谱流式细胞术检测 T 淋巴细胞亚群，百分比检测结果与传统流式细胞检测结果较一致；如进行绝对计数检测，建议使用微球法。光谱流式仪使用体积法进行绝对计数检测，需重新建立参考区间。

PO-0289

铁死亡在肝癌中的调控因素及潜在应用

潘亚芳、郭玮
复旦大学附属中山医院

目的 研究铁死亡在肝癌中的调控因素及潜在应用。
方法 通过查阅铁死亡参与肝癌进展的相关文献进行综述。
结果 各项研究表明铁死亡影响肝癌的发生发展，并已知肝癌中参与铁死亡调控的相关因素：P62-Keap1-NRF2 通路的激活抑制肝癌细胞中铁死亡的发生；Sigma-1 受体对肝癌细胞铁死亡有保护作用；MicroRNA-214-3p 通过靶向肝癌细胞中的 ATF4 增强 erastin 诱导的铁死亡；LncRNA-GABPB1-AS1 和 GABPB1 在 erastin 诱导 HepG2 肝癌细胞铁死亡过程中调节氧化应激。此外，在肝癌的治疗上研究显示可通过内、外源性途径诱导肝癌细胞铁死亡从而辅助治疗。
结论 铁死亡是诱导肝癌细胞死亡的有效机制，对肝癌中铁死亡的理解可以为我们改善肝癌的治疗和发展带来新希望。

PO-0290

Research Progress in Prognostic Factors and Biomarkers of Ovarian Cancer

Shuna Liu、Ming Wu、Xin Fu、Fang Wang
南京医科大学第一附属医院（江苏省人民医院）

Purposes Ovarian cancer is the most fatal gynecological tumor, its incidence is next to cervical cancer and endometrial cancer, but its mortality rate is the first among reproductive system malignancies. Compared with other gynecological tumors, ovarian cancer has complex pathological types, high recurrence rate and poor prognosis. Patients with distant metastasis due to delayed medical treatment and tolerance to chemotherapy have worse prognosis. Therefore, the identification of effective clinical prognostic factors and biomarkers is crucial to improve the prognosis of ovarian cancer patients.

Methods Based on the topics discussed in this review, we systematically searched the recent medical literature on novel prognostic biomarkers of ovarian cancer in PubMed and PMC databases by using our search strategy. All the literature included in the study were published between February 1, 2015 and February 1, 2021. After excluding the duplicated literature in the two databases, a total of 1,923 literature met the restriction conditions. Then the retrieved literature were imported into the literature management software Endnote. Preliminary screening was performed by reading the titles and abstracts of the literature to exclude irrelevant studies, and then the full text of the included literature was evaluated. In order to ensure the reliability of the research results, we only selected studies with more than 50 patients with ovarian cancer, and the biomarkers studied in the literature were consistent with the clinical results. The inclusion and exclusion criteria and search strategy are provided in the appendix. Finally, a manual search was conducted in major journals and the reference lists of the selected papers to find other relevant citations that were missing by the electronic search.

Results A total of 297 different novel prognostic biomarkers were reported in 296 studies that met the inclusion criteria. These prognostic biomarkers were classified according to the purpose of the study, there were 45 studies on biomarkers in the blood of ovarian cancer patients and 251 studies on biomarkers in tumor tissues. The 41 novel prognostic biomarkers provided by 45 studies can be classified by biological function, including cell proliferation and invasion, inflammatory response, angiogenesis, antioxidant, immune response, chemotherapeutic sensitivity, mitosis process, EMT (epithelial-to-mesenchymal transformation) and metastasis, deregulation of the cellular transport and apoptosis process. The selected tissue prognostic biomarkers can be divided into immunohistochemical biomarkers (68.77%), DNA biomarkers (3.95%) and RNA biomarkers (27.28%). These markers are classified according to their biological functions, mainly including such functional pathways as EMT and metastasis, inflammation and immunity, antioxidant, angiogenesis, cell proliferation, migration and invasion, chemotherapeutic sensitivity and cell cycle regulation.

Conclusions Ovarian cancer is the most fatal gynecological malignancy with high incidence and low survival rate. By exploring the prognostic biomarkers associated with ovarian cancer recurrence and progression, independent risk factors affecting patient prognosis were identified, which laid a solid foundation for the development of novel treatment strategies and the improvement of patient treatment outcomes. This review searched the literature and database for the relevant reports on prognostic biomarkers of ovarian cancer, reviewed the classic clinical prognostic biomarkers, and focused on the recently discovered various prognostic markers. The prognostic value of a variety of novel biomarkers was evaluated by integrating genomic, proteomic and metabolomic data and clinical information with a multivariate analysis model. The effectiveness of these novel prognostic biomarkers still needs to be further validated in large clinical trials. By studying the functional pathways of regulation of these molecular markers, the potential molecular mechanisms are revealed, so as to identify new therapeutic targets. This is a high-precision medical method, which may promote personalized treatment of ovarian cancer patients and improve their prognosis.

PO-0291

A multivariate diagnostic model based on urinary EpCAM-CD9 positive extracellular vesicles for resectable prostate cancer diagnosis

Yibei Dai[1]、Yiyun Wang[2]、Lingyu Zhang[1]、Zhenping Liu[3]、Pan Yu[1]、Ying Cao[1]、Ying Ping[1]、Danhua Wang[1]、Gong Zhang[1]、Yiwen Sang[1]、Xuchu Wang[1]、Zhihua Tao[1]
1. The Second Affiliated Hospital Zhejiang University School of Medicine
2. 浙江大学医学院
3. 杭州师范学院附属余杭医院杭州市余杭区第一人民医院

Prostate cancer (PCa) is one of the most frequently diagnosed cancers and the leading cause of cancer death in males worldwide. However, current biomarkers used in the clinic such as prostate-specific antigen (PSA) are not satisfied for the resectable PCa due to its low specificity, unclear benefits for reducing PCa deaths and the harms of overdiagnosing indolent disease. In this study, we aimed to investigate the performance of urinary EpCAM-CD9 positive EVs ($uEV_{EpCAM-CD9}$) for the diagnosis of prostate cancer using a newly laboratory-developed chemiluminescent immunoassay. Results showed that the $uEV_{EpCAM-CD9}$ were able to distinguish PCa from controls and significant decrease of $uEV_{EpCAM-CD9}$ were observed after prostatectomy. We further constructed an exclusive multivariate diagnostic model based on $uEV_{EpCAM-CD9}$, PSA and other clinical parameters, which showed an enhanced diagnostic sensitivity without substantially decreasing specificity and performed excellently to diagnose resectable prostate cancer (AUC = 0.953, P<0.0001). Moreover, this diagnostic model also exhibited a superior diagnostic performance (AUC = 0.921, P<0.0001) over PSA (AUC = 0.712, P=0.0018) at the PSA gray zone. Overall, the multivariate diagnostic model is a promising tool in the field of resectable PCa diagnosis.

PO-0292

Changes of serum IL-10, IL-1β, IL-6, MCP-1, TNF-α, IP-10 and IL-4 in COVID-19 patients

Qingqing Lu[1]、Zhenhua Zhu[2]、Chaochao Tan[3]、Hui Zhou[2]、Yan Hu[2]、Ge Shen[4]、Pan Zhu[4]、Gang Yang[4]、Xiaobing Xie[2]
1. Hunan University of Chinese Medicine
2. 湖南中医药大学第一附属医院
3. 湖南省第一人民医院
4. 娄底市疾控中心

Background and purpose Studies have shown that some cytokines in COVID-19 patients were elevated. This study aims to assess whether IL-10, IL-1β, IL-6, MCP-1, TNF-α, IP-10 and IL-4 serve as potential diagnostic biomarkers of COVID-19.
Methods The above serum cytokines in COVID-19 patients and non COVID-19 patients were detected by ELISA, SARS-CoV-2 IgM and IgG were detected by chemiluminescence method. Independent-samples Mann-Whitney U-test was utilized to compare cytokines levels in different groups and course, Levene T-test, T'-test were utilized to compare they in different genders, and Spearman Correlation test was utilized to analyze the correlation between the cytokines levels with ages, SARS-CoV-2 IgG and IgM.
Results Serum levels of IL-10, IL-1β, MCP-1, TNF-α and IL-4 in COVID-19 patients were significantly higher than those in non-COVID-19 patients, while IL-6 were only significantly higher than in healthy people, IP-10 were significantly lower than in other diseases patients. AUCs of COVID-19 diagnosed by IL-10, IL-1β, IL-6, MCP-1, TNF-α, IP-10 and IL-4 were 0.735, 0.775, 0.595, 0.821, 0.848, 0.387 and 0.682, respectively. In COVID-19 patients' serum, the levels of IL-

10 and MCP-1 of male had noticeably higher than those of female, and all cytokines were significantly positively correlated with age, IL-1β and IL-4 were significantly negatively correlated with SARS-CoV-2 IgM, while IL-10, IL-1β, IL-6, TNF-α and IP-10 were significantly negatively correlated with SARS-CoV-2 IgG. IL-10 on 43-56 days were significantly lower than at 29-42 days, TNF-α at 15-42 days were significantly higher than at 0-14 days, IP-10 at 0-14 days were the highest, IL-4 at 29-42 days were significant higher than on 0-14 days.
Conclusions The detection of IL-10, IL-1 β, IL-6, MCP-1, TNF-α and IL-4 would assist the clinical study of COVID-19, and IP-10 may be the cytokine `of early elevation in COVID-19 patients.

PO-0293

IL-1B 及 IL-1RN intron2 基因多态性与大肠癌关系的研究

邢培祥、杨发林、阚世锋
山东大学齐鲁医院

目的 探讨白介素-1B（IL-1B）及白介素-1RN（IL-1RN）基因多态性与中国山东地区汉族人大肠癌的关系。
方法 用基因芯片检测 IL-1B–31/-511 位点单核苷酸多态性（SNP）；以凝胶电泳检测 IL-1RNintron2 基因多态性(VNTR)；以 ELISA 测定 IL-1b/-1ra 血清水平。以其它 3 类大肠相关疾病及健康体检者为对照，以病例-对照研究方法分析 490 例大肠癌与 IL-1B–31/-511 SNP 及 IL-1RNVNTR 的关系。用 χ^2、*t* 检验行相关指标的比较。以比值比(OR)及其 95％可信区间(95％CI)估计相对风险。
结果 （**1**）大肠癌组 IL-1ra /-1b 比值显著低于对照组（u =-23，*P*<0.01）； IL-1B-511TT 及 T 频率均显著高于对照组[（χ^2 =5.22，*P*<0.05）vs（χ^2 =4.59，*P*<0.05）]。（2）直肠癌及管状腺癌组-511TT/T 频率均显著高于对照组，其 OR(95％CI)分别为,TT: 1.59（1.03～2.45）及 1.74（1.19～2.55）； T: 1.39（1.04～1.86）及 1.42（1.10～1.83）。低分化管状腺癌组-511TT 频率（61.90%）显著高于对照组；而其 CT 频率（19.05%）显著低于对照组，其 OR(95％CI)分别为,TT: 4.57（1.96～10.65）及 CT:0.23（0.08～0.64）；中及低分化管状腺癌组-511T 频率均显著高于对照组，其 OR(95％CI)分别为： 5.80（1.24～27.08）及 2.35（1.24～4.59）。
结论 IL-1B/T SNP 与山东地区汉族人大肠癌相关。

PO-0294

Cyr61 Mediates Oxaliplatin Resistance in Colorectal Cancer Cells by Regulating Bcl-XL Expression

Yanfang Song
Peoples Hospital Affiliated to Fujian University of Traditional Chinese Medicine

Even though the clinical application of oxaliplatin (L-OHP) has brought improvements in the survival of colorectal cancer (CRC) patients, about half of patients with CRC fail to acquire good clinical outcomes, indicating resistance to L-OHP therapy. Cysteine-rich protein 61 (Cyr61), as a multifunctional extracellular matrix protein, is highly expressed in a variety of tumors, and increased Cyr61 is known to be closely involved in chemotherapeutic resistance of many tumors, but its role in the L-OHP resistance of CRC cells has not been studied. In this study, we aimed to investigate the role of Cyr61 on L-OHP resistance of CRC cells and mechanism underlying. Our findings showed that the mRNA and protein level of Cyr61 in L-OHP-resistant cells were significantly increased compare with those in the non-resistant cells. Knockdown of Cyr61 enhanced chemosensitivity of L-OHP-resistant cells. Mechanistically, we found that overexpression of Cyr61 decreased the L-OHP-induced apoptosis in the drug-resistant of CRC

cells through the regulation of Bcl-xL. Collectively, our results revealed for the first time Cyr61 displays a crucial role in the CRC cell resistance to L-OHP, and targeting Cyr61 may be a promising therapeutic strategy to overcome L-OHP resistance in CRC.

PO-0295

High Performance of SARS-Cov-2 N Protein Antigen Chemiluminescence Immunoassay as Frontline Testing for Acute Phagse COVID-19 Diagnosis：A Retrospective Cohort Study

Qiaoling Deng[1]、Guangming Ye[1]、Yunbao Pan[1]、Wen Xie[1]、Gui Yang[1]、Zhiqiang Li[2]、Yirong Li[3,4]
1. Department of Laboratory Medicine, Zhongnan Hospital of Wuhan University
2. Department of Neurosurgery, Zhongnan Hospital, Wuhan University
3. Department of Laboratory Medicine, Zhongnan Hospital of Wuhan University
4. Wuhan Research Center for Infectious Diseases and Cancer, Chinese Academy of Medical Sciences

Objectives Disease COVID-19 emerged and rapidly spread throughout the world. Testing strategies focus on patients with COVID-19 requires assays that are high-throughput, low-risk of infection and small sample volumes. Antigen surveillance can be used to identify exposure to pathogens and measure acute infections.
Methods A total of 914 serum samples collected from 309 currently infected COVID-19 patients, 48 recovered ones and 410 non-COVID-19 patients were used to measure N protein antigen by an chemilumineseent immunoassay. Diagnostic performances were analyzed in different periods after onset.
Results There was a high level of N protein antigen in COVID-19 patients (0.56 COI), comparing to the recovered patients (0.12 COI) and controls (0.19 COI). In receiver-operating characteristic curve analysis, area under the curve of serum N protein antigen was 0.911 in the first week after onset. In this period, Sensitivity and specificity of serologic N protein antigen testing was 76.27% and 98.78%. Diagnosis performance of specific antibodies became better from third week after onset. Subgroup analysis suggested that severe patients had higher levels of antigens than mild patients.
Conclusions High level of serum antigen suggested early infection and seriously ill. Serum N protein antigen testing by chemiluminescence immunoassay is considered as a viable assay used to improve diagnostic sensitivity for currently patients.

PO-0296

Study of risk factor of urinary calculi according to the association between stone composition with urine component

Pan Wang、Jiansuo Zhou、Chong Liu、Boxin Yang、Liyan Cui
Peking University Third Hospital

Urolithiasis is a common urinary disease with high recurrence. The risk factor for the recurrence of calculi is not very clear. The object of the present study was to evaluate the association between calculi composition and urine component and analyse the risk factor for the recurrence of urolithiasis. In this study, a total of 223 patients with calculi and healthy control were enrolled, and the components of the calculi and urina sanguinis collected before surgery were analysed. Of the 223 patients, 157 were males and 66 were females. According to the stone composition, the case group was subdivided into three groups. 129 patients had single calcium

oxalate stones, 72 had calcium oxalate stones mixed with other stones and 22 had other type of stones excluding calcium oxalate stones. Urine biochemicals were analysed and the associations were found between the chemicals in each group. Multivariate logistic analysis demonstrated that reduced urinary magnesium and uric oxalic acid were independent risk factors when comparing all cases with normal controls. Only decreased urinary magnesium was found to be a risk factor comparing the single calcium oxalate group with normal control group. Low level of urinary magnesium and uric oxalic acid were found to be risk factors comparing the mixed calcium oxalate group with normal control group. No risk factor was found comparing the other stone group with normal control group. In conclusion, there were clear relationships between stone components and urine chemicals. Urine chemicals might be risk factors to predicate the occurrence of urolithiasis.

PO-0297

抗肾小球基底膜抗体（ELISA 法）与肾穿刺活检不符一例

杨静、周佳烨、邵文琦、王蓓丽、潘柏申、郭玮
复旦大学附属中山医院

目的 本研究报道 1 例患者因血尿 2 周入院，于肾炎类型的鉴别过程中发现 ELISA 法检测抗肾小球基底膜（GBM）抗体阳性而肾穿刺活检结果为阴性，针对两种检查方法的结果差异，我们进行了原因分析。

方法 通过文献复习，结合患者临床症状和其他辅助检查等，依据患者 ELISA 法检测抗 GBM 抗体与病理结果不一致的可能原因进行分析。

结果 我们通过（1）更换不同品牌的 ELISA 检测试剂盒进行检测，该患者的血清抗 GBM 抗体检测结果为阴性；（2）使用 ANCA 六基质（包括 GBM 抗原点）和 GBM 猴肾组织片的荧光法检测，结果均为阴性。结果不符的可能原因：（1）肾小球严重破坏的情况下，荧光可能会产生假阴性结果；（2）患者体内有其他自身抗体共存的情况下，免疫球蛋白和/或补体成分的其他沉积可能会模糊图像导致假阴性结果。（3）ELISA 检测方法中常见的非特异性结合导致假阳性结果。

结论 通过更换不同的检测平台进行抗 GBM 抗体检测，结合患者临床症状和其他辅助检查，本实验室采用的 ELISA 试剂盒检测抗 GBM 抗体阳性的原因可能是由于患者体内的其他抗体与微孔板包被的 GBM 产生了非特异性反应导致的假阳性。

PO-0298

前列腺特异性抗原同源异构体 p2PSA 的稳定性研究

周佳烨、王蓓丽、潘柏申、郭玮
复旦大学附属中山医院

目的 鉴于大量研究发现，p2PSA 的加入对于提高辅助诊断前列腺癌的正确性，区别癌症的侵袭性以及病理性升级有重大价值。在具有一定的临床价值的背景下，探究 p2PSA 的稳定性因素对临床开展的影响。

方法 PSA 范围在 4-10ng/ml 并接受直肠超声引导前列腺穿刺活检的 100 名男性患者采集血清标本，通过模拟临床实际可能会遇到的影响血样检测结果的前处理因素，包括时间、温度、添加剂、反复冻融，检测总 PSA、游离 PSA、游离 PSA 百分比、p2PSA 以及其衍生指标 Phi 的，判断是否产生临床可接受的偏倚。

结果 在常温 31℃条件下且未离心情况下，血液需在 2h 内完成检测，大于 2h 后检测 p2PSA 均产生明显偏倚；离心后的血清置于 4℃条件下且 6h 内完成检测，p2PSA 结果与立即检测时一致。将

血清分离后 4℃保存可稳定 24h，-20℃或-70℃条件下保存可稳定 6 个月，-70℃的条件比-20℃保存效果好，偏倚更小。
结论 本研究显示不管在何种条件下，血清 p2PSA 水平均随着时间的延长而升高的趋势，在未离心、常温放置的情况下结果升高最为明显，将血清分离保存的情况下 p2PSA 水平是随时间的延长呈现下降的趋势。

PO-0299

新冠肺炎康复者恢复期血浆治疗 COVID-19 患者体内抗体含量和核酸基因 ORF1ab 与 N 清除研究

段丽[1]、林国跃[1]、秦莹[1]、李明[1]、宋玉霞[1]、李剑平[2]、蔺志强[1]、孙贤礼[1]、李远达[1]、张弛[1]、屈晓娟[1]
1. 新疆医科大学第八附属医院（新疆新冠肺炎医疗救治定点医院）
2. 辽宁省血液中心沈阳中心血站

目的 探讨康复者恢复期血浆治疗 COVID-19 患者后体内抗体 IgM、IgG 产生和核酸基因 ORF1ab、N 清除效果。
方法 检测 COVID-19 患者治疗前后抗体 IgM、IgG ct 值和核酸基因 ORF1ab、N 变化，并统计比对分析。
结果（1）有 99 例快速发展型、重型和危重症 COVID-19 患者接受康复者恢复期血浆治疗，总有效率 100%，治愈率 100%，总输血率达 9.31%（99/1064），无严重输血不良反应。（2）康复者恢复期血浆 229 袋每袋 200ml 平均含有抗体量 IgG ct 值 31.61±23.28（1:64），IgM 为 7.19±11.94（1:8）。（3）输注康复者冰冻血浆患者体内抗体 IgG 和 IgM ct 值（68.70±69.14 和 47.89±64.63）分别显著高于输注血浆前（4.46±13.99 和 4.55±11.02）含量，与未输注血浆组（43.41±35.61 和 17.33±16.26）比较明显的增高（p＜0.05）；重型和危重型患者入院时抗体 IgG 含量明显高于快速发展型（P＜0.05）；IgM 抗体重型和危重型差异大，危重型 IgM 显著下降（P＜0.05）。输血组重型患者出院时 IgG 和 IgM 抗体含量均明显高未输血组（P＜0.05）。（4）未输血组入院或出院时抗体 IgG 含量重型低于快速发展型（P＜0.05），快速发展型出院时 IgG 含量比入院时明显的高（P＜0.05）；重型患者入院时 Ig M 含量明显高于快速发展型（P＜0.05）。（5）输血组病毒核酸基因 ORF1ab、N 转阴率（63.89%）明显高于未输血组（26.50%）（p＜0.005）。（6）快速发展型和重型患者住院天数输血组均较未输血组患者明显缩短（P＜0.05）。
结论 应用康复者恢复期血浆治疗 COVID-19 患者可大幅提高重型和危重型住院患者抗体含量、加快病毒清除及促进核酸转阴效果。

PO-0300

肌钙蛋白大数据回顾分析

周佳烨、林依婷、周琰、王蓓丽、郭玮
复旦大学附属中山医院

目的 心肌肌钙蛋白是诊断急性心肌梗死的重要生物标志物。本研究的目的是评估生物学和时间因素与血浆心肌肌钙蛋白 T（cTnT）浓度的相关性，并探讨哪个因素（性别，年龄，血样采集时间和季节）对血浆 cTnT 水平的影响最大。
方法 本研究选取了 2019 年上海市中山医院 3519 名急诊胸痛中心患者，收集了患者的基础资料及血浆 cTnT 检测结果。在进行数据分析之前，使用 Tukey 检验严格排除检测结果中的异常值。Kolmogorov-Smirnov（K-S）检验用于估计数据分布，非正态分布的数据表示为中位数（Q1，

Q3）。 使用 Mann-Whitney U 检验比较男性与女性之间的 cTnT 水平，Kruskal-Wallis 检验比较各性别组之间的 cTnT 水平，分析各个因素与血浆心肌肌钙蛋白 T（cTnT）浓度的相关性。
结果 在 70 岁以上的人群中，男性和女性的 cTnT 水平均随着年龄的增长而逐渐升高。 cTnT 在 80 岁以上的个体中达到最高水平（男性为 0.019μg/ L，女性为 0.016μg/ L）。不同血液采样时间的个体之间的 cTnT 浓度不同。在男性和女性中，cTnT 浓度分别在 8：00 和 13：00 达到最大值（分别为 0.013μg/ L 和 0.012μg/ L）。此外，在春季和冬季，cTnT 水平通常高于夏、秋两季。
结论 血浆 cTnT 水平受性别，年龄，采血时间和一年中的季节的影响很大。因此，为避免错误地将 cTnT 值识别为异常，应考虑个体的性别和年龄，一天中的采血时间以及一年中的季节，并建立不同的参考区间。

PO-0301

高血压性脑出血患者血清胶质纤维酸性蛋白水平变化及意义

王虹霏、史清海
新疆军区总医院

目的 胶质纤维酸性蛋白(GFAP)特异性表达于中枢神经系统星形胶质细胞，本研究通过观测高血压性脑出血患者血清中 GFAP 的浓度变化，探讨其可否作为诊断脑出血及评估患者病情和预后的标志物。
方法 选取 55 例高血压性脑出血患者和 55 例健康体检者进行临床观察。病例组分别在脑出血发病后 12 小时内和入院后 10 天内连续采集静脉血。根据头颅 CT 资料诊断及评估疾病，用格拉斯哥昏迷评分对患者临床状况进行评估，采用酶联免疫吸附法进行分析血清中 GFAP 的浓度。统计分析上述资料。
结果 55 例患者男性 42 例，女性 13 例，平均年龄 52 岁。超过半数(43%)患者表现为中重度脑出血，平均血清 GFAP 水平为 0.034 ng/mL。55 例健康体检者男性 35 例，女性 20 例，平均年纪 47 岁，平均血清 GFAP 水平为 0.012ng/ml。入院时精神表现正常患者组（格拉斯哥昏迷评分 15 分）与健康体检者相比，血清中 GFAP 显著升高，平均血清 GFAP 水平为 0.045ng/ml。GFAP 诊断脑出血的截止值为 0.03g/L，敏感性为 77.8%，特异性为 94.2%[曲线下 ROC 分析面积 0.972 (95% CI，0.802-1)，p＜0.001]。与格拉斯哥昏迷评分相比，患者发病 12h 内血清中 GFAP 的浓度与其并无显著相关性。与手术后患者的颅内压进行比较，发现在术后十天内，患者的颅内压如果一直高于正常，GFAP 的水平也会明显升高。与不同部位的脑出血体积相比较，呈正相关（相关系数 0.55，p＜0.05）。
结论 研究表明 GFAP 是诊断脑出血疾病的敏感和特异性的生物标志物，可能作为临床诊疗高血压性脑出血疾病的一种有价值的工具。

PO-0302

Hs-CRP、PCT、IL-6 和 NLR 对细菌感染和肺炎支原体感染的早期诊断价值比较

刘伟平[1]、毛小倩[2]
1. 自贡市第一人民医院
2. 天津医科大学临床医学院

目的 比较超敏 C 反应蛋白（hs-CRP）、降钙素原（PCT）、白介素 6（IL-6）、中性粒细胞与淋巴细胞比值（NLR）对细菌感染和肺炎支原体感染的早期诊断价值。
方法 收集自贡市第一人民医院 2020 年 12 月至 2021 年 2 月的初诊入院的肺部感染性疾病患者 131 例，其中细菌感染组 72 例、肺炎支原体感染组 59 例。收集两组患者的一般临床资料，对所有

受试者进行血常规、IL-6、hs-CRP、PCT 检测。利用 SPSS 26.0 软件对所有数据进行统计学分析，比较 hs-CRP、PCT、白介素 6（IL-6）和 NLR 对细菌感染和肺炎支原体感染的鉴别诊断价值。
结果 细菌感染组 hs-CRP、PCT、IL-6 和 NLR 值均高于肺炎支原体感染组，差异有统计学意义（P＜0.05）；细菌感染组和肺炎支原体感染组比较，PCT、hs-CRP、IL-6、NLR 的 ROC 曲线下面积（AUROC)分别为 0.971、0.859、0.831、0.858。诊断切点分别为 0.49 ng/mL、38.33mg/L、19.50 pg/mL、4.82；PCT 的诊断灵敏度为 100%、特异度为 93.2%、约登指数为 0.93；hs-CRP 的诊断灵敏度 75.0%、特异度 84.7%、约登指数为 0.60；IL-6 的诊断灵敏度 73.6%、特异度 81.4%、约登指数为 0.55；NLR 的诊断灵敏度 79.2%、特异度 79.7%、约登指数为 0.59。
结论 血液 PCT、IL-6、NLR、hs-CRP 测定对于鉴别诊断细菌性感染和肺炎支原体感染有较高的临床价值，PCT 的诊断价值最高。

PO-0303

新型心肌标志物血清可溶性生长刺激表达基因 2(sST2) 蛋白在血液透析患者中的应用价值

漆星
四川大学华西医院资阳医院·资阳市第一人民医院

目的 探讨血清可溶性生长刺激表达基因 2(sST2) 蛋白血清水平在维持性血液透析（MHD）患者发生心血管疾病（CE）的价值。
方法 收集四川大学华西医院·资阳医院 2019 年 1 月 1 日至 2019 年 12 月 31 日，血液透析中心患者 205 例，其中男性 108 例，女性 97 例，平均年龄（57.02±15.03）岁，将患者分为 MHD 并发 CE 组 113 人和 MHD 未并发 CE 组 92 人，采用高灵敏度双抗体夹心法检测 sST2，以及采用罗氏 cobas e602 电化学发光法测定血清 NT-proBNP、TNT 和 MYO，分析在 MHD 患者中心血管疾病的风险预测模型比较。
结果 MHD 并发 CE 组 113 人和 MHD 未并发 CE 组 92 人作为对照组，MHD 并发 CE 组年龄，伴糖尿病的风险构成统计学差异，NT-proBNP、sST2、TNT 值更高均构成构成统计学差异；通过 Logistic 多因素回归分析，sST2 是 MHD 并发 CE 的独立危险因素；绘制 ROC 曲线表明 NT-proBNP、sST2、TNT 对 CE 具有较好的独立预测能力；采用 R 语言运算随机森林 sST2 与 NT-proBNP、TNT 相比，sST2 是最重要的变量，其平均下降精度和平均递减 Gini 明显高于 NT-proBNP 和 TNT；再次建立三个预测模型，TNT 和 NT-proBNP 为Ⅰ，TNT、NT-proBNP、sST2 为Ⅱ，NT-proBNP、TNT、MYO 为Ⅲ，通过 R 语言得出Ⅰ与Ⅱ的 NRI：0.2083,Ⅱ比Ⅰ准确度增加了 20.83%，IDI 值: 0.0411 P= 0.00473，表明Ⅱ相对Ⅰ预测风险在新模型中提高了 4.11%。Cox 回归分析 sST2 是其死亡的独立预测因子。
结论 sST2 作为 MHD 患者新型标志物，相对其他心肌生物标记物有干预能力小，预测性能高，利用 R 语言随机森林对多种生物标记物的评估及风险预测模型建立，也是我们今后为患者全面评估风险预测体系的探索方向

PO-0304

The role of TPS, CA125, CA15-3 and CEA in prediction of distant metastasis of breast cancer

Jingya Zhang、Li Ren
天津市肿瘤医院(天津医科大学肿瘤医院)

Objective To explore the application value of breast cancer tumor markers TPS, CA125, CA15-3 and CEA detection alone and in combination for the monitoring of distant metastasis of breast cancer.
Method The clinical data of 389 female breast cancer patients admitted to Tianjin cancer hospital from January 2016 to March 2017 were retrospectively analyzed. Serum levels of TPS, CA125, CA15-3 and CEA were compared to analyze their significance in monitoring distant metastasis of breast cancer. The patients were divided into the distant metastatic group and the non-metastatic group according to whether the patients had distant metastasis. The non-metastatic group was divided into control group and distant recurrent group according to whether distant metastases occurred within 3 years after treatment.
Result The level of serum tumor markers of distant metastatic group and recurrence group were higher than those of non-metastatic group and non-recurrence group and the level of serum tumor markers of distant recurrent group were higher than those of control group. The receiver operating characteristic curve analysis revealed the four markers had diagnostic value in distant metastasis of breast cancer (AUCTPS=0.754, AUC15-3=0.821, AUCCEA=0.755, AUCCA125=0.651) and in distant recurrence in 3 years of breast cancer (AUCTPS=0.751, AUC15-3=0.744, AUCCEA=0.725, AUCCA125=0.661). TPS, CA15-3, CEA show similar performance in diagnosis of metastasis of breast cancer. TPS, CA15-3, CEA and CA125 show comparable performance in diagnosis of distant metastasis in 3 years of breast cancer.
To estimate whether the discrimination ability could be improved by marker panels, we established marker panels composed of TPS, CA125, CA15-3 and CEA didnot significantly improve AUCs than a single marker in the analysis groups (non-distant metastasis vs. metastasis in three years). To discriminate distant metastasis from non-distant metastasis, no significant improvements were shown in AUC compared with single marker. However, the sensitivity of all the markers were improved when the marker-panels were used.
Conclusion All tumor markers can be used effectively in monitoring distant metastasis of breast cancer. Different combination of serum TPS, CA125, CA15-3 and CEA is more valuable than using the tumor marker singly in terms of improving sensitivity.

PO-0305

胸苷激酶 1 检测在肝癌诊断及预后中的价值研究

胡涛、卢仁泉、郭林
复旦大学附属肿瘤医院

目的 研究胸苷激酶-1（TK-1）在肝细胞肝癌（HCC）中的诊断及预后价值。
方法 总共收集了 123 名 HCC 初诊患者的血清标本，以及 80 名肝良性病变患者和 98 名健康人群对照标本，检测并比较了不同人群的血清 TK-1（sTK-1）的水平，分析 TK-1 在肿瘤诊断中的特异性和敏感性；结合 HCC 患者的 AFP，CA19-9 等数据，使用 ROC 曲线建立模型，分析 sTK-1 在 HCC 中的诊断价值；检测 HCC 患者术前、术后、术后 1 个月、3 个月、6 个月的 sTK-1 水平，并随访术后 12 个月肿瘤复发情况，分析 sTK-1 在 HCC 患者手术疗效评价和预后管理中的作用。
结果 HCC 患者 sTK-1 中位水平为 2.38 pM，阳性率为 55.3%，显著高于肝良性病变患者的中位水平 1.50 pM 和和健康人群的 1.32 pM（P 均<0.001）；TMN III-IV 期 HCC 患者 sTK-1 中位水平 2.93 pM，高于 I-II 期患者的 1.94 pM（P=0.019）；HCC 患者 sTK-1 的 AUC 为 0.7983，联合

AFP 诊断的 AUC 为 0.9221；术前 sTK-1 阴性患者的无进展生存期（PFS）显著高于 sTK-1 阳性患者（P<0.001）；在 HCC 患者 sTK-1 水平动态监测中，肝癌患者术后 sTK-1 水平比术前有明显的下降（P<0.001），术后复发或转移患者的 sTK-1 水平在术后 6 个月内显著高于术后无进展患者（P 均<0.001）。

结论 sTK-1 能够辅助诊断 HCC，sTK-1 联合 AFP 检测可以进一步提高 HCC 诊断的特异性及敏感性。术前 sTK-1 是独立的 HCC 复发风险预测指标。术后半年内 sTK-1 水平的动态变化能够帮助肝癌患者评价手术疗效和进行预后分层。

PO-0306

拉萨地区 1196 例藏族儿童维生素 D 营养状态分析

尼玛顿珠[1]、边珍[1]、秦绪珍[2]
1. 西藏自治区人民医院
2. 中国医学科学院北京协和医院

目的 分析西藏拉萨地区 0-12 岁儿童维生素 D 浓度分布，观察地域、性别、年龄、季节对儿童维生素 D 营养状态的影响。

方法 纳入在西藏自治区人民医院门诊就诊的 1196 例 0-12 岁儿童，排除明确诊断患儿，采用索霖化学发光法检测血清 25-(OH)D 水平，收集性别、年龄、检测日期等相关信息，并进行统计分析。

结果 本地区 0-12 岁儿童血清 25-(OH)D 总体水平为 19.7（10.2，27.9）ng/mL。1196 例儿童中维生素 D 严重缺乏、缺乏、不足、充足、过量组患儿分别占 24.33%、26.92%、27.17%、21.32%、0.25%。不同年龄、性别 25-(OH)D 水平比较差异有统计学意义（P<0.05），学龄前组浓度最高，幼儿组、婴儿组和学龄组依次降低。随着儿童年龄增长，VD 充足率逐渐降低，1 岁以上儿童 VD 充足率不足 20%，男童高于女童。夏、秋季儿童 25-(OH)D 水平平均浓度高于春季，春季高于冬季。冬季维生素 D 缺乏、不足率明显高于其他 3 组（P<0.05）。

结论 拉萨市 0-12 岁儿童普遍存在维生素 D 缺乏和不足的现象，应改善饮食习惯，摄入 VD 含量较高的食物，根据不同地区、季节进行户外运动，增加皮肤暴露面积。孕妇及不同年龄阶段儿童补充 VD，定期监测血清 25-(OH)D 浓度水平，做到“因时、因地、因人而异”，并进行广泛的宣传教育。

PO-0307

1056 例抗中性粒细胞胞浆抗体的临床分布

姜茜
中国医科大学附属盛京医院

目的 通过对抗中性粒细胞胞浆抗体（ANCA）检测结果的分析，了解 ANCA 在就诊患者中的检出率及其分布特征，为临床疾病诊断提够帮助。

方法 使用 IIF 法判读 ANCA 荧光核型，同时使用 CLIA 法定量检测 ANCA 靶抗体。对 25822 例样本 ANCA 的检测结果进行分析，统计 ANCA 的阳性率、荧光核型及临床分布。

结果 共检出 1056 例阳性，ANCA 的阳性率为 4.09%，其中男性阳性率为 3.67%，女性阳性率为 4.38%，两组差异有统计学意义（P＜0.05）；阳性样本中，以 61 岁以上组别人数最多，占 45.27%，41-60 岁组别次之，占 27.37%，20 岁以下年龄组占 16.95%，位列第三，21-40 岁组别人数占比最少，占 10.42%。各年龄组中女性比例均高于男性，依次为 56.1%、74.4%、60.3%、73.6%。男性与女性的年龄构成差异有统计学意义（P＜0.01）；荧光核型以 pANCA 阳性率最高，为 51.14%，靶抗体以 MPO 为主（70.56%），aANCA 占 36.46%，cANCA 占 12.41%；荧光模型不同靶抗体的分布有统计学差异（P＜0.01）；临床诊断，23.30%为 ANCA 相关性血管炎，14.11%为类风湿性关节炎，10.42%为系统性红斑狼疮，8.43%为慢性肾病，6.16%为发热。

结论 ANCA 在不同年龄、性别、疾病中的检出率有所不同，ANCA 的检测不仅对 AAV 的诊断及治疗有帮助，对其他自身免疫性疾病的鉴别诊断亦有重要意义。

PO-0308

Combination of Alpha-fetoprotein, Des-gamma Carboxyprothrombin, and Lectin-Bound Alpha-fetoprotein in Detecting Early Hepatocellular Carcinoma

Yuan Liao、Yaqiong Chen
Third Affiliated Hospital of Sun Yat-sen University

Alpha-fetoprotein (AFP) is widely used as a surveillance test for Hepatocellular carcinoma (HCC) among patients with cirrhosis. Des-gamma carboxy-prothrombin (DCP), lectin-bound AFP (AFP-L3) and Golgi protein-73 (GP73) are potential surveillance tests for HCC. The aims of this study were to determine performance of AFP, DCP, AFP-L3 and GP73 and their combinations for the diagnosis of HCC. A total of 578 patients were enrolled, including 303 HCC patients, 104 patients with liver cirrhosis (LC), 101 patients with chronic hepatitis (CH) and 70 healthy volunteers. The serum levels of AFP, DCP, AFP-L3 and GP73 were quantified and the relationship between histological staging and serum markers were systematically analyzed. AFP had the best area under the curve (AUC = 0.850) followed by DCP (0.775) and AFP-L3 (0.763) for predicting HCC, while GP73 had low diagnostic value (0.549). The combination of AFP, DCP and AFP-L3 significantly improved diagnostic performance (AUC = 0.895). In addition, the combined index also achieved excellent diagnostic accuracy (AUC = 0.855) in early HCC. In conclusion, AFP was more sensitive than DCP and AFP-L3 for the diagnosis HCC. The combined index may be a strong indicator for discriminating HCC from non-malignant chronic liver diseases.

PO-0309

慢性肾脏病患者肺癌相关血清肿瘤标志物水平的改变及临床价值分析

苗强[1]、成渠霞[2]、牛倩[1]、蔡蓓[1]、张君龙[1]
1. 四川大学华西医院
2. 四川省广安市岳池县中医医院

目的 探讨肺癌相关血清肿瘤标志物在慢性肾脏病（CKD）患者中的表达变化及临床诊断价值，并初步估计参考范围。
方法 选取 2020 年 3 月-2020 年 9 月四川大学华西医院 729 例 CKD 患者为病例组， 94 例健康体检者为对照组；检测血清中 CA125、CYFRA21-1、SCC、NSE、ProGRP 的水平，比较各指标在两组间差异及不同 CKD 分期中水平的变化，对 CKD 各期患者肺癌相关肿瘤标志物阳性率进行比较分析并应用 ROC 曲线对其临床诊断价值进行评价；采用非参数法初步估计 CKD3~5 期肺癌相关指标的 95%参考范围。
结果 CKD 患者肺癌相关肿瘤标志物水平除 NSE 外均明显高于健康对照组（P<0.05），其中 CYFRA21-1、ProGRP 水平在 CKD2~5 期患者中均明显高于对照组（P<0.01），SCC 在 CKD3~5 期、CA125 在 CKD4~5 期患者中明显升高（P<0.01）。CYFRA21-1、ProGRP 在 CKD3~5 期患者中阳性率均大于 60%明显高于对照组（P<0.001）。在 ROC 曲线分析中，ProGRP、CYFRA21-1、SCC 对 CKD 诊断的灵敏度分别为 83.3%、90.9%、75.9%，曲线下的面积分别为 0.933、0.928、0.789。ProGRP 在 CKD3、4、5 期患者中的 95%参考范围上限分别为

148.5 pg/ml、225.9 pg/ml、375.5 pg/ml；CYFRA21-1、SCC 在 CKD3 和 CKD4~5 期患者中的的 95%参考范围上限分别为 7.56 ng/ml、11.27 ng/ml 和 4.52 ng/ml、8.92 ng/ml。
结论 血清 ProGRP、CYFRA21-1、SCC、CA125 的水平随着 CKD 分期的递增而显著增高，NSE 水平不受影响， 建议 CKD 患者联合检测肺癌相关血清肿瘤标志物并采用恰当的参考限值进行结果解释。

PO-0310

Association of Genetic Variants in TPMT, ITPA, and NUDT15 With Azathioprine-Induced Myelosuppression in Southwest China patients with Autoimmune Hepatitis

Qiang Miao、Lin Yan、Yanhong Zhou、Yi Li、Yuangao Zou、Lanlan Wang、Yangjuan Bai、Junlong Zhang
West China Hospital, Sichuan University

Aims This study aimed to investigate the influence of *TPMT*3C, ITPA, NUDT15*, and 6-thioguanine nucleotides (6-TGN) on azathioprine (AZA)-induced myelosuppression in Southwest China patients with autoimmune hepatitis (AIH).
Methods A total of 113 Chinese patients with AIH receiving AZA maintenance treatment were evaluated. The relevant clinical data of the patients were collected from the hospital information system. Genotyping of *TPMT*3C(rs1142345), ITPA (rs1127354) and NUDT15(rs116855232)* was conducted using a TaqMan double fluorescent probe. The concentration of 6-TGN was determined using UPLC-MS/MS.
Results Among AIH patients treated with AZA, 40 (35.4%) exhibited different degrees of myelosuppression. The *NUDT15* variant was associated with leukopenia (*P*=8.26X10-7; OR=7.5; 95% CI, 3.08–18.3) and neutropenia (*P*=3.54X10-6; OR=8.05; 95% CI, 2.96–21.9); however, no significant association with myelosuppression was observed for *TPMT*3C* and *ITPA* variants (*P*>0.05). There was no significant difference in 6-TGN concentration between AIH patients with or without myelosuppression (*P*= 0.556), nor was there a significant difference between patients with variant alleles of TPMT*3C, ITPA, or NUDT15 and wild-type patients (*P*>0.05). Interestingly, it was found that patients with a lower BMI had higher adjusted 6-TGN levels and a higher incidence of myelosuppression. (*P*=0.026 and 0.003).
Conclusion This study confirmed that *NUDT15* variants are a potential independent risk predictor for AZA-induced leukopenia and neutropenia. BMI may be a crucial non-genetic factor that affects the concentration of AZA metabolites and myelosuppression. In addition, the 6-TGN concentration in red blood cells does not reflect the toxicity of AZA treatment, and new biomarkers for AZA therapeutic drug monitoring need further research.

PO-0311

尘螨过敏原组分 Der p1、Der p2 特异性 IgE 纳米磁微粒化学发光免疫学检测方法的建立及其性能评估

韩菲菲、崔玉宝
无锡市人民医院

目的 采用纳米磁微粒化学发光免疫学建立快速定量检测尘螨过敏原主要组分 Der p1、Der p2 特异性免疫球蛋白 E（sIgE）的方法。
方法 利用本实验室培养的尘螨获得主要过敏原 Der p1、Der p2 的单组份重组蛋白制品。基于常规化学发光平台，优化试剂组份和反应模式，评估纳米磁微粒化学发光免疫技术检测尘螨过敏原主要

组分 sIgE 的各项性能指标。同时以该方法检测 50 例疑似尘螨过敏患者血清 Der p1、Der p2 sIgE 水平，并参照美国赛默飞 Phadia（Immuno CAP 系统）对两种方法学进行比对及符合率统计分析。
结果 建立的纳米磁微粒化学发光免疫学检测体系最低检出限（LoD）小于 0.01 U/mL，线性范围为 0.2～100 U/mL，批内精密度小于 5%，交叉污染率小于 0.1%。与 Phadia 相比，尘螨过敏原组分 Der p1 阳性符合率为 78%，阴性符合率为 100%，χ2＝19.51,P＜0.001；Der p2 阳性符合率为 93.3%，阴性符合率为 85%，χ2＝31.25,P＜0.001，表明本研究建立的组分分辨诊断法与 Phadia 有良好的相关性，用于检测尘螨有显著意义。
结论 利用纳米磁微粒化学发光免疫法检测尘螨过敏原组分 Der p1、Der p2 sIgE，成功建立了组分分辨诊断技术平台,其 LoD、线性范围、批内精密度、交叉污染率等性能指标良好，与 Phadia 有较好的一致性，可成为尘螨过敏原主要组分 sIgE 临床检测的推荐方法。

PO-0312

血清 N-MID 在原发性肺癌患者骨转移辅助诊断和疗效监测中的应用分析

陆立、卢仁泉
复旦大学附属肿瘤医院

背景与目的 目前临床上用于原发性肺癌患者骨转移辅助诊断的血清学标志物相对缺乏，该研究旨在探讨血清中骨钙素 N 端中分子片段（N-MID）的表达水平在肺癌患者骨转移辅助诊断和疗效监测中的作用。
方法 选取 2017 年 3 月至 2018 年 1 月在复旦大学附属肿瘤医院诊断为原发性肺癌的 231 例患者作为实验组，其中包括 97 例肺癌合并骨转移患者以及 134 例未骨转移肺癌患者，选取 69 例同期健康体检人员为健康对照组。利用 Logistic 多因素回归模型分析血清 N-MID、癌胚抗原（CEA）、神经元特异性烯醇化酶（NSE）、细胞角蛋白 19 片段（CYFRA21-1）、碱性磷酸酶（ALP）等在肺癌骨转移中的相关性。
结果 治疗前骨转移组血清 N-MID 水平明显高于无骨转移组与健康对照组（P 均<0.001）。Logistic 多因素分析显示，血清 N-MID（OR=9.265）和 NSE 水平（OR=2.688）是肺癌患者发生骨转移的危险因素。通过受试者工作特征（ROC）曲线确定血清 N-MID 的 Cut-off 值为 14.96ng/mL，并将实验组分为 N-MID >14.96ng/mL 组和 N-MID≤14.96ng/mL 组。治疗前，血清 N-MID >14.96ng/mL 组肺癌患者的无进展生存期（PFS）明显低于 N-MID≤14.96ng/mL 组患者（HR=2.040）。在肺癌合并骨转移患者中，治疗前后血清 N-MID 水平降低提示病情缓解（P<0.001）。
结论 血清 N-MID 水平与肺癌合并骨转移存在相关性，检测治疗前后的血清 N-MID 浓度可用于肺癌患者骨转移的辅助诊断和疗效监测。

PO-0313

Cyr61 decreases Cytarabine chemosensitivity in acute lymphoblastic leukemia cells via NF-κB pathway activation

Xianjin Zhu
Fujian Medical University Union Hospital

Objective To investigate the role of Cyr61 in regulating ALL cell chemosensitivity to Cytosine arabinoside (Ara-C).
Methods Cyr61 levels in plasma and bone marrow (BM) from ALL patients were determined by enzyme-linked immunosorbent assay. The expression of Cyr61 in Jurkat (T ALL cell lines), Nalm-6 (B ALL cell lines), and bone marrow mononuclear cells from ALL patients were measured by

real-time PCR and western blotting. Cell apoptosis was analyzed using an Annexin V-FITC and PI Double-Staining Kit. Activation of signal transduction pathways was determined by western blotting. Bcl-2 expression was analyzed by real-time PCR and western blotting.
Results Cyr61 was increased in plasma, bone marrow (BM), and bone marrow mononuclear cells from ALL patients as compared with samples from normal controls. Furthermore, we observed that increased Cyr61 effectively decreased Ara-C-induced apoptosis of ALL cells, and its function was blocked by the use of the anti-Cyr61 monoclonal antibody 093G9. Furthermore, Cyr61 increased the level of Bcl-2 in Ara-C-treated ALL cells. Mechanistically, it was shown that Cyr61 affected ALL cell resistance to Ara-C partially via the NF-κB pathway.
Conclusion Our findings support a functional role for Cyr61 in promoting chemotherapy resistance and suggest that targeting Cyr61 directly or its relevant effectors pathways may improve clinical responses in ALL.

PO-0314

探究单克隆免疫球蛋白（M 蛋白）对 CysC 检测的影响

刘杭敏
福建医科大学附属协和医院

目的 探究单克隆球蛋白（M 蛋白）对 CysC 检测的影响。
方法 对 58 例 M 蛋白阳性的血清样本和 5 例 M 蛋白阴性的血清样本分别检测原倍和 1:3 稀释血清及消除了 M 蛋白的血清 CysC 值，去除 M 蛋白使用聚乙二醇 PEG6000 蛋白沉淀法［1］［2］［3］，所有的 CysC 值均由罗氏 cobas8000（c702）测得，计算回收率，以小于、等于和大于正常回收率（90%～110%）的 M 蛋白阳性的血清样本中对应的免疫球蛋白浓度作均数加减标准差（X±S）和作图等统计学方法，分析 M 蛋白对 CysC 检测是否产生影响，以及产生的具体影响。
结果 M 蛋白阳性的血清样本中，对应的免疫球蛋白浓度值越大，对 CysC 测量值的影响越大，消除了 M 蛋白的血清样本的回收率越偏离正常回收率，1:3 生理盐水稀释无法判断 M 蛋白对 CysC 检测的干扰。
结论 单克隆球蛋白（M 蛋白）对 CysC 的检测存在干扰。准确可靠的 CysC 的检测对检测产生 M 蛋白的这类疾病如多发性骨髓瘤等引发肾功能损害有参考价值

PO-0315

Bioinformatics analyses reveal that SCARA5 is a novel biomarker in colorectal cancer

刘锦
福建医科大学附属协和医院

Objective we evaluated SCARA5 expression levels in CRC and its potential value as a diagnostic biomarker for CRC.
Methods Data were downloaded from the TCGA, GEO, and Oncomine databases to evaluate SCARA5 mRNA expression levels. The prognosis value was assessed using the online tool Cutoff Finder. Immunohistochemistry was performed to analyze expression levels.
Results SCARA5 mRNA levels were downregulated in CRC tissues compared with normal tissues. Survival analysis showed that low SCARA5 expression was associated with poor prognosis. These results were validated in clinical specimens, wherein the SCARA5 protein levels were significantly downregulated in CRC tissues compared with para-carcinoma tissues.
Conclusions SCARA5 may act as a human cancer suppressor gene in CRC.

PO-0316

新生儿败血症中血清细胞因子谱的表达

谢奇朋、陈碎朋
温州医科大学附属第二医院、育英儿童医院

目的 败血症仍然是新生儿死亡的主要原因，但对其潜在的病理机制了解甚少。为了解细胞因子在新生儿败血症中的作用，特做此课题研究。
方法 我们招募了 40 名患有败血症的足月新生儿和 26 名无感染的新生儿作为对照。使用 Luminex Bead 免疫分析系统分析了血清中的四十种细胞因子/趋化因子。使用酶联免疫吸附测定法测量血清 IL-17。
结果 我们的结果显示血清 IL-6，IL-8，TNF-α，IL-1β，MIF，CXCL13，CXCL1，CXCL2，CXCL5，CXCL6，CXCL16，CCL27，CCL2，CCL8，CCL3，CCL20，CCL23，CCL27 和 CX3CL1 水平与对照组相比，新生儿败血症患者中显着增加（所有 $p < 0.05$）。迟发性败血症（LOS）的血清 CXCL6，CXCL1，IL-6，CXCL10，CXCL11，CCL20 和 IL-17 的水平高于早发败血症（EOS）（所有 $p < 0.05$）。相反，LOS 中的血清 IL-16，CXCL16 和 CCL22 低于 EOS（所有 $p < 0.05$）。CX3CL1，CXCL2，CCL8 和 TNF-α 的水平均与 SOFA 得分呈正相关。
结论 我们的发现表明，新生儿败血症可能与过量的促炎细胞因子有关。此外，趋化因子显着增加感染后免疫细胞的募集，以参与新生儿的抗感染防御，但这反而可能导致损害。

PO-0317

The Diagnostic Value of Serum Tumor-associated Autoantibodies in Esophageal Cancer

kangjia xiao、Renquan Lu、Lin Guo
Department of Clinical Laboratory, Fudan University Shanghai Cancer Center

Objective To explore the application value of serum autoantibodies in the early diagnosis of esophageal cancer.
Methods In total, 130 patients with esophageal cancer and 110 controls (25 benign controls + 85 healthy participants) were included. Enzyme-linked immunosorbent assay (ELISA) was used to quantitatively detect autoantibodies in esophageal cancer and control serum samples, and the results were used to analyze the relationship with clinicopathological parameters. Then, the sensitivity and specificity of autoantibody combinations were obtained after screening.
Results There were significant differences between the autoantibody test results of the esophageal cancer patient group and the control group. As a result, anti-CAGE, anti-CTAG2, anti-MAGE-A4, anti-Trim21 and anti-RalA were selected in combination. In the esophageal cancer patient group, the CUTOFF value of each serum autoantibody concentration was calculated according to the ROC curve, and the total sensitivity of the autoantibody combination was calculated, with a positive judgment standard of 83.08%, total specificity of 72.73%, and accuracy of 78.33%. A nomogram was established based on the positive judgment standard, and the area under the ROC curve was calculated to be 0.880 after verification with the calibration curve. Two-week follow-up analysis found that compared with the preoperative control, the postoperative model integral value will significantly decrease.
Conclusion The determination of serum autoantibodies has certain clinical application value in the early diagnosis of esophageal cancer and can be used as an auxiliary index for early diagnosis. The combination of serum autoantibody groups can effectively improve the specificity and sensitivity for early diagnosis.

PO-0318

非小细胞肺癌患者血清 POSTN 的表达与预后研究

贾丽
天津医科大学肿瘤医院

目的 分析骨膜蛋白（POSTN）在非小细胞肺癌中的表达情况，探讨非小细胞肺癌中 POSTN 蛋白的表达与临床各病理参数及预后的相关性。POSTN 在非小细胞肺癌患者血清中的表达是否增高；POSTN 在不同年龄、肿瘤大小、TNM 分期、是否有淋巴结转移、远处转移患者中的表达是否有差异，POSTN 检测能否提高非小细胞肺癌的检出率，尤其是对早期非小细胞肺癌的诊断；术后患者血清 POSTN 表达是否降低；POSTN 的血清学检测能否作为手术治疗效果的评价指标。
方法 收集天津医科大学肿瘤医院 2019 年 6 月-2020 年 1 月天津肿瘤医院有完整病理资料非小细胞肺癌患者 165 例，其中 8 例同时收集到术前术后血清，并收集 62 例健康体检者作为对照组。查阅整理病人的病理资料包括年龄、肿瘤大小、是否淋巴结转移、是否远处组织转移。采用酶联免疫吸附法（ELISA）测定样本血清中的 POSTN 的含量，运用 SPSS 统计软件进行统计分析，同时用 graphpad prism6.0 软件进行作图。
结果 POSTN 在非小细胞肺癌患者中的表达明显高于正常对照组； POSTN 在非小细胞肺癌中其表达在不同年龄患者中无统计学意义，与其肿瘤大小、TNM 分期、淋巴结转移、远处转移均差异具有统计学意义；POSTN 在非小细胞肺癌诊断中优于传统非小细胞肺癌标志物；多项标志物联合检测可增高其敏感性、特异性等诊断能力；术后患者血清 POSTN 表达明显降低。

PO-0319

血清羧肽酶 N1 在浸润性乳腺癌化疗监测中的临床检测价值

崔冉亮、任丽、李悦国
天津医科大学肿瘤医院

目的 浸润性乳腺癌的发病率和死亡率逐年上升，提高治愈率，选择准确监测疗效标志物格外重要，故本研究探讨血清 CPN1 是否可作为潜在标志物连续监测浸润性乳腺癌疗效在临床应用价值。
方法 收集浸润性乳腺癌的患者 34 例连续 5 次化疗血清，随机分组其中 15 例为训练组，19 例为验证组，利用电化学发光法测定血清 CA153 和 CEA 表达，并用 ELISA 法测定血清 CPN1 浓度，分析 CPN1 下降率在浸润性乳腺癌监测效能。
结果 患者血清 CPN1 水平整体呈现下降趋势，分析治疗前后血清的变化，。II 周期化疗前后血清 CPN1 水平变化（训练集：21.8±13.13 VS 13.69±4.56、验证集： 31.68±12.70 VS 18.83±9.65）与浸润性乳腺癌患者化疗预后有相关性（P＜0.05）；分析连续两次化疗周期前后下降比率绘制 CPN1、CA153、CEA 的 ROC 特征曲线，比较 AUC 结果，II vs III ：训练集：AUCCPN1=0.833 vs AUCCA153=0.742 vs AUCCEA=0.667；验证集 AUCCPN1=0.7766 vs AUCCA153=0.7701 vs AUCCEA=7340；III vs IV：AUCCPN1=0.899 vs AUCCA153=0.799 vs AUCCEA=0.681；验证集：AUCCPN1=0.7855 vs AUCCA153=0.7717 vs AUCCEA=0.7510；血清 CPN1 水平与肿瘤直径、淋巴结转移、CA153 相关（P＜0.05），对比影像学与血清 CPN1 变化一致。
结论 血清 CPN1 水平可作为化疗监测标志物评价疗效以及指导临床化疗用药。

PO-0320

1728 例皮肌炎患者抗特异性肌炎谱抗体结果分析

谢曙光、李玲
广州金域医学检验中心

目的 探讨抗特异性肌炎谱抗体在特发性炎性肌病中的临床意义，为临床提供辅助诊断依据。
方法 免疫印记法测定临床诊断为皮肌炎患者血清中抗肌炎谱抗体抗 EJ 抗体、抗 Fibrillarin 抗体、抗 KU 抗体、抗 MDA5 抗体等抗体并分析结果。
结果 （1）抗特异性肌炎谱抗体在 1728 例患者检测结果总阳性人数 907 例，总阳性率为 52.49%。不同年龄组之间，41～50 岁组阳性率最高，比例为 62.58%；其次是 61～70 岁组，比例为 57.80%；<18 岁组最低，为 30.82%；<18 岁组与 40 岁以上各年龄组阳性率比较，组间差异显著，P<0.05，具有统计学意义。（2）特异性肌炎谱抗体在男性组阳性率为 42.58%，女性组阳性率为 58.93%，组间差异显著，P<0.05，具有统计学意义。（3）不同特异性肌炎谱抗体在男性组及女性组阳性率占比情况：各抗体总阳性率与在男性组、女性组分布一致；抗 Ro-52 抗体总阳性率为 24.83%，女性阳性率为 18.17%，男性阳性率为 6.66%；抗 JO-1 抗体总阳性率为 7.29%，女性阳性率为 5.27%，男性阳性率为 2.03%；抗 RNA-PⅢ抗体总阳性率为 6.25%，女性阳性率为 4.34%，男性阳性率为 1.91%；男女组阳性率组间比较差异非常显著，P<0.05，具有统计学意义。（4）不同模式组合阳性率及占总阳性率的比例：907 例阳性结果出现了 195 种抗体组合模式，不同模式中 Q 模式（抗 Ro-52 抗体）阳性例数最高，共 121 例，阳性占比 13.34%；其次是 DQ 模式（抗 JO-1 抗体+抗 Ro-52 抗体），阳性例数为 64 例，阳性占比 7.06%；第三是 U 模式（抗 SRP 抗体）阳性例数为 39 例，阳性占比 4.30%。（5）单独 1 种抗体阳性率最多，共 475 例（58.59%）；其次是 2 种抗体阳性模式，共 323 例（35.61%）；第三是 3 种抗体阳性模式，共 80 例（8.82%）。

PO-0321

基于人工神经网络的抗核抗体荧光核型智能判读

任茂源、夏玲芝
南京金域医学检验所有限公司

目的 评价在使用 Helios 全自动间接免疫荧光分析仪自动对焦拍照的基础上使用 YOLOv4 目标检测网络模型在判读 ANA 荧光核型上的应用价值。
方法 从南京金域检验所有限公司自免室 ANA 荧光图片数据库中随机选取 12000 张荧光图片（均质型、颗粒型、着丝点型、核仁型、胞浆颗粒型、阴性各占 1/6）。其中 6000 张荧光图片作为训练集，剩下的 6000 张图片作为测试集（训练集和测试集中每个核型的数量都一致）。构建 YOLO v4 的目标检测网络，并通过水平镜像，垂直镜像，90°旋转，180°旋转把训练集中的数据进行数据增强，将训练集中的数据扩增到 24000 张。之后用 Kappa 检验分析神经网络判读和人工判读之间的一致性，K<0.4 为一致性较低的标准，0.4≤K≤0.75 为一致性适中的标准，K>0.75 为一致性较高的标准。
结果 模型的判读结果的总体一致率为 95.06%，Kappa 值为 0.94。不同核型的一致率从高到低为胞浆颗粒（98.5%）、着丝点型（96.4%）、均质型（95.7%）、核仁型（95.1%）、核颗粒型（93.5%）、阴性（91.2%）。
结论 和传统的人工判读相比，基于 Helios 的自动对焦功能，利用深度学习建立 YOLOv4 目标检测网络模型来通过图片预测 ANA 核型更加高效，也能够较好的满足临床需求，为未来 ANA 荧光核型检测的标准化打下基础。

PO-0322

利巴韦林在 HCV 患者 RNA 定量检测中的影响研究

王倩[1]、赵秋剑[1]、杨鹏[2]
1. 宝鸡市中心医院
2. 宝鸡市妇幼保健院

目的 丙型病毒性肝炎(hepatitis C virus,HCV)是全球性的传染性疾病，而我国更是 HCV 患者基数最多的国家，其防治迫在眉睫。核酸检测是临床上诊断 HCV 及评估 HCV 药物治疗效果的重要手段。然而 PCR 反应容易受逆转录抑制剂药物的影响从而影响结果的准确性，本研究从 HCV 的治疗药物利巴韦林入手，研究不同提取方法对 PCR 结果的影响，同时研究使用精胺（Seprmine）解除逆转录抑制后，HCV 在血液中的表达水平差异来为后续的优化 HCV 检测提供新的思路和研究基础。
方法 对比磁珠法和 Trizol 法提取病毒 RNA 的含量，分析不同提取方法对 RNA 纯度和 PCR 定量结果的影响；利用精胺解除逆转录抑制，分析利巴韦林对 PCR 结果的影响。
结果 磁珠法提取 HCV 患者血清 RNA 的纯度优于 Trizol 法，同时 PCR 定量结果中，磁珠法也高于 Trizol 法；加入精胺后，两种方法的 PCR 检出含量均有所提高，同时加入精胺后 Trizol 法的 PCR 结果高于磁珠法未加精胺的 PCR 结果。
结论 HCV 患者在接受干扰素和利巴韦林的治疗后，HCV 含量检测应优先选择磁珠法或去除利巴韦林影响的提取方法，这样可以有效的减少利巴韦林对逆转录反应的抑制，从而更好的反应血液中 HCV RNA 的实际含量，为临床的治疗提供更准确的检测结果。

PO-0323

隐源性机化性肺炎患者 T 淋巴细胞亚群分析临床意义

薛占成、刘锦、巩庚、周秀、鲍布和、庞伟
武警特色医学中心

目的 检测隐源性机化性肺炎患者支气管肺泡灌洗液（bronchoalveolar lavage fluid，BALF）及外周血（peripheral blood，PB）中 T 淋巴细胞亚群，探讨其在隐源性机化性肺炎诊断中的价值。
方法 选取 45 例隐源性机化性肺炎患者（观察组）及 30 例健康体检者（对照组）为研究对象，应用流式细胞仪检测其 BALF 及 PB 中 T 细胞亚群，并比较其差异性。
结果 观察组 BALF 和 PB 中 CD3+CD4+及 CD4+/CD8+比值低于对照组（P<0.05）， CD3+CD8+高于对照组（P<0.05）;观察组 BALF 中 CD3+和 CD3+CD8+显著高于 PB（P<0.05）绘制 ROC 曲线比较显示，BALF 中 T 淋巴细胞亚群检测价值高于 PB，差异具有统计学意义（P<0.05）。
结论 BALF 及 PB 中 T 淋巴细胞亚群检测有助于隐源性机化性肺炎的诊断。

PO-0324

A novel diagnostic predictive index combining TK1, HE4 and CA125 shows better performance than the risk of ovarian malignancy algorithm (ROMA) for premenopausal women with a pelvic mass

Cheng Zhu[2]、Renquan Lu[1,2]、Lin Guo[1,2]、Ailing Zhong[2]、Kangjia Xiao[2]
1. 复旦大学上海医学院肿瘤学系
2. 复旦大学附属肿瘤医院检验科

Objective The purpose of this study was to create a new diagnostic index ROMI (Risk of Ovarian Malignancy Index) developed from Risk of Ovarian Malignancy Algorithm (ROMA) by combing thymidine kinase 1 (TK1), HE4 and CA125, and to explore whether it presented stronger diagnostic capabilities in distinguishing malignant ovarian tumors from benign masses than ROMA.
Methods A total of 385 patients with a pelvic mass on imaging and 46 healthy controls were enrolled in analysis. ROMI was set up according to backward stepwise conditional logistic regression with univariate and multivariate analysis. Serum TK1, HE4 and CA125 were measured on preoperative samples. ROMI, ROMA, TK1, HE4 and CA125 were evaluated for sensitivity, specificity, accuracy, positive predictive value and negative predictive value. TK1 was analyzed in the cohort for all, pre- and postmenopausal women. For continues variables, the significance of differences was tested by Mann-Whitney U test or Wilcoxon signed-rank test according to comparison of independent samples or paired samples. The Fisher's exact test was used to compare decline rates of TK1 before and after surgery. The McNemar test was utilized for comparing sensitivity, specificity and accuracy of tumor markers. The diagnostic performances of ROMI, ROMA, TK1, HE4 and CA125 were evaluated by the receiver operating characteristic (ROC) curve and the area under the ROC curve (AUC) with 95% confidence intervals (95%CI). When p values were <0.05, the differences among various groups or AUCs were considered as statistically significant.
Results The levels of TK1 in benign masses were significantly higher for premenopausal women than for postmenopausal women (1.23 vs 1.11, p<0.001). For premenopausal women, ROMI had better specificity (0.939 vs 0.816, p=0.002) and accuracy (0.894 vs 0.825, p=0.013) than ROMA and comparable sensitivity (0.846 vs 0.835, p=1.000). Besides, at a set specificity of 0.800, ROMI had better sensitivity (0.901 vs 0.835, p=0.031) than ROMA; For postmenopausal women, ROMI had comparable sensitivity, specificity and accuracy with ROMA. The cut-off values of TK1 were 2.35 pmol/L and 1.27 pmol/L for pre- and postmenopausal women with a pelvic mass, respectively. For all, TK1 was elevated in malignant ovarian tumor group comparing to that in groups of healthy control and benign mass. The preoperative serum level of TK1 reduced significantly after surgery for all (p<0.001), pre- (p<0.001) and postmenopausal (p<0.001) women. Among 106 patients, a total of 31 cases accounting for 93.9% of tested premenopausal patients and 69 cases accounting for 94.5% of tested postmenopausal patients showed a downward trend for TK1 levels when compared to the preoperative levels. The decline rates between pre- and postmenopausal women showed no significant difference (p=1.000). The expression of TK1 was found to be positively correlated with the presence of intrapelvic metastasis (p<0.001), lymphatic metastasis (p<0.001) and distant metastasis (p<0.001). And there was a significant difference of serum levels of TK1 between stage I+II and stage III+IV patients (3.23 vs 13.53, p<0.001).
Conclusions ROMI shows better diagnostic performance than ROMA in distinguishing benign masses and malignant ovarian tumors for premenopausal women. The cut-off values of TK1 differ for pre- and postmenopausal women with a pelvic mass.

PO-0325

外泌体与自身免疫性疾病的发展现状与研究进展

袁成良、曹维维
德阳市人民医院

外泌体作为由细胞膜分泌的细胞外小泡的一种，可被多种免疫以及非免疫细胞分泌。由于其可传递多种来自源细胞的蛋白质，核酸和脂类等，在细胞间的局部和系统的信息交流中起到重要作用。外泌体涉及多种生理过程，广泛地参与到炎症、自身免疫性疾病和肿瘤的发生和发展中。对于外泌体的深入研究有助于我们更完整和系统地了解炎症和免疫反应的发生机制，并在作为疾病的检测和治疗中体现了巨大的潜力。本文主要从外泌体参与免疫反应的过程以及与自身免疫性疾病的关系方面进行探讨。

PO-0326

血清磷脂酰肌醇蛋白聚糖 3 在 HBV 相关 HCC 早诊中价值

刘秀红、姜菲菲、李鑫、李宁、娄金丽
首都医科大学附属北京佑安医院

目的 组织磷脂酰肌醇蛋白聚糖 3（GPC3）表达在 HCC 诊断中起重要作用，但因有创性受到限制。血清 GPC3 在 HCC 早期诊断中的效能，因入组患者、所用试剂和方法等不同而不同。本研究用有望上市的试剂对临床上诊治的患者分层研究，其目的是要明确血清 GPC3 在 HBV 相关 HCC 中早诊价值，为临床诊断提供数据。
方法 收集 2010 年 1 月至 2020 年 9 月，在北京佑安医院就诊的有 HBV 感染的 561 例患者和 154 例健康对照者的血清，其中慢乙肝 75 例、肝硬化 94 例、初治的肝癌患者 392 例，按巴塞罗纳分期分为极早期 69 例、早期 77 例、进展期 182 例、晚期 64 例。AFP 检测是用电化学发光法（Cobase601，德国罗氏，正常值<7ng/mL)；DCP 检测用化学发光酶免疫法（Cobase601，日本富士必欧，正常值<40ng/mL)；使用酶免疫试剂盒（CanAg-Glypican-3 EIA，FUJIREBIO，Diagnostics，Inc.）测定 GPC3。应用受试者操作特征（ROC）曲线分析 AFP、DCP 和 GPC3 的单独和联合诊断 HCC 能力。
结果 当 HCC 和非 HCC 比较时，DCP 的 AUC 为（0.850，95%CI:（0.821-0.879））高于 AFP 和 GPC3；当比较早期 HCC 和非 HCC 时，GPC3 的 AUC 为（0.822，95%CI:（0.759-0.886））高于 AFP 和 DCP。在 HCC、早期 HCC 以及非常早期 HCC 与非 HCC 相比时，AFP+DCP+GPC3 的 AUC 分别为（0.907，95%CI:（0.886-0.929））,（0.822，95%CI:0.781-0.863）和（0.768，95%CI:0.710-0.827），高于任何二者的联合。
结论 GPC3 无论单独还是联合均有从非肝细胞癌中诊断出极早期肝细胞癌的价值。

PO-0327

Decreased peripheral blood ALKBH5 correlates with markers of autoimmune response in systemic lupus erythematosus

罗清、黄自坤、李俊明
南昌大学第一附属医院

Although it has been proved that the epigenetic modification is involved in the pathogenesis of SLE, there is no study to explore whether the modification of m6A in RNA is involved. In this

study, the levels of m6A writers, erasers and readers in peripheral blood were determined by qRT-PCR. The results demonstrated that the levels of METTL3, WTAP, FTO, ALKBH5 and YTHDF2 in peripheral blood from SLE patients were significantly decreased. The levels of ALKBH5 in SLE patients were associated with anti-dsDNA, anti-nucleosome, rash and ulceration. Multivariate logistic regression analysis showed that the level of ALKBH5 is a risk factor of SLE. This study suggests that the mRNA level of ALKBH5 in peripheral blood may involve in pathogenesis of SLE.

PO-0328

Serum exosomal EphA2 is a prognostic biomarker in patients with pancreatic cancer

Qian Wei
Tianjin Medical University Cancer Institute and Hospital

Background Pancreatic cancer (PC) has one of the worst prognoses of malignant diseases. It is of great significance to identify biomarkers with predictive clinical value for its prognosis and recurrence.
Methods In our study, enzyme-linked immunosorbent assays (ELISA) were used to detect the expression of Exo-EphA2 in the serum of PC patients and controls. Kaplan-Meier curve and Cox regression analyses were used to evaluate the prognostic value of Exo-EphA2 expression in patients with primary and recurrent PC.
Results The level of serum Exo-EphA2 was significantly higher in the PC group than in the control group. High expression of Exo-EphA2 in PC was associated with shorter overall survival (OS), and proved to be a significant negative prognostic factor in the multivariate analysis (HR = 1.04, 95%CI: 1.00-1.09, P <0.001). Additionally, we found that the level of serum Exo-EphA2 in recurrent PC patients (first recurrence < 12 months) was positively correlated with the level of Exo-EphA2 at primary diagnosis. Multivariate analysis showed that a high expression of Exo-EphA2 in recurrent PC was associated with shorter recurrence-free survival (RFS) (HR = 1.41, 95% CI: 1.10-1.70, P < 0.001).
Conclusion High expression of serum Exo-EphA2 represents a biomarker of poor prognosis in pancreatic cancer patients.

PO-0329

Prognostic values of tumor immune microenvironment related genes in Ovarian Cancer:A gene expression-based study

Ze Li[1]、jing tian[2]、li ren[1]
1. Tianjin medical university cancer institute and hospital
2. 天津医科大学肿瘤医院妇科肿瘤科

Ovarian cancer is the most common malignant diseases in women and the leading cause of cancer-related death. The high mortality rate of ovarian cancer stems from a variety of factors, such as difficulty in screening, delayed diagnosis and limited treatment options. In The Cancer Genome Atlas (TCGA) ovarian cancer cohort, based on the tumor microenvironment cell infiltration level and immune-related genes, we tried to systematically determine predictive molecular networks and key genes as prognostic markers. We identified 13 nodes(hub-genes) in ovarian cancer, functional annotations indicated that the 13 hub-genes were mostly involved in Cell adhesion molecules (CAMs) , Natural killer cell mediated cytotoxicity， Leukocyte trans endothelial migration , TNF signaling pathway ,Phagosome ,etc.

Kaplan-Meier method indicated that expression of C3AR1, CD86, CXCL10 and FN1 significantly correlated with favorable outcome for OS (p<0.001). Moreover, we found that these genes also correlation with level of immune infiltrates (Macrophages, NK cells, Neutrophils). C3AR1, CD86, CXCL10 were significantly positive correlation with several immune checkpoint genes(PDCD1, PDCD1LG2, CTLA4, CD80)（average correlation coefficient was 0.71）. In summary, we identified genes that are potentially associated with prognosis, while also being correlated with immune checkpoint expression. So, whether it can be used as an evaluation indicator for immunotherapy needs further study.

PO-0330

The Roles of Host Noncoding RNAs in Mycobacterium tuberculosis Infection

Li Wei、Haixin Dong、Qingli Bie、Bin Zhang
Department of Laboratory Medicine, Affiliated Hospital of Jining Medical University, Jining Medical University

Tuberculosis (TB), which is caused by the intracellular pathogen Mycobacterium tuberculosis (M. tuberculosis), remains the leading cause of death from a single infectious agent (ranking higher than HIV/AIDS). Tuberculosis remains a major health problem. Mycobacterium tuberculosis, the causative agent of tuberculosis, can replicate and persist in host cells. Noncoding RNAs (ncRNAs) widely participate in various biological processes, including Mycobacterium tuberculosis infection, and play critical roles in gene regulation. In this review, we summarize the latest reports on ncRNAs (microRNAs, piRNAs, circRNAs and lncRNAs) that regulate the host response against Mycobacterium tuberculosis infection. In the context of host-Mycobacterium tuberculosis interactions, a broad and in-depth understanding of host ncRNA regulatory mechanisms may lead to potential clinical prospects for tuberculosis diagnosis and the development of new antituberculosis therapies.

PO-0331

新型冠状病毒 S 蛋白全长及受体结合区单克隆抗体的制备、鉴定和应用

范笑地、陈满君、余楠、温坤
南方医科大学珠江医院

目的 2019 年 12 月，湖北武汉爆发了由新型冠状病毒（nCoV-19）引起的新冠肺炎（COVID-19）疫情，已在全世界迅速蔓延，对人类的生命健康产生了严重的威胁。新型病毒可藉由刺突蛋白（S）的受体结合区（RBD）与人类细胞膜表面的血管紧张素转化酶 2（ACE2）受体的特异性结合而进入细胞，可诱导中和性抗体的产生。并且 S 蛋白是病毒最大的主要结构蛋白，具有很好的抗原性，有望成为检测 nCoV-19 的重要抗原靶标。因此，制备识别 S 蛋白的单克隆抗体，筛选高中和活性抗体，将成为研究 S 蛋白的结构和功能、发病机制等的重要工具。
方法 采用真核表达具备天然结构的三聚体 S 蛋白和 RBD 区免疫或加强免疫 BALB/c 小鼠，采用传统的杂交瘤细胞融合技术和 ELISA 的方法进行杂交瘤的制备和克隆筛选。进一步采用间接 ELISA、免疫印迹、生物膜层干涉技术（BLI）、细胞实验对抗体的效价、亲和力、识别位点及中和活性进行测定。最后，使用识别不同表位的 S 单抗，尝试各种组合配对，初步建立了双抗体夹心 ELISA 方法检测 nCoV-19 的 S 抗原。
结果 获得 19 株针对 nCoV-19 S 蛋白的单克隆抗体，其中 12 株结合 S 蛋白的 RBD 区，均具有不同程度的中和活性，5 株在体外细胞中和实验中表现出较高中和滴度（>1:320）。IgG 亚类鉴定显示：19 株抗体中，10 株为 IgG1，5 株为 IgG2a，4 株为 IgG2b。18 株 S 蛋白单抗至少识别 4 个以

上抗原位点。10 种优化配对组合检测 S 蛋白灵敏度均达 3.125ng/ml，其中仅 G1 和 G3 两个组合可检测到病毒培养上清液中的病毒抗原，灵敏度可达 10 TCID50/ml。
结论 获得了 nCoV-19 S 蛋白特异性单克隆抗体和具有较高中和活性的抗体，为进一步研究 S 蛋白的结构和功能、开发疫苗和药物等奠定基础。双抗体夹心 ELISA 法检测 S 抗原可做为感染早期诊断方法的一种补充，但其灵敏度仍有待提高。

PO-0332

Serum Nitrotyrosine and Occludin as Biomarkers for Predicting Severity, Hemorrhagic Transformation, and Patient Prognosis in Acute Ischemic Stroke Treated with t-PA Thrombolysis

Bin Wang
Affiliated Hospital of Xuzhou Medical University
徐州医科大学

Background and purpose Acute ischemic stroke (AIS) accounts for 80% to 90% of the total incidence of stroke. The overall prognosis and treatment of ischemia stroke are still unsatisfactory, as t-PA is the only FDA-approved drug, with a narrow treatment time window (4.5hrs). The blood-brain barrier (BBB) damage plays an essential role in cerebral injury and hemorrhagic transformation (HT)after AIS. We investigated the potential role of serum nitrotyrosine and occludin in predicting the severity of AIS, HT (HT), and patient prognosis.
Methods We conducted a correlation analysis study between serum nitrotyrosine and occludin and multiple factors of cerebral injury after t-PA thrombolysis for ischemic stroke in the Affiliated Hospital of Xuzhou Medical University between 2018 and 2020.
The main inclusion criteria in brief: adults, with AIS, receiving t-PA thrombolytic reperfusion therapy. In patients with AIS, serum nitrotyrosine and occludin levels were measured by enzyme-linked immunosorbent assay 24h after t-PA thrombolysis, and the presence and grading of cerebral edema（CED）was assessed by computed tomography, and the presence and grading of HT was assessed by cranial CT or MIR. Clinical outcomes included early neurological function NIHSS (NIH Stroke Scale) and neurological function status at three months. Ordinal regression models and logistic regression models were obtained with adjusted odds ratios and 95% CI(confidence intervals). Receiver operating characteristics analysis in the training cohort was used to define the optimal cutoff values and validated on an independent dataset.
Results We included a total of 594 patients in this research. Serum nitrotyrosine and occludin levels and cerebral injury (CED) adjusted odds ratios were 1.61 [1.34 to 1.93], (P<0.05) and 1.92 [1.61 to 2.43], (P<0.05), respectively; early neurological deterioration (NIHSS) adjusted odds ratios were 1.64 [1.33~1.94], (P<0.05) and 1.95 [1.58~2.24], (P<0.05); adjusted odds ratios for HT were 1.95 [1.58~2.64], (P<0.01) and 1.42 [1.13~1.73], (P<0.05); adjusted odds ratios for 90d functional status were 1.32 [1.01 to 1.53], (P<0.05) and 1.43 [1.18 to 1.74], (P<0.05), respectively. Serum nitrotyrosine and occludin levels were the best predictors of t-PA thrombolysis for AIS, with the area under the curve for nitrotyrosine and occludin being approximately 0.7 and 0.9, respectively.
Conclusions Serum nitrotyrosine and occludin levels in patients with AIS after t-PA thrombolytic reperfusion therapy can be used for the assessment of cerebral injury and HT and to predict the severity of AIS and prognosis after a short period.

PO-0333

Soluble Tim-3/Gal-9 as predictors of adverse outcomes after kidney transplantation: a cohort study

Yan Yang[1]、Lin Yan[2]、Yamei Li[2]、Yi Li[2]
1. West China Clinical Medical College, Sichuan University
2. 四川大学华西医院

Purpose T cell immunoglobulin and mucin domain-3 (Tim-3) and its ligand, galectin-9 (Gal-9), play an important role in immune regulation. Serum soluble Tim-3 (sTim-3) and Gal-9 (sGal-9) were observed to be correlated with renal function after kidney transplantation in our previous study, but whether these two could predict the adverse outcomes after transplantation is unknown.
Methods 91 recipients receiving kidney transplantation were enrolled in this cohort study. The expressions of sTim-3 and sGal-9 before and one month after transplantation were measured by ELISA. 20 of all recipients suffered adverse outcomes (consists of biopsy-proven rejection, graft loss, death and clinical rejection) within two years after kidney transplantation. 71 recipients had stable renal function during this period.
Results The level of sTim-3 before transplantation was significantly higher in recipients with stable renal function than adverse outcomes [Median (range), 2275 (840-4236) pg/mL vs 1589 (353-3094) pg/mL, P=0.002]. The level of sGal-9 after transplantation was significantly lower in stable group than adverse outcome group [Median (range), 4869: (1418-13080) pg/mL vs 6852: (4128-10760) pg/mL, P=0.003]. Area under curve (AUC) of sTim-3 before transplantation was 0.737 (P=0.002) through the analysis of receiver operating characteristic curve (ROC curve). AUC of sGal-9 after transplantation was 0.751 (P=0.003). After survival analysis, the percentage of recipients free from adverse outcomes was significantly lower in patients with low level of sTim-3 than high sTim3 (P<0.0001), so was in patients with high sGal-9 than low sGal-9 (P=0.0004). Post-eGFR had greater diagnosis sensitivity on adverse outcomes than pre-Tim-3 (85.0% vs 71.0%) and had lower sensitivity with post-Gal-9 (85.0% vs 92.9%). While pre-Tim-3 and post-Gal-9 had greater specificity compared with post-eGFR (83.3% vs 43.7% and 59.4% vs 43.7%).
Conclusion Serum sTim-3 and sGal-9 could predict the adverse outcomes within two years after kidney transplantation.

PO-0334

一种位于登革病毒特异性表位多肽筛选及其应用

林亚英
南方医科大学珠江医院

目的 鉴定 I 型登革病毒（denguevirus，DENV）感染病人中 NS1 蛋白 B 细胞表位，并以鉴定得到的 DENV 特异性表位建立一种 IgM 检测方法，探索这种方法在登革热诊断的应用价值。
方法 采用 10 名 2006 年广州地区 1 登革病毒感染病人血清和 1 组覆盖 DENV-1NS1 的重叠多肽（20 肽）反应来定位 I 型登革病毒非结构蛋白 1 上 B 细胞表位。根据筛选结果对阳性多肽进行进一步的生物信息学分析和多肽分析，筛选出具有 DENV 特异性的多肽片段。构建高反应性多肽三聚体-pBVIL1 质粒，在大肠杆菌表达系统制备的重组全长三聚体蛋白，以该重组蛋白作为抗原，建立 DENV IgM 抗体间接 ELISA。用这种方法检测来自同一组 80 例 2014 年 DENV-1 感染患者血清标本和 100 名健康人体检血清标本，并将其检测的敏感性与商品化的 Panbio DENV IgM 抗体捕获 ELISA 试剂盒进行对比.
结果 筛选得到 DENV 保守肽段 269-HLGKLELDF-277 能够识别 DENV 阳性血清。构建该多肽三聚体--pBVIL1 质粒，表达纯化重组蛋白构建间接 ELISA 试剂盒同 2014 年 DENV-1 感染病人血清反应。本研究所提供的 NS269 三聚体抗原能与 2014 年广州登革热疫情中 80 份 DENV-RNA 阳性患者血清（发病后 3-5 天血清）中 68 份发生阳性反应，检出率为 85%，上述 80 份样品采用澳大利

亚 panbio 公司登革热 IgM 捕获试剂盒检测，65 份样品阳性，其中 64 份同本发明提供的 NS269 三聚体抗原检测结果一致，同 panbio 公司登革热 IgM 捕获试剂盒检测结果无差异（P<0.01）。NS269 三聚体抗原与 100 份健康人血清无交叉反应特异性为 100%。

结论 NS269 抗原具有 DENV 特异性的免疫学活性，其检测结果同国外同类产品具有较好的一致性，可用于检测 DENV IgM 抗体，在 DENV 诊断试剂研究中具有一定的应用价值。

PO-0335

Tim-3 on NK Cells Associated with Disease Activity in SLE

Di Zhao
qilu hospital of shandong university

T cell immunoglobulin and mucin domain-containing molecule-3(Tim-3) has been found to play important roles in systemic lupus erythematosus(SLE), but whether Tim-3 is involved in depletion of NK cells in SLE pathogenesis remains unknown. In this study, we firstly observed a decreased proportion of CD3−CD56+ NK cells and an increased proportion of AnnexinV+NKcells in SLE patients. The proportion of AnnexinV+NKcells was positively correlated with anti-dsDNA and SLEDIA. Tim-3 expression on NK cells was up-regulated in SLE patients. Further analysis showed that Tim-3 expression on NK cells was negatively correlated with the proportion of AnnexinV+NKcells, anti-dsDNA and SLEDIA, while positively correlated with the proportion of NK cells.The present results suggest that Tim-3 might participate in the progression of SLE by protecting NK cells from apoptosis and Tim-3 might serve as a potential target for the treatment of SLE.

PO-0336

TIPE2 对肝细胞肝癌生长转移的影响和机制研究

曹雪蕾
山东大学齐鲁医院

目的 肝细胞肝癌是最常见的人类恶性肿瘤之一，其显著特点是容易发生侵袭和转移。因此，寻找能抑制肝癌生长和转移的分子，对肝癌的治疗具有十分重要的价值。TIPE2 是最近新发现的免疫负调控分子，前期研究发现 TIPE2 在人肝细胞肝癌组织中表达下调或缺失，为了明确 TIPE2 在肝细胞肝癌中的作用并阐明其作用机制，我们进行了如下研究。

方法 1. 免疫组化方法检测肝癌组织中 TIPE2 表达，并且分析其与临床病理特征之间的相关性。

2. 将 TIPE2 过表达载体转染入肝癌细胞系，检测细胞增殖、克隆形成以及细胞迁移和侵袭。

3. 建立裸鼠皮下和原位肝癌移植瘤模型，给与 TIPE2 质粒治疗，绘制肿瘤生长曲线，测量肿瘤体积和重量，观察肺转移情况。

4. 免疫共沉淀方法检测 TIPE2 能否与 Rac1 结合，并构建了 TIPE2 突变载体。进行免疫共沉淀并检测 Rac1 的活性。

5. 转染突变载体检测细胞迁移和侵袭，观察细胞骨架以及基质蛋白水解酶的表达。

结果 1. TIPE2 表达与 TNM 分期有显著相关性，TIPE2 表达降低或缺失与肝癌的侵袭转移有关。

2. 转染 TIPE2 后细胞生长明显减缓，克隆形成数明显减少，细胞迁移和侵袭的数量均明显降低。

3. TIPE2 组皮下瘤以及原位肿瘤相比于对照组明显减小，并且发生肺转移的比例降低。

4. 内源性 TIPE2 能够与 Rac1 结合，并且野生型 TIPE2 与 Rac1 的结合会降低
Rac1 的活性，而突变的 TIPE2 与 Rac1 的结合能力降低，并且能逆转其抑制效应。

6. 野生型 TIPE2 能够减少微丝的聚合，并且降低了 MMP9 和 uPA 水平，而突变载体的抑制作用消失。

结论 通过以上实验我们可以得出以下结论，TIPE2 通过 Rac1 通路抑制细胞骨架的聚合以及 MMP9 和 uPA 表达，进而抑制肝癌细胞的转移。

PO-0337

IL-2/4/6 通过自噬调节非对称氨基酸甲基化 90kDa 核蛋白的表达

曹雪蕾
山东大学齐鲁医院

目的 蛋白精氨酸甲基化修饰介导产生非对称性二甲基精氨酸（aDMA）和对称性二甲基精氨酸（sDMA）。目前，肿瘤微环境中低氧、饥饿或细胞因子是否调节 aDMA 或 sDMA 尚未得知。
方法 Western Blot 检测肿瘤细胞中内源性以及应用白介素和（或）雷帕霉素刺激的 aDMA 和 sDMA 修饰蛋白的表达及核定位或自噬关键分子 LC3 的表达。应用甲基化转移酶抑制剂 AdOx 后，Western Blot 检测经白介素处理的乳腺癌细胞中 p90aDMA 和 p70aDMA 的表达。应用自噬抑制剂 3-MA 或自噬相关基因 ATG5 的小干扰后，Western Blot 检测经雷帕霉素处理的乳腺癌细胞中 p90aDMA 和 p70aDMA 的表达。
结果 我们发现 aDMA 或 sDMA 修饰的分子量 70 或 90 kDa 的蛋白 p90aDMA、p70aDMA 和 p90sDMA 广泛表达于乳腺癌细胞系中。值得关注的是白介素 IL-2、IL-4 和 IL-6 而非 IL-8 促进 p90aDMA 而非 p90sDMA 在核中积聚；并且上述效应受到 AdOx 的抑制。这表明肿瘤细胞中内源性蛋白受到 aDMA 的修饰作用。而且，乳腺癌和宫颈癌细胞对低氧、饥饿和雷帕霉素发生应激，导致内源性 aDMA 修饰的蛋白的降解。然而，IL-2/4/6/8 对乳腺癌细胞中基础水平和雷帕霉素诱导的自噬无显著影响。但阻断自噬能逆转雷帕霉素诱导乳腺癌细胞中 p90aDMA 和 p70aDMA 蛋白降解。与之相反，雷帕霉素诱导乳腺癌细胞中 p90sDMA 的聚集。
结论 我们的研究加深了在不同应激反应中精氨酸甲基化调节网络复杂性的认识，并且首次证实了 aDMA 作为选择性自噬降解底物的特异性信号。

PO-0338

Effect of miRNA-200b on the proliferation and apoptosis of cervical cancer cells by targeting RhoA

Lijie He
Tianjin Fifth Central Hospital

Objective The paper aims to investigate the effect of miRNA-200b on the proliferation and apoptosis of cervical cancer cells by targeting RhoA.
Methods HeLa cells of cervical cancer were divided into five groups: blank control group, negative control group (miRNA-200b mimic NC), miRNA-200b mimic group, RhoA negative control group, and RhoA overexpression group. Cells were collected 48 hours after transfection. The expression levels of miRNA-200b were detected by RT-PCR. Target relationship between miRNA-200b and RhoA was verified by dual-luciferase reporter assay. RhoA mRNA and protein expression were detected by Western blot and RT-PCR methods. Flow cytometry was used to detect the apoptosis of cells in each group, and CCK8 method was used to detect the proliferation of cells in each group. The mRNA and protein expression of Bax and cyclin D1 were detected by RT-PCR and Western blot.
Results The results of dual-luciferase reporter assay showed that RhoA was the target gene of microRNA 200b. Compared with the blank control group and the miRNA-200b mimic-NC group, the proportion of apoptotic cells increased significantly in the miRNA-200b mimic group, and the proliferation of cells was inhibited ($P<0.05$). After overexpression of RhoA, the percentage of apoptotic cells decreased and the ability of cell proliferation increased significantly ($P<0.05$).

Conclusion miRNA-200b can inhibit the proliferation and promote the apoptosis of cervical cancer cells by targeting RhoA gene.

PO-0339

Preliminary study of serum Cripto-1 in early diagnosis and therapeutic evaluation of gastric cancer

Xin Zhang
Qilu Hospital of Shandong University

Objective To discuss the application value of serum Cripto-1 in the diagnosis and therapeutic evaluation of gastric cancer, which providing reference for clinics.
Methods From January to June 2018, serum specimens of 79 patients with gastric cancer (gastric cancer group), 42 patients with chronic atrophic gastritis (chronic atrophic gastritis group) and 30 healthy subjects (healthy control group) were collected in Qilu Hospital of Shandong University. Cripto-1 was detected by enzyme-linked immunosorbent assay, and carcinoembryonic antigen (CEA) and sugar chain antigen 724 (CA724) were determined by electrochemical immunoluminescence.
Results Levels of serum Cripto-1 in gastric cancer group, chronic atrophic gastritis group and healthy control group were [3.76（1.42-9.73）]μg/L, [0.71（0.34-0.86）] μg/L and [0.36（0.285-0.515）] μg/L, and a significant difference was observed among 3 groups（P<0.001）. Among them, levels of serum Cripto-1 in gastric cancer group were significantly higher than those in chronic atrophic gastritis group and healthy control group（all P<0.05）; levels in chronic atrophic gastritis group were significantly higher than those in healthy control group（P<0.05）. Levels of serum CEA [3.46（2.15-4.59）] U/L and CA724 [3.45（2.44-4.75）] U/L were only significantly increased in gastric cancer group. The area under the receiver operating characteristic curve for gastritis group diagnosis was 0.818（95%CI：0.747～0.876）, significantly higher than CEA and CA724（all P<0.05）. For gastric cancer patients, serum Cripto-1 were significantly decreased after operation when compared with levels in pre operation （P <0.05）.
Conclusion Serum Cripto-1 is increased in patients with gastric cancer, then declined after operation, with higher diagnostic value than CEA and CA724, which is a potential index for the diagnosis and therapeutic evaluation of gastric cancer.

PO-0340

B7-H3 在习惯性流产患者外周血中的表达探讨

冯萍
苏州大学附属第二医院

目的 通过检测习惯性流产患者外周血单核细胞 B7-H3 的表达，分析 B7-H3 在习惯性流产中的作用，为习惯性流产患者的临床治疗提供理论依据。
方法 采用流式细胞仪检测习惯性流产患者外周血单核细胞 B7-H3，采用酶联免疫吸附实验检测习惯性流产患者血清可溶性 B7-H3（sB7-H3），采用 CBA 方法检测习惯性流产患者血清 Th1/Th2 细胞因子，包括 Th1 型（IL-2、IFN-γ 和 TNF-α）、Th2 型（IL-4、IL-6 和 IL-10）。
结果 （1）习惯性流产患者外周血 CD14+单核细胞比例分别低于正常组、妊娠组和流产且妊娠组，均有显著差异（P＜0.05）；习惯性流产患者外周血 CD14+单核细胞 B7-H3 的表达水平分别明显高于正常组、妊娠组和流产且妊娠组，均有显著差异（P＜0.05）。妊娠女性孕周 3 个月、6 个月、9 个月分别按孕周、年龄分组，B7-H3 的表达水平没有显著差异。习惯性流产组血清 sB7-H3 水平和妊娠组均高于正常组和流产且妊娠组，均有显著差异（P＜0.05）。

（2）流产且妊娠组血清细胞因子 IL-2 分别高于正常组、妊娠组、习惯性流产组，均有显著差异（P＜0.05）；习惯性流产组、流产且妊娠组和妊娠组血清细胞因子 IL-4 均分别低于正常组，有显著差异（P＜0.05）；流产且妊娠组血清细胞因子 IL-6 分别高于正常组、妊娠组、习惯性流产组，均有显著差异（P＜0.05）；流产且妊娠组血清细胞因子 IL-10 分别高于正常组、妊娠组、习惯性流产组，均有显著差异（P＜0.05）。

结论 习惯性流产患者外周血单核细胞 B7-H3 高表达且存在 Th1/Th2 失衡现象，同时 B7-H3 与 IL-4 呈正相关，B7-H3 可能参与了习惯性流产的发病机制。

PO-0341

快速量子点荧光免疫层析法白介素 6 试剂盒的研发

唐劲松
东莞市大朗医院

目的 研发出快速检测白介素 6（IL-6）的量子点荧光免疫层析法试剂盒。

方法 通过量子点荧光材料标记 IL-6 抗体，研发出一种能快速定量检测 IL-6 浓度的量子点免疫荧光层析法试剂盒,通过对不同浓度标准品测量，绘制出标准曲线，计算剂盒的线性检测范围，并验证其灵敏度、回收试验、精密度、特异性、稳定性及与贝克曼 IL-6 发光试剂盒的相关性。

结果 试剂盒线性范围为 10-4000pg/mL，在此线性范围内，试剂盒线性相关系数 r≥0.950；灵敏度≥2pg/mL；在 50pg/mL 浓度的回收率在 90.5%-111.8%，变异系数为 8.57%，在 2500 pg/mL 浓度的回收率在 84.5%-110%，变异系数为 6.99%，在 5000pg/mL 浓度的回收率在 93.5%-106.3%，变异系数为 4.76%； 批内精密度其变异系数（CV）2.2%-3.9%，批间精密度其变异系数（CV）2.4%-5.3%；特异性实验中白介素-4、干扰素 γ 在实验中并未检测到；白介素-1α、白介素-1β、白介素-2、白介素-8 的交叉反应率均小于 0.1%；稳定性试验中试剂卡放在 50℃烘箱中加速破坏 1 周、2 周、3 周、4 周后与常温保存的试剂卡在低、中、高浓度的荧光信号 T/C 值基本没变化；本试剂盒与贝克曼发光法 IL-6 检测试剂盒进行 200 例临床样本检测比对，结果基本一致，回归方程为 y = 0.9894x+2.9985，R2 =0.9971，相关性良好。

结论 本试剂盒灵敏度、准确性、精密度、特异性及稳定性都较好，能够准确、快速的完成临床样品 IL-6 浓度的定量检测。

PO-0342

中国人群类风湿关节炎相关 TGIF rs73620203 基因多态性研究

谭慧玲、张丽静、任如钰、赖红历、王雪安、王莉、杨滨
四川大学华西医院

目的 本研究旨在全面探讨 TGIF 基因多态性（SNPs）与血清骨代谢指标和 RA 易感性的关系。

方法 在本项病例对照研究中，我们通过高分辨率熔解（HRM）分析对 155 例 RA 患者和 168 例健康对照者的 TGIF 基因中的 3 个 SNP 进行基因分型，用电化学发光法检测了 108 名随机选择的 RA 患者的血清骨钙素、骨碱性磷酸酶（BALP）和 βI 型胶原交联的 C 端肽（β-CTX）的含量。

结果 基因型和等位基因频率分析表明，rs73620203 与 RA 骨侵蚀有关（分别为 P = 0.012，P = 0.003），携带 rs73620203 的 T 等位基因的个体显示 RA 风险降低（OR = 0.59，95％CI = 0.42-0.84；P = 0.003）。在针对性别的分析中，rs73620203 多态性与女性 RA 患者的骨侵蚀有关（分别为 P = 0.022，P = 0.006）。 此外，rs73620203 基因座处为 TT 基因型的 RA 患者的血清骨钙素和 BALP 显著低于 CC 和 CT 基因型 RA 患者（分别为 P = 0.006，P = 0.037）。单倍型分析表明，RA 组单倍体 ATG，GCA 频率明显降低（分别为 P = 0.036，OR = 0.693；P = 0.002，OR = 0.189），而单倍体 ACA 频率升高（P = 1.70×10-6，OR = 5.058）。

结论 我们的研究首次表明 rs73620203 基因多态性与 RA 的骨侵蚀有关，并为了解不同性别的 RA 患者 TGIF 基因中的三个 SNP 与骨代谢调节之间的关系提供了新的见解，我们需要扩大样本量并进行进一步的功能实验验证我们的实验结果。

PO-0343

Expression and clinical significance of CXCL10 and CXCL11 in primary biliary cholangitis

Yan Liang[1]、Lin Zhou[1]、Hong Shi[1]、Zhong Renqian[1]、Zaixing Yang[2]
1. Department of Laboratory Diagnostics, Changzheng Hospital, Naval Medical University, Shanghai, China
2. 浙江台州第一人民医院

Objective To determine serum chemokine CXCL10 and CXCL11 and to explore the association with development and progression of PBC.
Methods Sixty PBC patients and thirty healthy controls (HC) were enrolled. The sera were detected for CXCL10 and CXCL11 using multiplex immunoassay. The expression of CD3 in portal areas of liver tissues was determined by immunohistochemistry in 6 PBC patients.
Results Serum concentrations of CXCL10 and CXCL11 were higher in PBC patients than HC (P<0.05). PBC stage and bilirubin were correlated inversely with CXCL11(r=-0.262, -0.315, P=0.043, 0.014). There were significant correlations between serum levels of CXCL10 (r=0.971, P=0.001) and CXCL11 (r=0.883, P=0.020) and CD3 expression within portal areas. In PBC patients, there were significant correlations between CXCL10 and CXCL11(r=0.744, P<0.01).
Conclusion Serum levels of CXCL10 and CXCL11 are increased in PBC patients, which are correlated with infiltration of CD3+T lymphocytes.

PO-0344

应用新型纳米探针检测 α 肿瘤坏死因子的光电化学免疫测定方法

张明明
东南大学附属中大医院

目的 肿瘤坏死因子-α（TNF-α）是一种细胞因子，主要是由单核细胞和巨噬细胞产生，是引发炎症和先天免疫的关键蛋白之一。 TNF-α 是许多疾病的潜在生物标志物，例如类风湿性关节炎、神经变性疾病、肺癌和卵巢癌等，因此 TNF-α 的检测具有非常重要的临床意义。本研究将开发一种高灵敏度高特异性的新方法用以 TNF-α 的检测。
方法 首先，我们选用芘四甲酸二酐衍生物（PTCNH2）作为光活性的光电化学免疫测定探针。 为提高光电化学免疫传感器的性能，氧化石墨烯（GO）被用作纳米载体和电子介体，与 PTCNH2（GO-PTCNH2）形成纳米杂化物，由于此纳米杂化物具有大的表面积，良好的电子传导性和丰富的羧基，故被用于衔接后续的生物分子。在通过其固定在电极上的抗体（抗-TNF-α）捕获 TNF-α 后，由于抗原蛋白的空间位阻和绝缘性，源自 GO-PTCNH2 的光电流强度将降低，由此构建出基于 GO-PTCNH2 的 PEC 免疫传感器。
结果 通过实验数据，我们统计出线性检测范围为 10pg / mL-100ng / mL，检测限（LOD）为 3.33pg / mL。 该方法还成功应用于人血清中 TNF-α 的检测，回收率为 92.5％~96.6％，相对标准偏差小于 9.99％。
结论 本研究开发了一种检测 TNF-α 的简单且经济有效的新方法。PTCNH2 作为主要光电流源，而 GO 通过增加生物分子负载和光电流强度而充当有效的纳米载体和电子介体。实验证明此方法具有显著的可靠性和实用性，可用于实际样品的检测。这种具有高灵敏度和高选择性的光电化学免疫传感器为疾病的早期筛查和诊断提供了希望。

PO-0345

NF-κB 参与细菌感染诱导的 DcR3 表达升高

陈洪卫
上海市松江区中心医院

目的 利用体外细胞实验研究细菌感染诱导 DcR3 表达升高的信号转导机制。
方法 流式细胞术检测细胞表面 Toll 样受体 2（TLR2）和 Toll 样受体 4（TLR4）的表达，脂多糖（LPS）、脂磷壁酸（LTA）以及酵母聚糖（zymosan）刺激细胞以及采用特异性抑制剂阻断 NF-κB 和 MAPK 信号通路后，ELISA 法检测细胞培养上清中 DcR3 的表达，Real-time PCR 法检测细胞内 DcR3 mRNA 表达水平，Western-blot 法检测细胞内 DcR3 蛋白的表达。
结果 HUVEC 细胞表面既表面 TLR2，也表达 TLR4 受体；中，高浓度的 LPS、LTA 以及 zymosan 刺激细胞 24 后，细胞培养上清中 DcR3 的表达较未刺激组明显升高（P<0.05）。细胞内 DcR3 mRNA 和蛋白的表达随刺激时间的延长和浓度的升高也明显升高（P<0.05）。通过阻断 NF-κB 通路，细胞以及上清液中 DcR3 表达较刺激组均明显下降（P<0.05），而阻断 P38 MAPK 通路对细胞及上清液中 DcR3 表达无明显影响。
结论 LPS、LTA 以及 zymosan 通过激活 NF-κB 信号通路诱导 HUVEC 表达 DcR3。

PO-0346

妊娠糖尿病(GDM)患者血清羟自由基（·OH）、谷胱甘肽过氧化物酶(GSH-PX)的变化

徐敏
昆明市延安医院

目的 通过测定正常妊娠妇女和妊娠糖尿病妇女体内羟自由基（·OH）、谷胱甘肽过氧化物酶(GSH-PX)的含量，探究其与氧化应激的关系及在妊娠糖尿病发病中作用。
方法 选取 2017 年 8 月～2018 年 2 月来我院诊治的 GDM 患者 20 例作为实验组，正常孕妇 20 例作为对照组，分别应用分光光度法测定每组抑制羟自由基(·OH)能力和 GSH-PX 的活力。
结果 实验组抑制羟自由基能力较对照组显著升高（P<0．05)、GSH-PX 活力较对照组显著下降（P<0．05)
结论 OH 含量升高，GSH-PX 含量的下降影响着机体的氧化应激状况，对妊娠糖尿病的发生具有重要作用。

PO-0347

血清血脂指标在糖尿病视网膜病变患者中的变化及影响因素

刘真真、邵明希、李圣杰、曹文俊
复旦大学附属眼耳鼻喉科医院

目的 探究血清血脂指标在糖尿病视网膜病变（DR）患者中的变化及影响因素。
方法 采用回顾性病例研究。纳入 2018 年 1 月至 2020 年 12 月在我院眼科确诊的糖尿病视网膜病变患者 146 例（糖网组），同期进行健康体检的年龄、性别匹配的健康体检者 189 例（对照组）。检测两组研究对象外周静脉血清甘油三酯（TG）、总胆固醇（TC）、脂蛋白 A（ApoA）、脂蛋白 B（ApoB）、高密度脂蛋白胆固醇（HDL）、低密度脂蛋白胆固醇（LDL）。两独立样本 t 检验比较两组血脂水平的差异，血脂指标与其他指标的相关性采用 Pearson 相关分析法，多因素 Logistic 回归分析筛选 DR 患者发病的危险因素。

结果 糖网组 TC、ApoA、ApoB、HDL 和 LDL 与对照组相比，均存在显著统计学差异（P<0.05），血清 TG 水平与正常对照组相比无显著统计学差异。Logistic 回归分析提示，ApoA（OR=0.095）、LDL（OR=0.589）、HbA1c（OR=9.234）均是糖尿病性视网膜病变的发病的独立危险因素（P<0.05）。

结论 血脂代谢异常是糖尿病视网膜病变发病的影响因素，加强血脂管理对糖尿病性视网膜病变患者的发病和治疗均有重要的临床意义。

PO-0348

ADAM10-cleaved ephrin-A5 contributes to prostate cancer metastasis

Shibao Li、Chenchen Cai
The Affiliated Hospital of Xuzhou Medical University

ADAM10 promotes the metastasis of prostate cancer, but the specific mechanism is indistinct. In this study, a DU145 cell line with stable overexpression and knockdown of ADAM10 was constructed. Overexpression of ADAM10 significantly promotes cell proliferation, migration, invasion and inhibits apoptosis. At the same time, it is found that ADAM10 can specifically hydrolyze ephrin-A5 and release it outside the cell. Meanwhile, immunofluorescence and immunoprecipitation techniques found that it interacted with EphA3 and ephrin-A5. After overexpression of EphA3, it exerts opposite effects in DU145 (ephrin-A5+) and PC-3 (ephrin-A5±) cell lines. The exogenous ephrin-A5-Fc treatment can reverse its cancer-promoting effect on PC-3 cells and increase the phosphorylation level of EphA3. Tumor-bearing experiments in nude mice showed that, compared with the control group, overexpression of ADAM10 resulted in accelerated growth of the primary tumor in nude mice. The content of ephrin-A5 in the tumor tissue decreased, but increased in the peripheral blood; accompanied by an increase in the expression of CD31 and VEGF in the tissue. Finally, Enzyme-linked immunosorbent assay (ELISA) results indicated that the serum ephrin-A5 content of patients with metastatic prostate cancer was significantly higher than that of the non-metastatic group (P<0.05). ROC curve showed that the AUC of serum ephrin-A5 as a marker for identifying prostate cancer metastasis was 0.843, with a sensitivity of 93.5% and a specificity of 75%. The above results indicate that in the progression of prostate cancer, ADAM10 can cleave ephrin-A5 to promote prostate cancer metastasis, and ephrin-A5 released into the blood can be used as a new biomarker for prostate cancer metastasis.

PO-0349

Dysregulated expression of long noncoding RNA KIAA1586-2:1 serves as a diagnostic biomarkers of gastric cancer

Haoliang Zhang
Affiliated Hospital of Xuzhou Medical University

Object Detect the expression level of exosomal long non-coding RNA lnc-KIAA1586-2:1 in the plasma of gastric cancer patients and evaluate its diagnostic value as a marker.

Methods In this study, HiPure Exosome RNA kits was used to extract plasma exosomes, and then extracted total exosome RNA, following we used western blotting and particle size analysis to identify exosomes. The expression of lnc-KIAA1586-2:1 in plasma exosomes of 29 healthy people and 63 gastric cancer patients was first detected by real-time quantitative reverse transcription PCR (qRT-PCR), and the relationship between the expression level and

clinicopathological parameters was analyzed .Finally, a receiver operating characteristic curves（ROC curve）was used to evaluate the clinical value of lnc-KIAA1586-2:1 as a diagnostic marker for gastric cancer.
Results Western blotting and particle size analysis showed successful separation of plasma exosomes. qRT-PCR results revealed that compared with the healthy control group, lnc-KIAA1586-2:1expression level in plasma exosomes of gastric cancer patients was significantly down-regulated(P<0.05), and the area under the ROC curve (AUC) was up to 0.710. lnc-KIAA1586-2:1 expression level was not correlated with age (P=0.7848), gender(P=0.3211), or lymphatic metastasis(P=0.4879), but with tumor size(P=0.0189), TNM stage(P=0.0056), and venous invasion (P=0.0367).
Conclusions Our experimental data suggest that lnc-KIAA1586-2:1 may performs a vital role in the progression of gastric cancer and is expected to be used as an assistant marker for early diagnosis of gastric cancer.

PO-0350

慢性非传染性疾病中 DAMPs 的表达及免疫状态研究

杨欢[1,2]、陈星[1,2]、李思进[1]、李慧洋[1]、任碧琼[1,2]
1. 湖南中医药大学临床医学院
2. 湖南省脑科医院

目的 探讨损伤相关分子模式（DAMPs）分子在慢性非传染性疾病（NCD）中的表达水平，同时分析各 NCD 组中 Th1、Th2 及 Th17 分泌的相关细胞因子 IFN-γ、TNF-α、IL-4、IL-6、IL-10、IL-17 表达水平并探讨 DAMPs 水平与细胞因子表达的关系，分析 DAMP 分子在疾病中激活机体免疫类型，为慢性病的预防和治疗及延缓衰老方面提供新思路。
方法 选择 2019 年 1 月至 2020 年 12 月湖南省第二人民医院明确诊断的 NCD 患者 101 名，包括 2 型糖尿病 30 名，H 型高血压 27 名，阿尔茨海默病 21 名，帕金森病 23 名，同期健康对照组 23 名。采用化学发光、免疫比浊、免疫增强比浊方法分别检测血清 S100、CRP、SAA 及 UA 水平，采用流式细胞术检测细胞因子 IFN-γ、TNF-α、IL-4、IL-6、IL-10、IL-17 水平。
结果 1. 2 型糖尿病组与 H 型高血压组血清 CRP、SAA 及 UA 水平均高于健康组，而血清 S100 水平无显著性差异。阿尔茨海默病组与帕金森病组血清 SAA 水平高于健康组，血清 S100、CRP、UA 水平无显著性差异。2. 2 型糖尿病组血清 IL-17 水平高于健康对照组，血清 IL-6、IL-10、IFN-γ 及 IL-4 无差异。H 型高血压组血清 IL-6、IL-10、IFN-γ 及 IL-17 均高于健康对照组(P< 0.05），血清 IL-4 差异无统计学意义。阿尔茨海默病组血清 IL-6、IL-10、IFN-γ、IL-17 及 IL-4 均高于健康组。帕金森病组血清 IL-6 及 IL-17 均高于健康组，血清 IL-10、IFN-γ 及 IL-4 水平差异无统计学意义。2 型糖尿病组中血清 SAA 与 IL-17、UA 与 IL-17、UA 与 IFN-γ 呈正相关；H 型高血压病组中血清 UA 与 IFN-γ 呈正相关；阿尔茨海默病组血清 CRP 与 IL-6 呈正相关关系；帕金森病组中血清 CRP 与 IL-6、CRP 与 IL-17 呈正相关，血清 SAA 与 IL-10 呈正相关关系，其余各指标之间无相关性。
结论 DAMPs 分子 S100、CRP、SAA 及 UA 在 NCD 中均有一定程度的升高；各 NCD 组的免疫激活类型不同，2 型糖尿病仅细胞因子 IL-17 水平升高；H 型高血压中 IFN-γ、IL-6、IL-10 及 IL-17 升高，阿尔茨海默病中 IFN-γ、IL-4、IL-6、IL-10 及 IL-17 均升高，Th1、Th2 及 Th17 细胞均被激活；帕金森病中 IL-6 及 IL-17 升高，Th2 及 Th17 细胞被激活，但未见 Th1 细胞激活的依据；DAMPs 分子介导的慢性炎症反应参与年龄相关疾病的发生发展，调控机体慢性炎症，本研究为 NCD 的防治及延缓衰老提供新思路。

PO-0351

基于数据挖掘研究血小板数量对血清钾的影响及解决方案

张好良[1]、夏良裕[2]
1. 徐州医科大学附属医院
2. 中国医学科学院北京协和医院

目的 为探究血小板数量对血清钾的影响并提供血清钾报告审核的解决方案。
方法 将同时送检血常规和血清生化或血浆生化的患者数据进行于大数据挖掘。利用决策树模型对血小板血清钾或血浆钾和进行分析，进一步根据血小板数量分为 A 组≤100×109/L、B 组（101-350）×109/L、C 组（351-500）×109/L、D 组>500×109/L 进行血清和血浆钾的验证，分别研究血清钾和血浆钾与血小板的关系。在实验室信息系统中将血小板数量与血清钾或血浆钾进行关联。
结果 决策树模型显示，血清钾随着血小板数量的增加显著升高（P<0.001），而血浆钾无明显增减。血清钾与血浆钾组间比较有统计学意义（P<0.001）。A、B、C、D 分组血清钾分别是（4.06±0.45）mmol/L、（4.19±0.35）mmol/L、（4.33±0.37）mmol/L、（4.54±0.46）mmol/L，组间相比 P 均<0.001，血浆钾分别是（3.86±0.50）mmol/L、（3.87±0.41）mmol/L、（3.81±0.41）mmol/L、（3.83±0.53）mmol/L，组间比较无统计学意义。血清钾与血小板数量呈（r=0.381）、血小板压积（r=0.384）正相关，与血小板其他参数不相关。血清钾与血小板数量的回归方程为 y=0.001x+4.06。报告审核时实验室信息系统对血小板>500×109/L 的血清钾结果进行拦截并添加备注。
结论 血小板增多症对血清钾有正干扰。血清钾和血浆钾应分别设置参考区间。实验室信息系统可即时拦截血清钾的报告审核并增加检验备注或通知临床医生进行血浆钾或血气钾的检测，避免假性高钾报告的发出。

PO-0352

乳胶增强免疫比浊法检测血清脂联素的性能评价

王黎[1]、蒋慧[1,2,3]、胡帅[1]、何仁栋[1,2,3]、郭斌[1,2,3]、雷燕[1,2,3]
1. 川北医学院附属医院检验科
2. 川北医学院医学检验系
3. 川北医学院转化医学研究中心

目的 脂联素（Adiponectin, ADPN）是脂肪细胞分泌的一种蛋白质激素，通过调控葡萄糖和脂质代谢来参与代谢过程，具有多种生理功能，包括抗炎症、抗动脉粥样硬化、调节胰岛素敏感性，在肥胖、胰岛素抵抗、心血管疾病、糖尿病、代谢综合征、骨关节炎、类风湿性关节炎等疾病中发挥重要作用。本文对乳胶增强免疫比浊法定量检测血清 ADPN 进行方法学评价，判断其是否满足临床检测需要。
方法 参考相关标准评价方法对免疫比浊法检测血清 ADPN 的精密度、正确度、回收实验、线性范围、临床可报告范围、干扰实验、生物参考区间进行评价。
结果 乳胶增强免疫比浊法测定血清 ADPN 的低水平质控品批内和批间变异系数分别为 3.36%和 4.55%，高水平质控品批内和批间变异系数分别为 3.39%和 5.46%，精密度良好；不同批号校准品相对偏差均在<10%可接受范围内，正确度验证通过；回收率为 96.17%~104.04%；血清 ADPN 水平在 1.12-40ug/mL，回归方程 Y=1.0058X-0.5043，r2=0.9987，符合厂家要求，检测线性良好；临床可报告范围上限为 400ug/mL，最大稀释倍数为 10 倍；当样本中胆红素≤40mg/dL、甘油三脂≤1000mg/dL、血红蛋白≤1000mg/dL 时对该方法检测血清 ADPN 无干扰；血清 ADPN 生物参考区间（女姓≥5 ug/mL；男性≥4 ug/mL）验证通过。
结论 乳胶增强免疫比浊法测定血清 ADPN，精密度良好，检测线性范围宽，干扰因素较小，满足临床实验室的基本要求，可为临床提供可靠检测结果。

PO-0353

Lp-PLA2 和 D-二聚体在急性非 ST 段抬高型心肌梗死患者中的表达

石秀芳、敖家富
亳州市人民医院

目的 分析急性非 ST 段抬高型心肌梗死（NSTEMI）患者中血清脂蛋白相关磷脂酶 A2（Lp-PLA2）和血浆 D-二聚体的表达变化及意义。
方法 收集 2019 年 5 月至 2020 年 4 月亳州市人民医院心内科确诊冠心病的 94 例患者，其中急性非 ST 段抬高型心肌梗死（NSTEMI）患者 32 例，急性 ST 段抬高型心肌梗死（STEMI）患者 32 例，不稳定型心绞痛（UAP）患者 30 例。收集一般资料及相关检查结果，并进行血清低密度脂蛋白胆固醇(LDL)、血清脂蛋白相关磷脂酶 A2（Lp-PLA2）和 D-二聚体检测，并对检测数据进行统计分析。
结果 NSTEMI 组、STEMI 组和 UAP 组的 Lp-PLA2 和 D-二聚体水平组间比较，差异均具有统计学意义（ P＜0.05 ），血清 LDL 在三组间表达水平差异无统计学意义(P＞0. 05)；冠状动脉病变支数一支病变组、二支病变组、多支病变组间比较，血清 LDL，Lp-PLA2 和 D-二聚体水平组间差异均无统计学意义(P＞0. 05)。
结论 Lp-PLA2 和 D-二聚体表达水平在三组间的明显差异，结合传统的生物学标志物，有助于 NSTEMI 患者预防和诊疗，但与冠状动脉狭窄程度没有相关性。

PO-0354

血液灌流联合高通量血液透析对不同年龄阶段尿毒症患者钙磷代谢和肾功能的影响

谌亚星
四川省人民医院

目的 血液透析是临床治疗肾衰竭的重要方法之一，本研究旨在探讨血液灌流联合高通量血液透析对不同年龄阶段尿毒症患者钙磷代谢和肾功能的影响。
方法 纳入 2020 年 3 月至 2021 年 3 月于四川省人民医院进行进行血液灌流联合高通量血液透析治疗超过 3 个月以上，每周 2-3 次患者，四个年龄阶段（<30 岁，30-40 岁，40-50 岁，>50 岁）各 80 例为研究对象,划分比较不同年龄阶段患者透析前后肾功能指标和钙磷代谢指标变化情况。入选的所有患者在入选后进行透析前后分别使用全自动生化分析仪检测血清钙、血清磷、血清尿素氮、血清肌酐及血清胱抑素 C。
结果 血液灌流联合高通量血液透析治疗前后患者血尿素氮、血清肌酐、血清磷、血清钙水平比较差异具有统计学意义（均 P<0.05）,血清胱抑素 C 水平比较差异无统计学意义。且在不同年龄差异更明显，年龄越小低透析治疗前后患者血尿素氮、血清肌酐、血清磷、血清钙水平比较差异越大，透析效果越好。
结论 血液灌流联合高通量血液透析对年级越小的尿毒症患者治疗效果较好,且能调节患者钙磷代谢,保护肾功能。

PO-0355

脂代谢在过敏性紫癜患儿疾病进展中的意义研究

张益多
四川大学华西第二医院

目的 研究血清中脂类物质代谢在过敏性紫癜患儿疾病进展中的变化，分析脂类物质检测在过敏性紫癜疾病进展过程中的临床应用价值。
方法 选取 2018 年 1 月至 2019 年 12 月，在我院就诊的过敏性紫癜患儿 32 例，过敏性紫癜康复患儿 26 例，同时选取紫癜性肾炎（HSPN）患儿 12 例，分别对血清中高密度脂蛋白胆固醇（HDL-C）、低密度脂蛋白胆固醇（LDL-C）、总胆固醇（TC）、甘油三酯（TG）、载脂蛋白 AI（Apo AI）、载脂蛋白 B（Apo B）以及甘油三酯-空腹血糖指数（TyG）进行检测，比较不同组之间血清中脂类代谢物质含量的差异，同时对脂类物质在过敏性紫癜疾病进展中的诊断价值进行分析。
结果 三组受试者在年龄、性别组成中不存在明显差异（P>0.05）。HSPN 组患儿血清中 HDL-C、LDL-C、TC、Apo A1、Apo B 以及 TyG 明显高于过敏性紫癜组以及过敏性紫癜恢复组，具有显著差异(P<0.05)。HSPN 组患儿血清中 TG 与过敏性紫癜组以及过敏性紫癜恢复组不存在明显变化（P>0.05）。过敏性紫癜组相比较过敏性紫癜恢复组血清中脂类物质水平均没有明显差异（P>0.05）。HDL-C、LDL-C、TC、Apo AI、Apo B 以及 TyG ROC 曲线下面积（AUC）分别为 0.667，0.614，0.690，0.680，0.631，0.644，cut-off 值分别为 1.495mmol/L，4.48mmol/L，5.375 mmol/L，1.495 g/L，1.18 g/L，8.77。
结论 血清中脂类物质代谢和过敏性紫癜进展过程密切相关，HDL-C、LDL-C、TC、Apo A1、Apo B 以及 TyG 对于紫癜性肾炎的诊断以及鉴别诊断具有较好临床意义，可以用于临床对于过敏性紫癜疾病进展情况的判断和治疗预后分析。

PO-0356

Simple and efficient methods for simultaneous extraction and determination of 11 water-soluble vitamins in plasma by LS/MS

Weikang Li
Guangdong Provincial Chinese medicine hospital

Purpose Targeted metabolic profiling characterized by complementary platforms, multiplexing, and low volume consumption is increasingly used for studies using biobank material. Using liquid-liquid extraction, we developed a sample workup suitable for quantification of 11 water-soluble vitamins simultaneously.
Method 200µL plasma was mixed with 1ml ethyl acetate after adding corresponding internal standard. After some process and removing the upper layer, the remaining aqueous fraction was mixed with 500µl MeOH:AcN(v:v=50:50) and go through the same process followed by evaporating by nitrogen flow with the upper layer liquid. Afte dissolved with 500µL 1% FA water and filtered with a 0.22µm water filtration membrane, the sample was injected using an autosampler, and the injection volume was 5µL. Isotope-labeled internal standards were used for all analytes. Chromatographic run times for the LC-MS/MS were 6 minutes.
Results The linear range for Thiamine Hydrochloride, Riboflavin, Nicotinic acid, Nicotinamide, Pyridoxine hydrochloride, D-Biotin, Folic acid and Cyanocobalamin were 0.1-50ng/ml; D-Pantothenic acid hemicalcium salt and Pyridoxamine dihydrochloride were 1-200ng/ml; L-Ascorbic acid was 0.1-100µg/ml. The lower limits of quantification and detection were lower than endogenous concentrations. Recoveries rate ranged from 25.81 - 134.72% of all analytes. The CV of inter-day precision and intra-day precision were 0.66 - 8.27%, 0.28 - 6.12 respectively. No significant evidence of potential carry-over effect and matrix effect was observed.

Conclusion This low-volume, high-throughput multianalyte assay shows good performance and convenience, and currently use in our laboratory for the quantification of 11 water-soluble vitamins in plasma to provide supplementary advice for clinic diagnosis.

PO-0357

识别 HDL 亚类的 ApoA1 单抗对冠心病的辅助诊断价值

丁慧、王寅
上海市交通大学医学院附属同仁医院

目的 探讨能识别高密度脂蛋白（HDL）亚类的载脂蛋白 A1（ApoA1）单抗对冠心病的辅助诊断价值及与冠心病的关联性。
方法 检测 180 例经冠脉造影确诊的冠心病患者和 199 例体检健康者（正常对照组）血清 ApoA1 单抗和多抗水平。采用 t 检验比较 ApoA1 单抗和多抗检测结果在组间的差异。采用 Pearson's 相关系数分析 ApoA1 单抗和多抗检测结果与冠心病的相关性。使用受试者工作特征（ROC）曲线评价二者对冠心病的辅助诊断价值。根据得出的最佳临界值比较 ApoA1 单抗和多抗的敏感性和特异性。引入常规危险因素（年龄、性别、糖尿病、高血压、血脂异常、吸烟）进行校正，采用非条件 Logistic 回归分析评估 ApoA1 单抗作为冠心病危险因素的价值及与冠心病的关联强度。
结果 筛选出一株组间检测结果具有显著性差异的 ApoA1 单抗（P＜0.001）。冠心病组 ApoA1 单抗检测结果明显高于对照组（P＜0.001），与冠心病显著正相关（r=0.229, P<0.001）；而 ApoA1 多抗检测结果明显低于对照组（P＜0.001），与冠心病显著负相关（r=-0.344, P<0.001）。ApoA1 单抗和多抗检测结果的 ROC 曲线下面积分别为 0.729 和 0.624，且单抗检测结果的灵敏度和特异性均优于多抗检测结果（0.696>0.563，0.634>0.558)。非条件 Logistic 回归分析显示 ApoA1 单抗和多抗检测的比值比（OR）分别为 3.25 和 0.245，95%可信区间（CI）为 1.75-6.05 和 0.028-2.160。
结论 ApoA1 单抗可甄别与冠心病正相关的 HDL 亚类，对冠心病有一定的辅助诊断价值，是冠心病的危险因素。

PO-0358

Serum microRNA expression patterns in subjects after five kilometers' exercise are strongly associated with cardiovascular adaptation

Dandan Li
Department of Clinical Laboratory, Jinling hospital, Nanjing University School of Medicine, 1Nanjing, China

Emerging evidence indicate that circulating microRNAs (miRNAs) are dysregulated during exercise. However, the changes of specific serum miRNAs during Five kilometers' run test and their association with traditional cardiovascular related indicators have not been well-characterized. A total of 240 venous blood samples were collected before and after the five kilometers' run test from 120 young subjects. The serum levels of miR-1, miR-21, miR-146a, miR-155, miR-181 and miR-210 were detected by reverse transcription-quantitative PCR (RT-qPCR). Besides, the levels of cardiac Troponin I (cTNI), myoglobin (Myo), creatine kinase (CK), creatine isoenzyme (CK-MB), aspartate aminotransferase (AST), lactate dehydrogenase (LDH), ischemic modified albumin (IMA), interleukin-6 (IL-6), and C-reactive protein (CRP) were also determined by automatic biochemistry analyzer. The correlation between serum miRNAs' levels and biochemical parameters were also analyzed. The levels of miR-1, miR-146a, miR-155, miR-181 and miR-210 were significantly increased in the serum of the subjects after five kilometers' run test as compared with resting state. Serum levels of miR-146a, miR-155 and miR-210 after five

kilometers' run test were positively correlated with Myo, CK-MB and LDH respectively, while miR-1, miR-146a, miR-181 and miR-155 were positively correlated with the levels of IL-6. Additionally, all the 5 miRNAs were negatively correlated with IMA levels. Multivariate logistic regression analysis showed that high levels of miR-146a, AST, LDH and IL-6 in serum were risk factors, while low IMA contents was a protective factor for cardiovascular adaptation during exercise. In conclusion, the dynamic changes of miRNAs under the condition of high intensity training contribute to the adaptive regulation of the body's cardiovascular function.

PO-0359

Covid-19 无症状感染者与症状前感染者实验室指标特征分析及风险分层模型的建立

李卫巍、夏欣一
中国人民解放军东部战区总医院

目的 区分 COVID-19 无症状感染者、非重症症状前患者和重症症状前患者有助于优化临床风险分层管理，改善预后。目前尚未有报道利用常规实验室指标对无症状和症状前 COVID-19 患者进行分层研究。
方法 收集 2020 年 2 月 4 日至 2020 年 4 月 10 日在武汉火神山医院住院的 COVID-19 患者。回顾性分析病例资料，对患者进行分类，所有患者被分为无症状、症状前感染或有症状。一共纳入 39 例无症状患者，34 例症状前患者，最终进展为非重症 9 例和重症 25 例，25 例中 ICU 入住率和死亡率分别为 8.3%和 3%，2907 个有症状（非重症 n=1385；重症 n=1522）的病人。用 63 个实验室指标构建风险分层模型。无症状患者疾病进展是由入院时的风险分层定义。
结果 根据实验室指标分析得出非重症症状前患者与重症症状前患者具有系统差异。因此，我们构造了二步法风险分层模型。第一步，区分症状前患者和无症状患者的 ROC 曲线平均 AUC=0.89（95%可信区间 0.81 ~ 0.98），所用实验室指标贡献度前 5（脑利钠肽 BNP、IgG、IgM、葡萄糖、D 二聚体）。第二部，对重症和非重症症状前患者进行临床预后进一步分层（曲线下面积 0.82），所用指标贡献度前 5（脑利钠肽 BNP、IgG、IgM、降钙素原、白/球蛋白比）。结果提示，应用实验室指标对无症状和症状前的 COVID-19 患者进行分层是可行的，该风险分层模型可用于筛查入院时的非重症和重症症状前患者。
结论 本研究建立的两步风险分层模型，以 10 项实验室指标为基础，对症状前患者和无症状患者进行初步区分，并进一步根据疾病严重程度对患者进行分层。该模型有助于尽早识别无症状 COVID-19 患者，并预测疾病严重程度，进行适当的临床管理。

PO-0360

比较不同高敏肌钙蛋白作为健康人群选择标准对 NT-proBNP 参考范围的影响

李阳、蔺亚惠、周洲
中国医学科学院阜外医院

目的 比较将高敏肌钙蛋白 I（hs-cTnI）和 T（hs-cTnT）高于第 99 百分位参考上限（99th URL）单独和联合作为健康人群选择标准时对 NT-proBNP 参考范围的影响。
方法 收集 1578 例院内健康管理中心表观健康人，依据 AACC 与 IFCC 联合共识中关于建立 NT-proBNP 参考区间的纳入排除条件剔除不符合条件样本后，最终纳入 1222 例。年龄 21-85 岁，男性 860 例，女性 362 例。按年龄分为 5 组（21-40 岁、41-50 岁、51-60 岁、61-70 岁、＞70 岁）。

用罗氏 Cobas E602 测定 NT-proBNP 和 hs-cTnT 的浓度，用雅培 i2000 检测 hs-cTnI 的浓度。按照 WS/T 402-2012 要求统计结果。
结果 将 hs-cTnI≥99th URL 作为健康人排除标准时男、女性 NT-proBNP 参考区间分别为 2.5-315.0ng/ml 和 2.5-469.5ng/ml，将 hs-cTnT≥99th URL 纳入后分别为 2.5-196.8ng/ml 和 2.5-337.9ng/ml，而不用 hs-cTn 排除时参考区间上限较高，分别为 2.5-351.1ng/ml 和 2.5-468.1ng/ml。若将 hs-cTnI 和 T 均纳入后参考区间上限无显著变化，分别为 2.5-197.6ng/ml 和 2.5-344.0ng/ml。按照年龄分组后，不考虑 hs-cTn 作为入选标准，年龄从小到大各组参考区间分别为 2.5-91.2ng/ml、2.5-154.9ng/ml、2.5-385.9ng/ml、5.0-327.5ng/ml 和 30.2-2150.8ng/ml。考虑 hs-cTnI 作为入选标准时，分别为 2.5-91.2ng/ml、2.5-154.7ng/ml、2.5-350.8ng/ml、4.8-327.6ng/ml 和 30.2-2150.8ng/ml；考虑 hs-cTnT 作为入选标准时，分别为 2.5-91.3ng/ml、2.5-141.1ng/ml、2.5-262.0ng/ml、4.6-327.8ng/ml 和 29.5-1525.3ng/ml；考虑 hs-cTnI 和 T 同时作为入选标准时，分别为 2.5-91.3ng/ml、2.5-137.3ng/ml、2.5-264.5ng/ml、4.5-327.8 ng/ml 和 29.5-1525.3ng/ml。
结论 将 hs-cTnI 和 T≥99th URL 单独和联合作为健康人群选择标准时显著影响 NT-proBNP 参考范围，纳入后总体、男性和女性的参考上限均逐渐降低，尤其对于 41-50 岁和 51-60 岁两组的参考上限降低更为明显。同时结果显示 hs-cTnT 的影响更为显著。

PO-0361

New biomarker LncRNA AL355711 promotes atherosclerosis

Chunmin Kang、Xianzhang Huang
The Second Affiliated Hospital of Guangzhou University of Chinese Medicine

Background and aims Atherosclerosis and related cardiovascular diseases are the greatest threats to human health worldwide. Vascular smooth muscle cells (VSMCs) contribute at least 50% of atheroma foam cells, and the first step is migration in human atherosclerotic lesions. Long noncoding RNAs (lncRNAs) have emerged as significant players in almost every diverse biological process. This study aimed to investigate the role of lncRNA in VSMCs.
Methods The expression of lncRNA or mRNA was detected using real-time quantitative fluorescence polymerase chain reaction. The Gene Expression Omnibus (GEO) DataSets in the NCBI portal were searched using the key words of “Atherosclerosis AND tissue AND and Homo sapiens” and datasets GSE12288, which measured the gene expressions from circulating leukocytes identifies patients with coronary artery disease or controls, was used to analysis the correlation coefficient and the expression profile. The protein level of ABCG1 and matrix metalloproteinase (MMP)3 was determined by immunohistochemistry and western blot analysis. The analysis of mouse aortic roots was performed using Masson stain and oil red O stain.
Results The expression of lncRNA AL355711, ABCG1 and MMP3 was higher in human atherosclerotic plaques or atherosclerotic coronary artery disease (CAD). Correlation analysis revealed that ABCG1 may be involved in the regulation between lncRNA AL355711 and MMP3 in atherosclerotic CAD. Knockdown of lncRNA AL355711 inhibited ABCG1 transcription and smooth muscle cell migration. In addition lncRNA AL355711 was found to regulate MMP3 expression through the ABCG1 pathway. The expression of ABCG1 and MMP3 was high in an animal model of atherosclerosis.
Conclusions The results indicated that lncRNA AL355711 promoted VSMC migration and atherosclerosis via the ABCG1/MMP3 pathway. The inhibition of lncRNA AL355711 might serve as a novel therapeutic target for atherosclerosis and lncRNA AL355711 in circulating leukocytes may be a new biomarker for atherosclerotic CVD.

PO-0362

中国南部地区脂蛋白相关磷脂酶 A2 水平及与经典心血管疾病标志物相关性初探

赵晶晶、张鹏、郑磊
南方医科大学南方医院

目的 探究中国南部地区多中心及不同性别、不同年龄段间脂蛋白相关磷脂酶 A2（Lipoprotein associated phospholipase A2，Lp-PLA2）水平差异，以及 Lp-PLA2 与常用的心血管标志物低密度脂蛋白胆固醇（Low density lipoprotein cholesterol，LDL-C）、超敏 C 反应蛋白（Hypersensitive C-reactive protein，hs-CRP）的相关性。

方法 纳入八所中国南部地区一线三甲医院健康人群的血清标本 2318 例，检测 Lp-PLA2 水平，对不同性别、年龄及不同中心的结果进行分析，并将 LP-PLA2 结果与经典心血管风险标志物 LDL-C（血脂水平）和 hs-CRP 的结果相关性进行分析。

结果 中国南部地区 2318 例健康志愿者 Lp-PLA2 平均值为 145.84ng/mL，参考区间上限为 217.93ng/mL，其中男性（1205 例）平均值为 152.13ng/mL，女性（1113 例）平均值为 139.03ng/mL，差异有统计学意义（$p<0.05$）；50 岁以下年龄组与 50-59 岁、60-69 岁及 70-79 岁三个年龄分组间差异有统计学意义（$p<0.05$），与 80 岁以上年龄段之间无明显差异，但无需根据年龄和性别设立独立的参考区间。各中心 Lp-PLA2 均值水平有所差异，其中海南省人民医院 Lp-PLA2 均值水平最高（157.67 ng/mL），福建医科大学附属协和医院 Lp-PLA2 均值水平最低（135.21 ng/mL）。相关性采分析结果提示 Lp-PLA2 和 LDL-C 以及 hs-CRP 分别都具有显著相关性。

结论 本课题对健康人群中研究通过大数据调查分析建立了中国南部地区健康人群 Lp-PLA2 水平 95% 参考区间，对 Lp-PLA2 与血脂和 Hs-CRP 相关性进行了初步探讨。

PO-0363

不同保存时间的脑脊液中外泌体生物学特性的对比

朱迎星
徐州医科大学附属医院

目的 脑脊液外泌体对于神经系统疾病的诊断和治疗具有不可比拟的优势,但其保存**方法** 、保存时间、保存效果的评估研究较少.文章旨在观察不同保存时间的脑脊液中外泌体的大小、密度、形态、总 RNA 量及标志蛋白表达有无改变。

方法 使用 Exoquick 试剂盒分别提取新鲜及保存在-80℃冰箱 1 年、3 年、5 年的脑脊液中的外泌体;使用纳米粒度颗粒跟踪分析仪对提取的外泌体进行粒径分析;使用透射电镜对提取的外泌体的形态进行观察;试剂盒提取脑脊液外泌体总 RNA,使用 NanoDrop ND-1000 对 total RNA 质量进行检测;Western blot 检测外泌体标志物 TSG101 和 CD63 的表达改变。

结果 保存时间达 5 年的脑脊液中的外泌体粒径较大(40～220 nm);电镜下不同保存时间的脑脊液中外泌体形态变化不明显;随着保存时间的延长,脑脊液中外泌体总 RNA 量降低，同时蛋白 TSG101 及 CD63 含量也发生降低,其中 CD63 降低尤其明显。

结论 不同保存时间的脑脊液中外泌体粒径及形态变化差异不大,但其内含 RNA 及蛋白标志物随着时间延长发生明显减少,因此进行外泌体 RNA 及蛋白的相关研究时推荐新鲜提取立即实验。

PO-0364

Corin 在顺铂引起肾脏毒性中的作用研究

薛美婷
天津医科大学肿瘤医院

顺铂是一种用于化疗的抗肿瘤药物，它对多种癌症有效。但由于顺铂引起的以肾毒性为首的毒性作用，其临床应用受到了很大限制。然而，顺铂引起肾脏毒性的具体机制，目前尚不完全清楚。因此研究顺铂引起肾脏毒性具体机制并且找到有效预防手段迫在眉睫。Corin 是一种 II 型跨膜丝氨酸蛋白酶，主要表达在心脏，在肾脏的表达仅次于心脏。Corin 的生物学功能是将 pro-ANP 转化成具有生物学活性的 ANP。我们之前的研究发现 Corin 参与了肾脏疾病发病以及进展，Corin 通过 MAPK 和 eNOS 信号通路在糖尿病肾病内皮功能障碍中起保护作用，因此 Corin 可能作为肾脏疾病的生物标志物。研究表明顺铂通过亚硝化应激、氧化应激、炎症、凋亡、调节内皮功能等途径引起肾脏毒性，并且 Corin-proANP 活化途径与这些信号通路有一定的相关性。我们通过诱导 Corin 敲除小鼠模型、HK-2 细胞 Corin 减少模型以及顺铂模型，运用 Western blot、real-time PCR、IHC、IF 等分子生物学技术研究 Corin 在顺铂引起的肾脏毒性中的具体保护性机制，以期为顺铂引起肾脏毒性提供新的治疗靶点。本研究课题在我们课题组之前的研究结果以及国内外学者的研究基础上，首次探索 Corin 在顺铂引起肾脏毒性中的保护性作用，具有一定的先进性和首创性，并且我们会在当前设想的基础上，随着研究深入分子机制的研究，力求发现更多原创性成果。

PO-0365

血清 Aβ40 与 Aβ42 在糖尿病肾病检测中的临床价值分析

杨海玉
泰州市中医院

前言 β 淀粉样蛋白（Aβ）是一种氨基酸片段，且主要由脑组织合成，其中 Aβ40 和 Aβ42 含量较多。近年来，Aβ40 和 Aβ42 越来越成为研究阿尔兹海默病的重要生物标记物。而在其他疾病中，Aβ40 和 Aβ42 却很少被关注。本研究通过分析糖尿病肾病患者血浆 Aβ40 和 Aβ42 的水平变化，旨在指导糖尿病肾病的早期诊断与预后评估。
目的 探讨血清 Aβ40 与 Aβ42 水平在糖尿病肾病中的表达和诊断意义。
方法 收集 2018 年 1 月至 2020 年 1 月糖尿病肾病患者 87 例作为观察组，并将同期 78 例健康受试者作为对照组，对比研究两组间 Aβ40 与 Aβ42 和基线资料的差异。将纳入的 87 例糖尿病肾病患者按 CKD 分期分为五组，对比组间血清 Aβ40 与 Aβ42 水平和基线资料差异，探讨 Aβ40 与 Aβ42 水平与糖尿病肾病肾功能损伤程度的差异。通过 ROC（受试者工作特征曲线）评估 Aβ40 与 Aβ42 水平对糖尿病肾病肾功能损伤的诊断价值。
结果 糖尿病肾病患者血清中 Aβ40 与 Aβ42 水平高于对照组（$P<0.05$），非参数秩和检验和 Pearson 积矩相关分析提示，血清 Aβ40 与 Aβ42 水平与糖尿病肾病患者肾功能损伤程度成正相关。通过血清 Aβ40 与 Aβ42 诊断糖尿病肾病的 ROC 曲线可知，Aβ40 的阈值为 121ng/ml,曲线下面积为 0.94；血清 Aβ42 的阈值为 113ng/ml,曲线下面积为 0.88。
结论 Aβ40 与 Aβ42 水平在糖尿病肾病患者血清中表达水平升高，且与患者肾功能损伤程度呈正相关。血清 Aβ40 与 Aβ42 水平在糖尿病肾病的临床诊断上具有较高的应用价值，同时对糖尿病肾病的临床治疗起到指导作用。

PO-0366

小而密低密度脂蛋白与 2 型糖尿病的 相关性分析

李珊珊、荣嵘
北京大学人民医院

目的 探讨小而密低密度脂蛋白与 2 型糖尿病的相关性及其 cutoff 值。
方法 收集北京大学人民医院内分泌科收治的 725 例 T2DM 患者的临床资料，纳入病例组。选取同期 822 例体检正常者纳入对照组。检测 LDL-C、 HDL-C、CHO、TG、GLU、CRP 及 sdLDL 水平，分析小而密低密度脂蛋白水平与 T2DM 的关系。
结果 sd LDL 在 2 型糖尿病组明显高于正常对照组（1.25±0.019 mmol/L，0.95±0.016 mmol/L，p<0.05），差异有统计学意义；根据病例颈动脉斑块情况，将其分为三组，sd LDL 在无斑块组，稳定斑块组及不稳定斑块组是依次递增的（1.04±0.01，1.23±0.04，1.29±0.04，p<0.05）有统计学意义；在校正了其他血脂成分的影响后，CHO,CRP,GLU 等是造成患 T2DM 的危险因素，血脂 sdLDL 与 T2DM 的发生密切相关（OR=89.335，95%CI:29.305-272.458，P<0.001）；根据是否患有 T2DM 对 sdLDL 进行 ROC 工作曲线分析，sdLDL 预测 T2DM 的最佳界值为 1.12mmol/L，AUC 为 0.775 （95%CI：0.748-0.802，p<0.05），诊断效能较高。
结论 sd LDL 在 2 型糖尿病患者中显著升高，可能是 2 型糖尿病的危险因子。当 sd LDL 为 1.12 mmol/L 时，需积极治疗，警惕 2 型糖尿病的发生。

PO-0367

健康体检人群代谢综合症与冠脉病变程度相关性分析

杨璐、卢英
江苏省人民医院（南京医科大学第一附属医院）

目的 探讨健康体检人群代谢综合症与冠脉病变程度的相关性。
方法 收集 2018 年 1 月～2019 年 1 月在本院体检中心行冠状动脉 CT 检查的 178 例体检者的相关临床资料，包括体检者的年龄、性别、身高、体重、血压、相关生化结果等，将所有受检者分为 MS 组和非 MS 组，比较两组间冠脉疾病的发生率，对代谢综合症与冠脉病变病情严重程度进行相关性分析。
结果 178 例体检者中，MS 组 65 例，非 MS 组 113 例，MS 组与非 MS 组相比，年龄、收缩压、舒张压差异无统计学意义，均 P＞0.05；而性别、BMI 指数、空腹血糖、TG、HDL-C 差异有统计学意义，均 P＜0.05；MS 组的冠脉疾病检出率高于非 MS 组，差异有统计学意义（P＜0.05）；BMI 指数、血压、TG 水平、代谢紊乱评分与冠状动脉病变积分呈正相关（P＜0.05）；多元回归分析显示，TG、高血压、3 项或 3 项以上的代谢紊乱是冠脉病变的危险因素。
结论 可以通过对体检人群代谢综合症患病情况的评估，筛查出冠心病发病潜在人群，开展相应的影像学检查，以期能够早期发现 CHD 疾病，为临床诊疗提供参考。

PO-0368

革兰阴性脓毒症患者血清 apoE、LDLR、LRP、PCSK9 检测的临床价值

祝青、郭琪、吴颖、吴圆圆、邹国英
湖南省脑科医院检验科

目的 探讨载脂蛋白 E(apoE)、低密度蛋白受体(LDLR)、低密度脂蛋白受体相关蛋白(LRP)、前蛋白转化酶枯草溶菌素 9(PCSK9）对革兰阴性（G-）脓毒症患者早期诊断、病情严重程度和预后的评估价值。
方法 选取湖南省脑科医院收治的 90 例革兰阴性脓毒症患者、40 例单纯全身炎症反应综合征（SIRS）患者、38 例革兰阳性（G+）脓毒症患者和 40 例健康体检人员为研究对象。采用 ELISA 法检测所有研究对象血清 apoE、LDLR、LRP、PCSK9 水平，收集其他实验室指标。采用 Mann-Whitney U 检验比较各组血清 apoE、LDLR、LRP、PCSK9 水平差异，采用受试者工作曲线（ROC 曲线）及曲下面积（AUC）分析各指标预测疾病发生、判断病情严重程度及评估预后价值。
结果 与健康对照组、SIRS 组、G+脓毒症组相比，G-脓毒症组患者血清 apoE、PCSK9 水平明显升高，而 LDLR、LRP 水平明显降低（P<0.05）；患者入住 ICU 后第 1、3、5 天血清 apoE 水平呈持续下降趋势（P<0.05），随着 G-脓毒症患者病情加重，apoE、PCSK9 水平明显升高，LDLR、LRP 水平明显降低（P<0.05）；死亡组患者较存活组患者血清 apoE、PCSK9 水平明显升高，而 LDLR、LRP 水平明显（P<0.05）；ROC 曲线分析结果显示 apoE、LDLR、LRP、PCSK9 早期诊断 G-脓毒症的曲线下面积分别为 0.900、0.840、0.932、0.897，判断病情严重程度的 AUC 分别为 0.810、0.772、0.720 和 0.764，而 apoE 联合 LRP 预测预后的 AUC、灵敏性和特异性分别为 0.97、95.24%、89.88%高于 apoE(0.71、66.18%、65.86%)、LRP(0.78、66.67%、78.26%)。
结论 血清 apoE、LDLR、LRP、PCSK9 可用于 G-脓毒症的早期诊断、病情严重程度的判断；apoE 与 LRP 联合应用提高预后评估的敏感性和特异性。

PO-0369

9 例细胞色素 P450 氧化还原酶缺乏症初诊患者血浆 19 项类固醇激素结果异常变化的研究

孙慧颖、侯生根、孔许净、樊晓敏、郑燕华、陈宝荣
北京金域医学检验实验室有限公司

目的 寻找并确定细胞色素 P450 氧化还原酶缺乏症诊断的异常血浆类固醇激素标志物。
方法 研究类固醇激素代谢路径，基于 LC-MS/MS 技术平台进行临床正常参考人群和患者血浆样本中 19 种类固醇激素的测量；以临床确诊的 9 例（男 3 例，女 6 例）细胞色素 P450 氧化还原酶缺乏症患者初诊时血浆中孕烯醇酮等 19 种类固醇激素的测量结果为研究对象，采用 R 4.0.1 软件绘制患者与正常参考人群组血浆孕烯醇酮等 19 种类固醇激素及睾酮/双氢睾酮比值结果的 box-plot 及散点图，分析 9 例细胞色素 P450 氧化还原酶缺乏症确诊患者与正常参考人群血浆类固醇激素结果数据分布的差异并进行 Wilcoxon 检验验证。
结果 9 例细胞色素 P450 氧化还原酶缺乏症患者初诊时血浆中孕烯醇酮等 19 种类固醇激素与正常参考人群比较结果呈现三种变化：孕烯醇酮、17-羟孕酮、皮质酮、11 脱氧皮质酮、11-脱氧皮质醇、21 脱氧皮质醇 6 种激素浓度明显增加，且与参考人群结果有显著差异（P<0.001，Wilcoxon 检验）；脱氢表雄酮、孕酮、雌酮、雌三醇、皮质醇、可的松 6 种激素浓度变化无明显规律，与参考人群结果无显著差异（P>0.05，Wilcoxon 检验）；17-羟孕烯醇酮、醛固酮 2 种激素浓度增加，但与参考人群结果差异不显著（0.001<P<0.05，Wilcoxon 检验）；男性细胞色素 P450 氧化还原酶缺乏症患者雄烯二酮、睾酮、双氢睾酮、硫酸脱氢表雄酮、雌二醇浓度明显降低，且与参考人群

结果有显著差异（P<0.001，Wilcoxon 检验）；女性细胞色素 P450 氧化还原酶缺乏症患者双氢睾酮、硫酸脱氢表雄酮 2 种激素浓度浓度降低，与参考人群结果有显著差异（P<0.001，Wilcoxon 检验），雄烯二酮、睾酮、雌二醇与参考人群结果无显著差异（P>0.05，Wilcoxon 检验）；男性细胞色素 P450 氧化还原酶缺乏症患者睾酮/双氢睾酮比值明显降低，且与参考人群结果有显著差异（P<0.001，Wilcoxon 检验）。女性细胞色素 P450 氧化还原酶缺乏症患者睾酮/双氢睾酮比值轻度增加，与参考人群结果无显著差异（P>0.05，Wilcoxon 检验）。

结论 孕烯醇酮、17-羟孕酮、皮质酮、11 脱氧皮质酮、11-脱氧皮质醇、21 脱氧皮质醇 6 种激素是细胞色素 P450 氧化还原酶缺乏症诊断的重要血清标志物；对于男性患者雄烯二酮、睾酮、双氢睾酮、硫酸脱氢表雄酮、雌二醇、睾酮/双氢睾酮比值也可作为细胞色素 P450 氧化还原酶缺乏症诊断的重要参照血清标志物。

PO-0370

尿 RBP、TRF 及 NGAL 在 2 型糖尿病肾病早期诊断中的应用分析

宋涛
湖北省襄阳市第一人民医院

目的 探讨尿视黄醇结合蛋白（RBP）、转铁蛋白（TRF）及中性粒细胞明胶酶相关载脂蛋白（NGAL）水平对 2 型糖尿病肾病（DN）早期诊断的临床意义。

方法 将 2019 年 1 月至 2020 年 12 月湖北省襄阳市第一人民医院内分泌科和肾病内科收治的 180 例 2 型糖尿病患者纳入研究组。根据患者 24 小时尿蛋白排泄率（UAER）水平将其分为三组，即正常白蛋白尿组 60 例（UAER<30mg/24h）、微量白蛋白尿组 60 例（UAER 30-300mg/24h）和大量白蛋白尿组 60 例（UAER>300mg/24h），选择同期 60 例健康体检者作为对照组，检测各组对象清晨尿液 RBP、TRF 及 NGAL 水平，并对结果进行统计学分析。分析检测结果与 UAER 的相关性，采用受试者工作曲线（ROC）评价 3 项指标对 DN 的诊断效率。

结果 正常白蛋白尿组 RBP、TRF 及 NGAL 水平与对照组比较差异无统计学意义（p>0.05）。微量白蛋白尿组及大量白蛋白尿组 RBP、TRF 及 NGAL 水平均高于正常对照组及正常白蛋白尿组，差异有统计学意义（p<0.05）。2 型糖尿病患者尿液 RBP、TRF 及 NGAL 水平与 UAER 结果呈正相关（r=0.778,0.645,0.693），尿 RBP、TRF 及 NGAL 诊断糖尿病肾病的 ROC 曲线下面积（AUC）分别为 0.895、0.833 和 0.714，敏感度分别为 81.7%、68.3%及 55.0%，特异度分别为 95.0%、94.2%及 89.2%。

结论 尿液 RBP、TRF 及 NGAL 可作为 2 型糖尿病肾病早期诊断指标，三者联合检测可提高疾病诊断的敏感度和特异度。

PO-0371

2 型糖尿病患者血清脂蛋白(a)水平与冠状动脉粥样硬化性心脏病发生风险及严重程度相关研究

顾俊旭、邢垚、苏明、贾玫、王春燕
北京大学人民医院

目的 探讨脂蛋白(a) [lipoprotein(a), Lp(a)]在 2 型糖尿病(Type 2 diabetes mellitus, T2DM)患者中与冠状动脉粥样硬化性心脏病(Coronary atherosclerotic heart disease, CAHD)发生风险及严重程度关系。

方法 对 2017 年 1 月至 2019 年 12 月在北京大学人民医院就诊的 T2DM 患者 1228 例（男性 717 例，女性 511 例）。根据冠状动脉造影(coronary angiography，CAG)结果分为 CAHD 组和 non-CAHD 组。糖尿病合并 CAHD 患者按照堵塞支数分为单支病变组、双支病变组和多支病变组；并根据 GS(Gensini score, GS)分为低 GS 组（GS ≤ 25）、中 GS 组（GS:26～40）、高 GS 组（GS≥41）。采用二元 Logistics 逐步回归方程评估 Lp(a)与 CAHD 发生风险及严重程度关系。
结果 CAHD 组血清 Lp(a)水平明显高于 non-CAHD 组[39.82 (48.06) nmol/L vs 38.27 (33.64) nmol/L，Z=-2.595, p= 0.006]。多支血管疾病组 Lp(a)水平显著升高[32.81 (40.73) nmol/L vs. 39.47 (45.54) nmol/L vs. 43.51 (49.94) nmol/L，H=18.440, p < 0.001]，高 GS 组血清 Lp(a)水平显著高于其他两组[33.74 (40.75) nmol/L vs. 39.57 (45.63) nmol/L vs. 46.21 (52.75)，H=20.548, p<0.001]。根据 Mantel-Haenszel 线性趋势检验分析得出，随着血清 Lp(a)水平的升高，冠状动脉阻塞程度加重（p<0.001）。经过 logistics 二元逐步回归方程分析得到 Lp(a)水平仍然与 CAHD 发生风险及其严重程度独立相关(CAHD 组 vs. non-CAHD: OR = 2.207, 95% CI: 1.790 – 5.060, p = 0.026; 多支病变组 vs. 单支病变组: OR = 3.288, 95% CI: 1.871 – 7.278, p = 0.035; 高 GS 组 vs. 低 GS 组: OR = 2.556, 95% CI: 2.046 – 5.378, p = 0.023)。
结论 在 T2DM 患者中，Lp(a)升高是 CAHD 的独立风险因素并于与 CAHD 的严重程度相关。

PO-0372

长链非编码 RNA SNHG1 在三阴乳腺癌中的生物学功能及其分子机制研究

汪桂华、鞠少卿
南通大学附属医院

目的 探讨 lncRNA SNHG1 在三阴乳腺癌（TNBC）的生物学功能及参与 TNBC 恶性进展的分子机制。
方法 检测 SNHG1 在乳腺癌患者癌组织和细胞中的表达，并分析其与临床病理参数之间的相关性；构建 shRNA 干扰载体检测 SNHG1 干扰对 TNBC 细胞增殖、周期、迁移与侵袭能力的改变。建立 SNHG1 干扰的稳转及对照株，构建裸鼠乳腺原位移植瘤模型，分析 SNHG1 的表达对 TNBC 原位移植瘤生长的影响。shSNHG1 转染 MDA-MB-231 细胞，转录组测序分析 SNHG1 参与的信号通路；RNA pull-down 联合质谱技术寻找与 SNHG1 相结合的蛋白；RIP 验证 SNHG1 与蛋白的结合；免疫组化法检测互作蛋白的表达；细胞功能试验分析 SNHG1 是否通过与此蛋白作用而影响 TNBC 的生物学功能。
结果 SNHG1 在 TNBC 组织的表达量显著高于其他类型乳腺癌及乳腺良性疾病，SNHG1 的高表达与肿瘤 TNM 分期显著相关。TNBC 细胞株中 SNHG1 的表达显著增高，主要定位于胞核部位。干扰 SNHG1 后，TNBC 细胞增殖明显减慢，细胞的迁移与侵袭能力明显减弱。shSNHG1 组瘤块体积和重量均小于对照组。干扰 SNHG1 表达后，差异基因富集的信号通路主要有 TNF-α 信号通路、细胞因子受体信号通路、NF-κB 信号通路等。RNA pull-down 筛选出可能与 SNHG1 相互作用的蛋白分子 NPM1，RIP 验证 SNHG1 与 NPM1 蛋白能够结合。TNBC 组织样本中 NPM1 蛋白及 mRNA 的表达水平显著高于其他类型乳腺癌；NPM1 蛋白在 TNBC 细胞中的表达高于其他类型乳腺癌细胞；NPM1 蛋白主要定位于胞核的核仁部位。TNBC 细胞中干扰 SNHG1 后 NPM1 蛋白表达下降，原位移植瘤 shSNHG1 组 NPM1 蛋白表达显著降低；而干扰 NPM1 表达对 SNHG1 无影响。以上说明 SNHG1 与 NPM1 结合后可调控 NPM1 蛋白的变化。NPM1 细胞生物学功能的影响：干扰 NPM1 后，可抑制 TNBC 细胞的增殖、侵袭和迁移，同时过表达 SNHG1 不能恢复干扰 NPM1 对细胞功能的影响。测序提示 SNHG1 可调节 NF-κB 信号通路。荧光素酶报告试验显示 SNHG1、NPM1 干扰均抑制 NF-κB 通路的活化。
结论 SNHG1 在 TNBC 中高表达，主要定位于胞核。干扰 TNBC 细胞 SNHG1 的表达可抑制细胞的增殖、侵袭和迁移，体内可抑制原位移植瘤的生长。SNHG1 与 NPM1 蛋白结合，调控其蛋白表

达增加，增加的 NPM1 可作为伴侣分子促进 NF-κB 靶基因的转录。SNHG1 参与三阴乳腺癌恶性进展，可能成为 TNBC 诊疗的潜在靶标。

PO-0373

Pre-albumin is a strong prognostic marker in elderly intensive care unit patients

Min Wang
Jiangsu Province Hospital

Aims There are many indicators that can be used to evaluate the association between nutrition status and in-hospital mortality. This will prompt us to think which one of these indicators is best. However, there is no literature to do this and make a comparison in a study.
Methods We operated a retrospective study including 145 patients admitted to our institution's elderly intensive care unit (ICU) from January, 2017 to December, 2019. Admission laboratory results were collected. Regression analysis and receiver operating curve were analyzed to explore the performance of different nutrition indexes.
Results Pre-albumin (PAB) was significantly different between survivor and non-survivor group (p =0.001). Univariate analysis showed nutrition indexes (lymphocytes, albumin, BMI, GNRI, PNI and PAB) were associated with in-hospital mortality (all P＜0.1). Following adjustment for age, platelets and creatinine (CREA), only BMI and PAB remained statistically significant (BMI: HR 2.799, 95% CI 1.167-6.715, p = 0.021; PAB: HR 6.329, 95% CI 2.660-15.151, p<0.001). In addition, PAB had the highest area under the curve (AUC) for predicting in-hospital mortality (AUC = 0.696) followed by BMI (AUC = 0.561) and other factors.
Conclusion PAB is a better predictor of in-hospital mortality than other nutrition indexes in elderly ICUs patients.

PO-0374

体液与细胞免疫检测应用在脓毒症患者诊断中的作用探讨

杨艳茹
陆军军医大学第一附属医院（西南医院）

目的 分析体液检测和细胞免疫检测用于脓毒症患者诊断中的价值。
方法 本次研究开始的时间为 2019 年 11 月，结束的时间为 2020 年 12 月，在此期间选取 90 例脓毒症患者作为研究对象，其中 48 例脓毒症患者和 41 例脓毒症休克患者分别纳入脓毒症组和脓毒症休克组，再选取同期于我院进行健康体检的人员 40 名作为对照组。所有研究对象均进行体液检测和细胞免疫检测，对检测结果进行分析和对比。
结果 脓毒症组患者的 IgG、IgM 和 IgA 水平分别为（3.54±0.44）mg/dL、（1049.78±27.71）mg/dL 和（3.52±0.61）mg/dL，脓毒症休克组患者的 IgG、IgM 和 IgA 水平分别为（3.50±0.42）mg/dL、（1074.19±28.16）mg/dL 和（2.91±0.53）mg/dL，对照组的 IgG、IgM 和 IgA 水平分别为（8.25±0.61）mg/dL、（1248.54±38.64）mg/dL 和（7.60±0.73）mg/dL，统计学分析后，脓毒症组和脓毒症休克组患者的 IgG、IgM 和 IgA 水平均显著低于对照组，且脓毒症休克组患者的 IgG 水平明显高于脓毒症组，IgM 水平明显低于脓毒症组，P＜0.05。脓毒症组患者的 CD3+、CD4+、CD8+水平分别为（72.51±7.52）、（46.67±3.48）、（30.57±3.36），脓毒症休克组患者的 CD3+、CD4+、CD8+水平分别为（37.27±4.18）、（24.41±1.92）、（12.63±2.13），对照组的 CD3+、CD4+、CD8+水平分别为（65.31±7.17）、（57.54±3.52）、（30.49±3.42），统计学分析后，脓毒症组的 CD3+水平明显高于脓毒症休克组和对照组，且脓毒症休克组的 CD3+水平明显低于对照组，P＜0.05；脓毒症组和脓毒症休克组的 CD4+水平均低于对照组，且脓毒症休克组的

CD4+水平低于脓毒症组，P＜0.05；脓毒症休克组患者的 CD8+水平明显低于脓毒症组和对照组，脓毒症组和对照组的 CD8+水平无显著统计学意义（P＞0.05）。
结论 体液检测和细胞免疫检测用于脓毒症患者的诊断中均具有较高的价值。

PO-0375

Association Between Serum Lipid Levels and Patients With Primary Angle-Closure Glaucoma in China: A Cross Sectional, Case-Control Study

Mingxi Shao、wenjun cao
EENT Hospital

Objective To evaluate the serum lipid levels of patients with primary angle-closure glaucoma (PACG) and to investigate the relationship between serum lipid levels and PACG.
Methods In this cross-sectional, case-control study, a total of 320 PACG subjects and 242 age- and sex-matched control subjects were recruited. Serum high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), small dense LDL-C (SDLDL-C), triglyceride (TRIG), and cholesterol (CHOL) levels were measured using enzymatic colorimetry. Serum apolipoprotein A (APOA), apolipoprotein B (APOB), apolipoprotein E (APOE), and lipoprotein(a) (LPa) levels were measured by immunoturbidimetry.
Results The serum LDL-C, TRIG, HDL-C, APOE, LPa, CHOL, APOB, and APOA levels were significantly higher ($p < 0.05$) in the PACG group than in the control group. Multiple liner regression analyses revealed that there was a statistically correlation between HDL-C levels and mean deviation MD (B = 0.389, P = 0.002, 95% confidence interval [CI] = -1.249 to -0.624); LDL-C levels and MD (B = 0.190, P = 0.019, 95% CI = -5.632 to -1.306); and CHOL levels and MD (B = 0.364, P = 0.27, 95% CI = -7.727 to -1.839). Logistic regression analyses showed that high serum HDL-C (odds ratio [OR] = 11.01, 95% CI = 5.616-21.587), LDL-C (OR = 1.330, 95% CI = 1.079-1.640), SDLDL-C (OR = 1.007, 95% CI = 1.005-1.008), APOA (OR = 13.621, 95% CI = 7.251-25.591), APOB (OR = 2.243, 95% CI = 1.060-4.732), LPa (OR = 0.999, 95% CI = 0.998-1.00), and CHOL (OR = 1.131, 95% CI = 1.005-1.326) levels were significantly associated with PACG.
Conclusions High serum HDL-C, LDL-C, APOA, APOB, LPa, and CHOL levels were associated with PACG.

PO-0376

图文并茂的免疫固定电泳结果检验报告单的设计与应用

王金行[1]、张玉辉[2]、王希超[1]
1. 中国医科大学附属第一医院
2. 柏彬医疗器械

目的 将免疫固定电泳常规图片与 IgD 的图片合拼成一张图谱导入文字报告单中建立图文报告。
方法 免疫固定电泳：采用美国 Helena 公司的 Spife3000 或 Spife TOUCH 电泳仪及配套试剂进行免疫固定电泳测定，每个标本分别在琼脂糖凝胶 SP、IgG、IgA、IgM、κ、λ 泳道加对应的固定剂及抗血清，由于 IgD 型多发性骨髓瘤少见，海伦娜胶片没有预留 IgD 泳道位置，将一个单独检验位作为 IgD 泳道加抗 IgD 血清。图文报告设计：报告单模版，结合本单位的原有常规化验单样式，根据报告纸张大小将需要的各项目、信息（患者信息：病案号、年龄、性别、科室等和检验信息：标本类型、检验结果、审核医师、检验医师、回报日期等）的位置及高度、宽度进行固定，预留出检验结果图片大小的位置。将染色处理完的琼脂糖凝胶片通过扫描仪，把每个样本转换成图像并保存。

图像合并与传输，采用北京柏彬软件工程师制作的处理程序，将免疫固定电泳常规图片与 IgD 的图片合拼成一张图片。通过信息监听程序，将生成的图片和对应样本信息等抓取并传输到院内的 lis 系统中。

结果 免疫 固定电泳 SP 参考泳道及对应的 IgG、IgA、IgM、κ、λ 与 IgD 泳道显示有无异常浓集区带，即特异性的抗原抗体沉淀带。同时加 IgD 泳道，避免将 IgD 型 MM 误诊为轻链型 MM 及轻链缺失的 IgD 型 MM 的漏诊。

结论 智能化和规范化图文报告有利于提高医疗诊断水平,方便临床会诊。给人的良好直观视觉感并增强其可信性。其广泛应用对提高实验室科技内涵和对实验室认知程度具有极其深远的意义。

PO-0377

三种 CKMB 活性试剂抗溶血干扰能力的比较

陈若虹
中南大学湘雅二医院

目的 通过对三种不同品牌的 CKMB 活性检测试剂进行比对及溶血干扰实验，寻找有较强抗溶血干扰能力的试剂。

方法 依据 EP9-A2 文件，收集 40 例血清样本用三种试剂检测 CKMB 活性，比较不同品牌之间的结果差异；人为对样本造成溶血后，再一次检测 CKMB 活性，比较同一试剂溶血前及溶血后结果的差异。依据 EP7-A2 文件，收集 CKMB 活性接近医学决定水平的高值和低值两份混合血清样本，在样本中加入用由红细胞制成的溶血干扰物作为干扰高值样本，加入等量的去离子水作为干扰低值样本，两份样本按 L、3L+1H、2L+2H、1L+3H、H 的比例混合，配置成不同浓度梯度的干扰样本，用血细胞分析仪检测干扰样本中的血红蛋白浓度，用三种试剂检测干扰样本中的 CKMB 活性，计算干扰样本与零干扰样本中结果的偏差。

结果 美康、关东、罗氏试剂检测 40 例样本的 CKMB 活性的均值为分别为：27.8±27.4U/L、23.7±26.0 U/L、35.7±29.5 U/L，关东与美康的平均偏差为 14.7%，罗氏与美康的偏差为 28.4%，关东与罗氏的偏差为 33.6%。三种试剂检测 CKMB 活性的两两比对线性回归方程在医学决定水平处的偏差均超过了设定的 12.5%的允许偏差。美康、关东、罗氏试剂溶血前后的 CKMB 活性均值的偏差分别为 109.6%、0.1%、160.6%。将溶血前后的检测结果作线性回归，计算在医学决定水平 25U/L、90U/L 处的偏差，美康试剂偏差分别为 202.9%、115.1%；关东试剂的偏差分别为 0.4%、5.6%；罗氏试剂的偏差为 197.8%、108.0%。5 个干扰样本中血红蛋白浓度分别为 0、125、250、375、500 mg/dL；美康试剂零干扰低值和高值样本 CKMB 活性均值分别为 34.7、92.8U/L，干扰样本的偏差分别为 69.5%、144.4%、225.7%、292.0%以及 8.7%、24.5%、36.8%、51.6%；关东试剂零干扰低值和高值样本 CKMB 活性均值分别为 28.5、85.3U/L，干扰样本的偏差分别为-4.8%、-9.5%、-10.9%、-14.1%以及 0.6%、1.4%、2.5%、5.0%；罗氏试剂零干扰低值和高值样本 CKMB 活性均值分别为 34、109.2U/L，干扰样本的偏差分别为 62.1%、132.8%、202.4%、282.4%以及 11.6%、22.0%、35.9%、53.2%。

结论 美康、关东及罗氏三种 CKMB 活性检测试剂之间的可比性较差。美康及罗氏试剂受溶血干扰影响较大，在样本溶血时结果假性升高，关东试剂有较强的抗溶血干扰能力，更适用于临床诊断与监测。

PO-0378

血 CEA、CA125、纤维蛋白原联合预测结直肠癌肝肺转移的价值探讨

吴虹铮、钟白云
中南大学湘雅医院

目的 初步探讨 CEA、CA125、纤维蛋白原联合检测对结直肠癌患者发生肝、肺转移的预测价值。
方法 选取 2015 年 1 月至 2021 年 1 月在中南大学湘雅医院确诊住院的 356 例结直肠癌患者为研究对象，其中结直肠癌伴肝或肺转移的患者 178 例作为实验组，并按照性别、确诊年龄、原发肿瘤部位匹配结直肠癌不伴肝及肺转移的患者 178 例作为对照组。收集所有患者第一次入院时癌胚抗原（CEA）、糖类抗原 125（CA125）与纤维蛋白原（Fg）的检测数据以及相关病例资料，采用单因素及多因素分析研究以上血指标单独或联合检测对结直肠癌肝、肺转移的预测价值。
结果 单因素及多因素回归分析结果表明结直肠癌伴肝或肺转移患者血 CEA、CA125 与纤维蛋白原水平显著高于结直肠癌不伴有肝及肺转移患者（P<0.05），ROC 曲线分析及约登指数进一步确定 CEA、CA125 与纤维蛋白原的临床诊断阈值分别为 10.05ng/ml、10.19KU/L、3.82g/L，且曲线结果表明 CEA、CA125、纤维蛋白原单独诊断 CRC 患者肝、肺转移的灵敏度分别为 61.2%、48.9%、65.2%，特异性分别为 87.1%、83.7%、77.0%，诊断准确性相对有限。但 CEA、CA125 联合纤维蛋白原检测时预测结直肠癌患者肝、肺转移的准确性较高（AUC=0.811，P<0.001），灵敏度和特异性分别为 79.8%、73.0%。
结论 血 CEA、CA125 及纤维蛋白原均为结直肠癌肝肺转移的独立预测因素，且 CEA、CA125 联合纤维蛋白原检测对结直肠癌肝、肺转移的预测价值优于单一或任意两种指标联合检测，灵敏度和特异性均较高，可作为结直肠癌肝肺转移预测模型的参考指标。

PO-0379

探讨血清蛋白电泳联合胱抑素 C 在 2 型糖尿病肾病辅助诊断中的应用

王丽馨
陆军特色医学中心（大坪医院）

目的 探讨血清蛋白电泳以及胱抑素 C 检测在 2 型糖尿病肾病辅助诊断中的临床应用价值。
方法 选择陆军特色医院中心 2017 年 01 月至 2021 年 04 月收治的 2 型糖尿病患者 160 例，经临床诊断分为糖尿病组 50 例，2 型糖尿病肾脏组 110 例 ，并按照《中华糖尿病杂志<中国糖尿病肾脏疾病防治临床指南（2019 年）>》对糖尿病肾病组分为 5 期，同时选取 50 例健康体检者作对照。用毛细管电泳法对所有样本进行血清蛋白电泳检测，透射比浊法检测血清中胱抑素 C（Cys-C）含量。
结果 血清蛋白电泳结果显示 β1-球蛋白随着疾病发展先代偿性升高后呈降低趋势，其余较大分子蛋白在病情发展过程中均呈现代偿性升高趋势。糖尿病肾病组与对照组相比，血清蛋白电泳中较多指标在 2 期时表现出显著性差异（P＜0.05），胱抑素 C 随着病情的发展一直呈升高趋势，对照组与糖尿病肾病组各期间均有显著性差异,其中(α+β2)/Alb、Cys-C、(α+β2)/Alb+Cys-C 的 ROC 曲线下 AUC 面积分别为 0.793、0.756、0.767，除 γ-球蛋白外，其余血清蛋白电泳指标 AUC 皆高于 Cys-C。
结论 2 型糖尿病肾病患者的血清蛋白电泳在 2 期时开始出现明显改变，(α+β2)/Alb 的比值联合胱抑素 C 对 2 型糖尿病肾病的辅助诊断有临床价值。由此可见，血清蛋白电泳可反映糖尿病肾脏疾病患者血清中蛋白的变化趋势，联合胱抑素 C 检测可为 2 型糖尿病肾病早期的诊断及患者的预后提供参考依据。

PO-0380

基于 MALDI-TOF 质谱技术快速筛选血清 M 蛋白方法的建立

崔瑞芳[1]、张瑞[2]、张顺利[2]、王清涛[2]
1. 长治医学院附属和平医院
2. 首都医科大学附属北京朝阳医院

目的 M 蛋白检测是多发性骨髓瘤(MM)的重要诊断标准。目前，血清蛋白电泳(PEL)和免疫固定电泳(IFE)是鉴定或排除 M 蛋白的常规方法。然而，现有的检测技术由于在灵敏度和/或特异性方面的缺陷，不能完全满足临床需要。本研究旨在建立一种基于 MALDI-TOF 质谱技术的灵敏、快速、特异的血清 M 蛋白检测方法。
方法 对样品前处理条件和 MALDI-TOF MS 条件进行优化。将 23 份 M 蛋白阳性样品分别进行原倍、10 倍、100 倍和 200 倍稀释后，使用 IFE 和 MALDI-TOF MS 方法进行检测，比较两种方法的灵敏度。采用 PEL、IFE 和 MALDI-TOF MS 对 712 份样品进行测定，以 IFE 为金标准，进行灵敏度、特异性和符合率评价。根据 M 蛋白不同分型，比较 PEL 和 MALDI-TOF MS 对 M 蛋白的检测能力。
结果 采用 MALDI - TOF MS 检测 M 蛋白的质荷比，通过还原将轻链与免疫球蛋白重链解离。以健康样本谱图为背景，对 MM 样本进行分析，从多克隆的背景中筛选出单克隆 M 蛋白。23 个 M 蛋白阳性样本分别进行原倍、10 倍、100 倍、200 倍稀释。10 倍稀释后，MALDI-TOF MS 的检出率为 100%，IFE 为 96%。当稀释 100 和 200 倍时，IFE 的检出率分别占 MALDI-TOF MS 的 28%和 23%。以 IFE 为金标准，在 712 份样品中，PEL 和 MALDI-TOF MS 的符合率分别为 85.9%和 92.3%。对于 IFE 阳性样本，PEL 和 MALDI-TOF MS 的符合率分别为 72.8%和 99.7%。在 M 蛋白不同亚型中，MALDI-TOF-MS 和 IFE 对 IgA、IgD、IgM、游离轻链和双克隆型的符合率达到 100%，而 PEL 对 IgM、IgA 和游离轻链样本的检出率分别只有 66.7%、58%和 19.5%。
结论 建立了一种快速筛查 M 蛋白的定性方法，该法简便、快速、高通量、价格低廉、特异性强、易于解读，可以满足大规模筛查实验的要求。MALDI-TOF MS 检测灵敏度高于常规的 M 蛋白检测技术，有望在多发性骨髓瘤的筛查、诊断、预后及微小残留病检测方面发挥重要作用。

PO-0381

4 例多发性骨髓瘤尿蛋白电泳 λ 轻链多聚体分析

陈欢欢、张炳峰、赵中建
江苏省人民医院（南京医科大学第一附属医院）

目的 分析多发性骨髓瘤（λ 轻链型）患者的非浓缩尿蛋白 SDS 电泳异常图谱，解决尿轻链多聚体对尿蛋白电泳检测的干扰。
方法 收集 2017 年 8 月至 2018 年 4 月江苏省人民医院检验学部发现的 4 例多发性骨髓瘤（λ 轻链型）患者尿液样本，用 5% β 巯基乙醇解聚，将未经解聚和解聚后的尿液同时行 SDS 电泳。
结果 4 例未经解聚样本电泳后都出现了异常条带，一例样本异常条带位于 IgM 所在的区域，3 例样本异常条带位于加样点附近，提示出现大分子蛋白；解聚后的 4 例样本电泳后，原有的异常条带消失，并且在轻链条带所在区域出现浓染条带，提示存在轻链多聚体。值得注意的是，原有的白蛋白条带区域出现大幅度减弱。4 例样本解聚前的电泳结果与解聚后的电泳结果均有显著差别，其中白蛋白比例分别为 74% vs 3.8%，77.2% vs 27%，61.5% vs 21.4%，61.2% vs 7.3%；游离轻链比例分别为 15% vs 91.3%，5.8% vs 70.3%，2.6% vs 75.4%，3.9% vs 87.5%。
结论 多发性骨髓瘤（λ 轻链型）患者尿液样本中出现了大量的轻链多聚体，严重干扰 SDS 电泳结果的准确性，错误的结果可能使临床对患者蛋白尿类型的作出错误判断，而准确的结果更有利于判断患者的预后。

PO-0382

TNF-α 在肺癌患者血清中的浓度和意义

李德涛
重庆医科大学附属第一医院

目的 探讨肺癌患者血清中 TNF-α 的浓度及其检测的临床意义。
方法 分别检测 63 例肺癌患者和 15 例肺良性疾病患者以及 39 例健康对照血清 TNF-α 的浓度，同时检测血清中其他常见肺癌肿瘤标志物（NSE、proGRP、CYFRA21-1）的浓度，比较各组血清 TNF-α 浓度的差异；分析血清中 TNF-α 浓度与肺癌患者临床病理特征的关系。
结果 肺癌患者血清 TNF-α 浓度显著高于肺良性疾病组和健康对照组{10.8（8.31，18.1）pg/ml vs 7.46（6.5，12.1）pg/ml，P=0.021；10.8（8.31，18.1）pg/ml vs 6.49（4.49，7.69）pg/ml，P＜0.01}；肿瘤直径＞3cm 组肺癌患者血清中 TNF-α 浓度显著高于直径≤3cm 肺癌患者组（P=0.0317）；发生淋巴结转移肺癌患者血清中 TNF-α 浓度同肺癌患者显著高于未发生淋巴结转移肺癌组（P=0.025）；肺癌患者血清中 TNF-α 浓度与肺部肿瘤的组织病理学类型、病理分期以及患者的吸烟状况、性别、年龄等无显著关系。通过绘制 ROC 曲线，当取 Cut-off 值为 8.665 ng/ml 时，血清 TNF-α 对肺癌的诊断价值最大，曲线下面积为 0.808（95% CI：0.727-0.889），敏感性为 73.0%，特异性为 80.9%，通过分析血清 TNF-α 水平与现有临床肺肿瘤标志物（NSE、proGRP、CYFRA21-1）的相关性，同血清 TNF-α 联合后，敏感性分别从 66.7%、40.5%、76.2%提高到 83.7%、83.9%和 93.6%，但是特异性由 94.9%、87.2%、92.3%降低到 76.8、70.5%、74.7。
结论 血清 TNF-α 浓度与肺癌肿瘤大小，淋巴结转移状态高度相关，值得进一步扩大样本量进行研究。

PO-0383

The molecular mechanism of TAT-P in reducing the damage of blood-brain barrier after ischemic stroke by inhibiting TRPV1 phosphorylation

Qian Feng[1,2]、jinjin song[2]、jia liang[2]、yuanjian song[2,3]、zhen zhang[2]
1. Affiliated Hospital of Xuzhou Medical University
2. 徐州医科大学
3. 徐州市医学遗传与转化工程中心

Objective To demonstrate the role of TAT-P in reducing blood-brain barrier damage after ischemic stroke and clarify the molecular mechanism of TAT-P in reducing blood-brain barrier damage after ischemic stroke.
Methods In this study, a mouse middle cerebral artery occlusion (MCAO) model was constructed by the intraluminal filament. Capsazepine (CPZ, 7.5ug/3uL /mice) was injected into the lateral ventricle 30 minutes before MCAO, TAT-P (12.5ug /uL /mice), and TAT-PS (12.5ug /uL /mice) were injected into the cortex and hippocampus. In our study, the motor function of mice was detected by the open field test and the rotarod test; the learning and memory function of the mice was detected by the water maze experiment; the cerebral infarct volume of the mice was detected by the TTC staining; the nerve function damage of mice was evaluated by mNSS score: the pathological damage of mice wad detected by HE staining: blood-brain barrier permeability of mice was detected by Evans Blue staining: the cerebral vascular damage and MMP9 expression in mice was detected by immunofluorescence staining; the interaction between PKA and AKAP150 was detected by Co-immunoprecipitation; the expression of pTRPV1, iNOS, NOX2、MMP9, Claudin5, Occludin, IL-IB, Cleaved-caspase3 protein level was detected by western blot.
Results Compared with the I/R group, the total distance, the total number of crossing and the latency in the middle area of mice in the IR+CPZ group and I/R+TAT-P group for the open field

were significantly increased (P<0.05) ; the latency of mice in the IR+CPZ group and I/R+TAT-P group were significantly prolonged in the rotarod experiment (P<0.05); the latency of the mice to reach the platform, the percentage of distance in the target quadrant and the percentage of time to total distance and total time and the number of crossing to the platform in the I/R+CPZ group and I/R+TAT-P group in the water maze experiment increased significantly (P<0.05).
(2) Compared with the I/R group, the cerebral infarction volume of the mice in the IR+CPZ group and IR+TAT-P group was significantly reduced (P<0.05); in the mNSS score, compared with the IR group, I/R +CPZ group, and I/R+TAT-P group mice nerve function damage scores were significantly reduced (P<0.05); in the HE staining experiment, compared with I/R group, /R+CPZ group and I/R+TAT-P group mice nucleus pyknosis was reduced, and cell edema was reduced
(3) Compared with the IR group, the amount of Evans blue penetrating the brainparenchyma in the I/R+CPZ group and I/R+TAT-P group were significantly reduced (P<0.05); in the immunofluorescence staining experiment, compared with the IR group, the fluorescence intensity of Claudin5 in the I/R+CPZ group and I/R+TAT-P group increased; in the western blot experiment, compared with the I/R group, the Claudin5. Occludin protein levels increased significantly (P<0.05).
(4) Compared with the I/R group, the MMP9 fluorescence intensity of mice in the I/R+CPZ group and I/R+TAT-P group were reduced; in the western blot experiment, compared with the IR group, the protein levels of iNOS. NOX2. and MMP9 in the I/R+CPZ group and I/R+TAT-P group were significantly reduced (P<0.05)
(5) Co-immunoprecipitation results showed that compared with the 1/R group, the combination of AKAP150 and PKA in the I/R+TAT-P group was reduced; the western blot results showed that compared with the I/R group, the protein level of pTRPVI in the I/R+TAT-P group was significantly reduced (P<0.05).
Conclusion TAT-P might reduce TRPV1 phosphorylation by inhibiting the combination of AKAP150 and PKA, thereby reducing blood-brain barrier damage after ischemic stroke.

PO-0384

LC-MS/MS 法测定肺栓塞患者血浆中利伐沙班的浓度

陆秋涯
上海交通大学医学院附属瑞金医院

目的 用 LC-MS/MS 法检测肺栓塞患者血浆中利伐沙班血药浓度，与常规凝血指标联合检测，评估患者疗效和凝血平衡。
方法 55 例肺栓塞患者（25 例男性），年龄 27~91 岁（均值 69.9 岁），服用利伐沙班剂量 15mg bid 或 20mg qd，其中 17 例测谷浓度，38 例测峰浓度。采样时，同步检测利伐沙班血药浓度、常规凝血 5 项和抗 Xa 活性。用 LC-MS/MS 法测定利伐沙班血药浓度，Sysmex C5100 测定凝血 5 项和 ACL-TOP 测定抗 Xa 活性。
结果 利伐沙班血药谷浓度中位数 49.7ng/ml（6.1~94.3ng/ml），峰浓度中位数 219.5 ng/ml（106.3~415.1ng/ml）。利伐沙班谷浓度与 APTT 和抗 Xa 活性有良好的相关性（p<0.05），而峰浓度与 PT、APTT 和抗 Xa 活性均有良好的相关性（p<0.05）。
结论 肺栓塞患者因服药剂量和个体代谢的差异，体内利伐沙班血药浓度存在很大差异。常规 PT 试验对于利伐沙班谷浓度不敏感。LC-MS/MS 法测定利伐沙班血药浓度与常规凝血 5 项、抗 Xa 活性联合检测，有利于患者药效和凝血平衡的评估。

PO-0385

20 例血红蛋白变异体不同检测系统结果分析

黄勤烽
联勤保障部队第九〇〇医院

目的 血红蛋白变异体在不同糖化血红蛋白检测系统中的图谱分析。
方法 1.20 例血红蛋白变异体样本，在 ARKRAY HA8180V、ARKRAY The lab 001、BIO-RAD VARIANT II 系统中分别检测。2.分析血红蛋白变异体的图谱及电泳特性。3.对 ARKRAY The lab 001、BIO-RAD VARIANT II 两个检测系统的检测结果进行对比分析，以平均血糖值（eAG）表示，换算公式 eAG(mmol/L)=1.59×HbA1c-2.59。
结果 1.ARKRAY HA8180V，序号 1 为 HbF，3、9、14、17 均有 HbA1c 检测结果，其余序号均无结果，无阴影无峰面积数据，图谱图形异常；2.BIO-RAD VARIANT II，序号 1 为 HbF，所有序号均可得到 HbA1c 结果，并分离出异常峰。3.ARKRAY The lab 001，序号 1 为 HbF，序号 3 为 HbS，序号 14、17 无 HbA1c 检测结果、无阴影、无峰面积数据、图谱图形异常，其余序号均可得到 HbA1c 检测结果，但未能分离出变异峰。4.BIO-RAD VARIANT II 的 HbA1c（5.19±0.46）低于 ARKRAY The lab 001 的检测结果（5.83±0.14），差异均有统计学意义（t=-3.597,P<0.05）；ARKRAY VARIANT II eAG 结果（5.67±0.73）同样低于 ARKRAY The lab 001（6.68±0.94），差异均有统计学意义（t=-3.594,P<0.05）。
结论 血红蛋白变异体对不同检测系统具有显著干扰，但是这种干扰通常取决于方法学、仪器的高分辨率，目前现有的血红蛋白检测系统，对于常见的 HbF、HbS，已能实现检测，对于罕见的血红蛋白变异体，仅能做到提示作用，进一步的确诊有待于基因测序。实验室在进行 HbA1c 检测时，应注意识别血红蛋白变异体，以防止对结果测定的影响。

PO-0386

降钙素原等生物标记物检测对呼吸机相关性肺炎患者的意义

王晓磊[1]、杨笑礼[2]
1. 杭州市第一人民医院
2. 浙江中医药大学医学技术学院

目的 研究机械通气合并呼吸机相关性肺炎(VAP)患者白细胞（WBC）、超敏 C-反应蛋白（hs-CRP）、降钙素原（PCT）和 PCT 清除率（PCTc）的水平及其临床意义。
方法 选择本院重症监护室 74 例机械通气患者，根据是否发生 VAP 分为 VAP 组和非 VAP 组，VAP 组根据预后情况分为恶化组和转归组。比较 VAP 组与非 VAP 组患者气管插管后第 1、3、5、7、9 天血液中 PCT、WBC 计数和 hs-CRP 浓度，比较恶化组和转归组患者血清中的 PCT 和 PCT 清除率的水平。应用受试者工作曲线(ROC)评价四项指标单独和联合诊断 VAP 的诊断效能(包括诊断准确率、灵敏度、特异度、阳性预测值和阴性预测值等) 以及 PCT 和 PCT 清除率对预后情况判断的价值 。
结果 VAP 组患者第 7 天的 PCT 结果以及第 9 天的 PCT 和 hs-CRP 结果显著高于非 VAP 组(P＜0.05)。ROC 曲线显示，在插管后第 7 天应用 PCT、hs-CRP 、WBC 单独和联合预测 VAP 的 AUC 分别为 0.764、0.645、0.559、0.735，其最佳截点分别为 PCT ≥0.33μg/L 、 hs-CRP≥128.5mg/L、 WBC≥15.3×109/L；插管后第 9 天应用 PCT、hs-CRP 、WBC 单独和联合预测 VAP 的 AUC 分别为 0.908、0.712、0.556、0.897，其最佳截点分别为 PCT ≥0.25μg/L 、 hs-CRP≥12.8mg/L、 WBC≥12.95×109/L。VAP 患者恶化组和转归组的 PCT 清除率在第 7 天和第 9 天的结果有明显差异(P＜0.05)，并且 ROC 曲线显示，PCT 清除率第 7 天和第 9 天的 AUC 分别为 0.773 和 0.777，约登指数分别为 0.433 和 0.522。而 VAP 组与非 VAP 组的白细胞浓度并无统计学差异（P>0.05）

结论 机械通气并发 VAP 患者 WBC 、hs-CRP、 PCT 水平明显升高，PCT 和 hs-CRP 对于 VAP 的诊断具有一定的临床价值。 PCT 清除率对 VAP 的预后判断有较高预测价值。

PO-0387

酶法测定尿液草酸和枸橼酸的方法学性能验证及分析前影响因素研究

秦东芳[1]、龚珂[1]、王学晶[1]、张曼[2]
1. 民航总医院
2. 首都医科大学附属北京世纪坛医院

目的 对酶法检测尿液草酸和枸橼酸试剂盒进行方法学性能验证，并对尿液保存方法进行探究，目的是用于泌尿系结石患者代谢评估的临床实践。
方法 参考美国临床和实验室标准协会（CLSI）文件和国内行业标准对草酸和枸橼酸酶法试剂盒进行性能验证，评价其精密度、正确度及线性范围。收集 2020 年 4 月北京大学民航临床医学院门诊 10 例尿液标本，分装后分别于室温、4℃和-20℃保存。在 0、2、4、8、24h 各测量一次草酸和枸橼酸浓度， 比较尿液草酸和枸橼酸浓度在不同温度下放置的变化情况。收集 20 例无结石对照和 20 例泌尿系结石患者的随机尿液标本，每例分为 4 组（A-D），分别按 100:1（即刻）、50:1（即刻）、100:1（24h 后）和 50:1（24h 后）加入 6mol/L 的 HCl 酸化。比较不同比例和时机加入浓 HCl 对草酸和枸橼酸浓度的影响。
结果 精密度和正确度验证分为低浓度和高浓度。在低浓度下，草酸的批内不精密度为 0.92%，批间不精密度为 1.63%，偏倚为-2.05%；枸橼酸的批内不精密度为 1.41%，批间不精密度为偏倚为 1.32%，偏倚为-3.36%；在高浓度下，草酸的批内不精密度为 0.32%，批间不精密度为 1.18%，偏倚为-0.93%；枸橼酸的批内不精密度为 0.91%，批间不精密度为 3.05%，偏倚为-4.62%。精密度和正确度良好。草酸在 1.65～210.71mg/L 范围内线性良好（Y=0.993X-0.216，R2=0.999）。枸橼酸在 0.19～17.85mmol/L 范围内线性良好（Y=0.953X+0.044，R2=0.999）。不加任何防腐剂，尿液在室温、4℃及-20℃保存后，草酸浓度显著降低，枸橼酸浓度较稳定。在尿液收集后即刻和收集后 24h，按照 50:1 的体积比例加入 6 mol/L 的 HCl，草酸和枸橼酸浓度没有差别（P＞0.05）。
结论 酶法尿液草酸和枸橼酸检测试剂盒的性能良好，可用于临床检测。尿液收集后 24h 加入浓 HCl 可保持草酸和枸橼酸稳定。

PO-0388

可溶性肿瘤生成抑制因子 2、平均血小板体积和同型半胱氨酸与慢性心力衰竭患者病变程度的相关性研究

蔡玉婵
上海市杨浦区中心医院

目的 探讨可溶性肿瘤生成抑制因子 2（soluble suppression of tumorigenicity 2，sST2）、平均血小板体积（MPV）、同型半胱氨酸（homocysteine,Hcy）与慢性心力衰竭（chronic heart failure,CHF)及其左心室射血分数和纽约心脏学会（NYHA）心功能分级之间的关系。
方法 选取 2019 年 9 月至 2021 年 4 月于杨浦区中心医院收治的 133 例慢性心衰患者为心衰组，另选取同期健康体检的 106 名心功能正常者作为对照组。检测所有研究对象 sST2、MPV 和 Hcy 浓度，分析三种生物标志物在不同 LVEF 和 NYHA 分级中的差异，并评估 sST2 与 MPV、Hcy 的相关性。

结果 与对照组相比，CHF 组 sST2、MPV 和 Hcy 浓度明显升高，差异均有统计学意义（P＜0.05）；随着 LVEF 的降低和 NYHA 分级的增加，患者 sST2、MPV 和 Hcy 水平逐渐升高，差异具有统计学意义（P＜0.05）；sST2 与 MPV、Hcy 浓度存在线性关系(r＝0.4581，P＜0.05；r＝0.5193，P＜0.05)。

结论 sST2、MPV 和 Hcy 浓度水平与 CHF 及其病变程度有关，联合检测 3 项指标可为 CHF 的严重程度及其预后评估提供重要参考价值。

PO-0389

基于血清直接胆红素的结肠癌根治术后患者生存期预测模型构建与验证

陆丽
上海交通大学医学院附属仁济医院(东院)

目的 探讨血清直接胆红素水平与Ⅱ、Ⅲ期结肠癌根治术后预后的关系。

方法 回顾性分析 567 例Ⅱ、Ⅲ期结肠癌根治术后患者的临床资料；单因素 Cox 回归分析血清总胆红素、直接胆红素及间接胆红素水平与Ⅱ、Ⅲ期结肠癌根治术后总生存期（OS）及无病生存期（DFS）的关系；X-tile 确定结肠癌患者 OS 和 DFS 的直接胆红素水平的 cut-off 值；选择影响结肠癌患者生存期的多个独立危险因素，采用多元 Cox 回归模型绘制预测结肠癌的 OS 及 DFS 的 Nomograms。

结果 单因素 Cox 回归分析确定直接胆红素为结肠癌 OS 及 DFS 的重要预后因素。X-tile 确定结肠癌 OS 和 DFS 的直接胆红素的 cut-off 值均为 3.1 μmol/L。多因素分析结果显示直接胆红素（P = 0.001）、年龄（P = 0.018）、低分化结肠癌（P < 0.02），T3 和 T4 期（P < 0.001），N 期（P < 0.001），具有淋巴血管侵犯（P < 0.001）是影响Ⅱ、Ⅲ期结肠癌根治术后 5 年总生存期的重要危险因素。单变量对数秩检验分析结合多元 Cox 回归分析显示直接胆红素高水平是Ⅱ、Ⅲ 期结肠癌根治术后患者预后的独立危险因素。

结论 直接胆红素可用于Ⅱ、Ⅲ期结肠癌根治术后患者的预后预测。

PO-0390

Trimetallic AuPtCo nanozyme for efficient catalysing the outstanding chemiluminescence based on biofunctionalization

Xiaoyan Zhou
Department of Clinical Laboratory, The Affiliated Hospital of Medical College, Qingdao University, Qingdao 266101, China

Chemiluminescence (CL) system with stable and glowing light emission is great significance for accurate CL quantitative of biomarkers. And catalysts harbor high catalytic activity that are effective for catalyzing the intensive chemiluminescence with improved analytical performance. In this work, trimetallic AuPtCo nanopolyhedrons possess the intrinsic peroxidase-like and catalase-like activities are synthesized through a facile strategy. The AuPtCo nanozyme can catalyze an intensive flash-type CL emission when reacts with chemiluminescent substrates of ABEI and H2O2. Interestingly, biofunctionalization on the surface of AuPtCo (AuPtCo@Bio) endows the slow-diffusion effect on the catalytic interface, thereby prolonging the emission for a glow-type CL. On the basis, the different biofunctionalized AuPtCo nanocomposites are versatilely adopted to

develop two CL assays, including AuPtCo@Cys-ABEI CL reaction and AuPtCo@AbLp-PLA2-based CL immunosensor for sensitive and selective detection of H2O2 and Lp-PLA2, respectively. Moreover, the application of these two CL assays in female vaginal discharge samples for H2O2 and human serum samples for Lp-PLA2 all exhibit good correlation with clinical results, demonstrating their excellent analytical performance. Overall, the trimetallic AuPtCo nanopolyhedrons and its biofunctionalized nanocomposites can be served as promising catalyst in the field of enzymatic bioanalysis, especially the chemiluminescent assays.

PO-0391

Clinical haematological nomograms for prediction of lymph node metastasis and prognosis in resectable esophagogastric junction adenocarcinoma

Can-Tong Liu、Yi-Wei Xu、Yu-Hui Peng
Shantou University Medical College Cancer Hospital

Background Esophagogastric junction adenocarcinoma (EJA) lacks blood-based predictive indicators for lymph node status and prognosis. We aimed to build nomograms with the preoperative haematological parameters to predict lymph node metastasis (LNM) and prognosis in resectable EJA.
Methods The training cohort consisted of resectable EJA patients from December 2003 to December 2010, and patients in the validation cohort were collected from January 2011 to December 2017. 52 candidate indicators for nomogram construction included sociodemographic data and preoperative clinical laboratory haematological baseline data. Lasso regression was used to build LNM prediction nomogram (H-score nomogram). Univariate and multivariate Cox regression analysis was applied to select factors for overall survival prediction nomogram (OS nomogram).
Findings 465 resectable EJA patients were appointed to the training cohort, and the validation cohort was comprised of 289 patients. For predicting LNM, the H-score nomogram containing seven indicators showed good discrimination and calibration ability, with C-indexes of 0·684 and 0·630 in the training and validation cohorts, respectively. Moreover, the OS nomogram for survival prediction composed of 12 factors yielded C-indexes of 0·652 and 0·613 in the training and validation cohorts, respectively. Kaplan-Meier survival analysis showed patients with high OS nomogram scores had worse 5-year OS than those with low scores (training cohort: 59·6% vs. 26·2%; validation cohort: 58·6% vs. 38·6%; all $p < 0·0001$).
Interpretations Nomograms constructed based on the clinical laboratory haematological indicators are potential prediction models for lymph node status and survival of resectable EJA.

PO-0392

GO-PTCNH2 纳米杂化物作为光电化学活性探针检测 TNF-α

陈梦园[1]、尹斐[1]、沈艳飞[1,2,3]
1. 东南大学医学院
2. 东南大学中大医院，临床检验医学中心
3. 东南大学江苏省重症重点实验室

肿瘤坏死因子-α(TNF-α)作为一种细胞因子，是肺癌等多种疾病的潜在生物标志物，开发出即时有效的检测方法将提高相关疾病诊断的准确性和有效性。为此，我们课题组开发了一种简单快速的光电化学（PEC）免疫分析方法用于有效检测 TNF-α。此法通过简单研磨和超声处理，得到了具有优异光电性能和快速电子传递动力的多层氧化石墨烯/氨基端基苊衍生物（GO/$PTCNH_2$）组装。

其作为光电化学活性探针，一方面具备优异的光电化学活性；另一方面，能够提供大的表面积，快速的电子转移动力学和丰富的活性位点用于生物分子连接。首先通过简单的滴涂法将 GO-PTCNH$_2$ 组装在电极上，然后将抗 TNF-α 与 GO-PTCNH$_2$ 偶联，并对目标蛋白 TNF-α 进行捕获，能够使得传感器 PEC 信号的下降值与目标物含量呈现线性关系，从而制备出了一种用于检测 TNF-α 的“signal-off”型 PEC 免疫分析法。此检测法具有 10 pg/mL - 100 ng/mL 的检测范围且具备 3.33 pg/mL 的检测限。另外，该方法并成功运用在人血清中 TNF-α 的检测，回收率在 92.5%~ 96.6%之间，相对标准偏差小于 9.99%。这是首次利用 PTCNH2 作为光电化学活性探针来检测肿瘤生物标志物，具有显著的可靠性和简单性，可用于实际样品的检测。总之，这种高灵敏度和高选择性的 PEC 免疫传感器为癌症的早期筛查和诊断提供了前景。

PO-0393

血尿酸水平与尿路结石患者肾功能的相关性分析

赖晓霏
重庆医科大学附属第一医院

目的 探究和分析血清尿酸水平对尿路结石患者肾脏功能的临床评价预防诊断中的应用价值。
方法 选择我院 2019 年 4-5 月信息完整的尿路结石患者共 51 例作为阳性组，20 例健康体检人群作为阴性对照组。分别收集 24 小时尿液和血清标本，对 24 小时尿液进行尿草酸、尿尿酸、尿枸橼酸、尿钙、尿镁、尿磷的检测，对血清进行血尿酸检测，并对检测结果进行统计学分析。
结果 1.尿尿酸、尿钙、尿枸橼酸的检测值在尿路结石组和健康对照组有明显统计学差异（p<0.05）,尿路结石患者以高尿酸尿、高钙尿、低枸橼酸尿为主要特征。2.在结石患者中，尿尿酸和尿钙的检测值在男性尿路结石和女性尿路结石患者中有明显统计学差异（p<0.05）,尿草酸和尿钙的检测值在较大结石（直径>10mm）和较小结石（直径小于 10mm）患者中有明显统计学差异（P<0.05）， 尿尿酸和尿磷的检测值在尿路结石初发和复发患者中有明显的统计学差异（p<0.05）,尿钙和尿镁的检测值在尿路结石患者排石治疗和外科治疗中有明显统计学差异（p<0.05）。尿液中的某些成分与结石患者的部分临床表现有相关性。3.在结石患者中，血尿酸与尿枸橼酸成明显负相关，相关系数 r 为-0.341（P<0.05）；血尿酸与尿尿酸成极其显著的正相关，相关系数 r 为 0.471（P<0.001）。高尿酸血症是导致尿路结石的高危风险因素。4.在结石患者中，血尿酸水平跟胱抑素 C 水平成明显正相关，跟血肌酐水平成极其显著正相关，跟 eGFR 成明显负相关，相关系数 r 分别为 oo（P 小于 0.05），oo（P 小于 0.001），-00（P 小于 0.05）。且血尿酸与 eGFR 在尿酸结石组（R 平方=0.290）的负相关性要高于非尿酸结石组（R 平方=0.077）和对照组（R 平方=0.043）。
结论 1.上尿路结石患者以高钙尿、高尿酸尿、低枸橼酸尿为特征 2.尿液中成分跟结石患者的部分临床特征有相关性 3.高尿酸血症是致尿路结石的危险代谢因素 4.高尿酸血症是结石患者肾功能下降的危险因素。

PO-0394

甲状腺癌患者血清 IGF-1 检测的临床意义

侯玉磊
重庆医科大学附属第一医院

目的 探究血清类胰岛素生长因子 1 （Insulin-like Growth Factor 1，IGF-1）在甲状腺癌患者中的临床意义。

方法 采集所有研究对象空腹静脉血 5 ml，3000 r / min，离心 6 min，分离血清，西门子 Immulite1000 化学发光仪检测血清 IGF-1 浓度。IGF-1 测定试剂盒（化学发光法）由西门子公司提供。
结果 中晚期甲状腺癌患者血清 IGF-1 浓度显著高于早期甲状腺癌患者血清 IGF-1 浓度（Z=-2.186，P=0.029）；单发结节患者血清 IGF-1 水平显著高于多发结节患者（Z=-2.024，P=0.043）；淋巴结转移的甲状腺癌患者 IGF-1 浓度显著高于未发生淋巴结转移的甲状腺癌患者（Z=-2.356, P=0.018）；结节大小>1cm 的甲状腺癌患者血清 IGF-1 浓度高于结节大小≤1cm 的患者（Z=-2.160，P=0.031），IGF-1 浓度与结节个数呈负相关（Z=-2.024，P=0.043）
结论 甲状腺癌患者血清 IGF-1 浓度与肿瘤分期、结节个数相关，其作为甲状腺癌新的标志物具有广泛的临床应用前景。

PO-0395

基于胸水生物标志物和 CT 征象的肺癌风险模型的建立与验证

毕小云
重庆医科大学附属第一医院

目的 利用生物标志物与 CT 征象建立肺癌风险模型，以期为伴有胸水的肺部良恶性病变的诊断提供依据。
方法 纳入 594 例胸水患者，其中训练集 460 例，验证集 134 例，根据临床-放射学及实验室参数纳入 20 个危险因素。通过多因素 Logistic 回归分析建立两个列线图模型（模型 1、模型 2），并对模型进行外部验证。用曲线下面积（AUC）来量化模型预测区分能力，以 Delong 检验进行 AUC 的比较，并通过校准曲线和决策曲线分析评价模型及其临床应用价值。
结果 通过多因素 Logistic 回归分析，5 年前胸外肿瘤病史、胸水癌胚抗原（CEA）、细胞角蛋白 19 片段（CYFRA21-1）、白球比（A/G）、肿块直径、空气支气管征、分叶征和血管集束征为肺癌的危险因素。模型 1 与模型 2 在训练集中 AUC 分别为 0.979（95% CI：0.968～0.991）和 0.932（95% CI：0.909～0.955），P<0.001。在验证集中 AUC 分别为 0.911（95% CI：0.861～0.961）和 0.846（95% CI：0.776～0.917），P=0.009。在诊断分类表中两个模型的正确分类比例分别为 86.6%和 82.1%。决策曲线分析表明在 50%的阈值概率下模型 1 的净效益为 45.0%，模型 2 为 39.8%，并且在校准曲线中前者的预测值与实际值显示了更好的一致性。
结论 通过验证，胸水生物标志物和 CT 征象结合构建的模型可用于评估伴有胸水的肺部病变的癌症风险。

PO-0396

AIS 患者血清 IMA 水平及其他血液学特征与 MCA 重度狭窄/闭塞的关系研究

陈星[3,4]、杨欢[1]、李思进[1]、李慧洋[1]、任碧琼[2,4]
1. 湖南中医药大学临床医学院检验医学系
2. 湖南中医药大学临床医学院检验医学系
3. 湖南中医药大学临床医学院检验医学系
4. 湖南省第二人民医院检验科

目的 探讨急性缺血性脑卒中(AIS)患者血清缺血性修饰白蛋白(IMA)水平以及其他血液学特征与大脑中动脉(MCA)重度狭窄/闭塞的关系，为 MCA 重度狭窄/闭塞性 AIS 患者提供辅助诊断依据。
方法 纳入 2019 年 1 月至 2020 年 12 月我院卒中救治中心收治的 AIS 患者 169 例，根据 MRA 确定颅内大动脉是否重度狭窄/闭塞分为非重度狭窄/闭塞和重度狭窄/闭塞两组。再次将重度狭窄/闭塞

按是否 MCA 重度狭窄/闭塞分为 MCA 重度狭窄/闭塞和其它血管重度狭窄/闭塞两组。纳入健康人 29 例为对照组。测定患者的血清 IMA 及白蛋白（ALB）水平，计算 IMA 与白蛋白比值(IMAR)、经白蛋白调整的缺血性修饰白蛋白指数(IMA index)，同时检测血清超敏 C 反应蛋白（Hs-CRP）、血清淀粉样蛋白 A(SAA)、尿酸（UA） 、小而密低密度脂蛋白（sdLDL-c）、血脂、胆碱酯酶酶（CHE）、血常规、凝血常规等，结合患者一般资料进行综合分析。

结果 研究结果显示，重度狭窄/闭塞组血液 IMA、IMAR 水平、白细胞(WBC)、中性粒细胞值(NUT) 、INR、FDP、DD 显著高于非重度狭窄/闭塞组，而 TG、C/H、CHE 水平显著低于另外一组；MCA 重度狭窄/闭塞组的血液 IMA、IMAR 水平、INR、TT 显著高于其它血管重度狭窄/闭塞组，而 IMA index、ALB、CHE 水平显著低于另外一组；各组之间 sdLDL-c、Hs-CRP、SAA 等指标无统计学差异。多重线性回归分析表明，IMA 与白蛋白呈明显负相关。联合诊断 ROC 曲线分析表明，在 AIS 患者中，判断 AIS 患者患有颅内大动脉重度狭窄/闭塞的最佳组合为入院 NIHSS 评分+ CHE (AUC=0.783)。判断 AIS 患者患有 MCA 重度狭窄或闭塞最佳组合为 IMAR 联合入院 NIHSS 评分及 CHE(AUC=0.827)。

结论 MCA 重度狭窄/闭塞患者的 IMA、IMAR 水平明显增高， ALB、IMA index、CHE 水平显著降低。IMA、IMAR 及 IMA index 同时使用，对 MCA 重度狭窄/闭塞型 AIS 患者有一定的辅助诊断价值，并且 IMAR 联合入院 NIHSS 评分及 CHE 是判断 AIS 患者为 MCA 重度狭窄或闭塞性的最佳组合。

PO-0397

LC-MS/MS 法检测 24 小时尿液游离皮质醇的内标选择和评价

赵蓓蓓[1,2]、李冰玲[1]、袁楚茹[1]、董衡[1,2]、林清娜[1]、佘旭辉[1,2]、李卓阳[1,2]
1. 广州金域医学检验中心有限公司
2. 广州医科大学金域检验学院

目的 评估 LC-MS/MS 法检测 24 小时尿液游离皮质醇的方法中，不同氘代标记的同位素内标，对临床样品检测结果的影响。

方法 建立 LC-MS/MS 法检测 24 小时尿液游离皮质醇的方法，选择皮质醇-D4（9,11,12,12-D4）、皮质醇-D6（2,2,6,6,21,21-D6）作为同位素标记内标，评估了方法的基质特异性、基质效应、准确度、精密度、干扰实验等。将所建立方法应用于实际样品检测中，评估不同同位素标记内标对尿液样品检测结果的影响。

结果 分别采用皮质醇-D4、皮质醇-D6 作为内标，方法的基质特异性、基质效应、准确度、精密度、干扰实验等评估均满足要求。但在实际样本检测中，部分尿液样本中能检出皮质醇-D4，比较了选用皮质醇-D4 和皮质醇-D6 作为内标，建立的 LC-MS/MS 定量的检测结果存在显著差异，最高差异可达 41.7%。

结论 尿液基质中可能存在自然界同位素标记物皮质醇-d4 或皮质醇-d4 同分异构体等干扰物，虽然 LC-MS/MS 方法验证通过，但在大批量临床样本检测过程中发现干扰，可更换氘代标记数量更多的皮质醇-D6，减少对临床样品检测结果的影响。

PO-0398

Establishment of Sex-and Age-Specific Reference Intervals for High-sensitivity Cardiac Troponin I in Healthy Adults of Jilin Province Aged 20~≤95 years

bing he
First Hospital of Jilin University

Objective Cardiovascular disease was the leading cause of morbidity and mortality worldwide. Cardiac troponin (cTn), especially high-sensitivity cardiac troponin (hs-cTn), was the preferred biomarker for the diagnosis of MI. At present, there was no uniform standard for the reference interval of hs-cTnI in Chinese population. The aim of our study was to establish the 99th percentile gender-and age-related reference interval for hs-cTnI in healthy adults of Jilin Province, and to analyze the relationship between hs-cTnI and other laboratory findings.
Methods The serum specimen from recruited healthy adults (n=2183, 20~≤95 years old) were collected from the First Hospital of Jilin University. Due to the unknown interception point, we continued collecting samples from March to June 2020 to try for more than 120 individuals at every 10 years of age and each sex. The serum hs-cTnI concentration was measured on the VITROS 5600 Integrated System. For each group, the Dixon test was used to identify outliers, which were removed. Distribution and scatter plots were visually inspected to determine sex and age partitions. One sample Kolmogorov–Smirnov test was used to decide whether a random sample follows a Gaussian distribution. Differences were tested using Harris and Boyd's z-test after achieving normality. Ninety percent confidence intervals were computed for the upper limits of each reference interval. Reference interval was established by Medcalc according to the EP28-A3c guidelines issued by the Clinical and Laboratory Standards Institute. Correlation analysis was used by Spearman method.
Results The 99th percentile URL hs-cTnI concentration was 11.1 ng/L (90% CI 10.3–12.9 ng/L) for all healthy participants according to the non-parametric method. The 99th percentile URL was significantly higher in men (12.5 ng/L, 90% CI 11.1–13.8 ng/L) than in women (9.6 ng/L, 90% CI 7.6–10.9 ng/L). The 99th percentile URL of ≥55 years old group (12.6 ng/L, 90% CI 11.1–13.8 ng/L) was higher than in the < 55 years old group (8.0 ng/L, 90% CI 5.0–10.3 ng/L). The males 99th percentile URL for hs-cTnI concentration were 10.3 ng/L for <55 years old group and 13.7 ng/L for ≥55 years old group. In females, the 99th percentile URL for hs-cTnI concentration were 5.3 ng/L for <55 years old group and 10.6 ng/L for ≥55 years old group. The gender difference in the serum hs-cTnI concentration was more significant for the <55 years old group. Hs-cTnI values were significantly associated with age ($r = 0.57$, $p < 0.001$). Except for age, the strongest correlation was shown between hs-cTnI and NT-proBNP ($r = 0.44$, $p < 0.001$). Additionally, the correlation between hs-cTnI and sex ($r = 0.14$, $p < 0.001$) was lower than that between hs-cTnI and age.
Conclusion There were gender- and age-specific differences in the hs-cTnI reference intervals in healthy adult of Jilin province, China. We first established the reference intervals of hs-cTnI in Chinese adults and the validation of the reference intervals should be tested in future.

PO-0399

P2PSA 及其衍生指标对前列腺癌诊断和治疗的应用价值

陈晓婷
江苏省人民医院（南京医科大学第一附属医院）

前列腺癌是欧美国家男性最高发的肿瘤，近年来，在我国的发病率也逐年上升。相对于发达国家，我国患者的前列腺癌病死率更高。前列腺特异抗原（PSA）已广泛应用于前列腺癌的筛查和治

疗监测，但是，PSA 特异性不高，会造成 PSA 灰区患者的过度筛查与诊断。proPSA 分为 4 种亚型，其中[-2]proPSA（P2PSA）最稳定且最具癌症特异性，成为比 PSA 更为特异的标志物。而由 P2PSA 计算的衍生指标前列腺健康指数（PHI，[(p2PSA/fPSA)×√tPSA]）和%p2PSA[(p2PSA/fPSA)×10 0]，在预测高分级前列腺癌，提升前列腺癌预测模型效能等方面都有较高价值，可减少不必要的前列腺穿刺活检。本文就 P2PSA 及其衍生指标 PHI 和%p2PSA 在前列腺癌诊断和治疗中的应用价值作一综述。

PO-0400

Relationship between Oxidative Stress Biomarkers and Visual Field Progression in Patients with Primary Angle Closure Glaucoma

Shengjie Li、wenjun cao
Eye & ENT Hospital, Shanghai Medical College, Fudan University

Purpose To investigate the serum changes of oxidative stress markers and the relationship between these factors and visual field (VF) progression in patients with primary angle closure glaucoma (PACG).
Methods A case-control and a prospective cohort study. A total of 94 patients with PACG and 89 normal controls were enrolled. Furthermore, 94 PACG subjects were followed up for at least two years (once every six months). All participants were evaluated for serum levels of superoxide dismutase (SOD), total antioxidant status (TAS), hydrogen peroxide (H2O2), malondialdehyde (MDA), glutathione peroxidase, glutathione reductase, and detailed eye and systematic examination. Binary logistic regression analysis and Cox regression analysis were performed.
Results The serum levels of SOD and TAS in the PACG group were significantly lower than those in the control group ($p < 0.001$). Meanwhile, PACG subjects had significantly higher levels of MDA and H2O2 than the normal control subjects ($p < 0.001$). Serum levels of TAS (OR = 0.773, 95%CI = 0.349 − 0.714, $p < 0.001$), SOD (OR = 0.975, 95%CI = 0.955 − 0.995, $p < 0.001$), MDA (OR = 1.155, 95%CI = 1.080 − 1.235, $p < 0.001$), and H2O2 (OR = 1.216, 95%CI = 1.142 − 1.295, $p < 0.001$) were independent risk/protective factors for PACG. TAS levels (HR = 0:041, 95%CI = 0.008 – 0.218, $p < 0.001$), SOD levels (HR = 0:983, 95%CI = 0.971 – 0.994, $p = 0.003$), and MDA levels (HR = 1.010, 95%CI = 1.001 – 1.018, $p = 0.015$) at baseline were associated with visual field progression. Kaplan–Meier curves reveal that patients with TAS < 0.95/SOD < 143/ MDA > 12 had a significantly higher percentage of PACG progression ($p < 0.05$).
Conclusions Decreased levels of TAS and SOD as well as increased levels of MDA at baseline were associated with VF progression in patients with PACG. These findings suggest that oxidative stress was involved in the onset and development of PACG.

PO-0401

Gd-BOPTA-enhanced MRI in the hepatobiliary phase: Evaluate liver function with the Degree of Biliary System Visualization

min huang
Shandong Provincial Hospital Affiliated to Shandong First Medical University

Background Assessment of preoperative hepatic function is very important in surgical planning for avoiding post-hepatectomy liver failure. The Child-Pugh classification system is commonly

used for evaluation of liver function. However, it has limitation in quantitatively evaluating liver function.
Purpose To evaluate liver function according to the degree of biliary system visualization of Gd-BOPTA-enhanced MRI.
Results The RE were associated with total bilirubin (r = -0.542, P < 0.01), prothrombin time (r = -0.520, P < 0.01), albumin (r = 0.555, P < 0.01) and liver parenchyma enhancement (r=0.457, P<0.001). The RE was significantly higher for NLF group than LCA (P < 0.001), LCB (P < 0.001), and LCC (P < 0.001) groups. The RE was significantly higher for LCA group than LCB (P < 0.001), and LCC (P < 0.001) groups. ROC curves revealed a cut-off value ≥2.695 (sensitivity 0.81, specificity 0.93, AUC 0.793) for NLF group, and ≥ 2.305 (sensitivity 0.83, specificity 0.92, AUC 0.954) for LCA group.
Conclusions The degree of biliary system visualization of Gd-BOPTA-enhanced MRI may be used as an imaging-based, quantifiable metric to estimate liver function.

PO-0402

慢性肾功能不全患者中血清脂肪酶升高的临床研究及相关性分析

黄少铃、何奥玉、李卫滨、张胜行
中国人民解放军联勤保障部队第 900 医院

目的 研究慢性肾功能不全（Chronic renal failure，CRF）患者血清脂肪酶（Lipase，LIPA）水平与病情严重程度之间的关系，探究 CRF 患者血清 LIPA 升高的原因。
方法 选取联勤保障部队第九〇〇医院 2021 年收治的慢性肾功能不全住院患者共 110 例，用回顾性分析方法收集资料，比较血清 LIPA 在 CRF 不同阶段患者中的表达水平及 30 例健康对照者之间的差异，分析血清 LIPA 升高与肾小球滤过率（Estimated Glomerular filtration rate，eGFR）、尿素（Urea）、胱抑素 C（Cystain C，CYS-C）、血肌酐（Serum creatinine，Scr）、淀粉酶（Amylase，AMY）、全段甲状旁腺素（Intact parathyroid hormone，iPTH）、甘油三酯（Triglycerides，TG）之间是否存在相关性。
结果 1.110 例 CRF 患者中，共有 45 例发生血清 LIPA 水平增高，占比 40.9%，其中 CKD5 期 48.1%、CKD4 期 42.9%、CKD3 期 28%、CKD2 期 20%。所有病例均未出现 LIPA 超出上限三倍及以上的情况，AMY 均在正常范围内。正常体检组未出现 LIPA 增高超出上限的情况。2.CRF 患者血清 LIPA 水平为 258.5（173.75~389）U/L，正常体检者为 96(82~107)U/L，差异有统计学意义（P＜0.05）。3.CKD2 期患者血清 LIPA 水平为 122.5(113.5~531.25)U/L，CKD3 期患者为 177(148~291)U/L，CKD4 期患者为 272.5(146.25~433.75)U/L，CKD5 期患者为 280.5(222~462.5)U/L。其中正常体检组与 CKD3、CKD4 期、CKD5 期差异有统计学意义（P＜0.05），CKD3 期与 CKD5 期差异有统计学意义（P＜0.05）。4.CRF 患者的血清 LIPA 与 AMY（r=0.37,P＜0.05）、P（r=0.35,P＜0.05）呈正相关。与 iPTH、TG 的相关性无统计学意义。
结论 慢性肾功能不全患者血清脂肪酶相较正常人升高，升高幅度在参考区间上限的三倍之内，从 CKD3 期开始，随 CKD 的进展而增加。LIPA 水平与肾功能、血清淀粉酶水平密切相关，其升高的原因可能是 CRF 时清除率的下降或产生亚临床胰腺损伤。诊断急性胰腺炎时，应考虑到慢性肾功能不全导致血清 LIPA 升高的可能；对 CRF 患者动态检测血清脂肪酶对判断 CRF 分期及严重程度、指导治疗、判断预后有一定临床价值。

PO-0403

二甲双胍减轻铁代谢及脂质代谢紊乱机制的研究

贾佳
南京大学医学院附属鼓楼医院

目的 近十几年的研究发现二甲双胍不仅是降糖首选药，而且具有良好的降脂减肥作用，但是又有研究表明，长期服用二甲双胍会导致不同程度的贫血，原因尚未明确。
方法 铁作为机体必须的微量元素之一，以多种存在形式参与脂质代谢的过程。铁与脂质两种代谢途径在体内许多场所相互作用，铁可通过参与脂质代谢的酶和转运蛋白的组成，直接影响脂质的分布、转归和分泌，也可通过亚铁形式的铁诱导氧化应激和炎症间接影响脂质代谢；而脂质代谢也不同程度影响铁的吸收和分布。本研究旨在用高脂喂养的脂肪肝小鼠模型探讨二甲双胍的降脂作用与铁代谢通路改变的影响。
结果 二甲双胍灌胃脂肪肝小鼠模型相较于未用二甲双胍灌胃小鼠肝细胞死亡及肝纤维化程度均减轻。
结论 二甲双胍通过对机体脂代谢的影响，降低机体铁死亡，对于伴有血脂紊乱相关疾病的预防和治疗有重要意义。

PO-0404

五种项目在乳腺癌患者中的变化及临床意义

赵宗晨
山东第一医科大学附属省立医院

目的 乳腺癌患者外周血红细胞分布宽度（RDW-CV）、中性粒细胞与淋巴细胞比值（NLR）、血小板分布宽度（PDW）、白蛋白（ALB）及血红蛋白与红细胞分布宽度的比值（HGB/RDW-CV）的变化及临床意义。
方法 收集 2010 年 7 月至 2012 年 2 月山东大学附属省立医院乳腺癌住院患者 400 例为研究组，体检健康志愿者 300 例为健康对照组。比较两组 RDW-CV、NLR、PDW、ALB 及 HGB/RDW-CV 比值的结果及与其他病理参数的关系。
结果 乳腺癌患者组的 RDW-CV、NLR、PDW、ALB、HGB/RDW-CV 比值均显著高于对健康照组，差异有统计学意义（P<0.05）。绘制 ROC 曲线，RDW-CV 曲线下面积为 0.333，确定最佳截点后，将 400 例乳腺癌患者组分为低 RDW-CV（≤12.55，146 例）组和高 RDW-CV（>12.55，254 例）组。NLR 曲线下面积为 0.446，分为低 NLR（≤2.37，301 例）组和高 NLR（>2.37，99 例）组。PDW 曲线下面积为 0.652，分为低 PDW（≤12.15，211 例）组和高 PDW（>12.15，189 例）组。ALB 曲线下面积为 0.951，分为低 ALB（≤44.65，334 例）组和高 ALB（>44.65，66 例）组。HGB/RDW-CV 曲线下面积为 0.749，分为低 HGB/RDW-CV（≤10.78，253 例）组和高 HGB/RDW-CV（>10.78，147 例）组。高低组 RDW-CV、NLR、PDW、ALB 在病理分级中均无统计学意义（P>0.05），高低组 HGB/RDW-CV 在病理分级分级中有统计学意义（P<0.05）。高低组 RDW-CV、NLR、PDW、ALB 在 TNM 分级中无统计学意义（P>0.05），高低组 HGB/RDW-CV 在 TNM 分级中有统计学意义（P<0.05）。
结论 NLR、RDW-CV、PDW、ALB 及 HGB/RDW-CV 在乳腺癌诊断提供了重要的参考价值，且 HGB/RDW-CV 与乳腺癌的恶性程度有关。

PO-0405

新疆生产建设兵团某师 30 岁以上常住居民血脂异常随机抽样调查

查贺飞、刘春燕、张新
新疆生产建设兵团医院

目的 探讨新疆生产建设兵团(以下简称兵团)某师常住居民血脂异常的患病率及影响因素，为预防血脂异常提供依据。
方法 选取 2014 年 11 月至 2015 年 3 月兵团第四师≥30 岁的常住居民(居住时间＞6 个月)，采用多阶段分层随机抽样的方法，最终纳入 4624 人为调查对象。比较男女的血脂水平及血脂异常患病率差异；分析不同年龄组男女血脂异常患病率差异；比较血脂正常组和血脂异常组合并超重和肥胖、糖尿病、高血压、慢性肾病患病率；采用多因素 Logistic 回归分析兵团第四师居民血脂异常的影响因素。
结果 女性 TC 和 LDL-C 水平高于男性，TG 水平和血脂异常患病率低于男性，差异有统计学意义(*P*<0.05)。调查对象＜60 岁时，相同年龄段中男性血脂异常的患病率均高于女性，调查对象≥60 岁时，男性血脂异常的患病率低于女性，差异有统计学意义(*P*<0.05)。血脂异常组合并超重和肥胖、糖尿病、高血压、慢性肾病的患病率均高于血脂正常组，差异有统计学意义(*P*<0.05)。性别(男性)、超重和肥胖、糖尿病、高血压和慢性肾病均是调查对象发生血脂异常的独立危险因素(*P*<0.05)。
结论 中青年男性和更年期后女性是兵团第四师居民血脂异常的防控重点，应加强血糖和血压的检测，并通过改善不良的生活习惯降低该地区血脂异常的患病率。

PO-0406

高尿酸血症伴高血压患者认知功能障碍的横断面研究

冯双亮
山东第一医科大学第一附属医院（山东省千佛山医院）

目的 高尿酸血症和高血压是认知功能障碍的独立因素。然而，这两个因素的结合与认知功能障碍之间的关系尚不清楚。本研究旨在探讨高尿酸血症合并高血压与认知功能障碍风险的关系。
方法 本研究于 2018 年对 2963 名 45 岁及以上的参与者进行了横断面调查。自报高血压及血压≥140/90mmhg 者为高血压。以空腹静脉血尿酸水平测定高尿酸血症。采用简易精神状态检查（MMSE）探讨认知障碍。采用多变量 logistic 回归模型分析不同人群组合与认知功能障碍的关系。
结果 健康 1724 例（58.2%），高尿酸血症伴高血压 57 例（1.9%），单纯高尿酸血症 45 例（1.5%），单纯高血压 1137 例（38.4%）。高尿酸血症合并高血压组 MMSE 评分（26.8±3.4）明显低于正常对照组（28.1±1.9；P<0.001）。高尿酸血症合并高血压组认知功能障碍的患病率明显高于其他组（17.5%）。认知功能障碍与高尿酸血症合并高血压（校正比值比[OR]：3.04；95%可信区间[CI]：1.30-7.24）、单纯性高尿酸血症（校正比值比[OR]：0.44；95%可信区间[CI]：0.05-3.55）、单纯性高血压（校正比值比[OR]：1.26）显著相关；95%置信区间[CI]：0.79-1.99）。女性单纯性高血压、单纯高尿酸血症、高尿酸血症合并高血压有相关性，有统计学意义，男性无相关性。
结论 高尿酸血症合并高血压与认知功能障碍风险增加有关，尤其是女性。为早期预防认知障碍和痴呆提供临床依据。

PO-0407

全自动生化分析仪生化检验指标在肝硬化疾病诊断中的应用价值评估

付舒婷
吉林大学第一医院

目的 利用全自动生化分析仪生化检验指标在肝硬化疾病诊断中的应用价值评估。
方法 选取我院 2019 年 11 月～2021 年 3 月收治的 80 例肝硬化患者作为研究对象分为研究组，同时选取同期 80 例健康体检者作为参照组，两组人员均在空腹状态下抽取 5ml 静脉血液，离心机调至 3500 r/min，5min 进行血清分离，通过全自动生化分析仪对血液标本进行生化指标检验，然后借助两点终点法、速率法、酶法等对肝功能指标包括丙氨酸氨基转移酶（ALT）、门冬氨酸氨基转移酶（AST）、碱性磷酸酶（ALP）、γ-谷氨酰转肽酶（γ-GT）、总蛋白（TP）、白蛋白（ALB)、总胆红素(TBIL)、直接胆红素(DBIL)、胆碱酯酶(CHE）等进行检测，对比两组人员肝脏的生化指标。
结果 研究组门冬氨酸氨基转移酶（AST）、丙氨酸氨基转移酶（ALT）、γ-谷氨酰转肽酶（γ-GT）、碱性磷酸酶（ALP）、总胆红素(TBIL)、直接胆红素(DBIL)水平均明显高于参照组，研究组总蛋白（TP）、白蛋白（ALB)、胆碱酯酶(CHE）水平均明显低于常规组，差异有统计学意义（P<0.05）。
结论 生化检验指标在肝硬化疾病诊断中的临床应用价值高，临床上可依据生化检验指标判断肝硬化患者的肝脏病变程度，从而为疾病的临床诊断提供指导意见和诊断依据，对早期的诊断具有重要意义。

PO-0408

98 例维持性血液透析患者透析充分性的实验室指标评价

刘春燕、李晓苗、葛若卿、梁梦洁、张新
新疆生产建设兵团医院

目的 采用实验室指标对 98 例维持性血液透析(maintenance hemodialysis, MHD)患者透析充分性进行评价，为 MHD 患者诊疗方案的持续改进提供实验室基础。
方法 选取 2017 年 10 月至 2019 年 08 月在新疆生产建设兵团医院血液净化中心接受透析龄 3 个月以上的 98 例 MHD 患者（男 50 例，女 48 例），参照《中国血液透析充分性临床实践指南》对 MHD 患者透析充分性的评价标准，采用非参数检验、c2 检验对 MHD 患者透析前的单室尿素清除率（spKt/V）、酸碱平衡、营养状况及骨矿物质代谢等实验室指标进行统计分析。
结果 66.3%的 MHD 患者 spKt/V≥1.4，女性组 spKt/V≥1.4 的患者数量多于男性组（P<0.05）。62.2%患者存在不同程度的酸中毒，女性组血清碳酸氢盐<20.0mmol/L 的患者数量多于男性组（P<0.05）。17.3%患者血清白蛋白（Alb）未达到 35 g/L，Alb 浓度达到 35～40.0 g/L 的患者为 59.2%，仅有 23.5%患者控制较好（≥40 g/L），且女性低蛋白血症患者数量明显多于男性（P<0.05）。33.7%的患者存在不同程度贫血，其中女性贫血患者高达 47.9%，女性贫血患者数量显著多于男性（P<0.05）。43.9%的患者呈现低钙血症状态，男性校正血钙<2.10 mmol/L 的患者数量多于女性（P<0.05）。另外，55.1%的患者甲状旁腺激素≥300 pg/mL，甲状旁腺激素的浓度从 1.23 到 1914 pg/mL。
结论 98 例 MHD 患者实验室指标基本能达到《中国血液透析充分性临床实践指南》的标准，但女性更易发生营养不良、酸碱平衡紊乱等临床表现，男性更易发生骨矿物质代谢紊乱，临床应制定精细化、个体化 MHD 患者透析治疗和生活指导方案，以期更好延长患者生存期。

PO-0409

Optilite 特定蛋白分析仪尿液 Lambda 游离轻链参考区间的建立

张玲、潘建华、周锐雄
广州金域医学检验中心

目的 初步建立 Optilite 特定蛋白分析仪尿液 Lambda 游离轻链参考区间。
方法 选取广州金域体检中心健康者 150 名，男女各 75 人，男女性平均年龄 43 岁，按年龄段分为 5 组选样，为 20～30 岁选 20 人、31～40 岁组选 50 人、41～50 岁组选 40 人、51～60 岁组选 30 人、≥60 岁组选 10 人。留取肉眼可见的澄清尿液样本，立即送检，并参考血液检测的相关项目指标正常，该组人群血液酶法检测尿素(UREA)平均值为 4.72mmol/L、肌酐(Cr)均值为 81U、γ-谷氨酰转肽酶(GGT)均值为 26U/L，血常规 31 项结果无异常，同时采用 Optilite 特定蛋白分析仪（免疫比浊法）检测 Lambda 游离轻链。依据我国卫生行业标准 WS/T 402—2012《临床实验室检验项目参考区间的制定》CLISI C28 建立 Lambda Freelite 的参考区间，采用 EP Evaluator 软件进行统计。
结果 测得尿液 Lambda Freelite 均值 4.182mg/L、标准差 3.72mg/L、检测结果范围 0.67-20.61mg/L、最小值 0.67mg/L、最大值 44.58mg/L、次大值 20.61mg/L、极差 43.91mg/L、1/3 极差为 14.64mg/L、离群值验证 23.97mg/L。剔除离群值 44.58mg/L 后验证极差为 19.94mg/L，1/3 极差为 6.65mg/L，离群验证值为 4.49mg/L，小于 1/3 极差 6.65mg/L，验证通过，本室验证 Optilite 特定蛋白分析仪检测 Lambda Freelite 的参考区间为 0-15.42mg/L，与 Optilite Lambda Freelite 厂家说明书提供的参考范围 0-3.79mg/L，比值相差 4.07 倍。
结论 临床实验室应该根据中国人群建立 Optilite 特定蛋白分析仪尿液 Lambda 游离轻链参考区间来对检测结果进行判断，为临床提供可靠客观的诊断依据。

PO-0410

同位素稀释液相色谱串联质谱技术在定量血清载脂蛋白 C-Ⅰ、C-Ⅱ和 C-Ⅲ上的应用

李卿、居漪、孙贺伟、虞科颖
上海市临床检验中心

目的 载脂蛋白 C 家族在血脂异常方面有重要临床意义。目前 apo C 项目尚未广泛开展。在临床质谱领域上，罕见蛋白类项目。本研究使用同位素稀释液相色谱串联质谱技术（ID-LC-MS）定量检测载脂蛋白 C-Ⅰ、C-Ⅱ和 C-Ⅲ，为建立基于质谱平台的蛋白类多项目联合检测提供方法支持。
方法 采用“自下而上”的蛋白定量思路。选择代表性定量肽段，对样品与同位素标记的肽段同步进行变性、还原、烷基化等前处理，经胰蛋白酶酶解，用液相色谱串联质谱定量检测目标肽段，峰面积与内标比和浓度构建校准方程，换算出待测物的载脂蛋白 C-Ⅰ、C-Ⅱ和 C-Ⅲ的含量，并与定值血清的靶值比较。
结果 肽段 TP（apo C-Ⅰ）、TY（apo C-Ⅱ）和 GW（apo C-Ⅲ）响应最高，被选择为定量肽段。使用校准品的定量肽段与同位素标记肽段的峰面积比与校准品浓度建立校准方程，三个蛋白的校准方程相关系数 R>0.95。ID-LC-MS 检测定值血清样品，与靶值的相对偏移分别为-1.5%（apo C-Ⅰ）、-5.2%（apo C-Ⅱ）和-5.4%（apo C-Ⅲ）。
结论 ID-LC-MS 可用于定量检测人血清 apo C-Ⅰ、apo C-Ⅱ和 apo C-Ⅲ。apo C-Ⅰ的定量结果并不包括截短的 apo C-I 亚型，apo C-Ⅱ和 apo C-Ⅲ的定量结果为血清中总的组分。清晰明确的靶向定量，不仅为临床的应用转化提供了借鉴方案，也推动了方法的标准化和溯源。

PO-0411

新生儿高胆红素血症凝血功能回顾性分析

谢珊辉
中国医科大学附属盛京医院

目的 探讨新生儿高血清胆红素血症与凝血功能异常的相关性。
方法 收集盛京医院于 2018 年 1 月至 2021 年 4 月分娩的 138 例新生儿为研究对象，将临床上诊断为高胆红素血症的 97 例患儿为病例组，包括生理性黄疸组和病理性黄疸组，将同期出生的 41 例正常足月儿为对照组。检测并比较各组新生儿凝血功能相关指标包括活化部分凝血活酶时间（APTT）、凝血酶原时间（PT）、血浆纤维蛋白原降解产物（FDP）、凝血酶时间（TT）、血浆纤维蛋白原（FIB）、抗凝血酶活性测定（AT）、总胆红素（Tbil）、直接胆红素（Dbil）。
结果 病例组和对照组相比，FDP、Tbil、Dbil 水平升高，APTT 延长，TT 缩短、AT 水平降低，差异具有统计学意义(P<0.05)，而病理性黄疸组和生理性黄疸组相比，AT 水平升高，Tbil 水平降低，APTT、PT 缩短，差异具有统计学意义(P<0.05)。logistics 回归分析结果显示病例组 Tbil，FDP 水平均高于对照组，TT 延长(P<0.05),而生理性黄疸组 FDP 水平高于病理性黄疸组，Tbil 水平低于病理性黄疸组(P<0.05)。
结论 新生儿高胆红素血症可影响凝血功能，在新生儿儿科临床中应加强对凝血指标的监控。

PO-0412

肝酶、平均血小板体积和红细胞分布宽度值对预测妊娠期糖尿病发生发展的临床应用价值

缪淑贤
江苏省人民医院（南京医科大学第一附属医院）

目的 探讨测定肝酶、红细胞分布宽度(RDW)和平均血小板体积(MPV)数值对于预测妊娠期糖尿病(GDM)发生发展的临床应用价值。
方法 收集 368 例 2019 年 1 月至 2019 年 12 月在江苏省妇幼保健院确诊为妊娠期糖尿病孕妇的病例资料，记录相关实验室检查参数结果。同时收集同期 368 例健康体检者作为对照组，比较不同组间所有参数差异。
结果 在所有参数中，GDM 组的血小板分布宽度(PDW)、转氨酶(ALT)和 γ-glutamyl 转移酶（GGT）明显高于健康对照组（P＜0.05）；GDM 组的血小板压积 (PCT)水平显著降低(P＜0.01)；而在平均血小板体积（MPV）、红细胞分布宽度（RDW）、血小板计数（PLT）和天冬氨酸转氨酶（AST）水平上，组间无显著差异。
结论 我们的研究结果表明，ALT、GGT、PCT 和 PDW 可以作为预测 GDM 发展的预测指标，为临床诊断妊娠期糖尿病开拓了新的思路。

PO-0413

四川省学龄前儿童全血微量元素检测结果分析

李清春、丁玲
四川金域医学检验中心有限公司

目的 微量元素在人体内含量虽然微乎其微，但却能在生理代谢过程中发挥着不可或缺的作用，对维持机体的正常生理功能和生长发育具有十分重要的意义，其含量在人体内处于动态平衡，缺乏或过量均会对人体产生不良的影响，尤其是学龄前儿童微量元素的缺乏对儿童的生长发育有较大影响。

通过对四川省 18439 人次（共 129073 例数据）学龄前儿童全血微量元素镁、钙、锰、铁、铜、锌、铅 7 种元素进行结果分析，了解四川省学龄前儿童（0~7 岁）微量元素含量水平。
方法 采用电感耦合等离子质谱（ICP-MS）技术对 18439 人次（共 129073 例数据）学龄前儿童全血进行微量元素检测，并按不同性别、年龄、项目对检测结果进行统计、比较、分析。
结果 检测结果显示，在检测的 7 种元素中，缺乏人数最多的是锌，锌缺乏者 3540 人（19.20%）；其次是铁，缺乏者 629 人（3.41%）；过量人数最多的元素是铜，过量者 1267 人（6.87%）；其次为锰，过量者 122 人（0.66%）。同时，锌、铁的缺乏及铜、锰的过量在 0~2 岁年龄段时人数最多，随年龄增长，缺乏或过量人数皆逐渐降低，直至 6~7 岁阶段人数有所回升。学龄前儿童中，铁、铜、锰、锌的缺乏及镁、铜、锰、钙的过量人数在 0~2 岁阶段远高于 3~7 岁的儿童。
结论 锌元素的缺乏和铜元素的过量在四川省学龄前儿童中是非常多见的，是这个年龄段儿童全血微量元素异常普查的主要方向，而 0~2 岁年龄段则是学龄前儿童全血微量元素异常的主要年龄段。建议儿童应注意微量元素的普查，在医师的指导下及时全面的进行膳食营养调节。同时，根据儿童不同年龄阶段，医师应针对相应最容易发生异常的元素进行着重监测和调节，以保障儿童微量元素在体内含量不失衡，从而减少微量元素异常对儿童生长发育的影响。

PO-0414

一氧化氮、胱抑素 C 和同型半胱氨酸联合检测对脑梗死辅助诊断价值

刘园
南京大学医学院附属鼓楼医院

目的 评价血清一氧化氮（NO）、胱抑素 C（Cys C）及同型半胱氨酸（Hcy）联合检测对脑梗死的诊断价值。
方法 选取 2019 年 1 月至 2019 年 6 月在南京大学医学院附属鼓楼医院就诊的 60 例脑梗死患者为观察组，30 名同期健康体检者作为健康对照组。采用间接比色法进行 NO 检测，采用免疫比浊法进行 CysC 检测，采用酶循环法进行 Hcy 检测。检测观察组和对照组血清 NO、CysC 及 Hcy 水平，并对两组检测结果进行比较分析。绘制受试者工作特征（ROC）曲线并计算及比较曲线下面积，评价 3 指标单项及联合检测的诊断价值。
结果 观察组血清 NO、CysC 和 Hcy 水平分别为：42.05(32.70~53.30) μmo/L、1.20(0.88~1.59) mg/L、19.80(14.93~22.65) μmo/L，均明显高于对照组（均 P<0.05）。单项指标检测诊断脑梗死时，Hcy 的敏感度最高（78.33%），CysC 的特异度最高（96.67%）。3 项联合检测时，敏感度高达 90.00%，特异度为 90.00%。血清 NO、CysC、Hcy 诊断脑梗死的最佳诊断临界值分别为 40.30μmo/L、1.05mg/L、14.50μmo/L，ROC 曲线下面积分别为 0.657、0.831、0.829。 3 项联合检测 ROC 曲线下面积为 0.942，高于 NO、CysC、Hcy 单指标检测，差异有统计学意义（Z=5.011、3.038、2.768，均 P<0.05）。
结论 血清 NO、CysC 及 Hcy 在脑梗死辅助诊断中具有一定价值，3 项联合检测相比于单项检测效能具有明显的优势，有更好的临床价值。

PO-0415

安徽地区非孕期健康女性抗苗勒氏管激素医学参考值建立

王波、张明亮
合肥金域医学检验实验室有限公司

目的 分析安徽地区非孕期健康女性抗苗勒氏管激素（AMH）情况，建立安徽地区抗苗勒氏管激素（AMH）医学参考值。

方法 选取 2020 年 1 月-2020 年 12 月送检合肥金域医学检验实验室有限公司抗苗勒氏管激素（AMH）样本 4019 例，按年龄段分为 5 组，20~24 岁（422 例）、25~29 岁（853 例）、30~34 岁（945 例）、35~39 岁（730 例）、40 岁以上（1069 例），抗苗勒氏管激素（AMH）采用 Roche cobas e602 全自动电化学发光免疫分析仪检测（该项目参加安徽省及卫生部临床检验中心室间质评，成绩优秀）。分析不同年龄段抗苗勒氏管激素（AMH）结果差异，参考值范围用（P50）及双侧限值（P2.5，P7.5）表示。

结果 5 组 AMH 检测结果差异具有统计学意义（$p<0.05$），抗苗勒氏管激素（AMH）在 20~24 岁参考值为（1.650-9.590）ng/ml、25~29 岁参考值为（1.080-9.260）ng/ml、30~34 岁参考值为（0.572-7.450）ng/ml、35~39 岁参考值为（0.677-5.140）ng/ml、40 岁以上参考值为（0.046-2.060 ng/ml）。

结论 本次回顾性分析发现抗苗勒氏管激素（AMH）随着年龄不断增长，AMH 结果有下降趋势，存在地区特异性，因此建立各地区抗苗勒氏管激素（AMH）医学参考值及其重要。

PO-0416

Performance evaluation of ICP-MS in detecting eight nutrient elements

Fang Luan
Shandong Provincial Hospital

Objective To evaluate the performance of ICP-MS in detecting eight nutrient elements.

Method Nutrient elements in whole blood were determined within one week using Agilent 7900 Inductively Coupled Plasma Mass spectrometry (ICP-MS) (Agilent, Tokyo, Japan). The ultrapure water (≥18.0MΩ.cm, 25℃) used in the experiment was prepared by Milli-Q ultrapure water meter (Millipore Corporation, USA). Whole blood element testing kit was used for measurement (LOT: WL191102; Baichen, Hangzhou, China). The performance evaluation is as follows: The matching calibrator (LOT: 20011401) were tested for 3 times for assessing the linearity. In accordance with the Clinical and Laboratory Standards Institute (CLSI) 15A-3, within-run Coefficient of variations (CVs) and total CVs were calculated in four replicates of two concentrations quality control products (LOT:2001140) every day for five consecutive days. Trace Elements Whole Blood L-2 RUO (LOT: 1702825; Seronor™, Norway), which have been analyzed in independent laboratories (ALS Scandinavia AB, Luleå, Sweden), was determined for estimation of bias. The internal standard recovery was within 80-120%.

Result Limit of detection (LOD), and limit of quantification (LOQ). The LOD and LOQ were determined through detection of reagent blank for at least 10 times for each analyte and calculate the standard deviation (SD). The LOD was defined as three times of SD while the LOQ was defined as ten times of SD. The LODs of Mg, Ca and Fe were 0.003, 0, and 0.006 mmol/L, Cu and Zn were 0 and 0 μmol/L, Mn, Se and Sr were 1.366, 0.695, and 0 μg/L; LOQs, 0.009, 0, and 0.021 mmol/L, 0 and 0 μmol/L, 4.552, 2.316, and 0 μg/L, respectively.

Linearity. Linearity was evaluated via linear regression of the calibrator concentrations on the theoretical concentrations. The correlation coefficients (r2) of linearity for Mg, Ca, Fe, Cu, Zn, Mn, Se and Sr were >0.999.

Precision Precisions of Mg, Ca, Fe, Cu, Zn, Mn, Se and Sr were evaluated using two concentrations of quality controls. The within-run CVs and totle CVs for eight nutrient elements were shown in Supplemental table 2 respectively.

Estimation of bia. Comparing with the analytical data of Seronorm™ Trace Elements Whole Blood L-2 RUO, bias of Mg, Ca, Fe, Cu, Zn, Mn, Se and Sr were all within 10%.

Conclusion ICP-MS behaves well in accuracy, repeatability, linear range in detecting elements in whole blood.

PO-0417

难治性继发性甲状旁腺功能亢进中脂肪因子的变化研究

周允、曹永彤
中日友好医院

目的 对难治性 SHPT 患者血清全段甲状旁腺激素（intact parathyroid hormone, iPTH）和脂肪因子水平进行相关性分析。
方法 选取拟行甲状旁腺切除术（parathyroidectomy, PTX）治疗的终末期肾病患者 70 例，收集患者临床资料，ELISA 测定血清 TNF-a、IL-6、总脂联素（total adiponectin, APN）和高分子量脂联素（high molecular weight adiponectin, HMW APN）、Chemerin 和 Adipsin 水平，采用 Pearson 法对其相关性进行分析。
结果 70 例患者中，男性 40 例，女性 30 例，平均年龄 47.5 ± 12.5 岁（24～69 岁）；PTX 前血清 iPTH 1212 ± 709 ng/L（328～3585 ng/L），WBC 计数 6.27 ± 1.57 109/L（3.75 ～9.96 109/L），SOD 149 ± 29 U/ml（86～215 U/ml），TNF-a 115 ± 75 pg/ml （2～397 pg/ml），IL-6 35 ± 22 pg/ml （2～181 pg/ml），APN 15.1 ± 9.6 μg/ml （1.6～43 μg/ml），HMW APN 4.9 ± 3.7 μg/ml （0.2～20 μg/ml），Chemerin 210 ± 42 ng/ml （135～307 ng/ml），Adipsin 16.8 ± 0.5 μg/ml （15.2～17.7 μg/ml）。Pearson 相关分析表明，SHPT 患者血清 iPTH 水平与年龄、WBC 计数、TNF-a、APN、HMW APN 无显著相关性，与 SOD （p=0.005）、Chemerin （p=0.002）呈显著正相关，与 IL-6 （p=0.048）、Adipsin （p=0.000）及 HMW APN/APN 比值（p=0.046）呈显著负相关。
结论 难治性 SHPT 患者 PTX 前血清 iPTH 水平与血清 SOD 和脂肪因子 Chemerin、IL-6、Adipsin 水平以及 HMW APN/APN 比值密切相关，提示脂肪因子家族可能参与了 SHPT 患者内环境稳态的调控。这将为阐明 SHPT 患者的微炎症状态提供新认识，为 SHPT 并发症的防治提供新见解，而其内在机制也值得进一步探讨。

PO-0418

同型半胱氨酸及血脂相关指标在糖尿病合并冠心病中的应用研究

王堃[1]、师悦杰[2]
1. 中南大学湘雅医院
2. 中南大学湘雅医学院

目的 研究同型半胱氨酸、高密度脂蛋白、低密度脂蛋白、载脂蛋白 A1、载脂蛋白 B 等血脂相关指标在糖尿病合并冠心病患者中的独立相关性、预测价值和对于疾病预后的作用。
方法 收取符合收入标准的非合并糖尿病冠心病患者 145 例，合并糖尿病冠心病患者 28 例，健康体检受试者 59 例，三者分别定为疾病对照组、疾病观察组、健康对照组，采用回顾性分析的方法研究 HCY 及血脂相关指标与冠心病患病情况的关系。
结果 采用 t 检验分析同型半胱氨酸及其他血脂相关指标。其中观察组（冠心病）HCY 水平显著高于健康对照组（15.44±7.66vs10.96±1.77，P<0.05，有统计学意义)。疾病观察组与疾病对照组相比，甘油三酯、HCY 显著升高，有统计学意义（HCY：21.48±6.12vs13.84±2.21，P<0.05，有统计学意义；TG：1.76±0.49vs1.08±0.38，P<0.05,有统计学意义）。对 55 岁以下人群估计 HCY 参考区间（<14.24umol/L）。对 HCY 与冠心病患病情况在控制其他血脂指标的前提下进行偏相关分析。
结论 TG、HCY 是冠心病发病的独立危险因素，且 HCY 与冠心病发病具有较稳定的相关性，即使控制了其他血脂指标，相关性仍然显著。55 岁以下糖尿病合并冠心病患者的 HCY 参考区间为（<14.24umol/L)。

PO-0419

常规检验项目在多发性骨髓瘤及相关浆细胞疾病预测中的应用

梁珊珊、贾成瑶
四川大学华西医院实验医学科

目的 多发性骨髓瘤及相关浆细胞疾病临床表现不特异，临床容易漏诊、忽视，而影响患者的早期诊断和治疗，拟利用常规检验项目，建立浆细胞疾病诊断的预测模型，在临床诊疗工作中起到提示作用。
方法 回顾性分析 2012 年-2019 年在四川大学华西医院诊断为多发性骨髓瘤(MM)及相关浆细胞疾病且进行血清蛋白电泳检查患者的完整初诊数据，M 蛋白结果为阳性的人群为病例组，以血清蛋白电泳阴性人群为对照组。采用二元 logisitic 分析 MM 及相关浆细胞疾病的独立危险因素，并建立包含多个指标的概率预测模型，采用受试者工作曲线 ROC 对该模型进行评估，并验证模型准确性。
结果 共纳入实验组 743 例，对照组 3532 例，性别（SEX）、年龄（AGEclasss）、骨损情况（BONE IMPAIR）、血红蛋白（HB）、球蛋白（GLB）、白球比（A/G）、肾小球滤过率（eGFR）、校正钙（CA）比较，差异均有统计学意义（P<0.05）。建立回归预测模型，ROC 曲线下面积为 0.743，约登指数为 0.381，灵敏度 0.623，特异性 0.758。
结论 预测模型预测效果较好，但仍需不断完善。临床医生可利用此预测模型，通过常规的检验项目结果，尽早对可疑浆细胞相关疾病的人群开展血清蛋白电泳筛查。

PO-0420

TG/HDL-C 比值可作为预测 2 型糖尿病发生发展的新型标志物

童玲[1,2]、梁如意[2]、杨舒羽[2]、陈奕君[2]、干伟（通讯作者）[2]
1. 自贡市第三人民医院检验科
2. 四川大学华西医院实验医学科

目的 研究甘油三酯与高密度脂蛋白胆固醇比值（TG/HDL-C）与 2 型糖尿病发生发展的关系，评估其作为 T2DM 早期标志物的可行性。
方法 根据 1999 年 WHO 糖尿病诊断和分型标准，纳入 2015 年 1 月至 2021 年 1 月在四川大学华西医院内分泌科就诊的 553 名住院患者，根据葡萄糖耐量试验（OGTT）和临床检查结果，将其分为正常糖耐量组（NGT），空腹血糖受损组（IFG），糖耐量异常组（IGT），2 型糖尿病组（T2DM）以及 2 型糖尿病伴并发症组。对各组患者临床资料与实验室指标进行统计分析，采用单因素回归分析筛选与 T2DM 发生发展的相关指标，通过多因素回归分析逐步调整年龄、性别、吸烟、饮酒等指标，探讨 TG/HDL-C 是否是糖尿病发生发展的独立危险因素。
结果 TG/HDL-C 在各组之间的趋势如下：NGT 组 0.91（0.62-1.54），IFG 组 1.32（0.89-2.00），IGT 组 1.33（0.81-2.43），T2DM 组 1.68（1.08-3.27）以及 T2DM 伴并发症组 1.67（1.00-2.61）。在 TG/HDL-C 与 HOMA-IR 的受试者工作曲线（ROC）中，得到其 AUC 面积 为 0.707，当 TG/HDL-C 比值大于 1.272 时，预测胰岛素抵抗发生的灵敏度为 0.684，特异性为 0.651。在校正了年龄、性别、吸烟、饮酒、BMI 后，TG/HDL-C 仍然有统计意义，其 P 值如下：IFG 组（P=0.004），IGT 组（P=0.006），T2DM 组（P＜0.001）以及 T2DM 伴并发症组（P=0.001），其 OR 值分别为 IFG 组 1.347(1.100-1.648)，IGT 组 1.313(1.081-1.594) ，T2DM 组 1.456(1.207-1.751)和 T2DM 伴并发症组 1.404(1.159-1.700)。
结论 TG/HDL-C 是 2 型糖尿病发生发展的独立危险因素，相比于 OGTT，检测更为简单，可作为预测 T2DM 的早期标志物。

PO-0421

还原氧化石墨烯场效应晶体管生物传感器高灵敏免标记检测外泌体

喻轶、张国军
湖北中医药大学

外泌体是一种粒径在 50-150 nm 左右的微小囊泡，其中包含具有多种功能活性的生物分子如蛋白质，核酸等。由于与其来源细胞具有高度的同源性，广泛存在于各类体液中（如：血液，尿液，唾液等）可反应疾病的进程和状态，因此在临床诊断上具有重要的意义。目前，定量生物体液中低浓度的癌源性的外泌体仍然是一个巨大的挑战。场效应晶体管生物传感器由于在检测中具有灵敏度高，特异性高，高度集成化的特点被广泛的应用于各类生物分子的检测中。在本研究中，我们探索了一种基于还原氧化石墨烯场效应晶体管生物传感器高灵敏，免标记的方法来直接检测外泌体。在传感区域修饰了可特异性识别外泌体的 CD63 抗体，用于免标记的对外泌体进行定量检测，该传感器检测外泌体灵敏度为 33 particles/μL,且具有较高的特异性，与现有的检测方法相比灵敏度较高，此外该生物传感器可以用于检测临床血清样本中的外泌体，结果显示外泌体含量在在健康人群中和前列腺癌患者中存在显著的差异。与其他技术不同的是本研究提供了一种独特的方法，无需标记即可直接定量外泌体，表明了该传感器在临床癌症早期诊断中的潜力。

PO-0422

不同公式估算的肾小球滤过率与尿微量白蛋白/肌酐在糖尿病肾病中的应用

李强、 达娃顿珠
中国医科大学附属盛京医院

目的 通过分析糖尿病肾病患者和健康人肾小球滤过率和尿微量白蛋白/肌酐比值的情况，以进一步了解肾小球滤过率和尿微量白蛋白/肌酐与糖尿病肾病患者发病的关系，同时应用不同公式（CKD-EPI 2009 Cr 公式和 CKD-EPI 2012 CysC-Cr 联合公式）估算肾小球滤过率，为更好地防治和诊断上述疾病提供参考依据。
方法 比较糖尿病肾病患者公式（CKD-EPI 2009 Cr 公式和 CKD-EPI 2012 CysC-Cr 联合公式)估算的肾小球滤过率和尿微量白蛋白/肌酐水平，探究各项指标与糖尿病肾病各分期的相关性。
结果 在 DN 的各阶段 CKD-EPI2009Crea 公式较 CKD-EPI2012Crea-CYSc 公式得出的值更高，在 DN 二期时两种公式的标准偏差较小且两种公式间相差小。在 DN 三期时 CKD-EPI2012Crea-CYSc 公式得出的标准偏差较大，DN 四、五期时 CKD-EPI2009Crea 公式得出的标准偏差较大，且在 DN 五期两种公式得出的标准偏差间存在更明显的差异。
结论 用肌酐和胱抑素 C 联合使用计算的 CKD-EPI2012Crea-CYSc 公式有较好的一致性，用肌酐和胱抑素 C 联计算的 CKD-EPI2012Crea-CYSc 公式与单独用肌酐计算的 CKD-EPI2009Crea 公式有一定差异。CKD-EPI2012Crea-CYSc 公式的准确度较高是更适合临床评价肾小球功能的 eGFR 公式。

PO-0423

变构探针触发的双信号循环为基础的 CRISPR-Cas12a 系统用于免水洗胞外囊泡分析

赵贤贤[1,2]、罗阳[1,2]
1. 重庆大学医学院智慧检验与分子医学中心
2. 重庆大学医学院公共实验中心

Extracellular vesicles (EVs) are emerging as promising biomarkers for cancer diagnosis and therapy. Recognizing low abundance EVs from clinical samples in an easy-to-operate way is highly desired but remains a challenge. Herein, we established an allosteric probe-initiated dual cycle amplification-assisted CRISPR-Cas12a (AID-Cas) platform for sensitive detection of EVs in a wash-free way. In AID-Cas, the allosteric probe can specifically recognize and bind with target EVs and thus initiate the following dual-cycle amplification. Subsequently, the amplified products were transcribed to generate numerous single-stranded RNAs, which could work as crRNA to trigger the trans_x0002_cleavage of CRISPR-Cas12a. Consequently, the proposed approach achieved a good linear response to extracted EVs in a concentration range from 102 to 106 particles/μL. Because of its high sensitivity,together with its wash-free convenience, the proposed strategy could have promising clinical potentials for early diagnosis of cancers.

PO-0424

液相色谱串联质谱技术在 17-羟化酶缺乏症诊断中的应用

孔许净、郑燕华、樊晓敏、姚珺、孙慧颖、陈宝荣
北京金域医学检验实验室有限公司

背景 液相色谱串联质谱（LC-MS/MS）技术在临床检验中应用逐渐深入，尤其在内分泌领域逐步发挥重要作用，如儿茶酚胺及其代谢物、神经递质和类固醇激素的检测等。其中类固醇激素其含量低且化合物间结构类似，因免疫技术检测原理的限制难以实现其准确可靠地检测。目前越来越多的国内实验室建立多种类固醇激素的检测，可以提高检测的灵敏和准确度，从而更好地为临床服务。
目的 在 Waters TQ-S IVD 检测系统上建立一种高灵敏高特异性的液相串联质谱方法，检测肾上腺皮质代谢路径中的 19 种主要类固醇激素，应用于先天性肾上腺皮质增生症（CAH）中 17-羟化酶缺乏症（17-OHD）的筛查及鉴别诊断。
方法 采用固相萃取法进行标本前处理，在 Waters TQ-S IVD 检测系统上进行检测。液相**方法** 色谱柱为 C8 色谱柱，流动相 A 为 0.5mmol/L 氟化铵水溶液，流动相 B 为纯甲醇，采用梯度洗脱；质谱**方法** 采用多反应监测模式。本研究纳入 67 例血浆标本进行临床验证，其中包含 18 例 17-OHD 患者，49 例正常人。产生的数据通过 MassLynx 软件进行处理，以中位数表示，采用 t'检验进行统计学分析。
结果 17-OHD 患者血浆中孕烯醇酮（7033pg/mL）、孕酮（1ng/mL）、11-脱氧皮质酮（674.6pg/mL）和皮质酮（43.34ng/mL）在的含量均高于正常人（941.7pg/mL，0.06ng/mL，25.14pg/mL，1.8ng/mL），其他指标均出现不同程度的降低，且女性患者降低幅度明显高于男性患者。17-OHD 患者的类固醇激素异常主要体现在孕烯醇酮、孕酮、11-脱氧皮质酮和皮质酮升高及皮质醇、可的松、脱氢表雄酮、硫酸脱氢表雄酮、雄烯二酮、睾酮和双氢睾酮降低，其余指标无明显差异。
结论 本研究所建立的 LC-MS/MS 方法检测 19 种类固醇激素，可准确定位肾上腺皮质代谢路径中某一个酶的缺乏，对 CAH 中 17-OHD 的诊断具有重要价值。

PO-0425

HBV 相关肝硬化进展为肝癌的预测模型建立

冯永辉[1]、赵可馨[2]
1. The First Hospital of China Medical University
2. 中国医科大学附属第一医院

目的 肝癌是我国第二大致死原因，五年生存率低于 5%，预后极差。有效的早期筛查指标进行早期预测，对提高肝细胞癌的整体诊治水平至关重要。本研究纳入 HBV 相关肝硬化及肝癌患者的实验室检测指标作为预测因子，旨在建立有效的诊断预测模型；
方法 收集中国医科大学附属第一医院就诊的乙肝肝硬化 661 例和乙肝肝癌患者 696 例，选取相关实验室指标并对其数据进行 Logistic 回归，分析所选指标与 HCC 发病风险的相关性。选取肝癌发病风险高相关性指标（P < 0.05）构建列线图预测模型，并且通过 ROC 曲线及校准曲线对模型进行验证。
结果 对两组数据采用 Logistic 回归进行单因素分析，结果表明 24 个指标是肝硬化进展到肝癌的危险因素（P< 0.05）；使用方差膨胀因子进行多重共线性检验并采用向后逐步回归法进行多因素分析，结果表明 Ca、HBV-cAb、AFP、Fbg 均为肝癌的高风险因素（P< 0.05），将此 4 个指标构建列线图预测模型，ROC 曲线显示模型的 AUC=0.761（95% CI: 0.731-0.791），Hosmer-Lemeshow 拟合优度检验 P=0.19。验证组 ROC 曲线显示模型的 AUC=0.768（95% CI: 0.723-0.814），Hosmer-Lemeshow 拟合优度检验 P=0.91。
结论 基于 Ca、HBV-cAb、AFP、Fbg 建立了一个 HBV 相关肝硬化进展为 HCC 的预测模型，该模型具有良好的区分度和校准度，能够对患者 HBV 相关 HCC 发病风险的预测提供帮助。

PO-0426

公式法计算离子钙结果可靠性评估

林炜炜、张乐乐、沈盈、彭凤、李敏
上海交通大学医学院附属仁济医院

目的 比较离子选择电极法与 4 种公式法计算离子钙（iCa）结果的差异，评估公式法与离子选择电极法的相关性，对公式法计算离子钙结果的可靠性进行评价。
方法 回顾统计了 2020 年 7 月至 2020 年 12 月的 6147 例门诊及住院患者，其中男性 3591 例，女性 2556 例，平均年龄 57.89 岁（9 个月到 95 岁间），均有测定总钙、离子钙、总二氧化碳、碳酸氢根离子、总蛋白、白蛋白、氯离子等项目。以离子选择电极法为参考方法，计算法为实验方法，计算相关系数及回归方程；并以离子钙测定值为参考值，计算不同公式与直接测定值符合率。
结 果 公式法与选择电极法相关性由高到低依次为自建公式 2：（iCa=0.330×tCa-0.007[AG]+0.006×[Cl-]+0.003×[HCO3-]-0.001×ALB-0.158 ）；自建公式 1（iCa=0.327×tCa+0.006×[Cl-]+0.003×[HCO3-]-0.006×[AG]-0.108）；Forster 1985 公式；Nordin 1989 公式相关系数依次为：0.659,0.657,0.477,0.222。6147 例标本中离子选择电极法 iCa 浓度分布 0.23-1.70mmol/L，以离子选择电极法 iCa 浓度为对照组，以百分偏差小于 10%为要求，公式法符合率由高到低依次为：自建公式 2、Forster 1985 公式、自建公式 1、Nordin 1989 公式；符合率依次 92.19%、87.59%、82.11%、51.47；当离子选择电极法 iCa 浓度在 0.99-1.40mmol/L 之间时符合率最高,依次为 95.52%、90.78%、86%、52.92%；当离子选择电极法 iCa 浓度≤0.98 或≥1.41mmol/l 时，公式法结果符合率均下降，尤以离子选择电极法 iCa 浓度≤0.98mmol/L 更明显，符合率均降至 40%以下。此外自动线性建模（公式 2）结果显示，预测离子选择电极法 iCa 结果按重要性高低依次为 tCa(0.208)、Cl-（0.164）、AG(0.160)、HCO3-(0.157)、ALB(0.155)、TCO2(0.155)。

结论 离子选择电极法 iCa 浓度在 0.99-1.40mmol/L 时与公式法有很高的符合率，特别是公式 2，符合率 95.52%；离子选择电极法 iCa 浓度在≤0.98mmol/L 时，所有计算公式结果均明显高于实际测定值，用计算公式可能会高估 iCa 的浓度；离子选择电极法 iCa 浓度在≥1.41mmol/L 时，所有计算公式结果均明显低于实际测定值，用计算公式会低估 iCa 的浓度

PO-0427

高密度脂蛋白及其受体在革兰阴性脓毒症发生发展中的应用研究

邹国英、祝青
湖南省第二人民医院

目的 探讨革兰阴性菌脓毒症（G-脓毒症）患者血清高密度脂蛋白(HDL）、B 类 I 型清道夫受体(SR-BI）、载脂蛋白 M(apoM)、载脂蛋白 C(apoC)的水平，探讨其对 G-脓毒症的诊断、病情严重程度及预后的评估价值。
方法 选取湖南省第二人民医院 2019 年 9 月至 2020 年 9 月收治的 128 例脓毒症患者、40 例单纯全身炎症反应综合征患者，40 例健康人员作为研究对象。根据血培养及革兰染色结果分为 90 例 G-脓毒症患者和 38 例革兰阳性脓毒症患者；按病情严重程度分为一般组（53 例）和休克组（37 例）；按 28 天病情转归分为存活组（69 例）和死亡组（21 例）。采用酶联吸附法检测研究对象血清中 SR-BI、apoM 和 apoC 水平，并动态监测上述指标在患者入住 ICU 后第 1、3、5 天的水平变化。分析 HDL 及其受体与 SOFA、APACHEⅡ评分相关性，并绘制 ROC 曲线分析 HDL 及其受体对 G-脓毒症的诊断、病情严重程度及预后评估价值。
结果 1.早期诊断：SIRS 组、G+脓毒症组及 G-脓毒症组较健康对照组相比，患者血清 HDL-C、apoC、apoM 和 SR-BI 水平均有明显降低，ROC 曲线分析结果显示 SR-BI、HDL-C、apoM 和 apoC 诊断 G-脓毒症的敏感性分别为 97.78%、85.56%、93.33%和 73.03%，特异性分别为 82.50%、95.00%、61.54%和 82.50%。
2.判断病情严重程度：休克组较一般组患者血清 HDL-C、apoC、apoM、SR-BI 水平均明显降低；监测结果提示患者血清 SR-BI、apoC 水平呈上升趋势；SR-BI、apoC 水平改变程度达到 3 倍；SR-BI、apoC、apoM 与 SOFA 评分、APACHEⅡ评分存在负相关。进一步采用 ROC 曲线分析结果显示其诊断 G-脓毒症休克的敏感性分别为 32.43%、43.24%、65.75%、72.97%，特异性分别为 94.34%、86.79%、83.07%、81.13%。
3.预后评估：死亡组较存活组患者血清 HDL-C、apoC、apoM 和 SR-BI 水平明显降低；ROC 曲线结果显示 SR-BI 的的预测效能最好，apoM 联合 SR-BI 的 AUC、灵敏性和特异性分别为 0.977、95.24%、89.88%，高于 apoM 和 SR-BI。
结论 HDL 及其受体与细菌感染类型相关，患者血清 HDL-C、apoC、apoM 和 SR-BI 的水平可以作为 G-脓毒症早期诊断的潜在生物标志物，且其血清水平降低时，提示病情加重，尤其是 SR-BI 和 apoC 的监测有利于及时发现病情的改变。血清 apoM 与 SR-BI 联合应用提高预后评估的敏感性和特异性。

PO-0428

异常血红蛋白电泳原因分析

庞雪利
成都医学院第一附属医院

目的 地中海贫血是一组常见的危害较大的遗传性溶血性贫血疾病。它是由于基因缺陷或者点突变致使血红蛋白中一种或一种以上珠蛋白链合成缺如或不足所导致的贫血或病理状态，呈小细胞低色

素性贫血。血红蛋白电泳检测是地中海贫血的筛查试验，但血红蛋白电泳结果异常并非一定就是地中海贫血，本研究旨在探讨血红蛋白电泳结果异常的可能原因。
方法 收集 2018 年 9 月至 2021 年 3 月在成都医学院第一附属医院检测了血红蛋白电泳的 3666 名患者的结果并进行分析。同时分析了有异常电泳结果患者的血常规，铁蛋白和地中海贫血基因检测结果。其中，血常规主要分析了血红蛋白(Hb)，平均红细胞体积（MCV），平均红细胞血红蛋白含量(MCH)和红细胞体积分布宽度的变异系数（RDW-CV）。
结果 检测了血红蛋白电泳的 3666 名患者中，有 233 名患者的结果出现了异常，约占总数的 6.36%。在这 233 名患者中，检出地中海贫血基因阳性 128 例，为血红蛋白电泳异常总人数的 54.9%，为血红蛋白电泳筛检总人数的 3.49%。其中 α 地中海贫血 12 例，为地贫患者总人数的 9.37%。β 地中海贫血基因的阳性例数为 116 例，为地贫患者总人数的 90.63%。在 HbA2 升高的病例当中，80.03%为 β 地中海贫血；在 HbA2 降低的病例当中，18.37%为 α 地中海贫血，48.98%为缺铁性贫血，6.12%为 β 地中海贫血；HbA2、HbF 均升高的病例中，90.00%为 β 地中海贫血。可能为异常血红蛋白病的有 5 例。
结论 血红蛋白电泳的异常结果大部分是由于贫血导致，地中海贫血是导致出现异常结果的主要原因。而其他贫血疾病如缺铁性贫血也是导致出现异常血红蛋白电泳的重要原因。

PO-0429

Fitted serum ALT, AST, and AFP values in the short-term prognosis of chronic viral hepatitis

Jiexin Zhang、Lei Huang、Mengyao Yu、Shichang Zhang
Department of Laboratory Medicine, The First Affiliated Hospital of Nanjing Medical University

Purpose Chronic viral hepatitis (CVH) is a prior stage of cirrhosis, acute-on-chronic liver failure and primary cancer, which causes significant morbidity and mortality in liver-related diseases. Standard protocols of CVH monitor and assessment are of great significance for precise treatment and better prognosis during the long follow-up period. Our study aimed to analyze multiple serum indexes in CVH patients and compare their clinical prediction value of short-term curative effect.
Methods We enrolled 55 CVH patients who were first diagnosed in our hospital from July 2015 to June 2016 by necessary criteria. With the complete collection of their clinical as well as laboratory data up to now, we divided them into the effective treatment group (33 patients) and the ineffective treatment group (22 patients) according to clinical outcomes at discharge. The generalized models of each serum index were respectively constructed by R language to predict the fluctuation trend of each index in time-dependent manner and to observe the time-dependent relationship among these indicators.
Results Serum virus copy numbers, liver enzymes, and blood coagulation indexes were significantly decreased after standardized interferon therapy in the effective treatment group ($p<0.005$). Their serum alpha-fetoprotein (AFP) level was 29.80 (9.80, 158.90) ng/mL characterized by a sharp increase in less than 4 months followed by a rapid decrease to the baseline. We combined serum AFP with Alanine aminotransferase (ALT) and Aspartate aminotransferase (AST) of all patients to establish generalized additive models and found: 1) AFP secretion in the effective treatment group was upregulated in response to increased ALT and AST levels; 2) ALT and AST levels alleviated by liver cell regeneration; 3) AFP level gradually dropped as liver function restored. Overall, the dynamic changes of serum ALT, AST and AFP in CVH patients exhibited an intersecting nested bell-shaped diagram during five-year follow-up. Nevertheless, serum AFP level was 4.00 (2.40, 5.65) ng/mL in the ineffective treatment group, and it had no correlation with neither ALT nor AST.
Conclusion Serum AFP is a promising index of CVH short-term prognosis which predicts effective liver regeneration and recovery. The measurement of serum AFP, ALT and AST at

monthly interval will help to optimize the anti-virus therapy and may guide other interference protocols to prolong disease-free survival.

PO-0430

建立 LC-MS/MS 法测定血浆中利伐沙班的浓度

陆秋涯
上海交通大学医学院附属瑞金医院

目的 建立 LC-MS/MS 法检测血浆中利伐沙班血药浓度，用于患者服药后疗效和出血风险评估。
方法 血浆样品经含内标利伐沙班-d4 乙腈沉淀蛋白，使用色谱柱为 Phenomenex Kinetex F5 柱（3.0 × 100 mm, 2.6 μm），流动相为 5mM 醋酸铵水溶液（A）：甲醇（B），采用梯度洗脱分离，流速 0.5 mL·min-1，柱温为 40℃。 采用电喷雾离子化电离源（ESI），正离子方式检测，利伐沙班和内标的离子对分别为 m/z 436.0→m/z 145.1 和 m/z 440.1→m/z 145.1。
结果 血浆中利伐沙班在 2~500 ng·mL-1 范围内线性关系良好（r =0.9995）。 最低检测浓度为 2 ng·mL-1，提取回收率与基质效应分别为 97.5%~111.3%和 94.2%~102.8%。 质控样本日内和日间准确度分别为 95.0%~110.8%和 99.7%~112.9%，相对标准差（RSD）均<10%。 样本稳定性符合要求。
结论 本研究建立的方法快速且准确，适用于血浆利伐沙班的血药浓度检测,可用于药效和出血风险评估。

PO-0431

同型半胱氨酸、血清淀粉样蛋白 A、 脂蛋白相关磷脂酶 A2 在早期糖尿病足中的诊断价值

肖曦
湖南省

目的 探讨同型半胱氨酸（Hcy）、血清淀粉样蛋白 A（SAA）、 脂蛋白相关磷脂酶 A2（Lp-PLA2）在早期糖尿病足中的诊断价值。
方法 收集 252 例 wagenr 分级 1、2 级糖尿病足患者（观察组）和 175 例 2 型糖尿病无并发症患者（对照组），分别采用循环酶分析法、免疫透射比浊法和速率法检测两组血清 Hcy、SAA、 Lp-PLA2 的水平并比较，分析其在早期糖尿病足中的诊断价值。
结果 观察组 Hcy、Lp-PLA2、SAA 水平显著高于对照组，差异具有统计学意义（P<0.05）；Hcy、SAA、Lp-PLA2 均为早期糖尿病足的危险因素（β 值分别为 0.448、0.206、0.044）并具有统计学意义（P<0.001）；ROC 曲线结果显示，Hcy、SAA、Lp-PLA 曲线下面积（AUC）分别为 0.918、0.892、0.967，三者联合为 0.99。
结论 T2DM 早期糖尿病足患者体内 Hcy 和 Lp-PLA2 水平高于 T2DM 无并发症患者；Hcy、Lp-PLA2 和 SAA 为 T2DM 早期糖尿病足的相关危险因素，联合检测对早期糖尿病足的诊断具有重要意义。

PO-0432

Correlation of Krebs von den Lungen-6 and fibronectin with pulmonary fibrosis in coronavirus disease 2019

Dinghui Peng[1]、Yi Luo[1]、Li jun Huang[2]、Fan lu Liao[1]、Yan yuan Liu[1]、Peng Tang[1]、Han ning Hu[1]、Wei Chen[1]
1. Zhongnan Hospital of Wuhan University
2. Department of Clinical Laboratory, Huangzhou District People's Hospital

Objective Coronavirus Disease 2019 (COVID-19) caused by a novel severe acute respiratory syndrome corona_x0002_virus 2 (SARS-CoV-2), is still spreading worldwide, which may progress to pulmonary fibrosis (PF), leading to the worsen outcome. As the markers of lung injury, the correlation of Krebs von den Lungen-6 (KL-6) and fibronectin (Fn) with pulmonary fibrosis in COVID-19 was still unclear.
Methods 113 patients diagnosed as COVID-19 were enrolled in this retrospective study, and divided into three categories as mild, moderate and severe cases. The concentrations of serum KL-6 and Fn at hospital admission were tested using the method of latex agglutination assay and immunoturbidimetic assay, respectively.
Results Compared with that in the non-severe COVID-19 cases and normal control subjects, serum KL-6 con_x0002_centration on admission was significantly higher in the severe group, which was positively correlated with Creactive protein, and negatively correlated with lymphocytes count. Whereas, no obvious elevation in serum Fn concentration was investigated in COVID-19 patients with the different phenotypes. The severe cases displayed the higher incident rate of pulmonary fibrosis at hospital discharge. Compared with non-PF patients, the COVID- 19 cases with PF had the higher serum KL-6 values.
Conclusion Serum KL-6 concentration was significantly elevated in severe COVID-19 patients, which may be useful for evaluating the disease severity. For early prevention of the development of pulmonary fibrosis, high concentrations of serum KL-6 in the early stage of COVID-19 should be paid close attention.

PO-0433

铁蛋白用于化疗诱导的心脏毒性的诊断价值评估

张芳芳、任丽
天津医科大学肿瘤医院

目的 肿瘤患者在接受化疗期间或者化疗后短期或长期发生的心脏功能障碍称为化疗诱导的心脏毒性（CIC）。随着肿瘤患者生存期的不断延长，CIC 已成为导致肿瘤患者死亡的主要原因之一。近年来，越来越多的研究工作表明铁死亡过程在化疗诱导的 CIC 中起到了非常重要的作用。铁死亡是一种细胞内铁离子代谢紊乱并以 ROS 堆积和脂质过氧化为主要特点的细胞程序性死亡事件。目前对铁死亡机制的研究主要集中在细胞内的铁离子代谢变化，而 CIC 患者体内的总体铁含量是否会随之发生变化还不清楚。铁蛋白是反应人体铁含量相对稳定的一个指标，本研究旨在评价铁蛋白是否可用于 CIC 患者的早期预测及长期动态监测，为临床医生治疗方案的及时调整和改善肿瘤患者预后提供重要参考价值。
方法 单点采集样品随机选取天津市肿瘤医院 2020 年 10 月 1 日至 10 月 15 日接受化学治疗的 150 名患者和没有接受化疗的 100 名患者的血清样品，并对其中二十位接受化疗的患者的血清样本进行连续跟踪收集。针对所有样品的 B 型钠尿肽（BNP）、肌钙蛋白 I（TnI）和铁蛋白（Ferr）含量进行检测。结合患者病历资料，使用 Graphpad Prism 软件进行统计分析。
结果 1.单次检测患者血清铁蛋白含量我们发现铁蛋白在化疗患者血清中显著升高，但相关性分析结果显示无论在化疗组还是非化疗组，血清铁蛋白含量与传统心脏标志物（BNP,TnI）的相关性都不高，提示单次检测血清铁蛋白的含量对于评价化疗患者是否会发生心脏毒性意义不大。2.对铁蛋白

和 BNP、TnI 进行连续监测的结果显示，在出现心脏毒性的患者血清中，铁蛋白的异常升高均早于或伴随着传统心脏标志物的异常，提示连续监测血清铁蛋白可能具有化疗诱导的心脏毒性的早期预测价值及较高的诊断敏感性。
结论 连续监测血清铁蛋白含量有助于对化疗诱导的心脏毒性的早期诊断。

PO-0434

沈阳地区 13610 例维生素 D 结果分析及与 2 型糖尿病的关系

杨梅
中国医科大学附属盛京医院

目的 了解沈阳地区不同年龄、性别、季节人群维生素 D 的水平，探究维生素 D 水平与 2 型糖尿病（T2DM）的关系。
方法 选取 13610 例健康查体者，检测血清总 25-羟维生素 D 水平，比较不同年龄、性别、季节维生素 D 水平；选取 200 例 T2DM 患者为 T2DM 组，同期 200 例健康体检者为对照组，检测血清总 25-羟维生素 D 水平，采用二元 Logistic 回归分析对不同维生素 D 水平的 T2DM 比值比（OR）进行分析。
结果 受检者 13610 例中维生素 D 缺乏者占 21.53%，不足者 28.06%，正常者 50.41%；年龄分组中，婴儿组维生素 D 水平显著高于其他各组(P<0.05)，其次幼儿组，随着年龄增加，维生素 D 水平逐渐减低；按性别分组，男性维生素 D 水平显著高于女性(P<0.05)；按季节分组，夏季维生素 D 水平显著高于冬季(P<0.05)；T2DM 组维生素 D 水平显著低于健康对照组（P<0.05），维生素 D 不足人群较正常人群患 T2DM 的风险增加（OR=2.86,95%CI 为 1.39-6.11），维生素 D 缺乏人群较正常人患 T2DM 的风险则明显增加（OR=4.08,95%CI 为 1.20-8.33）。
结论 加强沈阳地区儿童及以上年龄段人群维生素 D 的补充，加强冬季维生素 D 的补充与监测。维生素 D 不足或缺乏人群患 T2DM 的风险明显增加。

PO-0435

血清 LDH,CA153,FA 和 Hcy 水平检测在 MA 和 MDS 临床鉴别诊断中的作用研究

岳虹
西安市第一医院

目的 探讨血清乳酸脱氢酶(LDH)、糖类抗原 153(CA153)、叶酸(FA)和同型半胱氨酸(Hcy)水平检测在巨幼细胞性贫血(MA)、骨髓增生异常综合征(MDS)临床鉴别诊断中的作用效果。
方法 选择 2018 年 5 月至 2019 年 8 月 MA/MDS 患者 98 例作为对象,设为观察组,根据疾病类型分为 MA 组和 MDS 组,选择同期体检健康者 54 例,设为对照组。检测各组 LDH、CA153、FA 及 Hcy 水平;绘制受试者工作特征曲线(ROC 曲线),分析 LDH、CA153、FA 及 Hcy 在 MA、MDS 中鉴别诊断效能。
结果 观察组 LDH、CA153 及 Hcy 水平均高于对照组(P<0.05),FA 水平低于对照组(P<0.05);MA 组 LDH、CA153、FA 及 Hcy 水平均高于 MDS 组(P<0.05);ROC 曲线分析结果表明,LDH、CA153、FA 联合 Hcy 检测在 MA、MDS 中鉴别诊断灵敏度、特异度均高于 LDH、CA153、FA、Hcy 单独检测(P<0.05)。
结论 LDH、CA153、FA 及 Hcy 在 MA、MDS 患者中表达异常,联合检测能实现 MA、MDS 的诊断、鉴别,能为临床诊疗提供依据和参考。

PO-0436

Down-regulation of USP8 Inhibits Cholangiocarcinoma Cell Proliferation and Invasion

xu jing
The Second Hospital of Shandong University

Objective Cholangiocarcinoma is the second most common primary hepatobiliary malignancy with high incidence and recurrence rate. Ubiquitin-specific protease 8 (USP8) is recently reported to be involved in tumor progression. Herein, we aimed to investigate the effects of USP8 on the growth and metastasis abilities of cholangiocarcinoma cells.
Methods The siRNA interference was used to knock down USP8 in cholangiocarcinoma cell lines QBC939 and RBE; Hucct-1 cells were transfected with pcDNA3.1-USP8 to upregulate its expression. The effects of USP8 on cholangiocarcinoma were detected by cell function assays. We analyzed the expressions of USP8, Bcl2, Bax, cleaved caspase-3, cleaved caspase-9, Akt, p-Akt, Cyclin D1 and P70S6K by Western blot analysis.
Results We demonstrated that knockdown of USP8 significantly inhibited the proliferation, migration and invasion of QBC939 and RBE cells in vitro, while USP8 overexpression showed significant promoting effects on Hucct-1 cells. Moreover, silencing of USP8 also promoted apoptosis in cholangiocarcinoma cells by regulating the Bcl-2/Bax axis and Caspase cascade; up-regulation of USP8 decreased apoptosis in Hucct-1 cells. Importantly, knockdown of USP8 inhibited activation of the Akt signaling pathway by decreasing the phosphorylation level of Akt and up-regulated p53 expression, while USP8 overexpression increased activation of the Akt signaling pathway in Hucct-1 cells. Further, IGF-1 could reverse the inhibitory effects of USP8 knockdown on the Akt signaling pathway and the proliferation of QBC939 and RBE cells.
Conclusion Taken together, our findings suggest that USP8 exerts an oncogenic role in the progression of cholangiocarcinoma and may be a potential therapeutic target for cholangiocarcinoma treatment.

PO-0437

ISG15 通过 NF-κB 通路调控细胞衰老和影响动脉粥样硬化的机制研究

李雪蘅
南方医科大学南方医院

背景 动脉粥样硬化（AS）是一种与年龄相关的慢性炎症疾病，其好发于中老年人，发病率与死亡率位居多种疾病的首位。细胞衰老在动脉粥样硬化不同阶段起着关键作用，内皮细胞衰老是动脉粥样硬化始动因素。本研 究通过芯片检测衰老内皮细胞中差异表达 mRNA，发现 ISG15 高表达。因此本研究通过探究 ISG15 对细胞衰老和 AS 的影响及具体机制，为调控细胞衰老和 AS 防治提供科学依据。
方法 分离新鲜的人原代脐静脉内皮细胞（HUVEC），利用过氧化氢刺激 HUVEC 构建细胞衰老模型进行基因芯片分析，采用免疫印迹实验检测人 AS 斑块组织和 AS 模型小鼠主动脉窦斑块组织中 ISG15 的表达水平，酶联免疫实验检测 ISG15 在不同年龄表观健康人群和对应年龄 AS 患者血清中的表达水平；构建 ISG15 小干扰片段转染 HUVEC， 通过 β 半乳糖苷酶染色、细胞周期 PI 染色、Edu 细胞增殖实验、单核巨噬细胞 黏附实验、一氧化氮检测、活性氧检测观察 ISG15 对复制性细胞衰老及应激性衰老的影响。
结果 1.进行基因芯片发现 ISG15 的 mRNA 水平上调； 2. AS 斑块和 ApoE-/-小鼠主动脉斑块组织中 ISG15 的表达水平 升高； 3. ＞60 岁的冠心病患者与对应年龄表观健康人相比，其血清中 ISG15 的表 达水平升高。同时＞60 岁的冠心病患者血清中的 ISG15 浓度较 20-45 岁的冠心病患者

升高； 4. 敲减 ISG15 能促进内皮细胞增殖和细胞周期转换，减少 β 半乳糖苷酶衰老细胞数量，增加一氧化氮表达并减少活性氧的产生和单核巨噬细胞的黏附； 5. 敲减 ISG15 可降低磷酸化 p65、磷酸化 IκBα、衰老标志物 p16 蛋白的水平，而过表达 p65 则作用相反。
结论 1.ISG15 在人和 ApoE-/-小鼠的动脉粥样硬化斑块组织中表达上调。 2.ISG15 在老年冠心病患者血清中表达升高。 3.ISG15 通过 NF-κB 通路调控内皮细胞衰老。

PO-0438

Volatile rganic compounds in urine for noninvasive diagnosis of hepatocellular carcinoma: a pilot study

Fangbo Xia、Hongwei Zhou
Zhujiang Hospital of Southern Medical University

Hepatocellular carcinoma is the sixth most prevalent cancer and the third most frequent cause of cancer-related death. In this study, firstly, the parameters of headspace solid-phase microextraction gas chromatography mass spectrometry (HS-SPME-GC-MS) method were optimized with univariate experimental design and central composite design. And then, a total of 95 urine samples divided into discovery phase and validation phase were collected and their urinary VOMs were analyzed with this method. Principal component analysis (PCA) in terms of VOM profiles demonstrated that HCC patients could be significantly distinguished from healthy controls. Partial least squares discriminant analysis (PLS-DA) based on the discovery phase showed 14 metabolites, including deoxyguanosine, pelargonic acid, undecanoic acid and others exerted higher contribution to the difference. ROC analysis showed these biomarkers possessed excellent performance to diagnose HCC patients in both discovery and validation phases. In conclusion, the analysis of VOMs in urine could distinguish HCC patients and this method might supply support for the detection of HCC.

PO-0439

Reference intervals for lipid-related parameters in healthy adults of Southwest China and its usefulness in assessing carotid atherosclerosis

Ruyi Liang[1]、Shuyu Yang[1]、Ling Tong[1,2]、Yijun Chen[1]、He Zhang[1]、Xiaolin Li[1]、Shanshan Liang[1]、Wei Gan[1]
1. West China Hospital, Sichuan University
2. 自贡市第三人民医院

Background Cardiovascular disease has become the first leading cause of death worldwide in recent years. Recent studies showed that combined lipid parameters were more powerful in predicting ASCVD. For example, it has been reported that TC/HDL-c and LDL-c/HDL-c ratio had a higher predictive value for atherosclerosis progression, than any single lipid parameter. Some studies have suggested that Non-high-density lipoprotein cholesterol (non-HDL-c) level is a better predictor of carotid IMT than lipid parameters alone, even than TC/HDL-c. Howeve, the comparison among the capabilities of lipid-related parameters for assessing atherosclerosis is still limited, and there were no specific reference intervals for Southwest Chinese.
Objective The study aims to build reference intervals of various lipid-related parameters for our laboratory, and to investigate the role of 4 traditional lipid indicators and 7 calculated lipid parameters in carotid plaque formation and progression.
Methods For building reference intervals, 777,5 participants (males, 38.8%) were eventually enrolled. The establishment of reference intervals were performed according to the EP28-A3C guideline on Defining, Establishing, and Verifying Reference Intervals. Outliers were identified

using Dixon-Reed's outlier test or method proposed by Tukey (1977). Method cited by the EP28-A3C guideline was used to judge whether partitioning of reference intervals was necessary. The 2.5th and 97.5th percentiles values of the distribution were defined as the lower and upper reference limits. The relationship between age/sex and lipid-related parameters were explored. For exploring its usefulness in assessing carotid atherosclerosis, 759 subjects (males, 50.1%) were selected. Linear and logistic regression analysis were used to evaluate the relationship between various lipid-related parameters and carotid intima-media thickness and carotid plaque.
Results Sex and age-specific reference intervals of lipid-related parameters were established. The multiple linear regression analysis demonstrated that TC/HDL-c (sβ: 0.136, p < 0.001)，LDL-c/HDL-c (sβ: 0.134, p < 0.001)，mono/HDL-c (sβ: 0.131, p < 0.001) and non-HDL-c/HDL-c (sβ: 0.136, p < 0.001) were independent risk factors for IMT, a model for predicting IMT was established. Age (sβ: 0.325, p＜0.001), SBP(sβ: 0.081, p: 0.014), smoking(sβ: 0.144, p＜0.001), eGFR (sβ: -0.107, p: 0.005), LDL-c/HDL-c (sβ: 0.121, p＜0.001), and mono/HDL-c (sβ: 0.116, p: 0.001) were enrolled in the model. And the multiple logistic regression analysis revealed that non-HDL-c/HDL-c (OR: 1.449, p < 0. 001), RC (OR: 3.357, p < 0. 001), and TC/HDL-c (OR: 1.449, p < 0. 001) were independent parameters, a model for predicting plaque was established. Age (OR =1.093, 95% CI: 1.076 – 1.111, p ＜0.001), SBP (OR: 1.013, 95% CI: 1.004-1.022, p: 0.006), smoking (OR: 2.976, 95% CI: 1.903 - 4.655, p ＜0.001), TG (OR: 1.565, 95% CI: 1.206 – 2.029 , p: 0.001), and LDL-c/HDL-c (OR: 1.327, 95% CI: 1.053 – 1.673, p: 0.017) were enrolled in the model.
Conclusion Sex and age-specific reference intervals of lipid-related parameters in Southwest China were established. It needed to be mention that while most laboratories currently applied the one-side reference range of HDL, but some recent studies showed that HDL-c is not the higher, the better, so we finally adopt the two-side reference range. TC/HDL-c, non-HDL-c/HDL-c and LDL-c/HDL-c were excellent indicators for carotid atherosclerosis. Models using routine clinical information and lipid-related parameters for predicting IMT and plaque were established and can be used in clinical practices.

PO-0440

血清 HMGB1、sRAGE 在初诊 MM 中的研究价值

李红梅
新疆生产建设兵团第六师医院

目的 评估血清高迁移率族蛋白 B1,可溶性晚期糖基化终末产物受体对初诊 MM 的诊断、疗效监测及预后价值。
方法 采用 ELISA 检测 2018 年 10 月至 2020 年 5 月收治的 50 例初诊 MM 患者化疗前后及 50 例血液科门诊就诊者的血清 HMGB1、sRAGE 水平，用 ROC 进一步分析血清 HMGB1、sRAGE 水平对 MM 诊断的效能；比较化疗前后血清 HMGB1、sRAGE 水平，分析其在 MM 患者疗效评估中的价值，根据血清 HMGB1、sRAGE 水平的均值进行分组，对所有患者进行跟踪，比较患者临床特点及生存状况。
结果 MM 组患者血清 HMGB1 水平高于对照组，sRAGE 水平低于对照组（P＜0.05）；分别单独应用血清 HMGB1、sRAGE 水平检测诊断ＭＭ的 AUC 为 0.955、0.811。经 3 个疗程化疗后，CR 组患者的 HMGB1 水平较化疗前低，PD 组患者的 HMGB1 水平较化疗前明显升高，PR 组患者的 sRAGE 水平较化疗前明显升高（P<0.05）；HMGB1 低表达组（25 例）和 HMGB1 高表达组（25 例）的患者相比，在 R-ISS 分期、HGB、CRP、ESR、CD56、CD117、D13S319 缺失等方面均有统计学差异；sRAGE 低表达组（28 例）和 sRAGE 高表达组（22 例）的患者相比，在 ISS 分期、CRP、CD56 等方面均有统计学差异；Kaplan-Meier 生存分析：HMGB1 低表达组的存活状况更好：其中 PFS:T 低表达组＞T 高表达组，OS:T 低表达组＞T 高表达组。sRAGE 高表达组的存活状况更

好：其中 PFS:T 低表达组＜T 高表达组，OS:T 低表达组＜T 高表达组。Cox 分析：LDH、HMGB1 均影响患者预后，其中两者均影响患者的 PFS。 另外 HMGB1 影响患者的 OS。
结论 初诊 MM 患者经化疗后血清 HMGB1、sRAGE 水平均发生改变，且初诊时 HMGB1 高表达组患者生存期更短，预后更差。

2. 贵阳妇幼保健院
3. 中国科学院上海生命科学研究院
4. 贵州省人民医院

Objective DNA is the main carrier of biological genetic information, and its stability is of vital significance for maintaining the health of organisms. Its abnormal function and damage can cause a variety of human diseases. Among all types of chromosomal damage, DNA double strand breaks have the most serious consequences. Inaccurate repairs can cause local DNA sequence changes and even chromosome rearrangements. The repair of DNA double-strand breaks involves multiple signal transduction pathways. As one of the most upstream signaling molecules, the ataxia telangiectasia mutated (ATM) gene plays a crucial role in the DNA damage response and ATM mainly plays a role by phosphorylating downstream proteins. This study mainly screened and suggested batches of potential ATM substrates through novel functional genetics methods, and initially explored the role of one of the ATM substrates, ubiquilin4 (UBQLN4), in the process of mesothelioma development.
Methods 1. Screen and prompt batches of potential ATM substrates using drug screening methods based on the GFP competition assay system. 2. By immunoprecipitation, Western blot and other methods to further confirm whether UBQLN4 is an ATM substrate. 3. To explore the expression level of UBQLN4 in mesothelioma through bioinformatics analysis and immunohistochemistry experiments. 4. To explore the effect of UBQLN4 on the formation, apoptosis and cycle of mesothelioma cells by cloning, CCK8 and flow analysis. 5. Explore the interaction between UBQLN4 and the BCL2 protein family through immunoprecipitation and IF. 6. Explore the expression levels of Bcl-2-related protein A (BCL2A1) and Bcl-2-like protein 10 (BCL2L10) in mesothelioma tissues by immunohistochemistry.
Results 1. Screened and suggested 51 potential ATM substrates, and confirmed that UBQLN4 was an ATM phosphorylated substrate. 2. UBQLN4 is highly expressed in mesothelioma tissue and significantly affects the prognosis of patients. 3. After knocking down UBQLN4, it was found that under the condition of inducing DNA damage, it can significantly enhance the apoptosis of mesothelioma cells, reduce the semi-lethal concentration of DNA damage drugs, and have no significant effect on the cycle of mesothelioma cells. 4. UBQLN4 interacts with members of the anti-apoptotic protein family BCL2A1 and BCL2L10 to enhance its stability and thereby regulate the apoptosis of mesothelioma cells. 5. UBQLN4, BCL2A1 and BCL2L10 are highly expressed in mesothelioma tissues, and the expression levels of BCL2A1, BCL2L10 and UBQLN4 are positively correlated.
Conclusions 1. Screen and suggest 51 potential ATM substrates, and confirm UBQLN4 as ATM substrate by biochemical methods. 2. UBQLN4 is highly expressed in mesothelioma tissues and significantly affects the survival and prognosis of patients. 3. UBQLN4 enhances its stability by interacting with anti-apoptotic proteins BCL2A1 and BCL2L10, thereby regulating the apoptosis of mesothelioma cells

PO-0442

Combined application of untargeted metabolomics analysis and gene expression profiling find a new glucose metabolism regulator C19orf12

Meng Zhao
Tianjin Medical University Cancer Institute and Hospital

Background and Aim Life is the interplay between energy and structure. Aberrant mitochondrial biogenesis and quality control are found in a variety of malignant diseases and may be the underlying cause of cancer. Thus, identifying new mitochondrial regulators could provide important insight into the contribution of altered metabolism to tumorigenesis. C19orf12 codes for a transmembrane glycine zipper-containing mitochondrial protein. Mutations in this gene are a cause of neurodegeneration with brain iron accumulation-4 (NBIA4), but the specific function of the encoded protein is unknown. It has been reported that genes downregulated in neurodegenerative disorders are often upregulated in cancer and vice versa. Thus, we carried out this study to evaluate the potential role of C19orf12 in cancer progression and explore the mechanism behind it using NSCLC as a model system.
Methods Untargeted mass spectrometry-based metabolomics was utilized to identify differences in the levels of functionally relevant intracellular metabolites. RNA-seq analysis was performed to find C19orf12 downstream targets. TCGA data and clinical samples analysis were utilized to examine clinical revavence of C19orf12. In vivo and In vitro NSCLC models was used to detect C19orf12 specific function in NSCLC progression.
Results TCGA data and clinical sample analysis indicates that C19orf12 is upregulated and correlated with poor prognosis in a wide range of malignant diseases, especially in NSCLC. High expression of C9orf12 was observed in NSCLC tissue compared to adjacent normal tissue. Experimental data demonstrate that C19orf12 promotes invasion, migration and resistance to anoikis in vitro and metastatic potential in vivo, but has no impact on cell proliferation and apoptosis. RNA-seq results combined with GO and GSEA analysis indicate C19orf12 regulates key factors in oxidative phosphorylation, cell adhesion, migration and actin cytoskeleton. Metabolomics analysis indicates aberrent glucose and lipid metabolism. Oncogenic pathway such as PI3K-AKT, ERK and JNK was activated after C19orf12 overexpression. Furthermore, loss of C19orf12 enhances H2O2-induced ROS accumulation and overexpression of C19orf12 reverses the effect. Fragmented mitochondrial network and decreased mitochondrial membrane potential was observed in C19orf12 depletion cells which indicates impaired mitochondria quality.
Conclusion Taken together, our findings identify C19orf12 as metastatic promoter in NSCLC, uncover the role of C19orf12 in mitochondria quality control and glucose and lipid metabolism, and provide a resource of potential NSCLC biomarkers and therapeutic targets

PO-0443

miR-494-3p 通过靶向调控 PRR14 表达参与食管鳞状细胞癌发生发展的分子机制

王成[1]、钟錦莎[1]、丁梦[1]、顾万建[2]、汪俊军[1]、张春妮[1]
1. 中国人民解放军东部战区总医院
2. 江苏省中医院

目的 探讨 miR-494-3p 通过调控 PRR14 (proline rich 14)蛋白表达参与食管鳞状细胞癌（ESCC）发生发展的分子机制。
方法 收集 ESCC 组织及癌旁正常组织 20 对，Western blot 和免疫组化检测组织中 PRR14 蛋白表达变化情况； qRT-PCR 检测 PRR14 信使 RNA（mRNA）表达水平；生物信息学方法预测可调控

PRR14 表达的 miRNA，分析 PRR14 蛋白和 mRNA 水平与 miRNA 表达相关性，荧光素报告试验证实 miRNA 与 PRR14 调控关系； RNAi 技术敲除 ESCC 细胞株（TE-10 和 ECA109）PRR14 基因表达后，利用 CCK8、EDU、克隆形成实验检测细胞的增殖能力，利用 Trans well，划痕实验和流式细胞术检测 PRR14 对细胞侵袭和凋亡的影响；进一步通过瞬时转染或慢病毒稳转过表达或抑制 miRNA、miRNA 过表达同时靶基因功能回复实验（ORF 过表达）重复上述检测指标。
结果 Western blot 和免疫组化结果显示，与癌旁正常组织相比，PRR14 蛋白在 ESCC 组织中显著高表达（$P < 0.05$）；qRT-PCR 显示，PRR14 mRNA 水平在 ESCC 组织中表达升高（$P < 0.05$）；生物信息学分析结果表明，miR-494-3p 可调控 PRR14 表达，且 miR-494-3p 在 ESCC 组织中表达显著降低，与 PRR14 蛋白和 mRNA 水平呈显著负相关（$P < 0.05$）；荧光素报告试验证实 miR-494-3p 可与 PRR14 3'UTR 结合并调控其表达；RNA 干扰、miRNA 过表达及回复实验显示，敲除 PRR14 或过表达 miR-494-3p 可抑制 TE-10、ECA109 细胞增殖，侵袭能力，并促进细胞凋亡。
结论 miR-494-3p 可通过调控 PRR14 蛋白表达抑制 ESCC 增殖、侵袭能力和促进细胞凋亡，与 ESCC 的发生发展密切相关。

PO-0444

2 型糖尿病患者 25-羟基维生素 D 缺乏与糖尿病并发症的关系

刘宁阳、张晋、秦晓松
中国医科大学附属盛京医院

目的 评价 2 型糖尿病(T2DM)患者血清 25-羟基维生素 D 水平与糖尿病并发症的关系。
方法 随机 2019 年 1 月至 2020 年 6 月住院患者 292 例 T2DM 病患者（其中无并发症组 46 例，糖尿病肾病组 33 例，糖尿病神经病变组 33 例，糖尿病视网膜病变组 18 例，合并两种以上糖尿病微血管并发症组 48 例，糖尿大血管并发症组 28 例，糖尿病微血管合并大血管并发症组 86 例）归为实验组，选择同期 118 例健康体检者为对照组。收集各组研究对象的一般资料，并比较各组患者的 FBG、TG、TC、HDL、LDL、Cr、CYSC、UA、Ca、P、HbA1c、25(OH)D3 对比实验组以及对照组的 25-羟基维生素 D 水平以及 25-羟基维生素 D 缺乏的下降率，对比实验组内各分组的临床指标。
结果 实验组患者的血清 25(OH)D3 水平均明显低于对照组($p < 0.05$)。糖尿病微动脉并发症组、糖尿病大血管并发症组和糖尿病微血管合并大血管并发症组在 BMI、TC、HDL、LDL、Cr、UA、Ca、P 等一般资料比较，差异无统计学意义（$P>0.05$），其中糖尿病微动脉并发症组中病程、HA1c、FBG 明显高于无并发症组，25(OH)D3 明显低于无并发症组；糖尿病大血管并发症组的病程明显高于无并发症组，25(OH)D3 明显低于无并发症组；糖尿病微血管合并大血管并发症组 CYSC 明显高于无并发症组和糖尿病微血管并发症组。单纯肾病组、单纯周围神经病变组以及合并三种微血管并发症组的 25(OH)D3 下降率明显高于无并发症组。相关性分析显示，在微血管并发症组和微血管合并大血管并发症组中 25(OH)D3 与 CYSC 呈负相关（分别为 $r=-0.178$，$P<0.05$ 和 $r=-2.61$，$P<0.05$）。
结论 糖尿病患者血清 25(OH)D3 水平与糖尿病及其并发症的发展有关。血清 25(OH)D3 水平低可能是糖尿病代谢控制更差的结果。

PO-0445

Serum Metabolites as Potential Diagnostic Biomarkers in Patients with AFP-negative Hepatocellular Carcinoma.

Duo Zuo 、Haohua An、Li Ren
Tianjin Medical University Cancer Institute and Hospital

PURPOSE Primary liver cancer (PLC) is the fourth most common malignancy in China. The lack of effective diagnostic methods has led to the failure of patients with PLC to receive timely and effective diagnosis and treatment. Hepatocellular carcinoma (HCC) is the most common liver malignancy, and it accounts for more than 90% of primary liver cancer. In this study, we applied nuclear magnetic resonance hydrogen spectroscopy (1H-NMR) high-throughput platform to detect small-molecule metabolites in serum of HCC patients, patients with benign liver disease (BLD) and healthy subjects, and explored the application of serum metabolites as potential diagnostic biomarkers for primary hepatocellular carcinoma with alpha-fetoprotein (AFP) negativity.

METHODS A total of 61 preoperative serum samples from HCC patients with negative serum AFP expression (AFP < 20 ng/ml) were collected from the Department of Hepatobiliary Oncology, Tianjin Medical University Cancer Institute and Hospital, along with 50 patients with hepatitis and cirrhosis (benign liver disease, BLD), and 59 healthy controls (HCs). Serum metabolites were detected by 1H-NMR platform and screened by multivariate analysis and univariate analysis to identify serum metabolite indicators that could be used as potential diagnostic markers for AFP-negative primary HCC.

RESULTS A total of 39 serum small molecule metabolites were obtained by 1H-NMR detection of serum samples. Through metabolomics data analysis methods and model validation, we found that 1H-NMR serum metabolic profile can distinguish patients with HCC from those with BLD, and HCs. Variable influence on projection (VIP) values > 1.0 and Mann-Whitney U test p-values < 0.05 were used as judgment criteria for the OPLS-DA model. Six metabolites, namely Glucose, Alanine, Glutamic acid, Glutamine, Glycerol, and Proline, were initially selected for the next step of analysis of HCC versus HCs. Six metabolites, namely Glucose, Glutamic acid, Glutamine, Lactic acid, 3-Hydroxybutyric acid, and Proline, were initially selected for the next step of analysis of HCC versus BLD. Moreover, Receiver operating characteristic curve (ROC) analysis showed that the combined diagnosis of glucose, glutamate and proline had good diagnostic performance in differentiating HCC patients with serum AFP-negative expression from HCs, and the area under curve (AUC) in the training set and the validation set were 0.941 [95% confidence intervals (CI): 0.890-0.993, training set] and 0.902 (95%CI: 0.767-0.973, validation set), respectively. Meanwhile, the combined diagnosis of glucose, glutamate, 3-hydroxybutyric acid, and proline in differentiating AFP-negative HCC patients from AFP-negative BLD patients was 0.886 (95% CI: 0.813-0.959, training set) and 0.705 (95% CI: 0.530-0.880, validation set), respectively.

CONCLUSION In this study, it was preliminarily found that the combined diagnosis of serum glucose, glutamate, 3-hydroxybutyric acid and proline could be used as potential diagnostic markers in discriminating between HCC patients with serum AFP-negative expression and BLD patients with serum AFP-negative expression, suggesting that the serum metabolomics study may provide a new idea for the development of clinical diagnostic markers in HCC patients.

PO-0446

2020 年某实验室全血微量元素不合格样本分析

张敏
西安金域检验所有限公司

目的 样本合格率是实验室分析前质量控制的重要组成部分，决定着检测结果的准确性，同时采集合格的临床样本，还可提升临床服务能力，改善医患关系。本研究通过分析微量元素不合格样本，指导分析前样本采集，提升送检样本质量。
方法 对 2020 年某实验室送检的微量元素不合格样本统计，样本类型为静脉全血和末梢血，抗凝剂选择为肝素抗凝。并对不合格样本进行分类分析。
结果 本次统计微量元素样本为 42660 例，不合格样本总数为 81 例，占总样本量的 0.19%。对不合格样本进行分类统计：样本凝固 41 例，占比为 50.6%；样本量不足 21 例，占比为 25.9%；样本类型不符 9 例，占比为 11.1%；样本采集容器错误 4 例，占比为 4.9%；其他原因 6 例，占比为 7.4%。
结论 样本是否合格决定着检测的成败和检测结果的质量。通过本次研究发现，不合格样本产生于采样过程中。加强采样人员培训和教育，提高样本采集人员的能力，同时实验室应加强分析前样本采集环节质量控制，提高样本合格率，对提升实验室的临床服务能力和促进实验室质量管理体系健康、有效运行至关重要。

PO-0447

Analysis of electrophoresis detection of 47940 cases in a tertiary academic China hospital: a 6-year retrospective audit and briefly review

Lujiang Yi
Department of Laboratory Medicine, The First Affiliated Hospital of Nanjing Medical University

Background This audit provides baseline data on the prevalence, testing pattern and yield of electrophoresis tests performed over a 6-year period in a tertiary academic China hospital.
Methods This was a retrospective audit of all SPE, UPE and IFE tests performed on new and follow-up adult patients (aged ≥18 years) from 2014 to 2019, using data from the Department of Laboratory Science of Jiangsu Province Hospital laboratory information system database.
Results A total of 47,940 cases of electrophoresis, there are 15,473 cases SPE tests (of which 25.6% were follow-up tests); have 12,531 cases UPE tests (10.2% of the tests were follow-up tests); have 19,327 cases SIFE tests (31.6% of which were follow-up tests). Hematology was the highest rate of submission and positive. SPE testing before IFE tests can effectively increase the positive rate of IFE.
Conclusion This audit provides baseline data on the prevalence of test requests, their source and the yield of electrophoresis testing in our laboratory. An increasing trend in SIFE and UIFE was evident.

PO-0448

生物合成 Au@Ag 双金属纳米颗粒用于快速比色检测 H2O2

蒋兴禄[1,2]、吴国球[2]
1. 东南大学医学院
2. 东南大学附属中大医院检验科

双金属纳米颗粒的性能取决于其组成、大小和形状，因此其合成方法和技术应用得到了许多研究人员的关注。然而，双金属纳米颗粒在化学合成过程中往往需要严格的反应条件和有毒的化学品。我们开发了一种生物合成的方法，即在室温下，没有稳定剂或表面活性剂的条件下成功制备 Au@Ag 双金属纳米颗粒。TEM 结果显示均匀圆形的双金属 Au@Ag 纳米颗粒，直径约为 14-18 nm，在核中间有 1 - 2 个金纳米颗粒，外层环绕 1-2 nm 大小的银纳米颗粒，X 射线衍射能谱结果进一步证明 TEM 图像中纳米颗粒含有 Au 和 Ag 元素，粒径结果和 TEM 的结果一致（约为 23.01 nm）。Au@Ag NPs 在 360 nm 处得到的强吸收峰，但在 H2O2 存在时，吸收峰发生红移至 426 nm，且吸收明显增强并和峰值的大小和 H2O2 的浓度有相关性(R2 = 0.9806，范围为 5 to 300 μM）。 在短短的两分钟内吸收峰值到达最大值。 通过研究发现这是由于局域表面等离子共振，它可以在不需要 3,3 ‘、5,5 ‘ -四甲基联苯胺(TMB)和过氧化物酶的情况下实现对 H2O2 的快速比色检测。

PO-0449

牛磺酸在结肠癌发展及预后中的作用研究

李琼[1]、赵新宇[1]、吕亚平[1]、张道祥[2]、李敏[1]
1. 上海交通大学医学院附属仁济医院
2. 安徽医科大学生命科学学院

目的 代谢组学研究表明，代谢物与肿瘤的生物学行为密切相关，但牛磺酸及其前体亚牛磺酸在结肠癌发展及预后中的作用尚且未知。本研究拟采用体外实验探讨牛磺酸在结肠癌发展及预后中的作用，最后采用血清标本对实验结果进行进一步验证。
方法 首先采用 GC-MS 分析结肠癌肿瘤组织与正常组织代谢产物的表达差异。接下来采用细胞增殖实验、克隆形成实验、细胞凋亡及迁移侵袭实验确定牛磺酸对亚牛磺酸诱导的结肠癌进展的影响。进一步采用 qRT-PCR 检测 EMT 相关标志物表达，Western blot 检测 ERK 信号蛋白的表达，确定牛磺酸调控结肠癌的进展是否与 EMT 及 ERK 通路密切相关。采用 LC-MS/MS 分析结肠癌细胞中牛磺酸及亚牛磺酸表达的相互影响，确定血清牛磺酸水平与结肠癌预后的相关性。
结果 与正常组织相比，结肠癌组织的代谢产物存在着显著差异，亚牛磺酸显著增加，牛磺酸明显减少（P<0.01）。体外实验均表明，牛磺酸可明显阻断亚牛磺酸诱导的结肠癌进展及转移（P<0.01）。并且 qRT-PCR 结果显示，牛磺酸可明显增加 CDH1，降低 Snail 的表达（P<0.01）。Western blot 结果表明，牛磺酸可明显降低 ERK 和 RSK 的磷酸化水平。代谢组学结果显示，结肠癌细胞中牛磺酸可显著降低亚牛磺酸的水平，而亚牛磺酸水平对牛磺酸并无显著影响（P<0.01）。LC-MS/MS 结果也证实，血清牛磺酸水平降低，预示着结肠癌患者的预后较差（P<0.01）。
结论 牛磺酸可通过 EMT 及 ERK 信号通路，也可通过对亚牛磺酸含量的调节，参与结肠癌发生发展的调控。并且，血清牛磺酸水平可作为结肠癌患者预后的潜在生物学标志物，具有潜在的临床应用前景。

PO-0450

环磷酰胺与他克莫司治疗特发性膜性肾病的效果比较分析

于瑶、吴丽娜
中国医科大学附属盛京医院

目的 特发性膜性肾病（Idiopathic membranous nephropathy）发病率较高，2020 年 KDIGO 临床实践指南提出经观察评估存在进展风险的 IMN 患者推荐应用免疫抑制治疗。为评估环磷酰胺和他克莫司治疗 IMN 的效果，寻找能够影响治疗效果的影响因素，尝试为最佳诊疗方案的制定提供依据。
方法 本实验选取 2015 年 6 月至 2020 年 2 月于中国医大学附属盛京医院肾脏内科就诊，诊断为 IMN 的患者共 176 例，对所有患者进行规律随访，收集用药前、治疗后 3、6、12 个月的临床资料，分析研究对象的临床资料、缓解情况，建立 COX 回归模型探寻 IMN 患者疗效影响因素。
结果 治疗前激素联合环磷酰胺和激素联合他克莫司两组 IMN 患者临床资料无统计学差异（P＞0.05），治疗后第 3 个月两治疗组间 Alb、TP、HDL-C、尿酸水平有显著差异（P＜0.05）。治疗 6 个月后两治疗组患者的 Alb 水平与治疗后第 3 个月和基线的 Alb 水平相比有统计学差异（P＜0.05）。治疗 12 个月后两组患者 Alb、TP 水平较前三个观察点有显著差异（P＜0.05）。治疗后第 6、12 个月不同治疗组 Alb、TP、尿酸水平差异有统计学意义（P＜0.05）。COX 回归模型显示治疗方案（以激素联合他克莫司治疗作为对照组，HR=2.243，95%CI 1.014-4.960，P<0.05）,治疗后第 3 个月 Alb 水平（HR=1.104，95%CI 1.044-1.168，P＜0.05）,与治疗后第 3 个月 24h 尿蛋白定量水平（HR=0.902，95%CI 0.814-1.000，P＜0.05）能够影响 IMN 患者治疗结局。
结论 在 12 个月治疗期内激素联合环磷酰胺方案治疗 IMN 的效果优于激素联合他克莫司。Alb 和 24h 尿蛋白定量是反映治疗效果比较理想的指标，治疗后第 3 个月的 Alb 和 24h 尿蛋白定量水平可以用来预测治疗结局。

PO-0451

Polyethylene glycol-6000 pretreatment method was used to obtain the accurate clinical chemical test results for lipemic serum samples

Wenhui Yang、Yulin Yuan
The People’s Hospital of Guangxi Zhuang Autonomous Region

Objective To obtain the accurate clinical chemical test results in lipemic serum samples. **Methods** Five simulated lipemic serum samples with different concentration gradients were prepared by fat emulsion for clinical chemical testing. Use 20% polyethylene glycol-6000 (PEG-6000) and 10000rpm low-temperature high-speed centrifugation to pre-treat the lipemic serum samples, and then the clinical chemistry tests were performed to compare the applicability of the two pretreatment methods. For different clinical chemistry testing items, select 20 samples with different concentration ranges and use the PEG-6000 pretreatment method as the experimental method to establish the linear regression equation. Finally, statistical analysis was conducted to determine whether the deviation was acceptable according to 1 / 2 of the allowable error of Health industry standard of the people’s Republic ofChinaand the EQA.
Results Use these two methods to pretreat the lipemic serum samples can help us get the correct test results when testing AFU, ALB, APO-A1, CEA, CHE, CL, GLU, CO2, PA, TBA, ALP, CREA, CA, FPSA, Fe, LPS, Mg, Na, P, T-Bil and TPSA. The PEG-6000 pretreatment method is better than high speed centrifugation method in the detection of ALP, CREA, CA, FPSA, Fe, LPS, Mg, Na, P, T-Bil and TPSA. In particular, we can only use the PEG-6000 pretreatment method instead of high-speed centrifugation method when testing TG item in lipemic serum samples.

Conclusion By using the PEG-6000 pretreatment method to establish the linear regression equation, more accurate clinical chemistry test results of lipemic serum samples can be obtained.

PO-0452

Early Systemic Inflammatory Response Syndrome Duration and Infectious Pancreatic Necrosis

Chaochao Tan
Hunan provincial hospital

BACKGROUND AND AIMS Infectious pancreatic necrosis (IPN) remains a major challenge for AP management and SIRS is associated with the severity of AP, but the relation with IPN remains unclear. In this study, we aimed to evaluate the correlation between SIRS and infectious pancreatic necrosis (IPN), and the application of SIRS duration to predict IPN in a prospective cohort of patients with AP.
METHODS Acute physiology and chronic health evaluation II (APACHE II) scoring system and CT severity index (CTSI) scores were calculated within the first 48 h after admission in 2130 patients with AP between January 2012 and October 2017 in Hunan Provincial People's Hospital. The SIRS duration of the first week, demographic, radiology, and all clinical laboratory data were prospectively collected. Univariate and multivariate logistic regression analyses were performed to evaluate the relationship between clinical parameters and IPN. The predictive accuracy of clinical parameters was measured using area under the receiver-operating curve (ROC).
RESULTS A significant upward tendency of IPN incidence was observed with increased SIRS duration. The AUC of SIRS duration to predict pancreatic infection was 0.92 [95% confidence interval (CI): 0.91-0.94], which was even moderately higher than the AUC of APACHE II and CTSI scores. A SIRS duration of ≥48h (persistent SIRS) had a sensitivity of 99.18%, specificity of 80.88%, and nearly 389.36 (95% CI 54.54, 2779.55) times more likely to develop IPN than those with duration of <48h ($P < 0.0001$).
CONCLUSION Early SIRS duration was strongly associated with IPN and could serve as an easy bedside indicator to predict pancreatic infection.

PO-0453

液相色谱串联质谱与均相酶免疫法检测甘胆酸在妊娠期肝内胆汁淤积症诊断价值中的比较

赵峰峰
东南大学附属中大医院

目的 比较液相色谱串联质谱与均相酶免疫法检测甘胆酸在诊断 ICP 中的应用价值；
方法 搜集 2020 年 11 月 1 日至 2021 年 4 月 30 日在东南大学附属中大医院产检的 396 名孕妇，产检检测甘胆酸的同时加做质谱法。比较二者阳性率及其在 ICP 诊断中的价值；
结果 396 名孕妇中有 48 名孕妇最终诊断为 ICP，其中液相色谱串联质谱阳性率为 100%，阴性率为 100%，均相酶免疫法阳性率为 87%，阴性率为 100%。
结论 液相色谱串联质谱检测甘胆酸在诊断 ICP 中具有明显的优势，建议推广。

PO-0454

脂蛋白相关磷脂酶 A2 对急性缺血性脑卒中早期神经功能恶化的预测诊断价值

杨丽华
陆军军医大学第一附属医院（西南医院）

目的 探讨急性缺血性脑卒中患者的血清脂蛋白相关磷脂酶 A2（Lp-PLA2）水平对早期神经功能恶化的预测诊断价值。
方法 选取 2020 年 3 月至 2020 年 12 月在我院收治经颈动脉彩超、头颅 CT、头颅 MRI 等检查确诊为急性缺血性脑卒中 100 例患者作为研究对象，进行分型和神经功能缺损程度(NIHSS 评分). 同时选取我院收治的非脑血管病人 100 例作为对照对象，比较 2 患者血清 Lp-PLA2 水平与急性脑梗死不同临床类型的相关性和神经功能损伤程度的关系。
结果 观察组 Lp-PLA2 水平明显高于对照组，组间差异显著（P<0.05）。通过 Lp-PLA2 水平与早期神经功能缺损程度的 Spearman 相关性分析，结果显示 Spearman 相关系数 0.58（P<0.05），中等程度相关性。
结论 Lp-PLA2 浓度与早期疾病严重程度呈正相关，能够作为评价病情严重程度的参考，且对神经功能的恶化具有警示作用。

PO-0455

The significance of KL-6 as prognosis monitoring biomarker in patients with severe COVID-19 from stabilized stage toward convalescence

Long He、Lie Ying Fan
East hospital, Shanghai

Background This study aims to identify some biomarkers for monitoring the recovery of lung injury in severe COVID-19 patients from stabilized stage toward convalescence.
Methods We enrolled participants who diagnosed with severe COVID-19 (n = 28) and health volunteers (n = 25) from Taikang Tongji (Wuhan) Hospital. The patients were in a stabilized stage and had a course of 48.1±12.8 days. We followed these patients for 90 days. The blood routine, cytokines (IL-1β, Il-2, IL-4, IL-5, IL-6, IL-10, IL-12p70, IL-17A, TNF-α, IFN-α, IFN-γ), type II alveolar epithelium injury indicators (Surfactant protein A (SP-A), Krebs von den Lungen-6 (KL-6)) and chest CT were tested on the 1, 30, 60, and 90 days after enrollment.
Results In stabilized stage, the parameters of blood routine and some cytokines (IL-1β, IL-2, IL-4, IL-12p70, TNF-α) had bounced back to normal (p>0.05). Some cytokines (IL-5, IL-6, IL-10, IL-17A, IFN-α, IFN-γ) and type II alveolar epithelium injury indicators (SP-A and KL-6) were still higher than normal (p<0.05). During the stabilized stage to convalescence, in spite of the variation of monocyte count, monocyte/lymphocyte ratio, IL-5, IL-10, IL-12p70, IL-17A, IFN-γ, IFN-α, SP-A and KL-6 were downward trend (p<0.05), only KL-6 level (p<0.05) could simultaneously reflect the lung injury volume which be measured by CT.
Conclusions Our preliminary data indicated that KL-6 could be an effective prognostic biomarker for monitoring the recovery of lung function in patients with severe COVID-19 from stabilized stage toward convalescence.

PO-0456

A candidate reference method using standards addition for lithium in human serum by ICP-MS

Xiaoyu Fan [1]、Qing Li[1]、Ping Lin[2]、Zhonggan Jin[1]、Meizi Chen[2]、Yi Ju[1]
1. Shanghai Center for Clinical Laboratory
2. 上海市精神卫生中心

Objective Therapeutic monitoring of lithium (Li) is important because of its narrow therapeutic range and therapeutic index. Standardization of the measurement of Li concentration in serum is of considerable interest for quality assurance in patient care. Here, the authors present the evaluation of a new inductively coupled plasma mass spectrometry (ICP-MS) method for the determination of lithium in serum.
Methods Serum samples were diluted 100 × by 0.3% ultrapure nitric acid, and used germanium (Ge) as an internal standard. Lithium calibration solutions with different concentrations were added to serum matrix solutions. The serum lithium concentration was calculated according to the standards addition method.
Results The validation of the method, as well as a comparison with other lithium method, was investigated. The correlation coefficients (r) between the measured Li/Ge ratios and the analyte concentration ratios were all > 0.9999. The measurement range from 0.10mmol/L to 4.45mmol/L . The expanded combined measurement uncertainties for the determination of the new method values were estimated as ≥ 1.0% (k = 2) for each measurand. The coefficients of variation (CV) were 1.11% and 0.49% for the two serum samples. Excellent trueness was found testing certified Standard Reference Materials from NIST: SRM956d Level I, Level II and Level III. Comparison with international inter-laboratory comparisons and the ion selective electrode routine method gave satisfied results.
Conclusions This new ICP-MS method is an attractive alternative for lithium measurement and may be used as a candidate reference method for setting target values in the standardization of serum lithium measurements.

PO-0457

血清 IgG/C3 比值在 IgAN 诊断预测中的作用

罗厚龙、夏勇、纪玲
北京大学深圳医院检验科

目的 探讨血清 IgG、C3 及其比值在 IgA 肾病（IgAN）诊断预测中的作用。
方法 收集自 2019 年 1 月~2020 年 12 月于北京大学深圳医院行肾穿刺活检诊断的原发性肾小球疾病患者 431 例，其中 IgAN 患者 243 例，其他肾小球疾病患者 188 例。在患者行肾穿刺前使用免疫比浊法检测患者血清中 IgG、C3 水平，并计算 IgG/C3 比值。通过绘制受试者工作特征曲线（ROC 曲线），计算曲线下面积（AUC），评价血清 IgG、C3 及其比值在 IgAN 诊断预测中的价值。
结果 IgAN 患者组血清 IgG 水平及血清 IgG/C3 比值明显高于其他肾小球疾病患者组，而其血清 C3 水平明显低于其他肾小球疾病患者组。其 AUC 分别为 0.703（IgG）、0.716（IgG/C3 比值）和 0.629（C3）。
结论 血清 IgG/C3 比值在原发性肾小球疾病中对 IgAN 的诊断具有一定的价值，且优于血清 IgG 和 C3。在未开展肾穿刺活检的医院或不同意行肾穿刺活检的患者中血清 IgG/C3 比值对 IgAN 诊断具有一定的辅助价值。

PO-0458

液相色谱-串联质谱联用检测血清油酸的建立及其在代谢相关脂肪性肝病分级中的应用

叶致含、马萌萌、陆柳、谢丽鸿、余明、宗明、范列英
上海市东方医院（同济大学附属东方医院）

目的 建立液相色谱-串联质谱联用技术（LC-MS/MS）检测血清油酸（OA）的方法，分析 OA 在代谢相关脂肪性肝病（MAFLD）分级中的作用。
方法 使用 OA-[13C5]作为同位素内标物，OA 和 OA-[13C5]的离子对分别为 281.3/281.3 和 286.3/286.3。ZORBAX SB-Aq C18 反相色谱柱，流动相 A 为超纯水，流动相 B 为甲醇：乙腈（1:1，v/v），进行梯度洗脱，流速 0.3 mL/min。考察精密度、线性、稳定性、携带污染率等性能以评价该方法的可靠性。选取体检 B 超和临床表现诊断 MAFLD 者 180 名及健康体检者 60 名，采用 LC-MS/MS 检测 OA，B 超评价 MAFLD 分级程度。最后进行综合分析，评价 OA 与脂肪肝分级的相关性。组间比较使用单因素方差分析，相关分析采用 Spearman 分析。
结果 所建立的 OA LC-MS/MS 方法特异性好，在 10~1000 μmol/L 范围内线性关系良好，y=0.00737x+0.00673，r=0.9994，定量限（LLOQ）为 10 μmol/L，批内精密度（CV）≤ 0.88%，实验室内总 CV≤ 1.41%，方法精密度较好，适合临床血清样本的测定。与对照组（200.53±67.45, μmol/L）相比，MAFLD 组血清 OA 含量（337.81±141.84, μmol/L）显著升高，且 OA 水平与 MAFLD 分级程度正相关。
结论 所建立的 LC-MS/MS 检测方法能够科学、高效定量血清中 OA 的含量，为动态监测代谢性疾病人群 OA 含量的变化提供可靠的方法。

PO-0459

血清脂类指标对视神经脊髓炎谱系疾病的诊断价值分析

王进洋[1,3]、王佳楠[2]、李芮冰*[3]、王成彬*[1,3]
1. 潍坊医学院医学检验学院
2. 解放军医学院
3. 中国人民解放军总医院第一医学中心检验科

目的 探讨视神经脊髓炎谱系疾病(NMOSD)患者血清脂类指标的诊断价值，并分析其与 NMOSD 临床特征的关系。
方法 回顾性分析 2018 年 1 月－2020 年 7 月于解放军总医院第一医学中心神经内科和眼科确诊的 324 例 NMOSD 患者(NMOSD 组)、147 例多发性硬化(MS)患者(MS 组)，以及 252 名无神经系统受累者(健康对照组)的临床及实验室诊断相关信息。采用 logistic 回归控制年龄、性别、病程、病变部位、各血清脂类指标间的相互作用，分析三组 研究对象的血清总胆固醇(TC)、三酰甘油(TG)、载脂蛋白 A1(ApoA1)、载脂蛋白 B(ApoB)、高密度脂蛋白(HDL)和低 密度脂蛋白(LDL)水平，以及各指标在 NMOSD 急性期、复发期、缓解期中的水平差异。根据 AQP4 抗体效价高低、受累部位不同等 NMOSD 临床特征进一步分组，分析各指标在不同亚组间的水平差异。
结果 NMOSD 患者中位病程为 20 个月，MRI 显示受累部位主要为视神经(198/324，61.1%)；MS 患者中位病程较长(48 个月)，呈多部位受累(56/147，38.1%)。NMOSD 组与 MS 组、健康对照组 TC、ApoA1、LDL、ApoB 水平差异有统计学意义(P<0.05)。亚组分析结果显 示，NMOSD 急性期、复发期、缓解期三个亚组中，仅急性期与复发期 Apo B 水平差异有统计学意义(P<0.05)；NMOSD 不同主要受累部位 TC、ApoA1、ApoB、HDL、LDL 水平差异有统计学意义(P<0.05)。ROC 曲线分析显示，联合血清 TC、Apo A1、Apo B、LDL 预测 NMOSD 的 AUC 为 0.732，敏感度为 57.86%，特异度为 81.15%。

结论 联合血清 TC、ApoA1、ApoB、LDL 能较好地特异性诊断 NMOSD，且 ApoA1 和 ApoB 可分别作为提示受累部位和 NMOSD 疾病活动程度的 指标。

PO-0460

血清 KL-6 在肺癌术后辅助治疗性肺损伤应用价值的探索

吴丽娜、陈晓卉、高弋、刘勇、秦晓松
中国医科大学附属盛京医院

目的 探讨血清涎液化糖链抗原-6（ KL-6）在非小细胞肺癌（NSCLC）术后辅助治疗性肺损伤中的诊断价值。
方法 本研究共分为三组，NSCLC 术后辅助治疗组（肺损伤亚组、无肺损伤亚组）、NSCLC 手术组（术前亚组、术后亚组）及健康对照组，其中 NSCLC 术后辅助治疗性肺损伤亚组以药物诱导性肺损伤（DILI）、放射性肺损伤（RILI）的诊断标准作为入组的金标准，比较各组血清 KL-6 水平的差异；并以 NSCLC 术后辅助治疗无肺损伤亚组为基准，初步建立血清 KL-6 用于 NSCLC 术后辅助治疗性肺损伤的诊断界值。
结果 NSCLC 术后辅助治疗肺损伤亚组患者血清 KL-6 水平[512.40 U/mL（322.30 ~ 819.20 U/mL）]显著高于无肺损伤亚组[147.80 U/mL（114.25 ~ 229.80 U/mL），P < 0.001）、NSCLC 术后亚组[143.80 U/mL（111.90 ~ 247.80 U/mL），P < 0.001）、NSCLC 术前亚组[204.40 U/mL（162.70 ~ 283.20 U/mL），P < 0.001）及健康对照组[177.70 U/mL（154.20 ~ 206.40 U/mL），P < 0.001）；血清 KL-6 为 310.15 U/mL 用于 NSCLC 术后辅助治疗性肺损伤的诊断界值，其灵敏度、特异性、阳性似然比、阴性似然比分别为 86.3%（95%可信限[confidence interval，CI]，0.73 ~ 0.94），96.2%（95% CI，0.86 ~ 0.99），22.43（95% CI，5.74 ~ 87.69），0.14（95% CI，0.07 ~ 0.28）。
结论 血清 KL-6 在 NSCLC 术后辅助治疗性肺损伤的诊断中具有良好的应用前景。

PO-0461

The relationship between serum trace elements and oxidative stress of patients with different types of cancer

Yuwei Yang、Chunmei Dai、Xiaohong Chen、Jiafu Feng
电子科技大学医学院附属绵阳市中心医院

Objective Many studies have identified a causal and promotive roles of oxidative stress (OxS) and oxidative damage caused by OxS in the occurrence and progression of cancer. Many biomarkers in the blood circulation of patients may change correspondingly with the development of tumors. This study aims to investigate the correlation between OxS and serum trace element (TE) levels of patients with different types of cancer.
Methods 1143 different types of cancer patients and 178 healthy controls from Mar. 2018 to Aug. 2020 in Mianyang Central Hospital were involved in this study. Their levels of OxS parameters (including total oxidant status (TOS), total antioxidant status (TAS) and oxidant stress index (OSI)) and the concentrations of serum TEs (including Cu, Zn, Fe and Se) were determined.
Results Compared with healthy controls, all types of cancer patients have higher TOS level (z = 4.976 ~ 9.245, all P < 0.001) and OSI level (z= 6.228 ~ 9.909, all P < 0.001), and lower TAS level (z= -8.517 ~ -3.994, all P < 0.001). But among patients with different types of cancer, there is no statistical difference in OSI ($\chi2$ = 14.072, P = 0.080) level, while statistically significant difference in TOS ($\chi2$ = 35.862, P < 0.001) and TAS ($\chi2$ = 45.593, P < 0.001) levels (Shown in Figure-1). This indicates that OxS is common in cancer patients, but the degrees of OxS may be different in patients with different types of cancer.

Many cancer patients have an increase in the Cu (z = 3.441 ~ 11.473, all P < 0.05) and a decrease in Se (z= -9.746 ~ -3.996, all P < 0.01). The decrease in Zn is observed only in breast cancer patients (z= -6.356, P < 0.001). The change of Fe varies among different types of cancer patients (Shown in Figure-2).
Multinomial logistic regression shows that the risks of different tumors are related to the level change of multiple TEs and OxS parameters (all P <0.05) (Shown in Table-1). And the more significant the changes of TES and OXS parameters in multiple tumors, the higher the risk of tumors, include the highest ORs (OR= 2.82 and 1.44, P <0.001 and =0.003) with the highest levels of TOS and Cu in cancer, The lowest level of FE in colorectal cancer, the lowest ORs (OR= 0.68 and 0.22, P <0.001) with the lowest levels of FE and SE in brain cancer, the lowest OR (OR= 0.81, P <0.001) with the lowest levels of Zn in breast cancer.
The correlation analysis of TEs and OxS parameters shows Cu (|r|= 0.297 ~ 0.795, all P <0.001) with mild-to-strong correlation in all types of cancer patients, Zn(|r|= 0.200 ~ 0.521, all P <0.05) with mild-to-moderate correlation except in brain cancer patients, Fe(|r| = 0.214 ~ 0.760, all P <0.05) with mild-to-strong correlation (except in brain and kidney cancer patients), and Se(|r|= 0.187 ~ 0.408, all P <0.05) with weak-to-moderate correlation (only in breast, lung, esophageal and kidney cancer patients). There were no correlations of TEs and OxS parameters in healthy control subgroup (all P >0.05).
Conclusions Tumorigenesis is often accompanied by OxS occurrence, which is a certain correlation with the change of TEs. In order to evaluate OxS correctly, TAS, TOS and their ratio OSI should be detected. In the specific cancer types, some TEs and OxS parameters change significantly, therefore, it can be potential marker for this cancer type.

PO-0462

AFP 联合 GGT/AST 检测对 HBV 相关肝细胞癌的诊断价值

蔡馨
武汉大学人民医院

目的 探讨 AFP 联合 GGT/AST 在 HBV 相关肝细胞癌（HCC）中的临床诊断价值。
方法 选取 2019 年 1 月 15 日—2019 年 6 月 15 日于武汉大学人民医院诊治的慢性乙型肝炎患者（CHB 组）、乙型肝炎肝硬化患者（LC 组）、HBV 相关 HCC 患者（HCC 组）和健康体检者（HC 组）共 352 例，其中 HC 组 86 例，CHB 组 68 例，LC 组 69 例，HCC 组 129 例，回顾性分析所有研究对象血清学检测数据。计算出预测变量，并绘制 AFP、GGT/AST 以及预测变量单独或联合检测的受试者工作特征曲线（ROC 曲线），计算曲线下面积（AUC）及敏感度、特异度。
结果 HCC 组 GGT/AST 和 AFP 水平显著高于其他组，组间差异均有统计学意义（P<0.05）。ROC 曲线结果显示，在 HCC 组分别与 HC 组，CHB 组，LC 组区别诊断中，联合指标的 AUC 将 AFP 单独诊断的 AUC 分别从 0.921，0.803，0.760 提升至 0.948，0.846，0.802。在 BCLC 分期的 A 期分别与 B 期、C 期的区别诊断中，AFP 单独诊断的 AUC 在联合 GGT/AST 后分别从 0.715，0.737 提升至 0.800，0.759。并且在 AFP 阴性的 HCC 患者中 GGT/AST 单独检测 AUC 均达到 0.7 以上。
结论 AFP 联合 GGT/AST 能提高 HBV 相关 HCC 的临床诊断性能，具有一定诊断价值。

PO-0463

先兆子痫早期预测 nomogram 标准图的建立与验证

岳朝艳、应春妹
复旦大学附属妇产科医院

目的 为了对先兆子痫进行早期预测，我们开发并验证了一种用于中国孕妇先兆子痫早期预测的新型列线图。
方法 采用逐步回归模型进行特征选择。多变量逻辑回归分析用于开发预测模型。我们纳入了 BMI、血压、子宫动脉超声参数和血清学指标危险因素，并用列线图表示。列线图的性能根据其校准、辨别力和临床实用性进行评估。
结果 由 11 个选定特征组成的特征与发育数据集的先兆子痫状态 (P <0.1) 相关。个性化预测列线图中包含的预测因子包括 BMI、血压、子宫动脉超声参数和血清学指标水平。该模型显示出良好的辨别力，ROC 曲线下面积为 0.8563（95% CI：0.8364-0.8761）且校准良好。当应用于验证数据集时，列线图仍然具有良好的辨别力和良好的校准（ROC 曲线下面积为 0.8324，95% CI：0.7873-0.8775）。决策曲线分析表明列线图在临床决策中是有效的。
结论 本研究提出的列线图综合了 BMI、血压、子宫动脉超声参数和血清学指标，可以方便地用于子痫前期的个体化预测。

PO-0464

血清中糖化白蛋白候选参考测量程序的建立及性能评估

张素洁、居漪、李卿、金中淦
上海市临床检验中心

目的 建立一种基于液相色谱串联质谱（ID-LC/MS/MS）技术的血清糖化白蛋白候选参考测量程序并对其进行评价。
方法 基于日本临床化学学会（JSCC）推荐的同位素稀释色谱串联质谱法，加入 ^{13}C 及氘同位素标记的糖化赖氨酸及赖氨酸内标，通过负离子交换柱从血清中分离白蛋白，加入盐酸将纯化的白蛋白分解为氨基酸片段,以赖氨酸（Lys）及糖化赖氨酸（DOF-Lys）纯品作标准品,优化液相和质谱条件,根据标准品和同位素峰面积比分别计算样本中赖氨酸和糖化赖氨酸的含量。采用日本临床化学标准参考物质研究所（ReCCS）糖化白蛋白标准参考物质 JCCRM611-1H 验证参考方法正确性；糖化白蛋白质控品（旭化成制药株式会社）高低两个浓度血清样本测定三个批次，评价本方法精密度。
结果 Lys 和 DOF-Lys 线性标准曲线 R^2 范围分别为 0.9959-0.9999 和 0.9959-0.9979。ReCCS 标准参考物质 JCCRM611-1H 的批内不精密度为 0.5%-3.7%，批间不精密度为 2.8%，与靶值偏移为 -0.72%。两个不同浓度血清样本批内不精密度为 0.4%-5.6%，批间不精密度为 3.1%-5.4%。
结论 建立了一种基于液相色谱串联质谱法检测血清糖化白蛋白的方法，该方法精密度高，正确性好，可作为我国测定糖化白蛋白的候选参考测量程序。

PO-0465

Anterior Gradient 2 Increases Long-chain Fatty Acid Uptake via Stabilizing FABP1 and Facilitates Lipid Accumulation

Yunqiu Wang
the Second Hospital， Shandong University

Anterior gradient 2 (AGR2), a protein disulfide isomerase (PDI), is a well-established oncogene. Here, we found that Agr2−/− mice had a decreased fat mass and hepatic and serum lipid levels compared with their wild-type littermates after fasting, and exhibited reduced high-fat diet (HFD)-induced fat accumulation. Transgenic mice overexpressing AGR2 (Agr2/Tg) readily gained fat weight on a HFD but not a normal diet. Proteomic analysis of hepatic samples from Agr2−/− mice revealed that depletion of AGR2 impaired long-chain fatty acid uptake and activation but did not affect de novo hepatic lipogenesis. Further investigations led to the identification of several effector substrates, particularly fatty acid binding protein-1 (FABP1) as essential for the AGR2-mediated effects. AGR2 was coexpressed with FABP1, and knockdown of AGR2 resulted in a reduction in FABP1 stability. Physical interactions of AGR2 and FABP1 depended on the PDI motif in AGR2 and the formation of a disulfide bond between these two proteins. Overexpression of AGR2 but not a mutant AGR2 protein lacking PDI activity suppressed lipid accumulation in cells lacking FABP1. Moreover, AGR2 deficiency significantly reduced fatty acid absorption in the intestine, which might be resulted from decreased fatty acid transporter CD36 in mice. These findings demonstrated a novel role of AGR2 in fatty-acid uptake and activation in both the liver and intestine, which contributed to the AGR2-mediated lipid accumulation, suggesting that AGR2 is an important regulator of whole-body lipid metabolism and down-regulation of AGR2 may antagonize the development of obesity.

PO-0466

脂代谢与肝纤维化的研究进展

吴逢曦
中南大学湘雅二医院

肝纤维化是肝脏病变的一个慢性过程，其引起的慢性门静脉高压会引起多种临床并发症，包括水肿、失代偿、出血事件以及肝性脑病。因此，肝纤维化的发展决定了患者生活质量以及预后。肝纤维化涉及细胞外基质成分的过度积累，其过程主要由非实质细胞的协同作用介导，特别是肝星状细胞、巨噬细胞（包括枯否细胞）和内皮细胞，肝星状细胞的激活在其中占主导作用。脂质是细胞膜的基本结构成分，在不同的代谢途径和细胞功能中起着至关重要的作用。肝脏是脂质稳态的中枢，肝脏脂质代谢由不同的核受体、转录因子共同调节，主要受到甾醇调节元件 1c、过氧化物酶增殖物激活受体、肝脏 X 受体、法呢样 X 受体等调控，共同维持肝内脂质稳态。脂代谢的紊乱会引发炎症、缺氧等一系列反应，进而调控肝纤维化。近年来，各种脂代谢相关分子都被证明与肝纤维化息息相关，与甘油三酯代谢相关的如前粒蛋白、与磷脂代谢相关的如鞘氨醇 1-磷酸和血小板活化因子、与胆固醇代谢相关的如 SREBP 切割激活蛋白和缺氧诱导因子 1α，以及一些脂蛋白如 vLDL、ApoA1、rHDL 等均在肝纤维化的发生发展中起着调控作用。因此，对脂代谢调控纤维化机制的深入研究，可能有助于肝纤维化的诊断和治疗

PO-0467

分析阿尔茨海默病相关非编码 RNA 调控网络及寻找潜在生物标志物的研究

郭瑞
山东省千佛山医院

阿尔茨海默病（AD）发病机制目前尚不明确，缺乏有效的生物指标和治疗措施。非编码 RNA 已被证实与多种疾病密切相关，但目前关于 AD 非编码 RNA 调控网络的研究还很少。申请人前期已利用测序技术在血清中发现 9 种 AD 相关 miRNAs，其中 miR-22-3p 差异最显著，经数据库预测得到 lncRNA(RP11-145M9.4)—miR-22-3p—ERBB3—circRNA1814 调控通路。本课题将进一步对 AD 血清 lncRNA、circRNA 和 mRNA 进行表达谱分析，应用生物信息学分析技术，构建 AD 相关 miRNA-lncRNA-circRNA-mRNA 调控网络。并以前期预测的调控通路为例，应用质粒构建、共转染、细胞模型构建等技术，建立体外实验验证流程，研究非编码 RNA 间的相互作用及对靶基因的调控作用，阐明非编码 RNA 调控网络在 AD 发病过程中的作用，为 AD 的诊治提供新的生物标志物和治疗靶点。

PO-0468

温和还原反应介导的电化学适配体传感方法用于蛋白标志物检测

李玲玲
上海交通大学医学院附属第九人民医院
上海大学

目的 机体细胞内各种蛋白的表达水平在病理状态下会发生一定改变，因此检测蛋白表达谱的改变可以快速且准确地诊断相关疾病。
方法 在本研究中，以肝癌相关蛋白质标志物-甲胎蛋白（AFP）作为研究对象，设计了温和还原反应介导的杂交链式信号放大策略用于蛋白质类疾病标志物检测的通用电化学适体传感方法。具体而言，含有二硫键的目的蛋白经电极表面固定化适配体捕获后，通过温和还原反应可以暴露出活性巯基，而蛋白表面的活性巯基通过巯基-马来酰亚胺反应偶联探针 DNA，并由此引发杂交链式反应，因此大量的电化学信号分子聚集在链式反应的长链产物上因而可得到放大的电化学信号响应。
结果 研究结果表明，温和还原反应介导的电化学适配体传感方法用于肝癌标志蛋白甲胎蛋白检测可以获得较宽的线性范围（1×10-4 ~ 100 ng/mL）和低的检出限（0.041 pg/mL）。
结论 进一步研究表明证实了该方法对蛋白识别的高选择性，也体现了其在蛋白检测中的普适性，可以通过改变相应的适配体来实现不同蛋白标志物的检测需求。因此，该方法为实现高通量、自动化的临床蛋白标志物分析奠定了基础。

PO-0469

CRP、CK、CK-MB、LDH 及 NSE 在新生儿缺氧缺血性脑病中的临床价值

乔正梅
宝鸡高新医院

目的 探讨 CRP、CK、CK-MB、LDH 及 NSE 在新生儿缺氧缺血性脑病中的相关变化及临床价值。
方法 选择 45 例缺氧缺血性脑病新生儿为患儿组，40 例健康新生儿作为对照组。按病情严重程度

将患儿组分为轻度组、中度组和重度组，根据病程检测各组出生后 3 小时（h）、3 天（d）、7d、14d 时间点的 CRP、CK、CK-MB、LDH 及 NSE 水平变化。病情严重程度、病程多个时间节点的多组间上述数据比较运用方差分析，病情严重程度的组间比较运用独立样本 t 检验，病程多个时间节点的组间比较运用配对 t 检验。

结果 患儿组 CRP、CK、CK-MB、LDH 及 NSE 水平均高于对照组，差异有统计学意义（P＜0.001）；轻度、中度和重度组随着病情程度的加重，其 CRP、CK、CK-MB、LDH 及 NSE 水平越高，差异有统计学意义（P＜0.05）。HIE 组于出生后 3h、3d、7d 的血清 CRP、CK、CK-MB、LDH 及 NSE 水平差异有统计学意义（P＜0.05），出生后第 3d 达到高峰，第 7d 明显下降，出生后第 7d 上述数据低于出生后 3h、3d，但明显高于对照组（P＜0.05）。经 14d 治疗后，HIE 治疗有效组的 CRP、CK、CK-MB、LDH 及 NSE 水平低于无效组（P＜0.05）。

结论 CRP、CK、CK-MB、LDH 及 NSE 水平能较好地反映新生儿 HIE 的病情严重程度和病程变化，随着脑损伤程度越重，CRP、CK、CK-MB、LDH 及 NSE 水平越高，并随病情好转进行性降低，因此检测 CRP、CK、CK-MB、LDH 及 NSE 水平变化有利于新生儿缺氧缺血性脑病的诊治。

PO-0470

纤溶酶原激活物抑制剂-1(4G/5G)基因多态性与深静脉血栓事件的风险

张莹、程晓东、胡玉皎、王昊、周铁成、郝晓柯、刘家云
空军军医大学西京医院

目的 分析我国西北地区纤溶酶原激活物抑制剂-1(PAI-1) (4G/5G)基因在不同人群中的分布情况，以及不同基因型患者血栓事件的发生率，为携带 PAI-1(4G/5G)基因 4G 型的手术患者提供数据支持和用药指导。

方法 收集 1 494 例人群血液样本，使用荧光探针原位杂交技术检测 PAI-1(4G/5G) 基因位点，分析我国西北地区 PAI-1(4G/5G)基因在体检健康者、剖腹产患者、烧伤患者、心脑血管疾病患者之间 4G 基因的差异性。

结果 336 例体检健康者中 5G5G（野生型）78 例（23.21%），4G5G（杂合突变型）152 例（45.24%），4G4G（纯合突变型）106 例（31.55%）。401 例剖腹产患者中 5G5G（野生型）60 例（14.96%），4G5G（杂合突变型）195 例（48.63%），4G4G（纯合突变型）146 例（36.41%）。603 例烧伤患者中 5G5G（野生型）100 例（16.58%），4G5G（杂合突变型）295 例（48.93%），4G4G（纯合突变型）208 例（34.49%）。154 例心脑血管疾病患者中 5G5G（野生型）21 例（13.64%），4G5G（杂合突变型）81 例（52.59%），4G4G（纯合突变型）52 例（33.77%）。PAI-1(4G/5G)4G 型基因携带率在剖腹产患者、烧伤患者、心脑血管疾病患者与健康体检人群间均差异有统计学意义（P<0.05）。200 例烧伤手术患者患病后 2 个月内深静脉血栓事件追踪结果表明，4G4G 基因型血栓事件为 86.49%，4G5G 基因型血栓事件为 65.00%，5G5G 基因型血栓事件为 50.00%，不同的基因型间差异有统计学意义（P<0.01）。

PO-0471

脑脊液常规、脑脊液糖/乳酸、脑脊液糖/血糖比值对颅内感染诊断的意义

余罗莉、江丽
福建医科大学附属第一医院

目的 分析颅内感染患者脑脊液常规、CSF 糖/血糖和 CSF 糖/CSF 乳酸比值变化的临床意义。
方法 收集我院 2016 年 5 月—2017 年 5 月进行脑脊液细菌培养的 72 例患者作为观察对象。其中 40 例培养出致病菌并有脑膜炎刺激症,将其作为感染组;32 例培养阴性的癫痫患者作为阴性对照组。对所有对象进行脑脊液常规检测（颜色、潘氏试验、白细胞计数及分类）和脑脊液生化检查（本文只做 CSF 乳酸、CSF 糖）,同时对 CSF 糖与血糖的比值以及 CSF 糖与乳酸的比值进一步分析。
结果 感染组患者脑脊液常规的白细胞总数显著高于对照组,其中细菌性脑膜炎患者多个核细胞明显多于单个核细胞;感染组 CSF 糖/血糖的值均<0.4,对照组 CSF 糖/血糖的值均>0.4,组间差异有统计学意义（P<0.05）;感染组 CSF 糖/CSF 乳酸的值均<1.00,而对照组 CSF 糖/CSF 乳酸的值均>1.00,组间差异有统计学意义（P<0.05）。
结论 脑脊液常规检查的变化,通过联合应用 CSF 糖与血糖的比值以及 CSF 糖与乳酸的比值的检测,可提高对细菌性脑膜炎的诊断和可信度,帮助患者早期确诊,更好地为临床早期治疗提供依据。

PO-0472

基于随机森林算法的肾移植术后 DSA 风险预测模型构建

周晓涵[1]、巫丽娟[2]、周娟[2]、陆小军[2]
1. 四川大学华西临床医学院
2. 四川大学华西医院

目的 肾移植后供者特异性抗体（donor specific antibody, DSA）是引起排斥的主要原因，排斥反应会导致移植物失功，早期预测或诊断 DSA 有助于对患者进行早期干预，改善患者预后。但目前尚无满足临床需求的移植后 DSA 预测手段，本研究全面探讨了肾移植术后发生排斥反应的相关因素，构建了基于随机森林算法的肾移植术后 DSA 风险预测模型，利用大数据建模的手段提高了肾移植术后发生排斥反应的预测效能。
方法 纳入四川大学华西医院 2009 年 1 月至 2019 年 12 月 4629 例肾移植术后受者，回顾性分析受者的人口学基本特征、流行病学资料及肾移植术后受者的临床特征、生化、免疫和血常规检测结果等 40 指标。经过筛选的病例按照 8:2 的比例随机划分为训练集和测试集，基于训练集使用随机森林算法建立肾移植术后 DSA 风险预测模型，并进一步评估模型预测效能及探索 DSA 影响因素的重要性。
结果 42.86%（1984/4629）患者产生术后 DSA，基于随机森林的 DSA 风险预测模型的训练集判对率为 86.1%，测试集为 87.0%；模型的特异性、灵敏度和 AUC 分别为 0.9209、0.7946 和 0.91。同时进行 DSA 影响因素重要性探索，发现最重要的预测因素前五位依次为年龄、eGFR(估算肾小球滤过率)、MCV（平均红细胞体积）、CREA（肌酐）和 SYS-C（胱抑素 C）。
结论 随机森林算法在肾移植术后 DSA 风险预测模型中有较好的应用，该模型可以很好预测肾移植术后 DSA 的发生风险。同时应当特别关注受者年龄、eGFR、MCV、CREA 和 SYS-C 五项指标的变化情况。

PO-0473

Urinary peptidomics analysis reveals proteases involved in idiopathic membranous nephropathy

Baoxu Lin 、Xiaosong Qin
Shengjing Hospital of China Medical University

Background Idiopathic membranous nephropathy (IMN) is a cause of nephrotic syndrome with increasingly incidence and lack of clear pathogenesis. Urine peptidomics is a promising technology to elucidate the molecular mechanism of diseases. Dysregulation of the proteolytic system is implicated in various diseases. Here, we aimed to conduct urinary peptidomics analysis and predict proteases may related to IMN.
Methods Naturally produced peptides in the urine of 20 heathy individuals, 22 patients with IMN, and 15 patients with other kidney diseases were extracted with weak cation magnetic bead (WC-MB), peptides fingerprint and proteomics profile were analyzed by matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF-MS) and data-independent acquisition mass spectrometry (DIA-MS), respectively. Proteins matched with peptides that were differentially expressed in IMN patients were identified. Proteasix database was used to predict the proteases that involved in peptide production, iProX and Gene Expression Omnibus (GEO) databases were used to validate the proteins and proteases corresponding to each peptide. Finally, western blot analysis was used to validate the expression of the key proteases .
Results Peptides fingerprints indicated there were differences in urine peptides components among heathy individuals, patients with IMN and other kidney diseases. In total, 1080 peptide-matched proteins were identified, 279 proteins differentially expressed in the urine of IMN patients were screened, and 32 proteases were predicted; 55 of the matched proteins were also differentially expressed in the kidney tissue of IMN patients, and these were mainly involved in the regulation of proteasome-, lysosome-, and actin cytoskeleton-related signaling pathways. The 32 predicted proteases showed abnormal expression in the glomerulus of IMN patients. Western blot revealed that the expression of calpain the CAPN1, matrix metalloproteinase MMP14, and cathepsin S (CTSS) was increased in the kidney tissue of IMN patients.
Conclusions Collectively, these results shown the calpain, matrix metalloproteinase and cathepsin axis may be dysregulated in IMN.

PO-0474

HYDRASHIFT 2/4 daratumumab 检测在消除达雷妥尤单抗对血清免疫固定电泳干扰的应用

徐双
北京大学人民医院

背景 达雷妥尤单抗是一种用于治疗浆细胞疾病的单克隆抗体，使用该药物治疗后免疫固定电泳会出现此种药源性 IgG-κ 型单克隆条带，进而导致免疫固定电泳结果出现假阳性，使临床医生对患者治疗疗效做出错误的分类。HYDRASHIFT 2/4 daratumumab 检测可以消除达雷妥尤单抗对血清免疫固定电泳结果的干扰。
方法 收集使用达雷妥尤单抗进行治疗的 8 名浆细胞疾病患者的血清样本（T0,T1（C2D1），T2（C3D1）），分别进行标准的免疫固定电泳检测及 HYDRASHIFT 2/4 daratumumab 检测。
结果 单抗治疗后，81.3%（13/16）的样本出现药物性单克隆条带（IgGκ 型），未出现药物性单克隆条带的样本考虑与个体差异、给药间隔时间有关。出现 IgGκ 型单克隆条带的样本中 76.9%

（10/13）可通过免疫固定电泳直接区分其为内源性或外源性单克隆条带，余 3 份样本（3/13），需要使用 HYDRASHIFT 2/4 daratumumab 检测进行区分。
结论 使用达雷妥尤单抗治疗后 81.3%（13/16）的样本出现药物性单克隆条带，其中 3 份样本（3/13）不能区分其为内源性或外源性单克隆条带，使用 HYDRASHIFT 2/4 daratumumab 检测可以去除达雷妥尤单抗对免疫固定电泳结果的干扰，辅助疗效评判。

PO-0475

血清 25 羟维生素 D 候选参考方法的建立

龙琪琛[1,2]、张天娇[1,2]、张莉[1,2]、曾庆璋[1,2]、周伟燕[1]、曾洁[1]、张江涛[1]、张传宝[1]
1. 北京医院 国家老年医学中心 国家卫生健康委临床检验中心 北京市临床检验工程技术研究中心 中国医学科学院老年医学研究院
2. 中国医学科学院北京协和医学院

目的 25 羟维生素 D（25-hydroxyvitamin D，25OHD）是反映体内维生素 D 缺乏状态的重要指标，检测 25 羟维生素 D 的临床需求日益增长。为确保常规检测的准确可比，推动 25 羟维生素 D 检测的标准化至关重要。本研究拟建立血清 25 羟维生素 D 候选参考方法，并对该候选参考方法进行全面的性能确认。
方法 使用 25 羟维生素 D3 和 25 羟维生素 D2 的标准溶液对质谱条件和色谱条件进行摸索和确认。比较不同类型的前处理方式，并对选择的样本制备方案进行优化。选择 14 种 25 羟维生素 D 的结构类似物进行干扰分离，并对方法的精密度、正确度和检测限等进行了性能确认。
结果 该方法使用的色谱柱为 Shimadzu Shim-pack Velox PFPP（2.1×100mm，1.8 μm），前处理方式使用蛋白沉淀和液液萃取一步处理法。该方法检测 25 羟维生素 D3 的不精密度为 0.97% ~ 1.25%，25 羟维生素 D2 不精密度为 1.24% ~ 2.77%。测定 25 羟维生素 D3 和 25 羟维生素 D2 的加标回收率及变异系数为 100.8% ± 0.8％ ~ 101.0% ± 0.6％和 99.9% ± 1.2％ ~ 101.0% ± 1.5％，且测定国际标准物质 NIST 972a 的相对偏倚均在不确定度范围内。方法的检测限和定量限分别为 0.002 ng 和 0.005 ng（25 羟维生素 D3）以及 0.004 ng 和 0.012 ng（25 羟维生素 D2）。
结论 本研究开发了基于同位素稀释液相色谱串联质谱法的血清 25 羟维生素 D 的检测方法。该方法准确精密灵敏，特异性高，分析时间短，有望作为 25 羟维生素 D 参考方法。

PO-0476

A nomogram for predicting metabolic steatohepatitis: the combination of NAMPT, RALGDS, GADD45B, FOSL2, RTP3, and RASD1

Shenling Liao 、He He、Yuping Zeng、Lidan Yang、Zhi Liu、Zhenmei An、Mei Zhang
West China Hospital, Sichuan University

Objective The gold standard for diagnosing MASH is the biopsy, but the biopsy is an invasive and costly method that is not easy to be accepted by patients. Therefore, developing new, non-invasive, and reliable biomarkers is undergoing. Our study aims to identify differentially expressed and clinically significant mRNAs and construct a potential prediction model for metabolic steatohepatitis (MASH).
Methods We downloaded four microarray datasets， GSE89632, GSE24807, GSE63067, GSE48452 from the Gene Expression Omnibus database. GSE63067, GSE24807, and GSE89632 were used to identify DEGs. GSE89632 was analyzed with the weighted gene co-expression network. The online analysis platform GEO2R (https://www.ncbi.nlm.nih.gov/geo/geo2r/) was employed to compare two groups of samples to

identify differentially expressed genes. With weighted gene co-expression network analysis (WGCNA) R package, clusters (modules) of highly correlated genes were found and the correlation between modules external sample traits was constructed for GSE89632. The differentially expressed genes analysis and weighted gene co-expression network analysis were performed to screen significant genes. Finally, we constructed a nomogram of six hub genes in predicting MASH and assessed it through receiver operating characteristic (ROC) curve， calibration plot and decision curve analysis (DCA). In addition, qRT-PCR was used for relative quantitative detection of RNA in QSG-7011 cells to further verify the expression of the selected mRNA in fatty liver cells.
Results The GEO2R and limma R package were applied to analyze differentially expressed genes. 296 DEGs were screened in GSE89632 (p-value < 0.05, log FC absolute value > 1.2). 83 DEGs were screened in GSE63067 (p-value < 0.05, log FC absolute value > 1.2). 1643 DEGs were screened in GSE24807 (p-value < 0.05, log FC absolute value > 2). There were 14 modules in the weighted gene co-expression network analysis, and brown module and yellow module had a negative and positive relation to disease respectively. GO and KEGG pathway analyses for genes in the two modules were performed, and these genes highlight inflammation and inflammatory cytokines. Based on common DEGs and brown and yellow modules, 7 hub genes were identified, which were NAMPT, PHLDA1, RALGDS, GADD45B, FOSL2, RTP3, RASD1. After logistic regression analysis, six hub genes were used to establish the nomogram, which were NAMPT, RALGDS, GADD45B, FOSL2, RTP3, RASD1. The area under the ROC of the nomogram was 0.897. The DCA showed when the threshold probability of MASH was 0-0.8, the prediction model was valuable to GSE48452. In QSG-7011 fatty liver model cells, the relative expression levels of NAMPT, GADD45B, FOSL2, RTP3, RASD1 and RALGDS were lower than the control group.
Conclusion We identified seven hub genes NAMPT, PHLDA1, RALGDS, GADD45B, FOSL2, RTP3, RASD1. The nomogram showed good performance in the prediction of MASH and it had clinical utility in distinguishing MASH from simple steatosis.

PO-0477

血清游离轻链、比值及差值在肾脏受累的系统性轻链型淀粉样变性病中的临床价值

胡娟娟
空军军医大学西京医院

目的 分析血清游离轻链、比值及差值在肾脏受累的系统性轻链（AL）型淀粉样变性病中的临床价值。
方法 对空军军医大学附属第一医院西京医院肾内科住院的新确诊为肾脏受累的 AL 型淀粉样变性患者 222 例进行血清游离轻链（sFLc）水平、sFLCκ/λ 比值、差值（dsFLC）进行回顾性分析，评估此检测在肾脏受累的系统性轻链（AL）型淀粉样变性病中诊断，治疗和预后的影响。
结果 肾脏受累的 AL 型淀粉样变性患者血 β2 微球蛋白和骨髓浆细胞比例与 sFLC 有相关性(P＜0.05)，血肌酐、24 小时尿蛋白定量与 sFLC-λ 有相关性(P＜0.05)。肾脏受累的 AL 型淀粉样变性研究组患者 sFLCκ/λ＜0．26 或＞1．65 的比例为 80.2%高于对照组患者，差异有统计学意义（χ^2=18.342，P＜0.05)。不同化疗疗程前后患者轻链差值变化结果显示，化疗一个周期后，dsFLC 达到缓解程度无反应性占比例大，为 47.3%，随着化疗次数的增加，无反应性比例减少，dsFLC 达到完全缓解比例从 8.15%到 35.1%，dsFLC 达到血液学有反应性比例从 52.3%到 81.9%。结果表明轻链差值（dsFLC）变化可以明确的反应血液学缓解程度。
结论 血清游离轻链水平、比值在肾脏受累的系统性轻链（AL）型淀粉样变性病的诊断中提供重要依据。sFLCκ/λ 比值、差值与患者临床预后密切相关，可作为预后评估监测的理想指标。

PO-0478

糖化白蛋白、尿蛋白以及空腹血糖检测对糖尿病肾病患者的临床评估

虢瑾、张莹、童开、肖鹏涛
空军军医大学西京医院

目的 探讨糖化白蛋白、尿蛋白以及空腹血糖检测对糖尿病肾病患者的临床评估。
方法 以我院 2019 年 1 月到 2020 年 12 月确诊为糖尿病的患者 289 例为研究组。根据其是否患糖尿病肾病将其分为肾病组（ n=90 ）和非肾病组（ n=199 ）。对照组为同一时间段在我院体检的健康者 80 名。对两组研究参与者均进行糖化白蛋白、尿蛋白以及空腹血糖的检测， 就检测结果进行组间及组内的数据对比分析。
结果 研究组患者的糖化白蛋白、尿蛋白以及空腹血糖水平均高于对照组，且差异有统计学意义（ P＜0.05 ）；肾病组患者的糖化白蛋白、尿蛋白以及空腹血糖水平均高于非肾病组（ P＜0.05 ），可知其水平与疾病严重程度正相关； 3 项联合检测、糖化白蛋白和空腹血糖联合检测、尿蛋白单一检测对糖尿病肾病的阳性率分别为 85.11％ 、 64.72％ 、 21.22％ ， 3 项联合检测的阳性率最高（ P＜0.05 ）。
结论 糖化白蛋白、尿蛋白以及空腹血糖水平对糖尿病肾病患者的诊断及疾病严重程度判断有重要临床意义，联合检测可显著提高诊断准确率。

PO-0479

分析儿童全血部分常量和微量元素含量的年龄差异

韩旭
山东省千佛山医院

目的 探讨儿童全血常量元素（钙、镁）和微量元素（铁、锌、铜）含量的年龄差异，并建立临床正常参考范围。
方法 以 20 946 例健康查体的儿童（男 12 447 例，女 8 499 例）为对象 按照年岭分为四组(<1 岁，1 岁～，3 岁～，>6 岁)。采用原子吸收光谱法测定末梢血钙、镁、铁、锌、铜元素的含量。计算出各年龄组、各元素含量第 3，10，25，50，75，90，97 百分位的相应数值。
结果 不同年龄组之间血钙、镁、铁、锌、铜的含量有显著性差异（P< 0.05），且随年龄的变化而变化。便于临床应用，取第 25-75 百分位的相应数值作为正常参考范围。
结论 判断 5 种元素含量是否正常应考虑年龄因素，各年龄组需分别参考其相应的正常范围。

PO-0480

Uridine Diphosphate Promotes Rheumatoid Arthritis Through P2Y6 Activation.

Hongxing Wang
Qilu Hospital, Shandong University

BACKGROUND Uridine diphosphate (UDP) is an extracellular nucleotide signaling molecule implicated in diverse biological processes via specific activation of pyrimidinergic receptor P2Y, G Protein-Coupled, 6 (P2Y6). There is very little knowledge about the function and mechanism of UDP in rheumatoid arthritis (RA).

METHODS This study used a quasi-targeted liquid chromatography-mass spectrometry (LC-MS) approach to investigate the unique expression of metabolites in RA synovial fluids (SF) (n = 10) with samples from osteoarthritis (OA) as controls (n = 10). RA fibroblast-like synoviocytes (FLSs) were collected from synovial tissues (n = 5) and cultured with UDP or MRS2578, a P2Y6 antagonist, and FLSs from OA were used as controls (n = 5). Rats with collagen-induced arthritis (CIA) were injected with UDP, MRS2578 or both (n = 9 for each group). P2Y6 expression was examined using real-time PCR, Western blotting and immunohistochemistry. Cell proliferation, apoptosis and migration of RA FLSs were measured using CCK-8 assay, real-time cell analysis, flow cytometry, wound healing assay and Transwell assay, respectively. The UDP levels in the culture medium, synovial fluid (n = 36) and peripheral blood (n = 36) of RA and CIA rats were measured using a Transcreener UDP Assay. Levels of proinflammatory cytokines were measured using a flow assay. Interleukin-6 (IL-6) levels were measured using ELISA and flow.
RESULTS LC-MS analysis detected significantly increased UDP levels in RA SF compared with OA SF, and the level was positively correlated with anticyclic citrullinated peptide (anti-CCP) and rheumatoid factor (RF)levels in RA. The increased UDP concentration was verified in the blood and synovial fluids of RA patients compared with samples from OA patients and healthy volunteers, respectively. UDP stimulated cell proliferation, migration and IL-6 secretion in RA FLSs and inhibited their apoptosis in culture, and MRS2578 inhibited these effects of UDP. UDP injection accelerated CIA and stimulated IL-6 production rather than other proinflammatory cytokines in the rat model, but simultaneous injection of MRS2578 suppressed these effects and alleviated CIA. P2Y6 expression was increased in RA and CIA synovial tissues.
CONCLUSION These results suggest that UDP is highly expressed in RA and stimulates RA pathogenesis by promoting P2Y6 activities to increase IL-6 production.

PO-0481

CircRNA 在代谢性疾病中的研究进展及前景

石盛洁、谢小兵
湖南中医药大学第一附属医院

代谢性疾病是影响世界公共卫生健康的主要原因之一，造成了大量人员死亡。早期诊断和预后判断是治疗、减少并发症以及降低死亡率的关键。环状 RNA（Circular RNA, circRNA）在机体的生理和病理过程中起重要作用，参与许多疾病的发生发展。保守性、稳定性、特异性、普遍性等优良特性使得 circRNA 有望成为新的潜在生物标志，但其作为检测指标应用于临床要需要迎接一定的挑战。

PO-0482

Albumin-bilirubin score is associated with response to pegylated interferon and nucleos(t)ide analogues in chronic hepatitis B patients

Zhen Xun 、Qishui Ou
The First Affiliated Hospital of Fujian Medical University, Fuzhou, China

Background and Aim Recently, the role of albumin-bilirubin (ALBI) score in chronic hepatitis B (CHB) has not been well-understood. We aimed to investigate the association of ALBI score with natural history of chronic HBV infection and treatment response of CHB patients.
Methods The ALBI score in a cohort of 849 individuals including 721 chronic HBV-infected patients naïve to anti-HBV treatment in different phases and 128 healthy controls were estimated. Additionally, the dynamic changes of ALBI score of 243 hepatitis B e antigen (HBeAg)-positive

CHB patients treated with pegylated interferon-alpha (PEG-IFN-α) or nucleos(t)ide analogues (NAs) were tested for 72 weeks.
Results ALBI score differed among phases, with the highest score in HBeAg-positive CHB patients, followed by HBeAg-negative CHB patients, HBeAg-positive chronic HBV infection, and HBeAg-negative chronic HBV infection. Besides, CHB patients harbouring high baseline ALBI score exhibited a relatively stronger therapeutic response to PEG-IFN-α or NAs. Moreover, the rate of HBeAg and HBsAg loss in patients with ALBI grade 2 was persistently higher than that in patients with ALBI grade 1 throughout the course of treatment. Furthermore,
ALBI score was an independent predictor of sustained response achievement. The combined use of ALBI score, HBeAg and ALT could enhance the predictive value of treatment response.
Conclusions ALBI score differed significantly across the natural course of chronic HBV infection and was correlated with PEG-IFN-α and NAs treatment response in HBeAg-positive CHB patients, which suggested that ALBI score could be useful as an auxiliary clinical factor to determine the initiation of therapy and predict stronger
antiviral treatment response.

PO-0483

Effect of Addition of WZB117 as an Inhibitor of Glucose Transporter 1 for Venous Blood Glucose Determination

lei zhang[1]、 Yaqiong Ran[2]、 Yan Zhu[2]、 Qianna Zhen[2]
1. 1 Clinical Laboratory, the First Affiliated Hospital of Chongqing Medical University
2. Clinical Laboratory, the First Affiliated Hospital of Chongqing Medical University

Objective Sodium fluoride (NaF) has been applied to inhibit glycolysis in venous specimens for decades. However, it has had little effect on the rate of glycolysis in the first 1 to 2 hours, resulting in a decrease of glucose, so a more efficient method is needed. Recently, we discovered that WZB117, a specific Glut1 inhibitor, restricts glycolysis by inhibiting the passive sugar transport of human red blood cells and cancer cells. The purpose of this study was to evaluate the results of intravenous blood glucose determination after the addition of WZB117.
Methods Venous specimens from 40 pairs of healthy volunteers were collected for several days and placed in tubes containing NaF plus EDTA-disodium (Na2) without WZB117 (the A group); citric acid, trisodium citrate, and EDTA-Na2 without WZB117 (B group); and NaF plus EDTA-Na2 with WZB117 (C group). The glucose concentration was measured after venipuncture and compared with test tubes treated for 1 hour, 2 hours, and 3 hours before centrifugation. Glucose level was determined by the hexokinase method. The paired t-test was used to examine differences in glucose values at baseline and at different time points. The number of misdiagnoses and the misdiagnosis rate were calculated at 2 diagnostic stages: high risk of diabetes (glucose level of 6.1 mmol/L) and diagnosis of diabetes (glucose level of 7.0 mmol/L).
Results Glucose levels decreased by 1.0% at 1 hour and by 2.1% at 3 hours in the C group tubes and simultaneously decreased by 1.7% at 1 hour and by 2.5% at 3 hours in the B group tubes. In contrast, glucose levels decreased by 4.1% at 1 hour and by 6.3% at 3 hours in the A group tubes. There was a statistically significant difference in glucose levels measured in the A group tubes and B group tubes at 1 hour, 2 hours, and 3 hours. The misdiagnosis rate of clinical diagnosis in diabetes was highest in the A group tubes (7.0‰ at 1 hour, 0.1‰ at 3 hours at 7.0 mmol/L point; 14.6‰ at 1 hour, 0.4‰ at 3 hours at 6.1 mmol/L point) and lowest in the C group tubes (2.95‰ at 1 hour, 0‰ at 3 hours at 7.0 mmol/L point; 4.8‰ at 1 hour, 0.1‰ at 3 hours at 6.1 mmol/L point).
Conclusion The tube addition of WZB117 is more suitable for minimizing glycolysis and has no effect on glucose levels even if specimens are left uncentrifuged for up to 3 hours.

PO-0484

Development of Potential Diagnostic Biomarkers for HBV-Related Hepatocellular Carcinoma with BCLC Stage 0-A by 1H-NMR-based Lipidomic Analysis.

HaoHua An、Li Ren
Tianjin Medical University Cancer Institute and Hospital

Background Early diagnosis is essential for improving the prognosis and survival of patients with hepatocellular carcinoma (HCC). However, due to the lack of ideal biomarkers with satisfactory sensitivity and specificity, the diagnosis of HCC has been challenging to date. This study aims to explore the clinical value of 1H-nuclear magnetic resonance (1H-NMR)-based lipoprotein subfraction assays in the diagnosis of hepatitis B virus (HBV)-related HCC.
Methods A total of 196 serum samples were detected by 1H-NMR spectroscopy. Eight pairs of cancerous and paracancerous tissue samples were detected by LC-MS/MS. Orthogonal partial least-squares discriminant analysis (OPLS-DA) and backward stepwise logistic regression were performed to classify distinct serum profiles and construct a prediction model for HCC diagnosis. Furthermore, the overall and disease-free survival rates were estimated by Kaplan–Meier survival analysis.
Results The diagnostic panel constructed from apolipoprotein-A1 (Apo-A1) and the number of very-low-density lipoprotein (VLDL), intermediate-density lipoprotein (IDL) and low-density lipoprotein (LDL-1, LDL-2, LDL-4 and LDL-5) particles achieved higher diagnostic accuracy (AUC: 0.891; 95% CI: 0.807-0.948) than that constructed from serum alpha-fetoprotein alone (AUC: 0.831; 95% CI: 0.736-0.902). In addition, Apo-A2, high-density lipoprotein (HDL) and HDL-3 Apo-A2, IDL and HDL-3 phospholipids, VLDL-4 cholesterol, and HDL-3 and HDL-4 free cholesterol were significantly decreased after surgical treatment. We also found that the expression of proteins involved in lipid metabolism was significantly changed in HBV-related HCC tissues and significantly associated with a poor HCC prognosis.
Conclusion Our research focused on an innovative combination of lipid profile alterations in HCC patients and 1H-NMR-based lipidomics research, which provided new insight for the development of diagnostic biomarkers for HCC. Moreover, LC-MS/MS analysis indicated that abnormal lipid metabolism may be an important factor in promoting HCC development.

PO-0485

四种不同方法的可溶性生长刺激表达基因 2 蛋白试剂的性能评价

莘琳琳、范雪松、袁慧
首都医科大学附属北京安贞医院

目的 对四种不同检测方法（分别用 A、X、J、L 表示）的可溶性生长刺激表达基因 2 蛋白（sST2）检测试剂盒进行性能验证，为后续临床实验室应用该指标提供参考。
方法 对四种不同方法学试剂的基本性能进行验证和方法学比对。收集 2021 年 1 月至 3 月首都医科大学附属北京安贞医院 120 例患者和 40 名表观健康人剩余血清，参考 CLSI 文件和行业标准要求对免疫层析(A)、增强免疫荧光（X）、乳胶免疫比浊（J）和磁微粒化学发光(L)的 sST2 检测试剂盒分别进行性能评价；并且以美国 Presage 生产的 ELISA 检测试剂盒作为参比试剂，进行临床样本比对和医学决定水平处的偏差的计算。
结果 四种检测方法试剂的批内精密度分别为 6.26%~9.14%、5%~5.88%、0.88%~1.42%、0.72%~0.8%；都有不少于 90%的表观健康人落入生物参考区间；线性验证均验证通过；但 A 试剂批间精密度为 CV%=18%，A 和 J 厂家的正确度验证未通过；J 试剂对类风湿因子的抗干扰能力与说明书标注的范围不符。X、J、L 试剂分别可进行 10 倍，20 倍和 50 倍的稀释比例，可报告范围

达到 10000ng/ml、8000ng/ml 和 15000ng/ml。四种试剂与美国 Presage 生产的酶联免疫吸附法试剂之间相关性 R2 分别为 0.8032、0.9569、0.9404、0.9064；在医学决定水平处的平均预期偏差分别为 45.19%、64.07%、59.12%、53.84%。

结论 四种不同方法学的 sST2 试剂的批内精密度、线性和生物参考区间均符合说明书标注的检测范围，但部分厂家的正确度和抗干扰能力以及试剂之间的一致性有待提高。

PO-0486

环状 RNA hsa_circ_0000745 与冠心病的相关性研究

苏明、张登伟、李珊珊、曹珍菊、贾玫
北京大学人民医院

目的 近年来，环状 RNA（circRNA）在冠心病中的作用越来越引起重视，探索新的 circRNA 对于揭示冠心病的发病机制有重要意义。为发现新的冠心病相关 circRNA，通过表达谱芯片进行了筛选发现新的 circRNA hsa_circ_0000745 在冠心病患者中表达上调。由此提示，该 circRNA 可能是潜在的冠心病相关基因。本研究以 hsa_circ_0000745 为研究对象，探讨其表达与冠心病之间的关系，旨在为冠心病的发病机制研究提供实验依据。

方法 分离经冠脉造影确诊的 200 例冠心病患者及 35 例非冠心病对照的外周血单个核细胞（PBMC），提取 RNA 使用随机引物逆转录成 cDNA，采用实时荧光定量 PCR 技术检测 hsa_circ_0000745 在冠心病及对照人群中的表达水平。采用 2-ΔΔCt 法标准化后利用非参数检验及 logistic 回归分析 hsa_circ_0000745 的表达差异性与临床表型之间的关联。

结果 与对照组相比，冠心病患者的 hsa_circ_0000745 表达上调（$p<0.05$），ROC 曲线下面积 0.657。单因素二元 logistic 回归显示冠心病发生与 hsa_circ_0000745 表达水平上调显著相关。此外，单因素二元 logistic 回归分析和多因素二元 logistic 回归分析显示，相对于心绞痛患者，急性心肌梗死患者 hsa_circ_0000745 表达显著上调。

结论 冠心病患者外周血单个核细胞中 hsa_circ_0000745 表达水平上调，可能是一种新的冠心病相关生物标志物。

PO-0487

Relationship Between Apolipoprotein E Genotype and Lipoprotein Particles in Patients with Coronary Heart Disease

Qiong Yang、Zhaohui Liu、Yahui Lin、Zhou Zhou
Fuwai Hospital, Chinese Academy of Medical Sciences

Background Recent studies have indicated that as the main therapeutic target for reducing cardiovascular risk, LDL-C cannot explain all cardiovascular risks. Intervention studies on cholesterol-lowering therapy shows that even after reaching the optimal cholesterol concentration, the residual risk still exists. These clinical evidences have led to further research on lipoproteins, making people aware of the atherogenic effects of lipoprotein particles themselves rather than their cholesterol content. The new cardiovascular risk factor LDL particles (LDL-P) can better indicate the risk of CHD than low-density lipoprotein cholesterol (LDL-C). Previous researches have shown that the concentration and subclass distribution of lipoprotein particles differ with APOE genotypes. Our study aims to cross-sectionally analyze the relationship among APOE genotype, lipoprotein particles and disease severity in patients with coronary heart disease treated with statins, so as to provide more accurate evidence for clinical cholesterol-lowering therapy.

Methods Blood samples were collected from 360 patients with coronary heart disease treated with statins within 24 hours after admission. Lipoprotein particle parameters including VLDL, IDL, LDL, Small-LDL, Medium-LDL, Large-LDL concentration and LDL size were measured by NMR spectrometer. The NMR spectroscopy (NMRS) can provide a quick measurement to distinguish and quantify lipoprotein subclasses. When exposed to magnetic field, different lipoprotein particles will emit a unique signal, which is proportional to their concentration. APOE alleles were determined based on SNPs rs7412 and rs429358 haplotypes. Genotyping was performed by using TaqMan SNP genotyping assays with genomic DNA extracted from peripheral blood leukocytes. The severity of coronary artery disease was indicated by Gensini score and the number of diseased coronary artery branches.
Results In order to facilitate statistical comparison, 360 patients were divided into three groups according to the carrying of three alleles of APOE: 47 patients in ε2+ group (ε2/ε2 and ε2/ε3), 252 patients in ε3 group (ε3/ε3 and ε2/ε4) and 61 patients in ε4+ group (ε3/ε4 and ε4/ε4). The comparison of clinical baseline of each group showed no statistically significant difference in age, BMI, HbA1c, hs-CRP, ALT, Cr, TC, TG, HDL-C, LDL-C, Lp(a) and the proportion of males and diabetes among the ε2+, ε3 and ε4+ groups in patients with coronary heart disease already treated with statin. However, compared with ε3 group, ε2+ group showed lower concentrations of total LDL, S-LDL and M-LDL particles and larger LDL size, which indicated cardiovascular protective effect. ε4 + group showed higher concentrations of total LDL, S-LDL particles and smaller LDL size, which indicated the residual risk of cardiovascular disease($P<0.05$). After adjusting for male, age, diabetes, BMI, HbA1c, hs-CRP, ALT and Cr, ε2+ genotype could independently increase the concentration of VLDL, L-LDL and LDL size, while decrease the concentration of LDL, S-LDL and M-LDL. ε4 + genotype could independently increase the concentration of LDL and S-LDL. The atherogenic S-LDL accounted for about 50% of total LDL particle concentration. The increase of S-LDL concentration was associated with high Gensini score ($B=0.058$, $P=0.024$). Compared with ε3 group, the risk of increased branch lesions in the ε2+ group was lower ($OR=0.416$, $P=0.027$).
Conclusions APOE genotype can affect the severity of coronary artery disease by affecting lipoprotein particle profile such as S-LDL concentration and LDL size. Individualized cholesterol-lowering therapy should be carried out for ε4 allele carriers. In addition to statins, they should further reduce the additional cardiovascular risks caused by increased LDL particle concentration.

PO-0488

基于危险因素和常规实验室指标的子痫前期风险预测模型研究

邓兴宇、杨楠、薛宇廷、张华、贾珂珂
北京大学第三医院

目的 构建妊娠早期子痫前期（preeclampsia, PE）风险预测模型，比较 Logistic 回归模型和极端梯度提升(extreme gradient boosting, XGBoost)模型的预测能力。
方法 回顾性分析 2015 年 1 月至 2020 年 8 月北京大学第三医院 925 例 PE 患者和 7613 例正常对照组的 6-10 周的一般资料、PE 发病危险因素和 27 项常规实验室指标，采用秩和检验、Logistic 回归、XGBoost 等统计学方法进行数据分析，分别建立预测模型，绘制受试者工作特征曲线，计算曲线下面积、灵敏度、特异度。并用 XGBoost 绘制特征重要性条形图。
结果（1）两组孕妇是否患血栓性疾病、阻塞性睡眠呼吸暂停以及是否采用辅助生殖技术的比例无统计学差异（$P>0.05$），是否患糖尿病、APS、SLE、肾性疾病以及是否为初产妇、是否有 PE 史的比例有统计学差异（$P<0.05$）。（2）27 个常规实验室指标中，两组除 PLT/LYM 的水平不存在统计学差异（$P>0.05$）外，其余指标均具有统计学差异（$P<0.05$）。（3）仅纳入危险因素建立 Logistic 回归模型 AUC=0.621（95%CI 0.601-0.640，敏感度=34.8%，特异度=81.5%），低于危险因素联合实验室指标预测 Logistic 模型 AUC=0.752（0.735-0.769，64.2%，76.0%），低于

XGBoost 模型 AUC=0.867（0.839-0.896，73.0%，82.3%）。XGBoost 筛选出重要性排在前三的指标依次为 TG、Lp(a)、C1q。
结论 PE 发病危险因素联合常规实验室指标预测妊娠早期 PE 发病风险的效果，优于单独使用 PE 发病危险因素。XGBoost 模型早期预测 PE 发病的性能优于 Logistic 回归模型。TG、Lp(a)、C1q 是用 XGBoost 模型早期预测 PE 发病的重要变量。

PO-0489

胃泌素释放肽的表达与胃癌的关系

李礼
滨海县人民医院

Purpose This study was to assess the diagnostic and prognostic value of ProGRP in gastric cancer (GC)patients.
Methods 150 patients with GC, 50 healthy controls and 66 patients with benign gastric diseases were recruited.The levels of serum ProGRP, CEA and CA72-4 were measured.
Results ProGRP in GC were significantly higher compared to controls, and ProGRP was significantly correlated with tumor size, TNM stage, differentiation, invasion depth and lymph node metastasis.ProGRP were significantly decreased after chemotherapy. ProGRP were significantly positively correlated with CA-724 and CEA respectively. With combined detection of ProGRP, CEA and CA72-4 have better diagnostic power for GC.
Conclusion ProGRP could be useful as a potential biomarker for GC diagnosis and therapy.

PO-0490

TC、TG 对 TBA 检测的交叉污染

刘道林、李丹
隆回县人民医院

发现问题：连续发现三例总胆汁酸异常升高，复查后均正常的标本。
提出质疑：1.仪器清洗工作站漏液？2.会不会是交叉污染？3.哪个部位的交叉污染？ 4.是比色杯污染？5.是搅拌棒污染？
查找原因：1.仔细检测仪器运转良好，无漏液等现象，2.再次排查比色杯清洗不干净引起的交叉污染，发现其对 TBA 检测无明显的污染。3.查找三个标本第一次检测所用到的 R1、样本、R2 搅拌棒均为 2，3，2 号搅拌棒。再查找这三个搅拌棒之前所检测的项目均为总胆固醇。做总胆固醇的交叉污染排除实验，确定 TC 对总胆汁酸的检测存在交叉污染。4.排除其他检测项目是否也存在对 TBA 有明显交叉污染。发现 TG 的 R1 试剂对 TBA 的检测也存在明显的交叉污染现象。
解决方法 贝克曼 AU5800 生化仪有内外两圈比色杯与搅拌棒，我们只需把 TBA 与 TC、TG、HDL、LDL、APA 这些项目不放同一圈检测就可以防止交叉污染的发生。

PO-0491

Analytical and clinical performance of a liquid chromatography–tandem mass spectrometry method for measuring gastrin subtypes G34 and G17 in serum (This manuscript has been accepted by Clinical Chemistry)

Songlin Yu
Peking Union Medical College Hospital

Background Two major forms of gastrin, gastrin-17 (G17) and gastrin-34 (G34), exist in blood. However, conventional immunoassay methods can only quantify total gastrin or G17 alone. Here, we aimed to establish a liquid chromatography–tandem mass spectrometry (LC-MS/MS) method to quantify G17 and G34 simultaneously.
Methods Serum samples were prepared by anion-exchange solid-phase extraction. The analytical performance of the LC-MS/MS method was validated and the method was compared to chemiluminescence immunoassay (CLIA) and radioimmunoassay (RIA). The G17 and G34 concentrations in 245 serum samples from healthy controls, individuals with gastrinoma, and individuals with other diseases were analyzed.
Results The total runtime of the LC-MS/MS method was 6 min. No substantial matrix effect was observed with internal standard correction. The intra-assay coefficients of variation (CVs) for G17 and G34 were 4%–14.2% and 4.4%–10.4%, respectively, and total CVs were 5.2%–14.1% and 4.6%–12.4%, respectively. The correlation coefficient between LC-MS/MS and CLIA was 0.87, and between LC-MS/MS and RIA was 0.84. The G17+G34 concentrations for 87.5% of individuals with gastrinoma were higher than the 95th percentile of healthy controls (18.1 pg/mL), whereas the concentrations for individuals with other diseases and GA overlapped. Based on the Youden indices calculated for G17+G34, G34, and G17, the most specific biomarker was G17 (96.9% clinical specificity at 209.8 pg/mL).
Conclusions This method should aid in the diagnosis of diseases associated with increased gastrin concentrations.

PO-0492

基于多中心研究建立中国男性性激素和性激素结合球蛋白年龄特异性的参考区间模型

马超超、邱玲
中国医学科学院北京协和医院

背景 卵泡刺激素(FSH)、促黄体生成素(LH)、催乳素(PRL)、雌激素(E2)、总睾酮(TT)、游离睾酮(FT)、生物可利用睾酮(BAT)和性激素结合球蛋白(SHBG)水平受年龄影响。本研究的目的是建立性激素和 SHBG 的年龄相关参考区间模型，并呈现男性性激素和 SHBG 随年龄的波动规律。
方法 基于全国多中心研究纳入 1043 名男性。采用 Tukey 方法识别异常值。基于 Altman 理论，采用加权多项式回归建立均值模型和标准差模型。95%年龄相关参考区间模型用均值模型±1.96 × SD 模型表示。采用 z 分数图来评价模型的拟合效果。
结果 中国成年男性性激素和 SHBG 呈右偏态分布。性激素和 SHBG 模型主要涉及 5 项，分别为常数项、Age-2、 Age-1 、Age 以及 Age3。所有性激素和 SHGB 的 z-score 图点均分布在 0 线上。所有性激素和 SHGB 的 Z-score 均满足正态分布。性激素以及激素结合球蛋白随年龄变化的模式各异。

结论 性激素和 SHBG 的分布向右侧倾斜。男性性激素和 SHBG 的年龄特异性参考区间模型随着年龄的增长呈现不同的模式。我们提供了计算男性性激素和 SHBG 年龄特定参考区间的工具。只需将年龄带入模型，即可计算出对应年龄下的参考区间。

PO-0493

谷氨酰胺肠外营养液对肝细胞短时急性损伤的临床研究

张洁心、衣鲁江、张炳峰
江苏省人民医院（南京医科大学第一附属医院）

目的 谷氨酰胺肠外营养液是重症患者补充谷氨酰胺的重要途径。该药广泛应用于营养支持治疗，使用前需评估患者肝肾功能，然而在给药过程中以及使用后其对肝细胞的作用影响尚无研究数据。
方法 我们招募 30 例经临床评估需输注谷氨酰胺肠外营养液的 45 至 65 岁重症患者（伦审号：2020-SR-487）。根据其病史及肝功分为三组：肝功正常且无肝原发病，有非肝癌的肝脏原发病且肝功正常，有非肝癌的肝脏原发病且肝功异常。在静脉滴注谷氨酰胺肠外营养液前、滴注完毕、滴注后 24 小时和滴注后 48 小时共计四个时间点分别收集患者血清标本进行肝功能评价。体外肝细胞系实验中，我们使用两种不同剂型谷氨酰胺肠外营养液以及其分解代谢产物谷氨酰胺、丙氨酸，分别按照浓度梯度、时间梯度刺激细胞，检测培养上清中各酶学指标的变化情况。使用流式细胞术检测细胞凋亡比例。
结果 我们首次观察到在肝功正常且无肝原发病组，多个肝脏酶学指标在使用该药后的短时间内（24 至 48 小时）出现大幅升高再逐渐恢复的现象。肝细胞培养上清中天冬氨酸氨基转移酶（AST）、乳酸脱氢酶（LDH）和 α-羟丁酸脱氢酶（HBDH）的活性在营养液刺激下呈剂量及时间依赖性大幅增加，且以谷氨酰胺单剂作用最为显著。进一步实验表明，在谷氨酰胺肠外营养液的推荐使用浓度范围内，肝细胞出现明显凋亡。
结论 以谷氨酰胺为核心成分的肠外营养液在短期内对患者肝细胞功能造成损伤，蓄积的代谢产物如谷氨酰胺更可导致细胞死亡。本研究结果提示临床，在该药使用过程中应密切关注其作为重症患者营养支持的科学性与适时性。

PO-0494

Metabolic characterization of hepatic disease patients with hepatitis B virus DNA replication by untargeted metabolomics

Lin Yu、Qian Zhou、Bei Xu、Jiafu Feng
Mianyang Central Hospital

Background and aims Until now, the metabolic effects of HBV DNA replication (active HBV) on the progress of hepatic diseases (hepatitis, cirrhosis, and liver cancer) and liver functions remain unexplored. Thus, the main aim of our study was to determine the serum metabolic characteristics of hepatic disease patients with active HBV.
Methods A total of 199 hepatic diseases patients with active and inactive HBV were enrolled to explore the serum metabolic characterizations via untargeted metabolomics. Multiple analysis including principal component analysis (PCA), partial least squares discriminant analysis (PLS-DA), volcano plot and pathway analysis were used for metabolic data analysis. Additionally, differential metabolites were analyzed by commercial databases. All samples were also analyzed for liver function tests.
Results Our data indicated that most of the altered metabolic pathways was D-Glutamine and D-glutamate metabolism, indicating a strong link to HBV replication ($p < 0.05$). In addition, alanine

transaminase (ALT) was increased concomitant to the progression of hepatic disease with HBV DNA replication, and the levels of L-lactate dehydrogenase (LDH-L), alkaline phosphatase (ALP), aspartate transaminase (AST) and gamma-glutamyl transferase (GGT) were statistical different between cirrhosis patients with the inactive and active HBV ($p < 0.05$).
Conclusions Thus, the metabolomic profiles demonstrated that there may be a relationship between D-Glutamine and D-glutamate metabolism and HBV DNA replication. Besides, there did have an influence of HBV DNA replication on liver functions. And L-Glutamic acid, D-Glutamine and D-Glutamate and ALT may be candidate biomarkers for monitoring hepatic disease prognosis, diagnosis and treatment efficacy.

PO-0495

妊娠期糖尿病患者多项生化指标检验分析

王维
成都市龙泉驿区妇幼保健院

目的 探讨妊娠期糖尿病(gestational diabetes mellitus，GDM)患者多项生化指标检验的结果及血糖干预价值。
方法 于本院 2018 年 9 月～2019 年 9 月期间内接收的 GDM 患者中随机选取 72 例作为研究对象，纳入观察组，另选取同期来本院进行健康体检的 OGTT 试验耐糖量正常的 67 例孕妇纳入对照组。对两组研究对象进行生化指标检验，对比入院时及干预后各项指标水平变化情况。
结果 观察组入院时 FBG、PBG、HbA1c 水平、TC、TG 水平、Scr、BUN、24h 尿蛋白定量水平均高于对照组，P＜0.05。经干预后 FBG、PBG、HbA1c 水平、TC、TG 水平、Scr、BUN、24h 尿蛋白定量水平较对照组稍高，但比较 P＞0.05。观察组总并发症发生率较对照组稍高，但比较 P＞0.05。证实糖尿病组经干预后预后较好。
结论 GDM 患者多项生化指标检验可帮助早诊断、早治疗疾病，对于改善预后来说意义重大。

PO-0496

Logistic 回归和 Fisher 判别分析模型在冠心病鉴别诊断中的临床价值

王潇、段勇、黄本林
昆明医科大学第一附属医院

目的 探讨基于常规实验室检查建立的 Logistic 回归和 Fisher 线性判别分析模型在冠状动脉粥样硬化性心脏病鉴别诊断中的临床价值。
方法 选取我院 2018 年 3 月—2019 年 2 月以胸闷胸痛为主诉就诊的 178 例患者为对象，根据冠状动脉造影结果分为冠心病组和非冠心病组，回顾性分析这些患者的常规实验室指标，建立诊断冠心病的 Logistic 回归和 Fisher 判别分析模型，并验证模型诊断和预测的准确率，进一步评价其在临床中的实际意义。
结果 建立的 Logistic 回归方程为：Logit((P)= -24.641+0.105×年龄+1.520×糖尿病+0.286×BMI+1.209×LDL-C+0.614×PDW+4.131×(Mono/HDL-C)；建立的 Fisher 分类判别分析函数为：f1（冠心病）= -69.314+0.629×年龄+2.378×BMI+1.985×PDW+5.123×LDL-C+0.304×Ln（TG）+1.972×Ln（HDL-C），f2（非冠心病）= -52.184+0.527×年龄+2.164×BMI+1.660×PDW+4.104×LDL-C-0.149×Ln（TG）+3.818×Ln（HDL-C）。Logistic 回归模型对冠心病和非冠心病的诊断准确率分别为 93.0%和 84.0%，预测准确率分别为 91.4%和 70.0%；回顾法、留一法交叉验证及外部数据验证法检验 Fisher 判别函数的判别正确率分别为 82.0%、81.5%、81.3%。

结论 Logistic 回归和 Fisher 线性判别分析模型在冠心病鉴别诊断中均具有较好的鉴别和预测价值。

PO-0497

冠心病患者血清总同型半胱氨酸（tHcy）升高与颈动脉斑块的关系探讨

方欢英
上海市东方医院（同济大学附属东方医院）南院检验科

目的 探讨冠心病患者血清总同型半胱氨酸（tHcy）升高与颈动脉斑块的关系。
方法 共纳入 283 例冠心病患者。超声检查评估颈动脉斑块。酶循环法测定血清 tHcy 浓度。
结果 颈动脉斑块患者血清 tHcy 水平明显升高且与年龄、收缩压、高敏心肌肌钙蛋白 T 水平呈正相关。校正年龄、收缩压后，logistic 回归分析显示血清 tHcy 水平是一个冠心病患者颈动脉斑块有无的影响因素（p=0.033），但暂未发现 tHcy 水平与颈动脉斑块是单侧还是双侧存在、以及是在左侧颈动脉还是在右侧颈动脉有关（p>0.05)。ROC 曲线分析显示血清 tHcy 判断颈动脉出现的 AUC 为 0.726(95%CI:0.664-0.789；P=0.000），其最佳截断水平为 13.6μmol/L。
结论 血清 tHcy 水平升高与颈动脉斑块出现有关，但与颈动脉斑块位置关系不大。

PO-0498

α1-酸性糖蛋白在肺炎支原体感染所致的支气管肺炎患儿中的临床意义

方欢英
上海市东方医院（同济大学附属东方医院）南院检验科

目的 探讨 α1-酸性糖蛋白（α1-AGP）在肺炎支原体（MP）感染所致的支气管肺炎中的临床意义。
方法 收集 2018 年 1 月-12 月我院儿科住院的肺炎支原体肺炎（MPP）患儿（87 例）和非 MPP 支气管肺炎患儿（181 例）的血液样本进行检测，比较两组 α1-AGP、降钙素原（PCT）等指标差异，并通过 Logistic 多因素回归进一步分析筛选 MPP 的主要相关因素，通过受试者工作特征曲线（ROC）及曲线下面积[AUC（95%CI）]评价不同指标对支气管肺炎和 MPP 的鉴别能力。
结果 MPP 患儿 AGP 水平显著高于对照组，差异有统计学意义（ (136.06±46.37 vs. 122.29±44.21, P= 0.020)。Logistic 多因素分析发现校正年龄后仅 α1-AGP 为 MPP 患儿的危险因素，其 ROC 曲线曲线下面积 0.703(95% CI: 0.634-0.772;P≤0.001)。联合 α1-AGP 与 PCT，可使 AUC（95%CI）略提升至 0.732 (95% CI: 0.666-0.797, P≤0.001)。
结论 α1-AGP 对 MPP 有一定诊断价值，入院初期检测患儿血液 α1-AGP，可助益于鉴别 MPP 和其他支气管肺炎，辅助临床及早进一步诊治。

PO-0499

血清 Lp（a）与心绞痛的相关性研究

何挚、束国防、芦慧霞
东南大学附属中大医院

目的 本研究通过观察 Lp（a）与心绞痛（AP）的相关性，探讨 Lp（a）对于 AP 的诊断和预测价值，为冠心病的预防提供帮助。

方法 选择本院心内科住院的 1336 名患者为研究对象，采集临床资料，检测 Lp（a）、TC、TG、HDL、LDL 等指标。根据研究对象 Lp（a）水平的四分位值分为 A、B、C、D 四组：A 组 Lp（a）≤159mg/L，共计 336 人；B 组，159mg/L<Lp（a）≤305mg/L，共计 332 人；C 组，305mg/L<Lp（a）≤562mg/L，共计 334 人；D 组，Lp（a）>562mg/L，共计 334 人。比较各组 AP 患病率，探讨 Lp（a）与 AP 发病的关系。
结果 各组 AP 患病率比较，A 组和 B 组差异无统计学意义（P＞0.05）；C 组显著高于 A、B 组（P<0.001）；D 组显著高于 A、B、C 组(P<0.001）。
结论 随着 Lp（a）水平的升高，AP 的患病率逐渐升高，且体内高水平的 Lp（a）浓度对于冠心病患者 AP 的发生具有一定的提示及鉴别作用。

PO-0500

急性心肌梗死患者的临床危险因素分析

何挚、束国防、芦慧霞
东南大学附属中大医院

目的 对临床急性心肌梗死（AMI）发生的危险因素进行调查分析，为此类疾病的预防提供循证依据。
方法 选择本院 880 名住院患者为研究对象，采集详细病史资料，检测 Lp（a）、TC、TG、HDL、LDL 等指标。按研究对象的临床诊断标准，分为 AMI 组，共 352 例；经冠脉造影检查确诊无上述疾病者为对照组，共 528 例。
结果 糖尿病不是 AMI 的危险因素，性别（P=0.663）、吸烟（P=0.068）不是其独立危险因素，年龄、TC、LDL、TG、高血压、Lp（a）为独立危险因素，HDL 为保护因素（P<0.001，OR=0.114）。
结论 AMI 发病有多个危险因素，其中年龄、高血压、TC、Lp（a）是独立的的危险因素，且 Lp（a）具有最好的风险评估作用，HDL 为保护因素。

PO-0501

Incidence rate of hemolysis, lipemia, icterus and influence factors: A single center retrospective study of 501, 612 fasting serum specimens

Gang Tian、Zhangrui Zeng、Xinrui Jin、Guangrong Li、Jinbo Liu
Affiliated Hospital of Southwest Medical University

Objective The aim of the study was to assess the incidence rate of hemolysis, lipemia and icterus and influence factors based on serum biochemical specimens in order to reduce laboratory turnaround time, specimen re-collection and re-test, as well as the preanalytical interference for clinical chemistry results.
Methods A single center retrospective study was conducted to analyze the incidence rate of hemolysis, lipemia and icterus and influence factors based on the hemolysis-, lipemia- and icterus- (HLI) index of 501,612 fasting serum specimens in a teaching hospital in the Southwest China from January 1, 2017 to May 31, 2018.
Results Among 501,612 specimens, the total incidence rate (IR) of hemolysis, lipemia and icterus was 3.84%, 0.53% and 6.12%, respectively. Compared with female, male has higher IR of hemolysis (4.13% vs 3.54%), lipemia (0.67% vs 0.38%) and icterus (6.95% vs 5.43%), all *P*<0.001. Specimens with longer transfer time or detection time had higher IR of hemolysis, lipemia and icterus (all *P*<0.001). Compared with specimens from outpatients, hospitalized patients had higher IR of hemolysis (4.03% vs. 3.54%), lipemia (0.63% vs. 0.36%) and icterus

(7.10% vs. 4.75%), all *P*<0.001. The medical department of pediatrics had the highest IR of hemolysis (16.2%) in 26 included departments with odds ratio (OR) 5.06, [95% confidence interval (*CI*), 4.72–5.43, *P*<0.001)] and adjusted OR (AOR) 4.93 (95% *CI*, 4.59–5.29, *P*<0.001) by year, gender, transfer time and detection time of specimens. The neonatology department had the highest IR of lipemia (3.82%) with OR 4.62 (95% *CI*, 3.72–5.73, *P*<0.001) and AOR 1.17 (95% *CI*, 0.91–1.51, *P*<0.001), and highest IR of icterus (30.1%) with OR 6.71(95% *CI*, 6.26–7.20, *P*<0.001) and AOR 4.93 (95% *CI*, 4.59–5.29, *P*<0.001). The pooled ratio risk (RR) of the top ten departments for hemolysis, lipemia and icterus was 1.12 (95%*CI*, 1.04–1.21), 1.05 (95%*CI*, 0.92–1.19) and 1.26 (95%*CI*, 1.11–1.43). There was higher IR of hemolysis and icterus for children under 1 year or adults aged more than 40 years.
Conclusion The HIL-index provides an effective screening tool for evaluating IR of hemolysis, lipemia and icterus. Strictly control pre-analytical factors related to hemolysis, lipemia and icterus are important to ensure the quality of the specimens and provide accurate, high-quality results.

PO-0502

Matrix metalloproteinase 3 as a valuable marker for patients with COVID-19

石盛洁
湖南中医药大学第一附属医院

The situation of the coronavirus disease 2019 (COVID‐19) continues to evolve, our studyexplored the significance of serum levels of matrix metalloproteinase 3 (MMP3) as amarker for patients with COVID‐19. Sixty‐two COVID‐19 patients in the First Hospital ofHunan University of Chinese Medicine and Loudi Center for Diseases Prevention andControl, from January to March 2020, were sampled as the novel coronavirus pneumoniainfected group.

PO-0503

Improvements of an autoverification system for clinical chemistry test results using a combined strategy of knowledge-based rule selection and historical data percentile-based range determining

Jing Zhu、HAO WANG、WEI GUO、BAI-SHEN PAN、BEI-LI WANG
Department of Laboratory Medicine, Zhongshan Hospital, Fudan University

Objectives The knowledge-based only autoverification has shown shortages and an improvement is necessary.
Methods The original autoverification system had no priority and the range of each rule was determined by knowledge. In the improved system, new types of rules, extreme value and consistency check, were added and the autoverification workflow was rearranged, to construct the framework. The ranges of extreme value rules, limit check rules, consistency check rules and delta check rules were determined by analysis of historical data from Zhongshan laboratory, generating the criteria. The effectiveness of the improved system was evaluated using pooled data of 20 centers
and the improvement of efficiency was assessed by a multicenter process.
Results The evaluation of effectiveness included true positive rate, true negative rate and overall consistency rate, compared to manual verification. The system had a true positive rate of 77.55%

and a true negative rate of 78.53%. The overall consistency rate was 78.3%, compared to 56.2% of the original system. Pass rates, an indicator of efficiency, of the improved system among hospitals were 43% - 93%, consistently higher than those of the original system, which were 36% - 81%. The customization of the improved system using individualized data further increased the lowest pass rate from 43% to 54%.
Conclusions The improved system showed a comparable effectiveness with the original system, while the efficiency was markedly increased. The customization trial suggested that the improved system could be popularized via utilizing the historical data of each individual hospital.

PO-0504

The role of prognostic nutritional index as an indicator of the severity and complications of silicosis

Lagu He、yuan huamin
Hunan Prevention and Treatment Institute for Occupational Diseases

Objective To evaluate prognostic nutritional index (PNI) for predicting the the severity and complications of silicosis.
Methods 166 cases silicosis patients were collected in Hunan Prevention and Treatment Center for Occupational Diseases (HPTCOD) from January 2020 to December 2020. The value of PNI and neutrophil/lymphocyte ratio (NLR) for prediting the prognosis of silicosis were evaluated by ROC and the relationship between the PNI , PLR, NLR , forced vital capacity(FVC) and forced expiratory flow in 1 s/forced vital capacity (FEV1/FVC) of silicosis patients were analyzed.
Results Silicosis patients exhibited higher PLR, NLR and lower PNI compared with the control groups (P<0.05). The calculated PNI was negatively correlated with NLR and PLR in the silicosis groups (r=-0.339, P <0.01; r=-0.542, P <0.01,respectively), In addition, PNI was positively correlated with FEV1/FVC in the silicosis groups (r=0.352, P <0.01).The areas under the ROC curves of NLR and PNI were0.866(95% CI 0.811 -0.922,P = 0.000) and 0.908 (95% CI 0.865▪0.951,P = 0.000). The median cut-off PNI score for the prediction of postoperative OS was 51.81. Based on this cut-off value, PNI-low (<51.81) group is more likely to get complications.
Conclusion PNI can be used as indicators of state and severity in clinical prognosis of patients with silicosis. PNI is more sensitive to assessing disease activity compared with NLR.

PO-0505

缺血修饰蛋白在急性冠状动脉综合征早期诊断中的研究

李建花
潍坊医学院附属医院

目的 通过观察急性冠状动脉综合征（ACS）患者血清中缺血修饰白蛋白（IMA）水平的变化，探讨 IMA 在 ACS 早期诊断中的价值。
方法 连续动态监测 115 例 ACS 患者［包括急性心肌梗死（AMI）52 例、不稳定型心绞痛（UAP）63 例］急性胸痛发作后 2、6、12、24、48 h 血清 IMA 水平的变化，并与 49 例疑似 ACS 最终确诊排除的患者（对照组）比较；评价 IMA 在 ACS 早期诊断中的应用价值。
结果 UAP 及 AMI 患者发病后 2h 血清 IMA 水平明显高于对照组（P＜0.05），AMI 患者发病 12 h 时达高峰，24 h 时下降到和对照组水平基本持平。受试者工作特征（ROC）曲线显示 AMI 患者发病 2 h 时，IMA 诊断 AMI 的曲线下面积（AUC）为 0.801。
结论 心肌缺血是 ACS 最常见的发病机制，IMA 可作为 ACS 心肌缺血的敏感指标，可用于早期诊断 AMI。IMA 无论对 UAP 患者的早期心肌缺血还是对 AMI 患者早期诊断及疗效监测均具有较高的应用价值，是对 ACS 预防、诊断、监测的一个较好的心肌标志物。

PO-0506

血清 AFP 的 O-GlcNAc 修饰在肝癌患者预后判断中的价值

吴昊、王蓓丽、郭玮
复旦大学附属中山医院

目的 本研究旨在探讨血清中 AFP 蛋白的 O-GlcNAc 糖基化修饰对肝癌患者预后评估的价值。
方法 收集复旦大学附属中山医院 100 名肝癌患者的血清标及病理资料。离心超滤管浓缩血清总蛋白后沉淀血清蛋白中的 AFP，WB 实验使用识别 O-GlcNAc 糖基化的特异性抗体检测血清 AFP 的 O-糖基化水平。结果量化后与肝癌患者的肿瘤大小、TNM 分期等病理因素行卡方检验。同时通过 Kaplan-Meier 法分析血清 AFP 的 O-糖基化水平与患者总体生存及无进展生存的关系。使用 COX 回归分析 AFP 的 O 糖基化水平是否可作为肝癌患者的独立预后因子。通过 LC-MS/MS 检测血清 AFP 发生 O-糖基化的关键位点，分析特定位点的糖基化水平与肝癌患者预后的关系。
结果 肝癌患者血清 AFP 的 O-GlcNAc 修饰水平与患者肿瘤大小、肿瘤结节数量、T 分期呈正相关。AFP 的 O-糖基化处于高水平的肝癌患者总体生存期及无进展生存期比低水平患者显著减短。TNM I-II 期患者，AFP 高水平 O-糖基化意味着总生存期及无进展生存期更短； III-IV 期患者，O-糖基化的差异与生存期的关系则无统计学意义。COX 回归分析得出 AFP 的 O-GlcNAc 水平可作为评估肝癌患者总体生存及无进展生存的独立预后因子。通过质谱技术鉴定出血清 AFP 的 O-GlcNAc 修饰关键位点为 Ser286，通过对 Ser286 有无糖基化修饰的患者生存期进行分析显示发生糖基化修饰与患者更短的总体生存及无进展生存显著相关。
结论 血清 AFP 的 O-GlcNAc 修饰可作为评估患者不良预后的独立指标，并对 TNM I-II 期患者的预后判断能力更强。Ser286 位点的 O-GlcNAc 修饰对判断患者预后有重要价值。

PO-0507

Noninvasive detection of human dehydroepiandrosterone, progesterone and testosterone using LC-MS/MS revealed effects of birth control pills/devices and body weight on ovulatory prediction

Liqiao Han
Guangdong Provincial Hospital OF Chinese Medicine

Liquid chromatography-tandem mass spectrometry (LC-MS/MS) has been increasingly used to measure steroids in human saliva. We studied the performance of a conventional LC-MS/MS for measuring dehydroepiandrosterone (DHEA), testosterone and progesterone in human saliva. These three steroids were co-extracted by liquid-liquid extraction and derivatized. Derivatives were resolved on a C18 column and quantified using an LC-MS/MS (AB Sciex API 2000) instrument. The assay's limits of quantification were 0.03 ng/mL for all three steroids. Inter-assay coefficients of variation were 16.6–18.8% (DHEA), 12.0–15.8% (testosterone), and 12.7–19.3% (progesterone). Assay linearity analysis showed R2 of 0.9926, 0.9750 and 0.9949 for DHEA, testosterone and progesterone, respectively. No carry-over between samplings was observed. An ion-enhancement effect of 11.6% for DHEA determination and ion-suppression effects of 13.9% and 20.7% for analysis of progesterone and testosterone, respectively, were determined. No interferences by 9 steroid analogs were detected. Spiked recoveries were 85.5% (DHEA), 86.5% (testosterone), and 92.6% (progesterone). Comparison with laboratory developed test (LDT)-LC-MS/MS methods by other New York State Department of Health certified laboratories revealed R2 = 0.9425 (DHEA, LC-MS/MS = 1.0267 LDT + 21.989), R2 = 0.9849 (testosterone, LC-MS/MS = 0.9447 LDT + 9.8037), and R2 = 0.9736 (progesterone, LC-MS/MS = 1.1196 LDT + 0.0985). Reference intervals for the 3 steroids in saliva for young males and females were estimated.

Results of intra-individual salivary progesterone analysis indicated that caution should be exercised when using progesterone concentrations in predicting ovulation for females who are under treatment with birth control pills/devices or has body a weight of > 90 kg.

PO-0508

Choosing an appropriate glomerular filtration rate estimating equation: Role of Body Mass Index

Jiayong Li
Clinical Laboratory Medicine Center, Shanghai General Hospital Affiliated to Shanghai Jiao Tong University

Background We aimed to investigate the accuracy of different equations in evaluating estimated glomerular filtration rate (eGFR) in a Chinese population with different BMI levels.
Methods A total of 837 Chinese patients were enrolled, and the eGFRs were calculated by three Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) equations, three full-age spectrum (FAS) equations and two Modification of Diet in Renal Disease (MDRD) equations. Results of measured GFR (mGFR) by the 99Tcm-diathylenetriamine pentaacetic acid (99Tcm-DTPA) renal dynamic imaging method were the reference standards. According to BMI distribution, the patients were divided into three intervals: below 25th（BMI_{P25}), 25th to 75th（BMI_{P25-75}) and over 75th percentiles（BMI_{P75}).
Results The medium BMI of the three BMI intervals were 20.9, 24.8 and 28.9 kg/m2, respectively. All deviations from mGFR (eGFR) were correlated with BMI ($p<0.05$). The percentage of cases in which eGFR was within mGFR ± 30% (P30) was used to represent the accuracy of each equation. Overall, $eGFR_{FAS\_Cr\_CysC}$ and $eGFR_{EPI\_Cr\_2009}$ performed similarly, showing the best agreement with mGFR among the eight equations in Bland-Altman analysis (biases: 4.1 and -4.2 mL/min/1.73m2, respectively). In BMI_{P25} interval, $eGFR_{FAS\_Cr}$ got -0.7 of the biases with 74.2% of P30, the kappa value was 0.422 in classification of CKD stages and the AUC_{60} was 0.928 in predicting renal insufficiency, and $eGFR_{EPI\_Cr\_2009}$ got 2.3 of the biases with 71.8% of P30, the kappa value was 0.418 in classification of CKD stages and the AUC60 was 0.920 in predicting renal insufficiency. In BMI_{P25-75} interval, the bias of $eGFR_{FAS\_Cr\_CysC}$ was 4.0 with 85.0% of P30, the kappa value was 0.501 and the AUC_{60} was 0.941, and $eGFR_{FAS\_Cr\_CysC}$ showed balanced recognition ability of each stage of CKD (62.3%, 63.7%, 68.0%, 71.4% and 83.3% respectively). In BMI_{P75} interval, the bias of $eGFR_{EPI\_Cr\_CysC\_2012}$ was 3.8 with 78.9% of P30, the kappa value was 0.484 the AUC_{60} was 0.919, and $eGFR_{EPI\_Cr\_CysC\_2012}$ equation showed balanced and accurate recognition ability of each stage (60.5%, 60.0%, 71.4%, 57.1% and 100% respectively). In BMI_{P75} interval, the bias of $eGFR_{FAS\_Cr\_CysC}$ was -1.8 with 78.5% of P30, the kappa value was 0.485, the AUC_{60} was 0.922. However, the recognition ability of each stage of $eGFR_{FAS\_Cr\_CysC}$ equation(71.1%, 61.2%, 70.0%, 42.9% and 50.0% respectively) was not as good as $GFR_{EPI\_Cr\_CysC\_2012}$ equation.
Conclusion For a Chinese population, we tend to recommend choosing $eGFR_{FAS\_Cr}$ and $eGFR_{EPI\_Cr\_2009}$ when BMI was around 20.9, $eGFR_{FAS\_Cr\_CysC}$ when BMI was near 24.8, and $eGFR_{EPI\_Cr\_CysC\_2012}$ when BMI was about 28.9.

PO-0509

广东省 11820 例儿童血清 25-羟基维生素 D 水平调查分析

李云珍、张玲、李玲、姚少濠、苏坤华、黄献中
广州金域医学检验中心

目的 了解广东省儿童血清 25-羟基维生素[25（OH）D]的水平状态，为 1～14 岁儿童合理补充维生素 D 提供科学依据。

方法 选取 2019 年 1 月~2020 年 12 月送检本检验中心常规体检的≤14 岁儿童 11820 例，其中男童 6787 例，女童 5033 例，通过采集静脉血进行血清 25（OH）D 检测。

结果 （1）广东省 11820 例≤14 岁儿童血清 25（OH）D 均值为（37.54±15.13）ng/mL，男、女童血清 25（OH）D 均值分别为（37.71±14.82）和（37.31±15.52）ng/mL 差异无有统计学意义（P=0.16）。学龄期组男童 25（OH）D 水平高于女童，比较有统计学意义（P<0.05）（2）婴儿组、幼儿组、学龄前组和学龄期组血清 25（OH）D 均值分别为（50.56±14.18）ng/mL、（42.26±12.85）ng/mL、（30.85±8.97）ng/mL、（25.349±8.09）ng/mL，血清 25（OH）D 水平婴儿组＞幼儿组＞学龄前组＞学龄期组，各组比较差异均有统计学意义（均为 P<0.01）。（3）25（OH）D 水平比较秋冬季高于春夏季，除春夏两季比较、秋冬两季比较，均无统计学意义（P＞0.05），其他季节组间比较均有统计学意义（P<0.05）。不同季节间 25（OH）D 不足及缺乏率比较，春季（11.87%）＞夏季（9.69%）＞冬季（9.26%）＞秋季（8.20%）。春季不足及缺乏率最高，较其他三季节比较均有显著差异（P<0.01）。夏秋两季比较有统计学意义（P=0.03），夏冬两季、秋冬两季比较无差异（P＞0.05）。

结论 广东省儿童血清 25（OH）D 总体平均水平达标，但是维生素 D 缺乏情况仍需重视，应依据季节、年龄特点行针对性补充维生素 D 措施。

PO-0510

Hb G-Coushatta 变异体对毛细管电泳法检测 HbA1c 的影响

刘瑜[1]、郭晓燕[2]、牛文彦[1,3]
1. 天津医科大学朱宪彝纪念医院
2. 天津医科大学临床医学院
3. 天津医科大学

目的 糖化血红蛋白（HbA_{1c}）是临床上常用的血糖监测指标。近年来研究发现，血红蛋白（Hb）变异体会导致 HbA_{1c} 电泳图谱中异常峰的产生，干扰 HbA_{1c} 检测结果的准确性，导致结果假性升高或降低。本文以血红蛋白 β 链变异体 Hb G-Coushatta 为主要研究对象，探讨其对毛细管电泳法检测 HbA_{1c} 的影响，为糖尿病的诊疗提供有益的参考。

方法 从 2020 年 6 月 1 日至 2021 年 3 月 17 日共收集天津医科大学朱宪彝纪念医院 HbA_{1c} 电泳图谱存在异常峰的标本 265 例，对这些标本经过 DNA 提取、PCR、胶回收及测序等，筛选存在 Hb G-Coushatta 变异体（HBB: c.68A>C）的标本 71 例作为实验组；另取 80 例 HbA_{1c} 电泳图谱无异常峰的标本（Hb AA）作为对照组。收集两组患者的性别、年龄、MCV、MCH、MCHC、RDWSD、FBG、HbA_{1c} 等参数，用 SPSS 25.0 进行统计分析。

结果 经分析发现，Hb G-Coushatta 组与对照组相比，二者的 MCH、MCHC、RDWSD、HbA_{1c} 均无明显差异(P>0.05)，而 Hb G-Coushatta 组的 MCV（87.2±4.0 fL）和 FBG（7.8 mmol/L）低于 Hb AA 组的 MCV（89.0±4.2 fL）和 FBG（9.1 mmol/L）(P<0.05)； 进一步对 HbA1c 分段处理后发现，当 HbA_{1c}≥10.0 %时，Hb G-Coushatta 组的 FBG 低于 Hb AA 组 (P<0.05)。

结论 Hb G-Coushatta 变异体的 MCV 低于对照组，这说明 Hb β 链第 22 位 Glu 变为 Ala 时，可能会影响红细胞的体积，导致其变小。另外，对于存在 Hb G-Coushatta 变异体的糖尿病患者来说，当其 HbA_{1c}≥10.0 %时，毛细管电泳法检测的 HbA1c 结果可能不能很好的反映其血糖水平。

PO-0511

Triptolide 通过靶向 P62/keap1 促进卵巢癌化疗敏感性的分子机制研究

麦佳
四川大学华西第二医院

目的 化疗耐药是卵巢癌患者疗效不佳的关键原因之一。包括顺铂、紫杉醇在内的多种化疗药物通过诱导大量的活性氧（ROS）应激杀伤肿瘤细胞，而氧化还原基因的异常表达是化疗耐药的重要机制。P62-Keap1-Nrf2 信号通路是调节氧化还原系统的重要信号通路，Nrf2 作为转录因子，直接参与抗氧化基因的转录调节，p62、Keap1 则可以通过相互作用调控 Nrf2 的蛋白表达水平。为了探索氧化还原调节在卵巢癌发生发展及治疗的应用，我们将深入探讨 P62/keap1 促进卵巢癌化疗敏感性的分子机制。

方法 本课题通过生物信息学分析，初步探讨 P62、Keap1、Nrf2 在卵巢癌中的作用，并建立了 p62-Keap1 的 BiFC 筛药模型，使用高内涵进行天然产物小分子药物库的高通量药物筛选。收集晚期卵巢癌患者化疗前后血清，进行 ROS 检测，明确氧化还原调节参与卵巢癌继发耐药；采用 WB、RT-PCR、IP、pull-down 实验进一步验证 Triptolide 抑制 P62-Keap1 相互作用的分子机制；将在卵巢癌耐药细胞的细胞实验和动物实验中联合使用 Triptolide 和化疗药物，观察 Triptolide 在化疗耐药卵巢癌治疗过程中的作用。

结果 公共数据库生存分析显示，P62、KEAP1 与卵巢癌病人预后密切相关；生物信息学分析结果显示 P62 在卵巢癌中参与氧化还原调节、MAPK 信号通路、细胞程序性死亡、蛋白翻译后修饰、蛋白磷酸化等生物学过程；高通量药物筛选发现 Triptolide 可以抑制 p62-Keap1 相互作用，体内、外实验证明 Triptolide 可以降低抗氧化基因表达，促进细胞凋亡。

结论 本课题将通过临床资料分析，体内、外功能评价，分子机制探索揭示了 Triptolide 通过调控氧化还原水平，促进卵巢癌化疗敏感性的作用及分子机制，为逆转卵巢癌化疗耐药策略提供了新的理论依据，对卵巢癌病人的治疗具有重要的意义。

PO-0512

Expression of IL-1β, TNF-α and IL-6 and correlation analysis with hs-CRP and ESR in knee osteoarthritis patients

Hongmei Ding
Tianjin Hospital

Objective To investigate the expression of interleukin (IL)-1β, tumor necrosis factor (TNF)-α and IL-6 and their correlation with high sensitivity C-reactive protein (hs-CRP) and erythrocyte sedimentation rate (ESR) in patients with knee osteoarthritis (KOA).

Methods Serum samples were obtained from 85 patients with KOA and 80 healthy controls (HC). Joint fluid samples were obtained from 25 patients with KOA. The levels of IL-1β, TNF-α and IL-6 in serum and joint fluid were measured by enzyme-linked immnuosorbent assay (ELISA). The levels of hs-CRP in serum were measured by Latex immunoturbidimetry assay. Serum levels of ESR were measured by automatic ESR monitor. The correlations between IL-1β, TNF-α, IL-6 and hs-CRP, ESR were evaluated using Pearson correlation test.

Results Serum levels of IL-1β, TNF-α and IL-6 in KOA patients were significantly higher compared with HC (all $P<0.01$). Moreover, the levels of IL-1β, TNF-α and IL-6 increased with the increase of clinical severity. The levels of IL-1β, TNF-α and IL-6 in joint fluid were higher than that in serum (all $P<0.05$). The levels of hs-CRP and ESR in patients with KOA were higher than HC (all $P<0.01$). The serum levels of IL-1β, TNF-α and IL-6 were positively correlated with hs-CRP (r

was 0.489，0.426，0.389，respectively) and ESR (r was 0.348，0.423，0.394，respectively). The levels of IL-1β, TNF-α and IL-6 in joint fluid were positively correlated with hs-CRP (r was 0.547，0.644，0.511，respectively) and ESR (r was 0.564，0.579，0.589，respectively).
Conclusion Our data showed that detection of inflammatory cytokines and hs-CRP, ESR may be used as potential biomarkers for assisting early diagnosis，disease evaluation and prognosis assessment of KOA.

PO-0513

新型电化学免疫传感器的制备及其在骨髓间充质干细胞成骨分化标志物检测中的应用研究

王婷
江苏省人民医院

间充质干细胞向骨细胞的分化是骨组织再生过程中最重要的环节，但易受生理微环境的影响。因此，通过实时监测细胞分泌的生物标记物来系统地评估骨移植物的有效性和安全性以提高疗效是未来组织工程进展的基本要求之一。目前常规技术手段如表面等离子体共振（SPR）和酶联免疫吸附试验（ELISA）存在一定的不足，例如所需样本量大、对检测背景要求高、特异性和灵敏度较低等。为了解决这些技术难题，亟需开发新的用于细胞行为分析的生物传感平台。在本研究中，我们设计了一种基于电化学阻抗谱（EIS）技术的免疫传感器，用于监测间充质干细胞的成骨分化过程中最主要的生物标志物——骨桥蛋白（OPN）的浓度变化。我们采用亲和素-生物素-OPN 特异性抗体对微电极表面进行功能化并用电化学工作站收集信号。在体外诱导间充质干细胞的成骨分化并收集不同时间点的细胞上清。随后使用传感器和 ELISA 检测上清中 OPN 的浓度并对两种方法的结果进行比较来评估免疫传感器的性能。同时对诱导的成骨细胞进行 OPN 和 OCN 的 PCR、ALP 活性、茜素红染色等其他骨分化评价检测。结果表明，该电化学免疫传感器对 OPN 具有媲美 ELISA 的检测性能，具有较高的灵敏度和特异性。相较 ELISA，该电化学免疫传感器以其定量检测的操作快速、简单、所需样本量小和超低检测限必将具有更广阔的临床应用价值。

PO-0514

Quantitative Assessment of Serum Amino Acids and Association with Early-onset Coronary Artery Disease.

Chao Xuan[1]、Hui Li[1]、Qing-Wu Tian[1]、Jun-Jie Guo[1]、Guo-Wei He[2]、Li-Min Lun[1]、Qing Wang[1]
1. Department of Clinical Laboratory, The Affiliated Hospital of Qingdao University, Qingdao, China.
2. 天津医科大学心血管病临床学院泰达国际心血管病医院

Background Cardiovascular disease (CVD) is a leading global cause of death. Early-onset coronary artery disease (EOCAD) is a CVD type, defined by the patient's age (<50 years old) when the initial diagnosis of coronary heart disease (CAD) is made. The majority of patients are male. EOCAD patients have a poor long-term prognosis, meaning that identifying risk factors is critical for disease diagnosis and control. Amino acids play essential roles in protein construction and metabolism. Our study aims to provide a profile of amino acid changes in the serum of patients with EOCAD and identify potential disease biomarkers. These biomarkers may help understand the pathophysiological process of EOCAD and may have special significance for the disease risk assessment and prediction.
Methods A total of 128 CAD patients (mean age 44.27 ± 5.26 years) and 64 controls (mean age 44.82 ± 5.12 years) were recruited from the Affiliated Hospital of Qingdao University between September 2019 and July 2020. Serum activity/concentrations of fasting blood glucose (FBG), triglycerides (TG), total cholesterol (TC), serum creatinine (SCr), high-density lipoprotein

cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), and lipoprotein(a) were determined using an automatic biochemistry analyzer (Hitachi HCP-7600, Hitachi, Japan). Ultra-performance liquid chromatography multiple reaction monitoring multistage/mass spectrometry (UPLC-MRM-MS/MS) was used to determine the amino acid profile of patients with EOCAD in sample pools. UHPLC separation was performed using an Agilent 1290 Infinity II series UHPLC System (Agilent Technologies), equipped with a Waters ACQUITY UPLC BEH Amide column (100 × 2.1 mm, 1.7 μm). An Agilent 6460 triple quadrupole mass spectrometry (Agilent Technologies, USA) with an electrospray interface and multiple reaction monitoring (MRM) modes was used for the quantitative analysis. The study was divided into two stages. In the first stage, 200 μL serum was taken from each sample and mixed into a sample pool with 8 other samples from the group. There were 8 sample pools in the CAD with MI group, 8 in the CAD without MI group, and 8 in the control group. UHPLC-MRM-MS/MS was used to analyze the levels of 25 serum amino acids and screen for potential differences between groups. In the second stage, UHPLC-MRM-MS/MS was used to verify the screened differential amino acids of interest in each sample and study their relationship with CAD.

Results In the first stage, every eight serum samples were combined into a single sample pool. The study included CAD with and without myocardial infarction (MI) groups, and control group, with each group containing 8 sample pools. Of the 25 amino acids examined, differences in serum levels between groups of eight were seen (One-way ANOVA, $p < 0.05$). Compared with the control group, serum levels of seven amino acids (L-Arginine, L-Methionine, L-Tyrosine, L-Serine, L-Aspartic acid, L-Phenylalanine, and L-Glutamic acid) increased and one (4-Hydroxyproline) decreased in the patient group. Results from the validation stage demonstrate that serum levels of 4-Hydroxyproline were significantly lower in MI patients (9.889 ± 3.635 μg/ml) than those in the controls (16.433 ± 4.562 μmol/L, $p < 0.001$). Elevated serum 4-Hydroxyproline levels were shown to be an independent protective factor for MI (OR = 0.863, 95% CI: 0.822-0.901). The significant negative correlation was seen between serum 4-Hydroxyproline levels and cardiac troponin I ($r = -0.667$) in MI patients.

Conclusion We initially quantified serum levels of 25 amino acids levels in EOCAD patients and identified eight amino acids associated with disease status. Compared to the control group, serum levels of L-Arginine, L-Methionine, L-Tyrosine, L-Serine, L-Aspartic acid, L-Phenylalanine, and L-Glutamic acid were higher in the EOCAD group, and 4-Hydroxyproline levels were lower. 4-Hydroxyproline appears to be a promising amino acid for further biomarker studies of predicting fibrosis and ventricular remodeling after MI.

PO-0515

Associations of serum amyloid A and 25-hydroxyvitamin D with diabetic nephropathy: a cross-sectional study

Fumeng Yang、Qian Liu
The Second People's Hospital of Lianyungang

Background Previous studies have separately reported that serum amyloid A (SAA) has a potential relationship with diabetic nephropathy (DN) and that 25-hydroxyvitamin D (25(OH)VD) is potentially linked to the occurrence and progression of DN. The aim of this study was to provide potential evidence for the prevention and management of DN by investigating the relationships between SAA, 25(OH)VD and DN.

Methods A total of 182 patients with type 2 diabetes mellitus (T2DM) were enrolled in this study. Conventional characteristics were measured and collected. Receiver operating characteristic (ROC) curve analysis was applied for the combined measurement of SAA and 25(OH)VD, and risk factors for DN were evaluated using binary logistic regression analysis.

Results The levels of SAA in T2DM patients were significantly higher than those in healthy subjects, and the level significantly increased with the progression of DN ($P<0.05$). In contrast, the level of 25(OH)VD in T2DM patients was significantly lower than that in healthy subjects, and

the level significantly decreased with the progression of DN (P<0.05). In addition, the combined measurement of SAA and 25(OH)VD could distinguish DN patients from T2DM patients better than the measurement of SAA or 25(OH)VD alone (P<0.05). In addition, the SAA level was an independent risk factor for DN, but the level of 25(OH)VD was an independent protective factor for DN.
Conclusion SAA and 25(OH)VD could be used as additional indicators to help distinguish patients with DN from those with T2DM, and might provide a potential basis for monitoring the occurrence of DN.

PO-0516

糖化血红蛋白在 4 种检测系统间结果的比较

单汉明、李晓博、谢轩波、刘洋洋
杭州迪安医学检验中心有限公司

目的 探讨不同检测仪器对糖化血红蛋白（HbA1c）检测结果的比对及偏倚评估。
方法 分别使用东曹 G11、惠中 MQ-6000、迈克 G01 及罗氏 Cobas c513 全自动糖化血红蛋白分析仪对 58 例患者的全血样本进行检测，记录相关数据并进行统计学分析。
结果 以东曹 HLC-723 G11 全自动糖化血红蛋白分析仪作为参比仪器,将惠中 MQ-6000、迈克 G01、罗氏 c513 全自动糖化血红蛋白分析仪与其进行比对并进行相关性分析。迈克 G01：y = 1.0891x - 0.0127，R^2 = 0.999；惠中 MQ6000：y = 1.1059x - 0.7626，R^2 = 0.9973；罗氏 c513：y = 1.0594x - 0.3043，R^2 = 0.9993。偏倚分析：迈克 G01 检测结果普通偏高，正偏倚明显；惠中 MQ-6000 和罗氏 c513 检测结果在 6%以上的，也明显存在正偏倚情况。
结论 糖化血红蛋白在不同仪器的检测值上具有一定的差异性，但相关性均较好，能提供可靠的检验数据。

PO-0517

Causal relationships between body fat percentage and non-alcoholic fatty liver disease: a Mendelian randomization study

yuping zeng、He He、Mei Zhang、Zhenmei An
Sichuan University, West China hospital

Background Several observational studies have revealed the positive correlation between body fat percentage and non-alcoholic fatty liver disease (NAFLD). However, the association might be biased by confounding factors (such as obesity, type 2 diabetes, and hyperlipidemia) and reverse causality (NAFLD causes abnormal body fat percentage). This study aimed to investigate the causal relationships between body fat percentage and NAFLD by two-sample Mendelian randomization (MR) analysis, to determine the potential causes and carry out risk stratification for NAFLD patients.
Methods Single-nucleotide polymorphisms significantly associated with exposures (body fat percentage and body fat mass) were extracted from the Neale Lab Consortium ($P < 5.0\times10^{-8}$). Genome-wide association studies (GWAS) summary data for outcomes (NAFLD, NAFLD-related risk factors, and disorders) were extracted from the MR-Base database. We used the inverse-variance weighted method to assess the causal association between exposures and outcomes. We also performed the sensitivity analysis by weighted median and MR-Egger regression. The strength and interpretability of instrumental variables and the statistical power of MR analysis were assessed. All analyses were conducted using the R packages “TwoSampleMR”.

Results Genetically predicted higher body fat percentage was causally associated with higher NAFLD risks (odds ratio (OR): 5.07, 95% confidence interval (CI): 1.99-12.92, P: 6.6×10-4). Body fat mass was also causally associated with higher NAFLD risks (OR: 3.95, 95% CI: 2.07-7.57, P: 3.3×10-5). Besides, genetically predicted 1-SD increased body fat percentage was associated with reduced total cholesterol (coef = -0.13) and high density lipoprotein cholesterol (coef = -0.23), increased fasting insulin (coef = 0.13), HOMA-IR (coef = 0.13), HOMA-B (coef = 0.07), systolic pressure (coef = 0.17) and diastolic pressure (coef = 0.24) with all P less than 4.2×10-3. Strong causal effects were seen for body fat percentage and type 2 diabetes (OR: 2.53, 95% CI = 2.04-3.13), high blood pressure (OR: 1.13, 95% CI = 1.11-1.16), and gout (OR: 1.72, 95% CI = 1.19-2.49) with P less than 5.0×10-3. Body fat percentage also significantly increased the risks of cardiovascular disease (OR: 1.66, 95% CI = 1.44-1.91), coronary heart disease (OR: 1.53, 95% CI = 1.34-1.75), myocardial infarction (OR: 1.55, 95% CI = 1.35-1.78), stroke (OR: 1.20, 95% CI = 1.08-1.33), and ischemic stroke (OR: 1.24, 95% CI = 1.12-1.36). Sensitivity analyzes supported the robustness of the causal estimates. The statistical power for MR analysis was more than 80%, suggesting a sufficient power to detect the observed ORs.
Conclusions Our study revealed a strong causal effect of body fat percentage on the increased NAFLD risks. We also observed the causal association between body fat percentage and NAFLD-related risk factors and cardiometabolic diseases. Further studies are needed to elucidate the specific mechanism.

PO-0518

“图灵图案”和纳米颗粒协同作用的智能水凝胶微流体界面的构建用于捕获、培养和分析活的循环肿瘤细胞

陈东亮、杨大伟
聊城市人民医院

从患者外周血中高效捕获活体循环肿瘤细胞(CTCs)并建立稳定传代的细胞株是生物学研究的难点。基于微流体界面具有体积小、处理速度快、多路复用能力和大比表面积的特点为 CTCs 高效捕获提供了可能。本文构建“图灵图案”和纳米颗粒协同作用的智能水凝胶微流体界面用于高效捕获、培养和临床药物分析活体循环肿瘤细胞。通过调控“图灵图案”中峰-谷相对高度、峰-峰宽度以及表面粗糙度探究其结构尺度与 CTCs 捕获效率和培养稳定传代的细胞株之间的关系。并建立对乳腺癌、肝癌、食道癌动物和患者外周血中 CTCs 的捕获和培养进行生物学研究（细胞计数、细胞迁移、细胞侵袭、细胞状态、细胞蛋白分泌含量）和临床药敏性分析，探讨疾病状态下 CTCs 与实体瘤各种临床指标及疾病转归的关系，可对病人进行个体化的治疗提供理论依据。

PO-0519

一种用于嗜铬细胞瘤诊断的磁性分子印迹聚合物的制备

王浩然[1,2]、张连杰[1]、徐成钰[1]
1. 苏州市独墅湖医院
2. 重庆医科大学

目的 嗜铬细胞瘤是起源于肾上腺髓质嗜铬细胞的神经内分泌肿瘤，大量分泌儿茶酚胺类物质，如果不加治疗容易导致患者死亡。采用高效液相色谱-荧光法检测随机尿样本中的甲氧基去甲肾上腺素(NMN)、甲氧基肾上腺素(MN)、 3-甲氧酪胺(3-MT)，可用于嗜铬细胞瘤(PPGLs)的诊断。为此，拟制备一种磁性分子印迹聚合物(MMIP)用于快速、简便地富集随机尿样本中的 NMN, MN 和 3-MT。
方法 采用多巴胺(DA)和 MN 为双模板分子，甲基丙烯酸为功能单体，二甲基丙烯酸乙二醇酯为交联剂，偶氮二异丁腈为引发剂合成 MMIP。在 500 μL 随机尿样本中加入 2.5 mL 磷酸盐缓冲液后，

再加入 40 mg MMIP，室温振荡 30 s 混匀，吸附 8.0 min 后磁分离。加入 1.0 mL 超纯水清洗后弃上清，再用 200 μL 2.0%醋酸溶液洗脱 7.5 min，磁分离后取上清液 50 μL 进行高效液相色谱-荧光法检测。

结果 1、采用 DA 和 MN 双模板，模板分子、功能单体和交联剂的比例为 1:20:20，合成的 MMIP 粒径较为均一，表面为空洞疏松的结构，对于 NMN, MN 和 3-MT 标准品的吸附效率均高于 89.0%。2、采用 MMIP 对随机尿样品进行预处理耗时 20 min。MMIP 处理随机尿样本批内变异系数均 ≤4.9%，批间变异系数均 ≤6.3%，结果见表 1；平均回收率为 93.2%-112.8%，结果见表 2，可重复使用 14 次。分别采用 MMIP 和固相萃取法对正常对照组和 PPGLs 组各 10 例随机尿样本预处理后检测，其结果有较好的相关性 (相关系数 ≥0.7)。

结论 合成的 MMIP 可以用于富集正常人和 PPGLs 患者随机尿中的 NMN, MN 和 3-MT，重复性好，样品预处理耗时短，为快速及时地诊断 PPGLs 奠定基础，有利于在临床中推广，3-MT 对于良性嗜铬细胞瘤的诊断效能仍需进一步探索。

PO-0520

UPLC-MS/MS based plasma lipidomics reveal a distinctive signature in systemic lupus erythematosus patients

Jiaxi Chen
Enze Hospital of Enze medical center group

Global lipidomics are of considerable utility for exploring altered lipid profiles and unique diagnostic biomarkers in diseases recently. We aim to apply ultra performance UPLC-MS/MS to characterize the lipidomics profile in systemic lupus erythematosus (SLE) patients and explore the underlying pathogenic pathways using lipidomics approach. Plasma samples from 18 SLE patients, 20 rheumatoid arthritis (RA) patients, and 20 healthy controls (HC) were collected. A total of 467 lipids molecular features were extracted from each sample. OPLS-DA, K-mean clustering analysis and KEGG pathway analysis indicated disrupted lipid metabolism in SLE patients, especially in phospholipid, glycerol and sphingolipid metabolism. AUC of lipid metabolism biomarkers were better than SLE inflammation markers that ordinarily used in the clinic. Proposed model of MG(16:0/0:0/0:0), MG(18:0/0:0/0:0), PE(18:3/16:0), PE(16:0/20:4) and PC(O-16:2/18:3) yielded AUC 1.000 (95% CI, 1.000-1.000), specificity 100% and sensitivity 100% in the diagnosis of SLE from HC. A panel of three lipids molecular PC(18:3/18:1), PE(20:3/18:0), PE(16:0/20:4) permitted to accurately diagnosis of SLE from RA, with AUC 0.921 (95% CI, 0.828-1.000), 70% specificity and 100% sensitivity. The plasma lipidomics signatures could serve as an efficient and accurate tool for early diagnosis and provide unprecedented insight into the pathogenesis of SLE.

PO-0521

基于人群的糖尿病预测模型的建立及验证

李迪
武汉大学人民医院

目的 构建并验证糖尿病预测模型。

方法 收集信息化数据库中空腹血糖小于 7.00 mmol/L 的患者，排除信息不全或 BMI 极度异常 (BMI<15 kg/m2 或 >55 kg/m2) 的患者。最终纳入训练集 9045 例，同时纳入临床特征与之匹配的验证集 3562 例。用随机森林在训练集数据中对变量进行重要性排序，筛选变量并构建糖尿病预测模型同时进行验证。

结果 训练集与验证集的临床特征中各个变量均匹配良好（P>0.05）。训练集中，随访时间跨度为2.00-5.71 年，随访期间糖尿病共发生 61 例（6.74‰）；验证集中，随访时间跨度为 2.00-5.65 年，随访期间糖尿病共发生 20 例(5.61‰)。根据平均准确度下降程度（Mean Decrease Accuracy）对自变量重要性进行排序，用赤池信息量(AIC)准则和贝叶斯信息量(BIC)准则对模型进行筛选得出模型包含是 Change in FPG, FPG 和 Age 三个变量。在内部验证中，模型的 C 指数为 0.921，Brier Score 为 0.006，十折交叉验证平均 AUC 为 0.915；在外部验证中，模型总 C 指数为 0.921，按照预测概率分组后随着样本量下降 C 指数有所降低，但总体上仍较高。模型的 Brier Score 为 0.005。十折交叉验证平均 AUC 为 0.960。反应了本研究模型有极高的准确性。
结论 本研究建立的预测模型对糖尿病患病风险有很好的预测能力。

PO-0522

赖氨酸羟化酶 JMJD6 作为黑色素瘤预后标志物的潜在价值研究

司文喆、崔丽艳
北京大学第三医院

背景 黑色素瘤起源于上皮组织基膜上的黑素细胞，是最具侵袭性的皮肤癌，占皮肤癌相关死亡的75%。尽管 BRAF 突变和丝裂原活化蛋白激酶（MAPK）通路在黑色素瘤的发病机制中起着重要作用，但 MAPK 信号在黑色素瘤发生发展中的调控机制仍不完全清楚。
方法 我们采用免疫组化方法检测黑色素瘤组织中 JMJD6 的表达。使用人黑色素瘤细胞系进行体外增殖和侵袭实验，并使用小鼠黑色素瘤 B16F10 细胞通过生物发光成像进行异种移植小鼠体内肿瘤生长和肺转移评估。通过内皮管形成实验、鸡卵黄囊膜实验和基质凝胶栓实验，研究了 JMJD6 对血管生成的影响。
结果 我们报道了羟化酶 JMJD6 在黑色素瘤中显著上调。我们发现 JMJD6 的高表达与黑色素瘤的临床病理分期、侵袭性和预后不良密切相关。RNA-seq 显示 JMJD6 的敲除影响一组转录物的选择性剪接，包括编码 MAPK 信号通路的关键成分 PAK1 的转录物。我们证明 JMJD6 增强 MAPK 信号传导并促进多种细胞过程，包括黑色素瘤细胞的黑素生成、增殖、侵袭和血管生成。
结论 我们的研究结果表明 JMJD6 与黑色素瘤的发生密切相关，支持 JMJD6 作为黑色素瘤侵袭性的潜在生物标志物和黑色素瘤干预的靶点。

PO-0523

The variation of serum adiponectin and the relationship with nesfatin-1, IL-6 and TNF-αin prediabetes

Kangkang Huang、Yunlai Liang、Yating Ma、Jiahui Wu、Huidan Luo、Bin Yi
Xiangya Hospital of Central South University

Aim Prediabetes may not clear symptoms until it has progressed to type 2 diabetes mellitus(T2DM). The variation and correlation among adiponectin, nesfatin-1, TNF-α and IL-6, which involve diabetes development, have not been elucidated. This study aims to investigate the roles of these factors in the process of prediabetes developing into diabetes.
Methods In total, 72 T2DM, 75 prediabetes and 72 age-sex-matched healthy individuals were enrolled in this study and their serum levels of adiponectin, nesfatin-1, TNF-α and IL-6 were tested with appropriate methods.
Results Results showed that serum levels of each factor in prediabetes were between in T2DM and the healthy group, and significant differences were found among them. Both nesfatin-1 and TNF-α levels in T2DM had obvious variation compared to those in prediabetes or in healthy, while no significant difference of nesfatin-1 or TNF-α levels was observed between the two groups;

both adiponectin and IL-6 levels in the healthy group were significantly changed in contrast to those in prediabetes or in T2DM, while between them there was no distinct difference of adiponectin or IL-6 levels. Further correlation analysis found that in prediabetes, serum adiponectin concentration was positively correlated with TNF-α (R=0.2939, P=0.0105) and IL-6 (R=0.3918, P=0.0005), and the relationship between them was greatly strengthened when prediabetes accompanied by insulin resistant (TNF-α: R=0.7732, P<0.0001, IL-6: R=0.6663, P=0.0005). In addition, we demonstrated that declined levels of adiponectin (OR=6.238, P=0.019) and nesfatin-1 (OR=2.812, P=0.01) as well as elevated TNF-α (OR=5.541, P=0.001) levels were risk factors for prediabetes towards diabetes.
Conclusion Conclusively, this research proved significant variations of adiponectin, nesfatin-1, IL-6 and TNF-α levels in the healthy, prediabetes and T2DM, suggesting a significant but slow and gradual change during the progression of healthy condition toward diabetes via prediabetes.

PO-0524

Clinical and diagnostic value of the combination of lymphocyte count and creatine kinase in the detection of coronavirus 2019

Yanqing Du
Tianjin Haihe Hospital

The current study aimed to investigate the diagnostic efficiency of absolute number of lymphocytes (LYM#) and creatine kinase (CK) levels in the diagnosis of coronavirus disease 2019 (COVID-19). Therefore, the clinical data from 84 patients with COVID-19 admitted to the Tianjin Haihe Hospital between January and February 2020 were collected. The patients were divided into the following groups: The common COVID-19 group (n=61); and severe COVID-19 group (n=23). In addition, 30 healthy subjects were included as the control group. The results demonstrated that the percentage of neutrophils (NEU%) was significant increased, while the absolute number of white blood cells (WBC), LYM# and the percentage of lymphocytes (LYM%) were significantly decreased in patients with COVID-19. Furthermore, in the severe group, the absolute number of red blood cells (RBC) in female patients, the percentage of neutrophils (NEU%), the neutrophil-to-lymphocyte ratio (NLR) and the serum levels of interleukin 6 (IL-6) and C-reactive protein (CRP) were notably elevated, while those of LYM# and LYM% were significantly decreased (all P<0.05). Additionally, in the receiver operating characteristics curve analysis for the combination of LYM# + CK, the area under the curve values were 0.9645 and 1, with sensitivity of 95.08 and 100%, specificity of 86.67 and 100% and cut-off values of 0.4188 and 0.5, for the common and severe COVID-19 group, respectively. This finding indicated that the diagnostic efficiency of LYM# + CK was higher than when a single factor was analyzed. Finally, a moderate correlation was obtained between lactate dehydrogenase (LDH) with CRP and NLR (r=0.492 and 0.433, respectively; all P<0.05). Overall, the results of the present study suggested that the values of LYM# and CK were associated with COVID-19 progression, suggesting that the combination of both factors could exert a clinical diagnostic value for COVID-19.

PO-0525

脂蛋白相关磷脂酶 A2、同型半胱氨酸、抗凝血酶Ⅲ与冠脉病变程度的关系

王贝
东南大学附属中大医院

目的 研究脂蛋白相关磷脂酶 A2（LP-PLA2）、同型半胱氨酸(HCY) 、抗凝血酶Ⅲ（AT-Ⅲ）与冠状动脉病变程度的关系。

方法 选取拟行冠脉造影检查的患者 292 例，根据冠脉造影结果分为冠心病组 175 例、对照组（非冠心病组）117 例。冠心病组根据检查结果对冠脉病变程度进行 Gensini 积分，分为第 1 组（n = 45）、第 2 组（n = 43）、第 3 组（n = 43）、第 4 组（n = 44）。测定患者血浆 LP-PLA2、HCY、AT-Ⅲ水平，比较两组 LP-PLA2、HCY、AT-Ⅲ的差异，并分析与冠状动脉病变严重程度的关系。

结果（1）冠心病组 LP-PLA2 高于对照组，HCY 高于对照组，AT-Ⅲ水平低于对照组，差异有统计学意义（P<0.05）；（2）在 Gensini 积分四分位分组中，随积分的增加，LP-PLA2、HCY 呈升高趋势,AT-Ⅲ呈下降趋势，差异有统计学意义（P<0.05）；（3）Logistic 回归分析：冠心病的危险性因素 LP-PLA2 （OR：1.08，95% CI：1.05 ~ 1.11，P <0.01），HCY（OR：0.89，95% CI：0.93 ~ 0.98，P<0.01）；AT-Ⅲ是冠心病的保护性因素（OR：0.95，95%CI：0.93 ~ 0.98，P < 0.01）；（4）相关性分析显示：LP-PLA2 ,HCY 与 Gensini 积分呈明显正相关（r = 0.48，r = 0.56,P < 0.01），AT-Ⅲ与 Gensini 积分呈明显负相关（r = -0.24，P < 0.01）。

结论 冠心病组 LP-PLA2,HCY 高于对照组，且与冠脉病变呈明显正相关；AT-Ⅲ低于对照组，与冠状动脉病变程度呈明显负相关，可作为预测冠状动脉病变严重程度的指标，具有临床指导意义。

PO-0526

粪便性状及分析前标本处理方式对钙卫蛋白检测结果影响探讨

曾俊祥
上海交通大学医学院附属新华医院

目的 探讨采样方式、离心条件等相关分析前因素对不同性状粪便的钙卫蛋白(fecal calprotectin, FC)检测结果的影响，从而进一步优化粪便钙卫蛋白检测流程。

方法 收集在上海交通大学医学院附属新华医院进行粪便钙卫蛋白项目检测的的粪便标本 357 例，按照布里斯托大便分类量表进行性状评估。选取不同性状的粪便标本同时进行称量法和 2 种商品化采样装置采样操作，比较不同采样方式、离心条件，以及离心对不同性状、对不同区间段 FC 值结果的影响。

结果 1）采样方式：商品化采样装置与称量法结果均存在一定偏差，在水样便和坚硬便的标本中尤甚，其中装置 A 所得结果较称量法所得结果平均偏移度为 27.2%，装置 B 则达到 57.5%。2）离心条件：离心前后 FC 结果差异有统计学意义（P<0.05），而离心的转数与离心时间对结果没有明显影响。离心后 FC 结果较离心前降低，其中坚硬的粪便样本最明显，离心前后水样便 FC 结果差异无统计学意义（P>0.05），而其他性状的粪便结果差异则有统计学意义（P<0.05）。离心后的结果更加接近称重法的结果。

结论 采样是 FC 检测分析前最重要也是最容易忽视的环节，对不同性状的粪便样本，采样装置的使用应有区别，液态稀便应使用定量移液管，而坚硬粪便应先用锉刀进行样本均质操作后再进行采样操作。在用采样装置采样后，除了液态便外其他性状的粪便均应常规进行离心操作。

PO-0527

Correlation of sperm DNA fragmentation index with seminal plasma biochemical index and semen parameters in infertile men

Kangsheng Liu
Department of Clinical Laboratory, Women's Hospital of Nanjing Medical University，Nanjing Maternity and Child Health Care Hospital, Nanjing, Jiangsu 210029, China.

In general, routine semen analysis makes only limited predictions about a man's reproductive potential and is not always able to explain why he is infertile. In fact, many male infertility cases are caused by sperm DNA defects ,which routine semen quality analyses fail to detect. The relationship between sperm DFI , sperm parameters and their diagnostic value were analyzed and evaluated by observing the seminal parameters of infertile patients without accessory gonadal infection. Specimens of 151 cases were collected from infertile patients who visited the male department of STD and reproductive specialty clinic of our hospital from August 2018 to September 2019. SCD test was performed to measure the DNA fragmentation in native. The routine semen analysis was performed with a semen quality detection system (CFT-920, Jiangsu Ruiqi Life Science & Tech Dev .Co.Ltd) and supporting reagents. Seminal plasma malondialdehyde (MDA), and total antioxidant capacity (TAC) were assessed. Fructose(Fru) 、a-glucosidase (a-glu), and zinc (Zn) levels are quantitatively detected by kehua-310, a fully automated biochemical tester provided by Nanjing Xindibio. According to DFI level, there were 31 cases in group I (DFI≤15%), 81 cases in group II (15% < DFI < 30%), and 39 cases in group III (DFI≥30%). Compared with group II, there were significant differences in sperm survival rate, PR% and Fru by non-parametric test (Z = -2.16 -2. 43. - 2. 20,respectively,P < 0. 05). There were significant differences in sperm survival rate and PR% between group I and group III (t = 4. 32, 4.25, respectively, P< 0.01). Compared with group III, there were significant differences in sperm survival rate and PR% by non-parametric test (Z= -3. 26, -3. 50, respectively).Sperm DFI was negatively correlated with sperm survival rate and PR%(R=-0.56,-0.46,P<0.01). DFI was positively correlated with MDA content (R=0.42, P<0.01) and negatively correlated with TAC (r=-0.40, P<0.01).There was no correlation with age ,abstinence days, semen volume, sperm concentration, percentage of normal form sperm, Fru, a-Glu, Zn (R= 0. 15, 0. 05,0.03,-0.03, -0.2, -0.16,- 0.20, 0.03, 0.15, p > 0.05).The survival rate and PR% of sperm decreased significantly with the increase of DFI level, antioxidant can decrease the rate of DNA fragmentation, antioxidant can decrease the rate of DNA fragmentation. Semen volume and sperm concentration were mainly related to the secretion volume of accessory gonads and total sperm count, but no correlation was found between them and DFI.

PO-0528

Sp17 抗体在肿瘤诊断中的初步探讨

高骞
中南大学湘雅医院

背景 肿瘤的发生发展是一个多因素、多步骤、多基因共同作用的综合病变过程。肿瘤的转移性以及早、中期无症状的特征使得在肿瘤的防治过程中，早期发现、早期诊断、早期治疗尤为重要。相较于肿瘤相关抗原(tumor-associated antigen, TAA)的升高出现于癌症晚期，肿瘤相关自身抗体(TAAbs)被发现在癌症早期阶段表现出升高的水平，且半衰期可能比抗原更长，更容易被检测到，有可能成为有价值的诊断标记物。

目的 初步探讨精子蛋白 17（Sperm protein 17，Sp17）抗体在肿瘤诊断中的价值。

方法 收集 2019 年 1 月至 2019 年 4 月期间,于中南大学湘雅医院确诊的未经治疗的肿瘤患者的血清，同时收集同期在该院体检的正常人血清，所有血清保存于-20℃至使用，采用 ELISA 检测血清中 Sp17 抗体浓度。GraphPad prism 7.01 作图软件帮助数据分析。
结果 本研究成功检测血清中 Sp17 抗体浓度，其中恶性黑色素瘤患者 Sp17 抗体浓度普遍较高。
结论 提示 Sp17 抗体在恶性黑色素瘤中可能有更多研究价值。

PO-0529

Data Mining: Biological and temporal factors associated with blood parathyroid hormone, vitamin D, and calcium concentrations in the Southwestern Chinese population

Fei Ding、li guixing
Department of Laboratory Medicine, West China Hospital, Sichuan University

Background Parathyroid hormone (PTH) and vitamin D plays a major role in calcium (Ca) homeostasis and bone turnover. The purpose of this study was to assess which factors (sex, age, time of blood sampling, season of the year, temperature and sunshine hours (SHH)) had the greatest impact on plasma PTH, 25-OH-VitD, and Ca levels, and then whether these effects were clinically acceptable in a large number of Southwestern Chinese subjects.
Method The data was from West China Hospital Health Examination Center, Sichuan University from April 1, 2018 to June 30, 2019. A total of 18,664 physical examination subjects were included. PTH and 25-OH-VitD were measured by a Roche Cobas e 601, and Ca was measured by a Roche Cobas 8000. Linear regression models were used to assess correlations between PTH, 25-OH-VitD, Ca and the above factors.
Results The concentrations of serum PTH in females were significantly higher than those in males, while the 25-OH-VitD and Ca were opposite. The concentration of PTH in data collection decreased in summer and increased in spring. The concentration of 25-OH-VitD decreases in spring and increases in autumn. PTH concentrations were negatively correlated with last month temperature and SHH, while 25-OH-VitD were opposite. Linear regression showed that season may be the main factor affecting serum PTH and 25-OH-VitD levels, and these effects were not clinically acceptable.
Conclusion In order to avoid influencing clinicians' investigation of suspected hyperparathyroidism and hypovitaminosis, reference intervals for PTH, 25-OH-VitD, and Ca should be established, taking into account sex, age and the season.

PO-0530

Fasting plasma lactate: A diagnosis and staging biomarker with superior performance in adult nonalcoholic fatty liver disease

Xin Nie[1]、Jianfei E[2]、He He[1]、Fei Ding[1]、Haolan Song[1]、Yong He[1]、Guixing Li[1]
1. Department of Laboratory Medicine, West China Hospital, Sichuan University, Chengdu 610041, P.R. China
2. Department of Laboratory Medicine, People's Hospital of Deyang City, Deyang, 618000, P.R. China

Purpose For the assessment and staging of metabolic diseases such as obesity and type 2 diabetes mellitus (T2DM), fasting plasma lactate (FPL) has been a useful marker. However, it has never been used to evaluate nonalcoholic fatty liver disease (NAFLD). Since NAFLD is one of the significant metabolic syndromes, we investigated whether FPL can be used as a biomarker for diagnosing and staging NAFLD.

Methods A total of 102 patients who were diagnosed with NAFLD and 100 healthy control between October 2018 and September 2019 were enrolled in our study. We determined the levels of FPL, total cholesterol (TC), triglycerides (TG), high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), alanine aminotransferase (ALT), aspartate aminotransferase (AST), fasting plasma glucose (FPG), fasting insulin (FINS), and homeostasis model assessment of insulin resistance (HOMA-IR). We performed receiver operating characteristic (ROC) analysis to evaluate their diagnostic performance.
Results In NAFLD patients, we found FPL, ALT, AST, TG, FPG, FINS, and HOMA-IR levels to be elevated while HDL-C level was reduced ($P < 0.05$). FPL, FPG, FINS, and HOMA-IR levels were higher in mild NAFLD patients than moderate to severe ones ($P < 0.05$). For NAFLD diagnosis and staging, the areas under the ROC curve (AUC) of FPL were 0.973 and 0.999, making it clearly ($P < 0.05$) superior to other biomarkers. For diagnosing and staging NAFLD, the cutoff value of 1.285 mmol/L and 2.370 mmol/L for FPL had the highest validity, respectively. The sensitivity, specificity, negative likelihood ratio (LR-), and positive likelihood ratio (LR+) were 87.25%, 98.00%, 0.13, and 43.63 for the diagnosis cutoff value and. 92.19%, 97.37%, 0.08, and 35.05 for staging, respectively. In addition, for NAFLD patients, FPL positively correlated with TG, FPG, FINS, and HOMA-IR ($P < 0.05$).
Conclusion Thus, in adult NAFLD, FPL can be used as a diagnosis and staging biomarker with superior performance.

PO-0531

Associations of urinary metabolites of polycyclic aromatic hydrocarbons with diabetes mellitus complicated with proteinuria in U.S. adults, NHANES 2003–2014

Jiang Li
Chian-Japan Friendship Hospital

Background Increasing concentrations of air pollution have been shown to be a risk factor for many diseases. Polycyclic aromatic hydrocarbon (PAH) exposure has been shown to be associated with diabetes mellitus (DM) and kidney disease. But studies on the correlation between urinary PAHs and DM complicated with proteinuria are limited. This study will explore the association between urinary PAHs and DM complicated with proteinuria based on a national representative sample from the general U.S. population.
Method Data utilized were extracted from the 2003-2014 National Health and Nutrition Examination Survey (NHANES). Eight urinary PAHs were detected as PAH metabolites (OH-PAHs). Multivariable logistic regression analyses were used to examine the association of OH-PAHs with DM and albuminuria. All of models were adjusted for confounding factors.
Result A total of 6,997 NHANES (2003-2014) participants with complete data were eligible. In the quartile analyses, 2-NAP was positive associated with the risk of DM and albuminuria in DM without albuminuria group [OR (95% CI), 1.54 (1.16-2.05), P<0.001], DM with albuminuria group [OR (95% CI), 1.70 (1.19-2.45), P<0.001] and albuminuria without DM group [OR (95% CI), 1.68 (1.30-2.17), P<0.001], 2-FLU was positive associated with the risk of albuminuria in DM with albuminuria group [OR (95% CI), 1.48 (1.03-2.13), P<0.05] and albuminuria without DM group [OR (95% CI), 1.50 (1.15-1.95), P<0.001], but 1-NAP was only positive associated with the risk of albuminuria in albuminuria without DM group [OR (95% CI), 1.47 (1.13-1.91), P<0.001] in the fully adjusted model.
Conclusion 1-NAP, 2-NAP, 2-FLU were positively associated with the risk of albuminuria in pure albuminuria group, but only 2-NAP was positively associated with the risk of DM in pure DM group. PAH exposure may be more closely associated with proteinuria. Prospective studies, including cohort studies and experimental studies, are needed to investigate the effects of OH-PAHs on kidney function impairment.

PO-0532

中国西部地区妊娠妇女特异性促甲状腺激素参考区间的建立

郭英
四川大学华西第二医院

目的 探讨中国西部地区妊娠期妇女特异性促甲状腺激素的正常参考区间。
方法 收集 2015 年 1 月 1 日至 2020 年 12 月 30 日期间到四川大学华西第二医院产科或妇科门诊就诊孕妇的促甲状腺激素（TSH）检测结果。排除有甲状腺疾病个人病史、接受影响甲状腺功能的药物治疗、多胎妊娠或超声检查发现相关异常的孕妇，以及 TSH <0.001mIU/L 或高于一般人群参考值的孕期妇女。建立参考区间的所有过程均参照临床实验室标准协会发布的文件 CLSI EP28-A3。根据抗甲状腺过氧化物酶抗体（TPOAb）是否阳性分组，建立以第 2.5 百分位数～第 97.5 百分位数（P2.5~P97.5）表示的参考区间。
结果 共纳入符合标准的 TPOAb 阴性组孕妇 14332 例，TPOAb 阳性组孕妇 10254 例。两组孕妇均孕早期 TSH 水平最低，孕晚期最高，孕中期处于两者之间，趋势一致。抗体阳性组中各孕期之间 TSH 水平比较和相同孕期中抗体阳性和阴性组之间 TSH 差异均有统计学意义。根据 CLSI EP28-A3 文件我们建立的 TPOAb 阴性组孕早期、孕中期和孕晚期 TSH 参考区间分别为 0.02-5.23mIU/L, 0.03-5.24mIU/L, 0.37-5.68mIU/L; TPOAb 阳性组孕早期、孕中期和孕晚期 TSH 参考区间分别为 0.23-4.73 mIU/L，0.35-4.67 mIU/L，0.43-4.75 mIU/L。
结论 妊娠期血清 TSH 水平不同于非孕正常妇女，且妊娠不同时期、TPOAb 阴性和阳性的参考区间亦不相同。建立特异性妊娠早、中、晚期血清 TSH 的参考区间非常必要，对 TPOAb 阳性的孕妇应全程监测甲状腺激素变化。

PO-0533

子痫前期患者检测孕中期 β-HCG 与孕后期 D-二聚体的临床意义

倪艳丽
南方医科大学珠江医院

目的 探讨子痫前期孕妇孕中期 β-HCG、孕后期 D-二聚体水平与疾病的发生及轻重程度的关系。
方法 回顾性分析 2015.1-2016.12 在南方医科大学珠江医院接受孕中期筛查并成功随访直至分娩的 54 例单胎孕妇孕中期血清学筛查 β-HCG MoM 值和孕后期血浆 D-二聚体结果与孕妇发生子痫前期及其轻重的情况。
结果 在 54 例患者资料中，39 例为正常孕妇，15 例经诊断为子痫前期患者，两组比较，孕中期 β-HCG MoM 值差异不显著；孕后期血浆 D-二聚体水平具有显著差异（P＜0.001）。患者组按轻重程度分组，重度组与正常组、轻度组具有显著性差异（P＜0.001、P＜0.01）。
结论 孕中期血清学筛查 β-HCG 对孕妇患子痫前期的预测意义不明显；孕后期血浆 D-二聚体水平对判断子痫前期孕妇的严重程度有显著的意义。

PO-0534

Transiently elevated TC and sdLDL-C levels and falsely low LDL-C levels in patients with extrahepatic cholangiocarcinoma

Yi Guo、Yong-Gen Zhang、Hong-Chun Li、Yin-Hai Xu
The Affiliated Hospital of Xuzhou Medical University

Purpose Most patients diagnosed with extrahepatic cholangiocarcinoma (ECCA) exhibit cholestasis caused by obstruction of the bile duct. Cholestasis has been shown to be associated with lipid metabolic disorders, but studies focused on the changing lipid parameters in ECCA patients have not been found. Here, we aim to observe lipid profiles in ECCA patients, and to investigate whether cholestasis relief corrects the dyslipidemia.

Methods We consecutively included patients admitted in the hepatobiliary surgery department from October 2019 to May 2020. The patients were presumedly divided into an ECCA group or a non-ECCA group base on the disease assessment. Patients who were histologically confirmed were finally included into the ECCA group. Blood samples were collected on admission and five days after treatment. Automatic biochemistry analyzer (Roche Cobas 8000) was used to test liver function and to measure serum lipid levels by spectrophotometry. Serum lipoprotein electrophoresis was performed using barbitone sodium buffer and Sudan black B. Statistical analysis was carried out using SPSS (version 23.0, SPSS Inc., Chicago, IL, USA). Continuous variables with normal distribution were expressed as mean ± standard deviation and analyzed using independent samples t-test, while those with skewed distribution were shown as median (Q1, Q3) and analyzed using Mann-Whitney U test.

Results One hundred and eighty patients met the inclusion criteria and were finally enrolled in the study. A total of 76 patients were diagnosed with ECCA after histological evaluation. Among these patients, 41 (54.0%) were diagnosed to have proximal cholangiocarcinoma, 9 (11.8%) had middle cholangiocarcinoma, and 26 (34.2%) had distant cholangiocarcinoma. In the ECCA group, 69 patients underwent radical resection, including 1(1.3%) in stage 0, 6 (7.9%) in stage I, 11 (14.5%) in stage II and 51(67.1%) in stage III. The other 7 patients were in stage IV, and underwent percutaneous transhepatic biliary drainage and stenting for palliative treatment. A total of 104 patients were enrolled in the non-ECCA group. Among these patients, 37 as diagnosed as choledocholithiasis, 3 as cholangitis, 53 as cholecystolithiasis, 9 as cholecystitis, and 2 as cholecystic polypus. In the non-ECCA group, 64 patients underwent cholecystectomy, and 40 underwent common bile duct exploration and T-tube drainage. Three hundred and sixty blood samples were collected, including 180 samples before treatment and 180 samples after treatment. Before treatment, TC levels were significantly elevated in the ECCA group compared to the non-ECCA group (5.70 [4.82, 7.40] mmol/L vs. 4.17 [3.53, 5.06] mmol/L, P <0.01). Correspondingly, the ECCA group showed significantly higher levels of sdLDL-C compared with the non-ECCA group (1.633 [1.043, 3.072] mmol/L vs. 0.980 [0.641, 1.329] mmol/L, P <0.01). Unexpectedly, the levels of LDL-C were slightly lower in the ECCA group compared with in the non-ECCA group. (1.97 [0.92, 2.84] mmol/L vs. 2.13 [1.69, 2.85] mmol/L, P = 0.04). Serum lipoprotein electrophoresis showed serum samples in the ECCA group were detained in the sample wells and lipoproteins failed to be separated.

The levels of TC and sdLDL-C were significantly decreased after treatment in the ECCA group. Most ECCA patients showed normal levels of TC and sdLDL-C after they received treatment, and there were no significant differences in TC and sdLDL-C levels between the ECCA and the non-ECCA groups after treatment (P>0.05). Lipoprotein electrophoresis results revealed that ECCA patients who had serum LDL particles that were not able to be separated showed a normal lipoprotein pattern after treatment

Conclusion ECCA patients exhibited transiently elevated TC and sdLDL-C levels and falsely low LDL-C results. TC, sdLDL-C, and LDL-C levels could return to the normal levels after cholestasis relief.

PO-0535

衰老标志物在细胞衰老及个体老化中的研究进展

韦钊
山东大学齐鲁医院

目的 随年龄增加，老年性疾病的发病率显著增加。细胞衰老一方面是机体防御肿瘤发生的重要屏障，另一方面在个体老化中起重要作用，并可通过 SASP 而促进肿瘤。预防和尽早发现是减少或延缓疾病发生的关键，而衰老标志物的发现则可以帮助我们解决这一问题。
方法 构建细胞衰老模型并进行基因芯片检测。通过生物信息学分析，找出衰老细胞相对于正常细胞表达上调的基因，与 GEO 数据库中人类胚胎干细胞和诱导性干细胞基因表达谱数据进行比对，找出同时在干细胞中表达下调的基因。对筛选到的基因在六种细胞衰老模式中的表达进行检测验证。
结果 我们发现有 41 个基因在复制衰老和氧化损伤诱导的细胞衰老中均上调显著。其中 11 个基因同时在人类胚胎干细胞和诱导性干细胞中表达下调。我们对这 11 个基因在六种细胞衰老模式中的表达进行了 PCR 验证，结果表明有 4 个基因在 5 种以上的细胞衰老类型中普遍上调。且不同年龄人类皮肤和皮下脂肪组织 RNA-Seq 数据表明这些基因确实存在指示衰老进程的潜力。
结论 通过基因表达谱筛选和在细胞衰老模型中的验证发现了 4 个可作为细胞衰老潜在标志物的基因。进一步明确多种细胞类型及多种衰老模式中这些衰老基因作为衰老标志物的潜在价值，将为衰老相关研究提供更多的检测手段及理论基础，研究这些基因指示个体老化及器官老化的能力，将为老年型疾病提供早期检测的理论基础，从而为衰老相关疾病的检测和治疗提供新的思路和依据。

PO-0536

基于数据挖掘分析 OGG1 在肝细胞癌组织中的表达及临床意义

张禾
四川大学华西医院

肝细胞癌是全球范围内最常见的成人原发性肝癌,也是中国癌症死亡的主要原因之一。肝细胞癌缺乏早期诊断标志物，预后较差。本文通过数据挖掘分析肝细胞癌中核酸修复蛋白 OGG1 的表达并探讨其临床意义。利用 TCGA 和 GEO 数据库分析肝细胞癌患者肿瘤组织和癌旁组织中 OGG1 基因表达差异和甲基化程度分析；使用 GEPIA 在线分析工具和 Kaplan-Meier Plotter 分析 OGG1 基因表达与患者生存时间的相关性；最后应用 STRING 数据库分析与 OGG1 相互作用的蛋白。OGG1 在肝细胞癌患者肿瘤组织中表达显著高于癌旁组织（$P<0.05$）；肝细胞癌肿瘤组织中 OGG1 基因的甲基化水平显著低于癌旁组织（$P<0.05$）；高表达 OGG1 的肝细胞癌患者生存时间更短（$P=0.01$）。STRING 数据库分析及功能富集显示 OGG1 与碱基切除修复、DNA-N 端糖苷化酶激活、DNA 分解代谢过程和脱氧核糖核酸分解代谢过程等发挥作用。通过对 TCGA 和 GEO 数据库中信息的深入挖掘和分析，发现 OGG1 在肝细胞癌中高表达且与患者预后密切相关，OGG1 可能成为评估肝细胞癌预后的指标和一个潜在的肝细胞癌治疗靶点。

PO-0537

两种糖化血红蛋白检测系统的方法学评价研究

宋佳、姚瀚鑫
吉林大学第一医院

目的 分别采用 TOSOH G8 离子交换高效液相色谱法检测系统和 Premier 亲和层析高效液相色谱法检测系统对 708 个糖化血红蛋白标本进行检测，在精密度，准确度，线性范围方面进行比较，然后

再选取常规标本和异常标本留样再测，异常标本包括肾病和贫血患者，比较相对于靶机相对偏倚小于 5%的标本数量，靶机为美国 Bio-Rad Vatiant Ⅱ。

方法 精密度：每日连续测定 5 次低值，高值室内质控，连续测定 3 天。批内 CV(%)≤1/4 TEa 临床允许误差；总 CV(%)≤1/3 TEa 临床允许误差。准确度：选取美国 CAP 糖化血红蛋白 2 支留样标本(1 号和 4 号)，2020 年卫生部室间质评糖化血红蛋白第一次 2 支留样标本（编号为 2 号和 3 号），2 支 Bio-Rad 定值校准品（编号为 5-6），作准确度标本。线性范围验证：取评价项目的高、低值病人标本各一份，（高值标本为接近线性范围上限或高于线性上限 10%-15%的标本，低值标本为接近线性范围下限的标本）。低值标本为 1 号，高值标本为 6 号，低高值标本 4：1 混和为 2 号，3：2 混和为 3 号，2：3 混和为 4 号，1：4 混和为 5 号。每个编号标本重复测定 2 次，记录结果。标本留样再测：比对 5 天，共检测留样再测标本 708 份，其中大于 6 的标本 328 份，留样再测标准相对于靶机相对偏倚小于 5%，1/2TEa。

结果 精密度结论两种检测系统均符合设定的精密度批内 CV 及总 CV 要求。正确度结论两种检测系统结果均在允许范围内。线性范围结论两种检测系统 R 值均大于 0.975，符合要求。常规标本留样再测结果为：亲和层析高效液相色谱法检测系统大于 5%的标本为 258 个，即 36.4%的标本与靶机相对偏倚超过 5%。离子交换高效液相色谱法系统大于 5%的标本为 84 个，即 11.8%的标本与靶机相对偏倚超过 5%。异常标本（肾病和贫血患者）留样再测结果亲和层析法检测系统与靶机相对偏倚超过 5%的标本数量最少。

结论 两种检测系统在精密度，准确度，线性范围方面均符合要求，对于常规标本，离子高效液相色谱法检测系统与 Bio-Rad 靶机比对相对偏倚超过 5%的标本数量最少，优于亲和层析法检测系统。对于肾病和贫血患者的标本，亲和层析法检测系统要优于离子交换层析法检测系统。

PO-0538

脊柱退行性病变老年女性定量 CT 骨密度与血清总胆红素和 AST/ALT 比值的相关性探讨

刘武征、徐东江
北京积水潭医院

目的 研究罹患脊柱退行性病变的老年女性定量 CT 骨密度（bone mineral density，BMD）与血清总胆红素（total bilirubin，TBIL）、天门冬氨酸氨基转移酶（Aspartate aminotransferase，AST），丙氨酸氨基转移酶（Alanine aminotransferase，ALT）的相关性。

方法 病例对照研究，回顾性分析 2019 年 7 月～ 2019 年 12 月期间在我院脊柱外科诊断为脊柱退行性病变并做定量 CT 的老年女性人群 555 例，根据中国老年骨质疏松症诊疗指南（2018）将入组人群分为骨质疏松组 277 例、低骨量组 211 例、骨密度正常组 67 例，分析三组人群体重指数（BMI）、总胆红素（TBIL）、天门冬氨酸氨基转移酶（AST）、丙氨酸氨基转移酶（ALT）及 AST/ALT 比值与骨密度的关系。以单因素方差分析研究各组差异，Person 相关分析不同指标间相关性，p<0.05 为具有显著性水平。

结果 经单因素方差分析，骨密度正常、骨密度减低、骨质疏松三组年龄分别为（58.67±9.23 岁、63.45±6.58 岁、69.28±7.75 岁），差异有统计学意义 (P<0．05)；腰椎 BMD 分别为（154.25±20.75 mg／cm3、102.77±10.35 mg／cm3、67.15±10.98 mg／cm3），差异有统计学意义 (P<0．05)；BMI 分别为（24.91±2.55 kg/m2、23.99±2.69 kg/m2、22.77±2.33 kg/m2），差异有统计学意义 (P<0．05)；TBIL 分别为（15.27±5.67μmol／L、15.24±6.79μmol／L、13.85±4.99μmol／L），差异有统计学意义 (P<0．05)；ALT 分别为（23.98±17.36IU/L、23.14±16.96 IU/L、18.15±9.10 IU/L、），差异有统计学意义 (P<0．05)；AST 分别为骨密度正常组（20.39±7.35 IU/L）、骨密度减低组（21.17±9.15 IU/L）、骨质疏松组（20.04±8.17 IU/L）三组间比较，差异无统计学意义；AST/ALT 分别为（0.98±0.29、1.06±0.39、1.23±0.43），差异有统计学意义 (P<0．05)。

结论 脊柱退行性病变的老年女性患者血清中 TBIL、AST/ALT 与骨密度有显著相关性，骨质疏松症诊断时起到辅助诊断意义。

PO-0539

血清可溶性甘露糖受体在肝癌患者中的表达及其临床意义

黄程荣
安徽医科大学第二附属医院

目的 探讨肝癌（HCC）患者体内可溶性甘露糖受体（sMR）的表达水平及其临床意义。
方法 采用酶联免疫吸附实验分别检测肝癌患者、慢性乙型肝炎（CHB）患者及健康对照（HC）血清 sMR 水平，统计分析一般资料，比较不同分期及病理特征患者血清 sMR 水平，并通过绘制 ROC 曲线评价 sMR 及 AFP 对肝癌的诊断效能。
结果 肝癌患者血清 sMR 水平高于慢性乙型肝炎及健康对照者，根据巴塞罗那临床肝癌分期分类标准将 HCC 患者的疾病严重程度分为巴塞罗那 A、B、C、D 期（早、中、晚、终末期），其中 A 期 27 例，B 期 39 例，C 期 42 例，D 期 21 例。结果提示随着疾病进展，肝癌患者体内 sMR 水平升高，同时发现 HCC 患者血清中 sMR 水平在肝癌组肿瘤直径＞5 cm 及多发结节组中均升高但 AFP 水平与肿瘤数目及肿瘤大小差异无显著性。进一步以不同研究对象作为对照组绘制 ROC 曲线评估 sMR 及 AFP 对 HCC 患者的诊断效能，研究发现以 HC 组或非肝癌患者为对照组 sMR 曲线下面积（0.992 和 0.864）均高于 AFP（0.848 和 0.761），且当 AFP 与 sMR 联合检测时，ROC 曲线下面积（0.996 和 0.909）均高于单个指标。说明 AFP+sMR 是 HCC 患者诊断的良好预测指标。以非肝癌组为对照组，AFP 阴性 HCC 患者（49 例）作为病例组，ROC 曲线下面积为 0.854（0.783~0.909），当 sMR 截断值为 110pg/ml 时，敏感性和特异性分别为 79.59%、80.0%，表明 sMR 对于 AFP 阴性的 HCC 患者也有一定的补充诊断价值。
结论 血清 sMR 水平在肝癌患者中升高，其表达水平与肿瘤分期、大小及数目有关，同时发现血清 sMR 及 AFP 联合检测对于肝癌的诊断水平高于单个指标对肝癌诊断具有重要临床意义和应用价值。

PO-0540

MicroRNA-210 did not change expression of TET2 and interleukin-6 in trophoblasts

Qian Li [2]、Yuping Duan[1]、Leiming Cai[1]
1. Wusong branch，Zhongshan hospital，Fudan university
2. 复旦大学附属中山医院吴淞医院

Recent studies have found that in the blood of patients with advanced pre-eclampsia (PE), the levels of hypoxia-related microRNA-210 (miR-210) and pro-inflammatory factor Interleukin-6 (IL-6) are significantly increased and positively correlated. Through bioinformatics analysis, we found that ten-eleven translocation enzyme 2 (Tet2) is the target gene of miR-210, while Tet2 is reported as atranscription repressor of IL-6. Here we detected expression of Tet2 and IL-6 in placenta from PE patients and analyzed the effect of miR-210 on IL-6 and Tet2 in primary trophoblast cells and HTR8/SVneo. We found that placental IL-6 expression was increased and Tet2 expression was down-regulated in PE. But Tet2 is not a direct target gene of miR-210. The mechanism of the decrease of Tet2 and the increase of IL-6 in PE placenta needs further exploration.

PO-0541

Inhibition of LDHA suppresses cell proliferation and increases apoptosis in cervical cancer cells

Wenjing Zhang、Liang Ming
The First Affiliated Hospital of Zhengzhou University

Propose Warburg effect or aerobic glycolysis has become a hallmark of cancer. Lactate dehydrogenase (LDH), which catalyzes pyruvate into lactate, plays a critical role during Warburg effect. It has been reported that LDHA is up-regulated in many cancers and plays a vital role in tumor growth and progression. However, its expression and function in cervical cancer (CC) has not been characterized thoroughly. Therefore, we undertook experiments in an attempt to elucidate the underlying roles and mechanism of LDHA in cervical cancer.
Methods To explore the gene expression of LDHA in human tumors and normal samples, we used web-based data to analyze The Cancer Genome Atlas (TCGA) datasets via Gene Expression Profiling Interactive Analysis(GEPIA) dateset. To examine the LDHA inhibition effect in CESC cells, oxamate was used. Meanwhile, we constructed stable LDHA-depeleted CESC cell lines. Moreover, we detected glucose consumption, lactate production and ATP level after inhibition of LDHA by shRNA or oxamate in both Hela and Siha cells. Furtheremore, we detected the effect of LDHA inhibiton on the cell proliferation, cell cycle and apoptosis.
Results We evaluated LDHA expression in TCGA database and found that LDHA was upregulated in cervical cancer compared to normal tissues and LDHA overexpression was remarkably correlated with shorter overall survival in cervical cancer patients. Moreover, we documented that inhibition of LDHA by oxamate, a small-molecule inhibitor of LDHA, disturbed energy metabolism by greatly decreasing glucose consumption, lactate production and ATP level in both Hela and Siha cells. Similarly, knockdown of LDHA in CESC cells also decreased the glucose utilization, and lactate production and ATP levels. LDHA inhibition by oxamate or shRNA in Hela and Siha cells inhibited the cell growth. Furthermore, we detected the effect of LDHA inhibiton on the cell cycle and found that knockdown LDHA or oxamate treatment led to G2/M cell cycle arrest. We detected the effect of LDHA inhibiton on the cell apoptosis and found that knockdown LDHA or oxamate treatment led to increased apoptosis and activated mitochondrial apoptosis pathway.
Conclusion LDHA inhibition decreased the glucose utilization, and lactate production and ATP levels, ultimately lead to disturb energy metabolism and repress the Warburg effect in CESC cells. LDHA deficiency resulted in increased apoptosis and G2/M cell cycle arrest. Collectively, these results indicate that LDHA is pivotal in CC pathogenesis and may be a promising therapeutic target for CC treatment.

PO-0542

IGF2BP1 基因在食管鳞癌中的表达水平及风险模型构建

韩博成、王敏、阴晟
中南大学湘雅二医院

目的 利用生物信息学手段探究 21 种 m6A 调节基因在食管鳞癌中的表达水平以及对患者的预后影响。主要解决两个问题，哪些基因表达量显著差异并且对患者预后显著影响的基因,基于显著基因构建的风险模型性能如何。
方法 利用肿瘤信息数据库 TCGA 和 GTEX 的 RNA-seq 数据分析 m6A 调节蛋白在食管鳞癌和正常组织中的表达差异；通过生存分析统计方法 Cox 回归筛选对患者预后有影响的蛋白；使用免疫组化方法从蛋白质水平验证 IGF2BP1 表达量；将 96 例食管癌患者分为训练集（60 例）和验证集

（36 例）；训练集通过 Lasso 回归方法构建风险模型，利用验证集验证模型性能，模型性能用 ROC 曲线反映。

结果 基于肿瘤信息数据库 TCGA-ESCA 和 GTEx 数据集分析结果发现 IGF2BP1 基因在食管鳞癌中高表达，而在正常食管中低表达。并且 IGF2BP1 基因高表达对食管鳞癌患者生存期延长有益(HR=0.478，95%CI=0.284-0.803，P<0.05)。免疫组化研究表明食管鳞癌中 IGF2BP1 蛋白的表达量高于其癌旁组织。本文利用与 IGF2BP1 相关的 55 种 RNA 的表达量构建风险模型，模型对患者一年期生存率具有一般的预测性能（最佳 cutoff=0.9858，AUC=0.65），对二年期生存率具有较高的预测性能（最佳 cutoff=1.128，AUC=0.83）。

结论 IGF2BP1 基因在食管鳞癌中高表达，且该基因对延长患者生存期有益；基于 IGF2BP1 相关 RNA 构建的风险模型对患者两年期生存率具有较好预测性能。

PO-0543

BATF2 抑制 GBM 中髓源性抑制细胞作用机制研究

张鑫
南方医科大学南方医院
四川大学华西医院

碱性亮氨酸拉链 atf 样转录因子 2 (BATF2)与炎症反应和抗肿瘤作用有关。然而，关于它在维持非支持性癌症微环境中的细胞外作用，我们知之甚少。在这里，我们发现 BATF2 可以抑制胶质瘤的生长和骨髓源性抑制细胞(MDSCs)的募集。有趣的是，过表达 batf2 的胶质瘤细胞系来源外泌体在体外抑制了 MDSCs 的趋化。此外，BATF2 抑制细胞内 SDF-1α，并有助于降低 SDF-1α。在 AMD3100 处理下，通过阻断 SDF-1α/ CXCR4 信号通路，可逆转 BATF2 下调诱导的 MDSCs 募集。通过对 24 对胶质瘤和健康供体不同阶段 EV 的检测，发现血浆中大量的 BATF2 阳性 EV 可以区分 III-IV 期胶质瘤、I-II 期胶质瘤和健康人。综上所述，我们的研究发现 BATF2 在调节 MDSCs 招募方面的新调控功能，为胶质瘤 BATF2+ plEVs 提供了预后价值。

PO-0544

Making Aggregation-Induced Emission Luminogen More Valuable by Gold: Enhancing Anticancer Efficacy by Suppressing Thioredoxin Reductase Activity

Hang Zou 、Jing Zhang、Lei Zheng
Nanfang Hospital, Southern Medical University

Gold complexes have been recognized as potential anticancer agents against various kinds of diseases due to their inherent suppressions of antioxidant thioredoxin reductase (TrxR) activity. Herein, a powerful aggregationinduced emission luminogen (AIEgen), TBP-Au, was designed and synthesized by integrating an anticancer Au(I) moiety with an AIE-active photosensitizer (TBP), in which both the production and consumption routes of reactive oxygen species (ROS) were elaborately considered simultaneously to boost the anticancer efficacy. It has been demonstrated that TBP-Au could realize superior two-photon fluorescence imaging in tumor tissues with high resolution and deep penetration as well as long-term imaging in live animals due to its AIE property. In addition, the introduction of a special Au(I) moiety could tune the organelle specificity and efficiently facilitate the ROS-determined photodynamic therapy (PDT). More impressively, TBPAu could efficiently eliminate cancer cells under light irradiation through the preconceived synergetic approaches from the PDT and the effective suppression of TrxR, demonstrating that TBP-Au holds great potential for precise cancer theranostics.

PO-0545

Identification of prognosis-related genes in the tumor microenvironment of stomach adenocarcinoma by TCGA and GEO datasets

Na renna
General Hospital of Northern Theatre Command
解放军总医院

Object Identification of prognosis-related genes in the tumor microenvironment of stomach adenocarcinoma by TCGA and GEO datasets。
Methods we used gene expression data of STAD avail- able from TCGA and GEO datasets to infer tumor purity using ESTIMATE algorithms, and predicted the associations between tumor purity and clinical features and clinical outcomes. Next, we calculated the differentially expressed genes (DEGs) from the comparisons of immune and stromal scores, and postulated key biological processes and pathways that the DEGs mainly involved in. Then, we analyzed the prognostic values of DEGs in TCGA dataset, and validated the results by GEO dataset. Finally, we used CIBERSORT computational algorithm to estimate the 22 tumor infiltrating immune cells (TIICs) subsets in STAD tissues.
Results stromal and immune scores were significantly correlated with STAD subtypes, clinical stages, Helicobacter polyri infection, and stromal scores could predict the clinical outcomes in STAD patients.We screened 307 common DEGs in TCGA and GSE51105 datasets. In the prognosis analyses, we only found OGN, JAM2, RERG, OLFML2B, and ADAMTS1 genes were significantly associated with overall survival in TCGA and GSE84437 datasets, and these genes were correlated with the fractions of T cells, B cells, macrophages, monocytes, NK cells and DC cells, respectively
Conclusions Our comprehensive analyses for transcriptional data not only improved the understanding of characteristics of TME, but also provided the targets for individual therapy in STAD.

PO-0546

miR-519d-3p/HIF-2α axis increases the chemosensitivity of human cervical cancer cells to cisplatin via inactivation of PI3K/AKT signaling

lixia jiang[1]、SHAOHUA SHI[1]、FENG LI[1]、QIAOFA SHI[2]、TIANYU ZHONG[1]、HUIJUAN ZHANG[1]、YU XIA[1]
1. Department of Laboratory Medicine,First Affiliated Hospital of Gannan Medical University
2. Department of Immunology, Medical College of Nanchang University

Cisplatin (DDP)-based chemotherapy is a standard treatment for cervical cancer, although chemotherapy resis- tance remains a major concern. Hypoxia-inducible factor-2 α (HIF-2α) plays an important role in chemotherapy resistance. MicroRNAs (miRs) can inhibit gene expression by binding to the 3'-untranslated region of the target gene. The authors' previous study showed that miR-519d-3p plays an important role in the regulation of HIF-2α expression under hypoxic conditions in cervical cancer. However, the function and regulatory mechanisms of the miR-519d-3p/HIF-2α axis in DDP-resistance in cervical cancer are not fully understood. Therefore, the aim of the present study was to investigate whether the miR-519d-3p/HIF-2α axis increased DDP resistance by regulating the PI3K/AKT signaling pathway. It was found that the expression of miR-519d-3p was lower in DDP-resistant cervical cancer cells (CaSki/DDP and HeLa/DDP) compared with CaSki and HeLa cells under hypoxic conditions. Additionally, miR-519d-3p overexpres- sion decreased the IC50 value in CaSki/DDP and HeLa/DDP cells, and inhibited

HIF-2α protein expression and the PI3K/AKT signaling pathway under hypoxic conditions. Furthermore, it was demonstrated that HIF-2α overexpres- sion reduced the effect of miR-519d-3p overexpression on HeLa/DDP and CaSki/DDP cells. Moreover, the present results suggested that HIF-2α overexpression increased the IC50 value in CaSki/DDP and HeLa/DDP cells. It was also found that HIF-2α overexpression reduced the effect of miR-519d-3p overexpression on the PI3K/AKT signaling pathway. Therefore, the present results indicated that the miR-519d-3p/HIF-2α axis increased DDP resistance of cervical cancer cells by suppressing the PI3K/AKT signaling pathway under hypoxic conditions.

PO-0547

炎症通过上调前列腺六次跨膜上皮抗原 4 促进肺铜摄取

薛明慧[1]、蔡刚[1]、江岑[1]、聂小蒙[2]、何思炜[1]
1. 上海交通大学医学院附属瑞金医院
2. 第二军医大学附属长海医院

目的 评估炎症对肺部铜代谢的影响，探究调节肺部铜吸收的机制。
方法 收集 19 名 ILD 患者，21 名支气管扩张患者，20 名符合全球哮喘倡议(GINA)指南的重度哮喘患者，22 名 COPD 患者和 24 名健康对照者的痰液，使用原子吸收分光光度计测定痰液中铜离子水平。使用香烟烟雾、脂多糖和硫酸铜构建小鼠慢性肺部炎症模型，对左肺进行 HE 染色分析和组织病理学评价；获取小鼠肺泡灌洗液，离心后涂片染色，进行白细胞分类计数；提取小鼠右肺组织 RNA，通过 RT-PCR 的方法检测 Steap4 基因表达水平；使用过氧化氢/过氧化物酶检测试剂盒检测组织匀浆中的 O2-水平；使用荧光染色的方法评估 DNA 降解水平。培养小鼠来源的原代支气管肺泡上皮细胞，PBS 处理作为对照组，分别给予 IL-17、TNF-α、IL-1、IL6、IL-4、IL-13 刺激。建立 Steap4-/- MLE-12 细胞系，与野生型 MLE-12 细胞分别通过炎症因子刺激后分析胞内铜离子水平，ROS 产生的水平和 TUNEL 染色阳性细胞的比率。
结果 严重哮喘或慢性阻塞性肺病患者的痰液铜离子水平显著高于正常对照组(P＜0.05)。间质性肺病和支气管扩张症患者痰铜水平也有升高，但与健康对照者相比差异无显著性意义(P>0.05)。动物实验中，组织学分析显示 CS/LPS+CuSO4 炎症模型小鼠血管及支气管周围炎性细胞浸润增加；与 CS/LPS 处理的小鼠相比，支气管肺泡灌洗液中细胞水平显著升高（P＜0.05），Cu-CS/LPS 处理的小鼠的中性粒细胞募集显著增加（P＜0.05），但嗜酸性粒细胞募集不明显（P＞0.05）；CS/LPS+CuSO4 处理的小鼠的 ROS 水平明显高于 CS/LPS 处理的小鼠（P＜0.05）；与对照组小鼠肺组织相比，CS/LPS 和 Cu-CS/LPS 组小鼠肺组织中 Steap4 mRNA 表达均显著上调（P＜0.05），且 Cu-CS/LPS 组小鼠肺组织中 Steap4 mRNA 表达高于 CS/LPS 组小鼠，但差异不具统计学意义（P＞0.05）。IL-17 和 TNF-α 可显著诱导 Steap4 在气道上皮细胞中表达，其他细胞因子如 IL-1、IL6、IL-4、IL-13 的诱导作用不明显（P＞0.05）。经炎症因子刺激后，Steap4-/-细胞的 ROS 生成和 TUNEL 染色阳性细胞的比率相较 Steap4+/+细胞明显减少（P＜0.05），胞内铜离子水平在两组之间没有显著差异（P＞0.05）。
结论 STEAP4 在气道上皮细胞的表达可以同时受到炎症因子 IL-17 和 TNF-α 的调控，且铜摄取中具有重要作用。

PO-0548

非痰液标本分离阴沟肠杆菌整合子分布及其耐药情况

朱玉、朱雯雯、王童、魏取好
上海市奉贤区中心医院

目的 了解非痰液阴沟肠杆菌的临床分布和耐药情况，为临床治疗阴沟肠杆菌感染抗菌药物的使用提供参考依据。
方法 收集 63 株 2016-2019 年非重复分离自非痰液标本的阴沟肠杆菌，运用聚合酶链反应（PCR）筛查第 1、2、3 类整合酶基因，对整合酶阳性菌株采用长片段 PCR 扩增整合子可变区，通过测序确定可变区基因盒种类。
结果 63 株分离自非痰液标本的阴沟肠杆菌中，21 株第 1 类整合酶阳性，未检出第 2、3 类整合酶基因。21 株第 1 类整合酶阳性菌株中，有 18 株成功扩增处可变区，其中 7 株可变区是 aadA2， 2 株是 aacA4，2 株是 aac（6’）-II-△ereA2-IS1247-aacA3-arr-△ereA2， dfA15， dfrA17，dfrA17-aadA5，aacA4-blaoxA-10-aacA1，aacA27-△ereA2-IS1247-△ereA2，aacA4，aadB-aadA2 各 1 株。其中基因盒组合 aac（6’）-II-△ereA2-IS1247-aacA3-arr-△ereA2 和 aacA27-△ereA2-IS1247-△ereA2 为阴沟肠杆菌中首次报道。
结论 非痰液标本分离阴沟肠杆菌菌株整合子携带率低于其他肠杆菌科细菌，其可变区耐药基因盒种类多样，首次在阴沟肠杆菌临床分离菌株中发现基因盒组合 aac（6’）-II-△ereA2-IS1247-aacA3-arr-△ereA2 和 aacA27-△ereA2-IS1247-△ereA2。

PO-0549

门诊采血自助排号和条码自动切割一体化方案的建立

王左
四川省肿瘤医院

背景 目前智能化采血系统已广泛应用于各大医院，极大的提高了门诊采血效率，减少了患者等待时间。但部分医院受制于采血场地及布局不易更改等原因，不能运用智能采血系统。故在既有条件下，对采血流程和方案进行优化，以缓解门诊采血负荷，具有现实意义。
目的 本研究设计并运用门诊检验患者采血自助排号和检验条码自动切割一体化方案，从而使患者自助采血排号和条码打印一次性解决。
方法 首先，优化实验室信息管理系统，并整合信息发布与自助机信息平台，实现三大平台智能互联互通。其次，将采血排队号、检验条码及患者回执单集成在一段条码纸上。然后，在条码打印机上安装条码切割机，编写切割程序，并按设计的规则自动触发切割条码。最后，将排队信息放大发布到电子屏幕上，语音播报采血患者。
结果 三大平台智能互联互通，实现了检验医嘱智能判断，排除并提示不符合采血者。集成打印条码，实现了门诊就诊患者刷一次电子就诊卡，就能完成自助采血报道，获取采血排队号、采血条码以及取报告回执单等四个要素。条码按规则自动切割，解决了患者拉拽条码打印机等不能分割条码，而导致的条码打印故障等问题。
结论 门诊采血自助排号和条码打印一体化方法的建立，实现了患者刷一次电子就诊卡完成四个采血要素的目标，优化了采血流程，减少了抽血者甄别医嘱和打印条码的时间，缩短了病人采血窗口处等待时间，提高了工作效率。

PO-0550

提升医学实验中专利技术的产出

谢盼盼
黑龙江金域医学检验实验室有限公司

目的 从事基础检验工作的技术人员，很多只关注自己本岗位职责或是实验相关基本工作，认为实用新型、发明专利距离自己很遥远，从未想过要参与其中。本文旨在帮助从事基层检验工作的人员，挖掘专利点，提升检验人员的创新意识和能力，增加实验室专利成果输出数量和质量。
方法 为了提升实验室员工发现专利点以及撰写专利的能力，采取以下几点措施：1.设置专职/兼职创新管理人员，每月定期统一收集各科室、各岗位实验操作或流程的痛点；2.定期交流，组织员工们对各类痛点进行改进的创新想法碰撞，包括结构类器具或检测方法，创新管理人员可做适当的指导；3.培训书写能力，将创新的想法书写成专利的稿件，此环节可以借助专业的第三方机构或人员的帮助；4.领导带头作用。各小组长/主管等领导身先士卒，带头参与，并带动员工参与。5.奖励制度。为了激励员工参与，设置合理的奖励措施；6.每季度公示发表的专利或获奖名单，营造良好的竞争氛围。
结果 本实验室在 2020 年实现了授权实用新型 11 件，受理发明 2 件（自主发明专利零突破）和实用新型 13 件，以及其他创新性的改进。
结论 通过以上措施的有效执行，加强了实验室的创新氛围，员工参与度从 0 提升至 40%，专利距离大家不再遥远。在输出专利的过程中，大家发现创新、写作能力和创新思维得到提升，输出的创新成果质量更是逐年提升，既提升了员工的综合素质，又提升了公司的知识产权核心竞争力，为公司的建设添砖加瓦。

PO-0551

Labeling and Tracking of Bacteria Outer Membrane Vesicles using an Aggregationinduced Emission Fluorogen

Zihao Ou
Nanfang hospital, Southern medical university

Visualizing the intracellular behaviors and the in vivo distribution of bacteria outer membrane vesicles (OMVs) is of great value to obtain knowledge about their roles in cross-species information communication between bacteria and their host, but ideal probes are currently lacking. In this work, an aggregation-induced emission (AIE) fluorogen, namely DPASP, was reported for OMV labeling and tracking with excellent performance. DPASP exhibits low background in aqueous solution, high affinity and strongly fluorescent response to OMVs, enabling it to achieve OMV labeling with high signal-to-noise ratio as well as superior labeling efficiency. Importantly, the excellent photostability of DPASP allows the intracellular movements of OMVs to be continuously visualized in real-time. Moreover, its capability of mapping the in vivo distribution of OMVs is also successfully demonstrated. All these advantages make DPASP a useful tool for studying behaviors and functions of bacteria OMVs in many physiological and pathological processes of human bodies

PO-0552

基于生物信息学方法构建类风湿性关节炎 miRNA-mRNA 调控网络

曹维维、袁成良
德阳市人民医院

目的 基于生物信息学方法构建类风湿性关节炎核心 miRNA-mRNA 调控网络并筛选相关核心基因，探索其在类风湿性关节炎疾病中的分子调控机制。
方法 从 GEO 数据库下载 miRNA 和 mRNA 基因表达谱芯片 GSE72564 和 GSE55235。采用 GEO2R 分析工具筛选差异表达的 miRNA 和 mRNA，应用 miRNet 在线数据库分析预测 miRNA 差异表达的靶基因并与 mRNA 数据集筛选出的差异基因进行交叉匹配，获得 miRNA-mRNA 相互作用关系对。使用 ClusterProfiler 包对 miRNA-mRNA 的差异基因进行 GO 和 KEGG 分析。应用 Cytoscape 软件绘制 miRNA-mRNA 调节网络图。
结果 共筛选出差异 miRNA23 个。筛选到差异基因 1038 个。交叉匹配后获得 143 个差异基因，GO 注释分析表明其主要位于细胞外基质等部位，参与细胞对氧含量降低的反应、细胞生长调节等生物过程。KEGG 分析表明其主要富集与 PI3K-AKT 等信号通路。成功构建 miRNA-mRNA 调控网络，筛选出 8 个 DE-miRNA,其中 hsa-mir-218-5p、has-mir-30c-3p、hsa-mir-1305、hsa-mir-708-5p 表达下调，而 hsa-mir-496、hsa-mir-346、hsa-mir-2276-3p、hsa-mir-4263 表达为上调，。KLHL21、HSPG2 等关键基因在互作网络中发挥重要作用。
结论 通过数据挖掘和芯片分析方法成功构建类风湿关节炎 miRNA-mRNA 调控网络，为进一步研究 RA 发生和发展的分子机制提供了有价值的线索。

实验室检验数据实时监控

白岩
吉林大学第一医院

建立完整的检验信息系统，构建高效的数据统计平台，实时显示是检验质量实时监控的条件；提升医院检验的科学管理效能，是提高医疗质量实时监控的目的。检验系统质量控制实时监控的应用：医疗基本统计信息；建立质控平台，加强检验的科学管理；完善检验质量实时监控，建立医疗检验质量指标警示系统。实时监控的方式是监控检验效果的决定因素。检验质量管理是医院的核心和精髓，

PO-0554

LINC00665/miR-9-5p/ATF1 信号通路在结直肠癌中的调控作用

赵旭鸿[1]、翁文浩[1]、龙吟[1]、潘伟洁[1]、李智[1]、孙奋勇[2]
1. 上海市杨浦区中心医院（同济大学附属杨浦医院）
2. 上海市第十人民医院（同济大学附属第十人民医院）

目的 了解长非编码 RNA00665（LINC00665）在结肠直肠癌(CRC)及其调控机制中的作用。
方法 采用实时聚合酶链反应(RT-PCR)来检测 LINC00665、miR-9-5p 和激活转录因子 1(ATF1) mRNA 在 CRC 组织中的表达。同时，采用免疫组织化学和免疫印迹试验（Western blot）对 CRC 组织中 ATF1 的表达进行检测。并采用 CCK-8 和菌落形成试验检测细胞增殖、流式细胞术检测分

析细胞周期和细胞凋亡、划痕愈合实验和 Transwell 实验检测细胞迁移和侵袭、双荧光素酶报告基因分析进行验证 LINC00665 与 miR-9-5p、miR-9-5p 和 ATF1 的靶向关系。
结果 LINC00665 在结直肠癌组织中显著过表达，并与 miR-9-5p 的表达呈负相关、与 ATF1 的表达呈正相关。LINC00665 通过分泌 miR-9-5p 促进结直肠癌细胞的增殖、迁移和侵袭，并抑制细胞凋亡。ATF1 被证实是 miR-9-5p 的下游靶点，并受 LINC00665 间接调控。
结论 LINC00665 通过调节 miR-9-5p/ATF1 轴参与了结直肠癌的进展。

白藜芦醇改善高糖诱导肾脏细胞损伤的作用机制研究

王琳
天津医科大学

目的 糖尿病肾病（diabetic nephropathy，DN）是以渐进性肾功能损伤为特征的一种微血管病性合并症。与单纯糖尿病相比，其死亡风险高 3–12 倍。新近研究表明炎症反应以及肾脏细胞发生的程序性死亡（programmed cell death，PCD）是 DN 进展的主要原因之一。我们前期研究发现在 DN 中，Gasdermin E（GSDME）可介导肾脏细胞发生焦亡。白藜芦醇（resveratrol，RSV）作为一种天然多酚类物质可降低多种疾病中的炎症反应，但其在 DN 中的作用机制尚不明确。因此，我们进一步探究白藜芦醇（RSV）对体外高糖刺激引起肾脏细胞损伤的潜在分子保护机制。
方法 取处于对数生长期的 RGMCs、HK2，分为甘露醇高渗透压对照组（OC）、正常对照组（NG）、高糖组（HG）以及高糖 RSV 处理组，分别处理 24、48h。LDH 试剂盒检测不同时间各组细胞上清液中 LDH 的水平；Western blot 检测不同时间各组凋亡相关蛋白 Bcl-2、Bax、caspase-1、p20（caspase-1 活性片段）、GSDME（Gasdermin E）、GSDME-N（GSDME 活性片段）、caspase-3、p17（caspase-3 活性片段）、炎性因子 IL-1β 及其活化形式 mIL-1β 的表达；ELISA 检测不同时间各组细胞培养上清 IL-1β 的水平。
结果 LDH 结果显示 RSV 可降低高糖刺激 48h 后细胞的死亡率。Western blot 结果显示 RSV 处理 24h 后，Bax 表达较 HG 组显著降低，同时伴随 Bcl-2 表达升高；RSV 处理 24h 后 HG 组 p20、mIL-1β 表达降低； RSV 处理 48h 后 p17、GSDME-N 的表达较 HG 组明显下降，同时 ELISA 结果显示，RSV 处理 48h 后 HG 组 IL-1β 的释放率显著降低。
结论 RSV 通过抑制高糖刺激引起的早期凋亡以及晚期 GSDME 介导的细胞焦亡，并减少炎症因子的产生来改善高糖引起的肾脏细胞损伤。

PO-0556

The association between chronic obstructive pulmonary disease and dietary inflammatory index

Haiyue Liu[1,2]、Xiaobo Ma[1,2]、Yanqing Zheng[1,2]、Bo Zhu[1,2]、Gangsen Zheng[1,2]、Lili Fang[1,2]、Guolin Hong[1,2]
1. 厦门大学附属第一医院检验科
2. 厦门市基因检测重点实验室

Background Chronic obstructive pulmonary disease (COPD) is characterized as an inflammatory disease with irreversible and progressive airflow limitation and has become a major public health problem throughout the world due to its high morbidity and mortality. The role of dietary in inflammatory lung diseases is depicted in previous studies. Nevertheless, little is known about diet-related inflammation in COPD. In this study, we aimed to explore the association between COPD and dietary inflammatory index (DII) scores in adults over 40-year-old.
Methods Data were obtained from the 2013-2018 National Health and Nutrition Examination Survey (NHANES). In the present study, 9929 participants were included and analyzed. The DII

score was calculated and divided into tertiles. Logistic regression analysis was performed to determine the odds ratios of DII tertiles.
Results Participants were categorized into COPD (565, 5.69%) and non-COPD groups (9364, 94.31%) according to interview information. COPD individuals had higher DII scores than non-COPD individuals (0.429 ± 1.809 vs. -0.191 ± 1.791, $p < 0.001$). The highest DII score tertile included 46.55% of COPD individuals and was associated with lower family incomes and education and a higher smoking rate ($p < 0.01$). The odds ratios (95% CIs) of COPD according to logistic regression were 0.709 (0.512-0.982) for T1 and 0.645 (0.475-0.877) for T2 of the DII score ($p = 0.011$).
Conclusion Higher DII scores were positively correlated with COPD in participants over 40 years old. These results further support that diet can be used as an intervention strategy for COPD management.

PO-0557

通过体外培养探索中药单体苦参碱对肠道菌群的影响

刘海月[1,2]、马晓波[1,2]、郑燕青[1,2]、朱波[1,2]、郑港森[1,2]、房丽丽[1,2]、洪国焌[1,2]
1. 厦门大学附属第一医院检验科
2. 厦门市基因检测重点实验室

背景与目的 中药的治病机理复杂，较难用现代科学的理论解释。近年来的研究表明，中药可能对肠道菌群肠道产生影响，进而发挥治病作用。肠道菌群被认为是人类的第二基因库。肠道菌群的紊乱会导致多种疾病的发生与，包括了肥胖、糖尿病、冠心病、高血压、自闭症、抑郁以及炎症性肠病等等。诸多的研究已经表明通过粪菌移植的方式能够通过改善肠道菌群而达到治疗疾病的作用。葛根素又被成为葛黄素，它是从中药葛根中分离提存的一种异黄酮衍生物，既往的研究认为它具有治疗冠心病、扩张冠状动脉的作用。近年来的研究表明心脑血管疾病与肠道菌群密切相关，因此，葛根素也有可能通过影响肠道菌群来发挥作用。本研究拟通过体外培养结合 16S 测序的方法，探索葛根素对肠道微生物的影响。
方法与结果 搜集心脑血管疾病患者粪便标本共 9 例。进而配置培养液，其中培养液包括 PBS 培养液以及富营养培养液，根据是否添加苦参碱（10mg 配置于 500mL 培养液中）分为 4 组，分别是 PBS 组、富营养培养液组、PBS+苦参碱组、富营养培养液+苦参碱组。每一份样品取 1g 粪便，并加入 9ml 生理盐水稀释，取 10ul 粪便稀释液，接种到含有 200ul 培养液的 96 孔板中进行厌氧培养，体外培养 24 小时。通过吸取培养孔中的培养液，分离培养液中的 16S rRNA，进而通过测血的方法，探索不同培养物对粪便菌群的影响。结果发现：通过分析菌群多样性以及 LEfSe 分析发现，苦参碱能够体外抑制条件致病菌 Hydrogenorobacterium 以及 Alcaligenaceae 的生长，并增加肠道中产丁酸盐的益生菌种类的相对丰度。
结论 苦参碱有可能通过影响肠道菌群中的 Hydrogenorobacterium 以及 Alcaligenaceae 来发挥药理作用。

PO-0558

临床分离非痰液标本中鲍曼不动杆菌整合子的分布与耐药性分析

王童、朱玉、朱雯雯、魏取好
上海市奉贤区中心医院

目的 整合子在细菌耐药性产生和播散中起着重要的作用，本研究旨在了解临床分离自非痰液标本中鲍曼不动杆菌中整合子的分布。

方法 收集 2016 年 1 月至 2019 年 12 月非重复分离自就诊患者非痰液标本的中鲍曼不动杆菌，采用 Phoenix 100 全自动微生物分析仪进行细菌鉴定和药物敏感性试验，PCR 筛查第 1、2 类整合酶基因，整合酶基因阳性菌株通过长片段 PCR 扩增整合子可变区，通过测序确定可变区基因盒种类。
结果 76 株非重复分离自就诊患者非痰液标本的中鲍曼不动杆菌中，有 10 株（13.2%）检测到第 1 类整合酶基因，未检出第 2 类整合酶基因。第 1 类整合酶阳性菌株可变区耐药基因盒有 aacA4(7 株)、catB8（7 株）、aadA1（7 株）、dfrA17（3 株）、aadA5（3 株）。其中 aacA4、aadA1、aadA5 赋予宿主细菌对氨基糖苷类抗菌药物耐药，catB8 赋予宿主细菌对氯霉素类抗菌药物耐药，dfrA17 赋予宿主细菌对甲氧苄啶耐药。与第 1 类整合酶阴性菌株相比，第 1 类整合酶阳性菌株对？？、？？抗菌药物的耐药率较高，差别具有统计学意义（P＜0.05）。【如果耐药率没有差别，则写：第 1 类整合酶阴性和阳性菌株对临床常用抗菌药物的耐药率之间的差别无统计学意义，（P＞0.05）】
结论 第 1 类整合子在非痰液鲍曼不动杆菌中的检出率低于肠杆菌科细菌，携带 1 类整合子的菌株对？？抗菌药物具有较高的耐药率。【整合子中耐药基因盒对鲍曼不动杆菌耐药性贡献有限。】

PO-0559

核苷（核苷酸）类似物抗病毒治疗对 PIVKA-II 在慢性乙肝相关肝细胞癌诊断应用中的影响

杨紫伟、吕萍
中国医科大学附属第一医院

目的 探讨核苷（核苷酸）类似物抗病毒治疗对血清 PIVKA-II 在慢性乙肝相关肝细胞癌诊断应用中的影响。
方法 收集 65 例慢性乙型肝炎、63 例慢性乙肝肝硬化和 81 例慢性乙型肝炎相关肝细胞癌患者，根据是否接受过抗病毒治疗将患者分为治疗组和未治疗组。采用 SPSS22.0 统计软件进行非参数 Mann-Whitney U 检验、卡方检验、受试者工作曲线分析及 logistic 回归分析。
结果 经过抗病毒治疗的肝细胞癌患者 PIVKA-II 中位水平明显低于未治疗患者（27.13ng/mLvs739.87ng/mL,P=0.001）。ROC 曲线分析结果显示，经过抗病毒治疗的患者肝细胞癌最佳诊断阈值为 13.20ng/mL（<40.0ng/ml）。当以 13.20ng/mL 作为诊断肝细胞癌临界值时，可以有效提高肝细胞癌诊断灵敏度，降低漏诊率。
结论 核苷（核苷酸）类似物抗病毒治疗会降低患者血清 PIVKA-II 水平，在应用 PIVKA-II 进行慢性乙肝相关肝细胞癌诊断时，应考虑抗病毒治疗对 PIVKA-II 水平的影响，可降低 PIVKA-II 的诊断阈值。

PO-0560

MiRNAs 作为乳腺癌潜在预后生物标志物构建及评估

张开炯
四川省肿瘤医院（四川省第二人民医院四川省癌症防治中心）

目的 基于 TCGA 数据库筛选乳腺癌预后相关的 miRNAs 生物标记物。
方法 首先，从癌症基因组图谱（TCGA）数据库中获得乳腺癌 miRNAs 表达和临床数据，分析 miRNAs 在乳腺癌组织和正常组织差异表达情况。其次，将所有乳腺癌肿瘤样本随机分为训练集和验证集，对差异表达明显的 miRNAs 采用单因素 Cox 分析和最小绝对收缩和选择算子（LASSO）Cox 回归分析筛选预后相关性，对 LASSO 回归分析有意义的 miRNAs 进行逐步多因素 Cox 回归分析，建立预后风险评估模型，并采用受试者工作特征曲线（ROC）评估模型 1、3、5 年预测能力。再次，将训练组构建的风险模型纳入验证组进行验证，以明确所构建风险预后模型的可靠性。

结果 与正常组织相比，乳腺癌组织中 269 个 miRNAs 存在明显差异表达（FDR<0.05，fold change>2），其中 204 个 miRNAs 表达上调，65 个 miRNAs 表达下调。在训练集中采用单因素 Cox 分析和 LASSO 回归分析，发现 18 个差异表达的 miRNAs 与乳腺癌预后不良相关。对 18 个 miRNAs 采用逐步多因素 Cox 回归分析，筛选出 8 个 miRNAs 组合（hsa-mir-3923、hsa-mir-105-2、hsa-mir-3927、hsa-mir-449c、hsa-mir-106a、hsa-mir-1262、hsa-mir-605 和 hsa-mir-3929）用于乳腺癌不良预后模型构建。在训练集和验证集中，发现该风险模型可明显区分乳腺癌高危组和低危组（p 均<0.01），且该模型具有良好的预后和预测准确性。
结论 筛选的 8 个 miRNAs 组合的评分模型可作为预测乳腺癌不良预后的生物标记物。

PO-0561

耐吡咯类药物白色念珠菌 ERG3、ERG5 与 ERG11 基因突变研究

李倩珺
广州医科大学附属第一医院

目的 研究耐吡咯类药物白色念珠菌的 ERG11、ERG3 与 ERG5 基因的突变与其耐药性关系。
方法 收集 417 株临床镜检有真菌的阴道分泌物标本进行真菌培养，筛选白色念珠菌，进行微量肉汤稀释法得到氟康唑、酮康唑、克霉唑、硝酸咪康唑四种药物对白色念珠菌的敏感性和 MIC 值。根据 CLSI-M27 文件药敏试验标准，筛选出耐药的白色念珠菌。提取 DNA，扩增 ERG11、ERG3 与 ERG5 基因，扩增后的 PCR 产物进行双向测序，将测序结果与 GenBank 中的标准序列（SC5314）和 GenBank 序列号：AF069752 比较分析。
结果 氟康唑对白色念珠菌耐药率为 9.05%。酮康唑的抑菌率总体比克霉唑、硝酸咪康唑强。ERG11 突变检测中发现 18 种错义突变，其中 G465S、M527I 未见报道。ERG3 发现 17 种错义突变。ERG5 发现 12 种错义突变。
结论 在广州医科大学附属第一医院外阴阴道念珠菌病患者中，白色念珠菌仍为主要病原体，光滑念珠菌的比例上升。耐吡咯类药物白色念珠菌 ERG11、ERG3、ERG5 基因出现若干错义突变位点，其中某些位点突变导致的氨基酸变异可能与其耐药性产生有关。

PO-0562

Laparoscopic liver resection for hepatocellular carcinoma complicated with significant portal hypertension: a propensity score-matched survival analysis

Yuan Hong
The First Affiliated Hospital of Kunming Medical University

Background Significant portal hypertension (SPH) is a relative contraindication for patients with resectable hepatocellular carcinoma (HCC). However, increasing evidence indicates that hepatic resection is feasible for patients with HCC and SPH.
Methods HCC patients with cirrhosis who underwent laparoscopic liver resection (LLR) across two centers from April 2013 to April 2018 were included. Surgical and survival outcomes were analyzed to explore potential prognostic factors. Propensity score-matched analysis was performed to minimize bias.
Results A total of 151 patients were divided into two groups based on the presence (SPH, n=68) or absence (non-SPH, n=83) of SPH. Patients in the SPH group were associated with a longer operation time, more blood loss, and later TNM stage (P<0.05) than patients in the non-SPH group. However, there were no significant differences noted in the postoperative 90-day

mortality rate (n=0), overall postoperative complications (P=0.785), Clavien-Dindo classification (P=0.105), conversion to open surgery (P=0.504), or length of hospitalization (P=0.379). The same results were obtained after a propensity score-matched analysis. The 1-, 3-, and 5-year overall survival (OS) and recurrence-free survival rates in the SPH group were 77.9%, 40.6%, 31,8%, 64.3%, 41.0%, and 20.5%, respectively, and those in the non-SPH group were 90.4%, 54.3%, and 38.3% and 87.9%, 52.8%, and 24.2%, respectively (log-rank P>0.05). Alpha-fetoprotein>400 μg/L [hazard ratio (HR): 5.24, 95% confidence interval (CI): 2.89-9.49], ascites (HR: 2.69, 95% CI: 1.53-4.71), American Society of Anesthesiologists (ASA) (III vs. II) (HR: 2.78, 95% CI: 1.44-5.36) and tumor diameter>5 cm (HR: 2.99, 95% CI: 1.40-6.38) independently predicted worse OS.
Conclusions LLR for patients with HCC complicated with SPH appears feasible at the price of increasing operation time and blood loss. Alpha-fetoprotein, ascites, ASA, and tumor diameter may predict the prognosis of HCC complicated with SPH after LLR. Prospective trials with a larger sample size are necessary to confirm these results.

PO-0563

AP1M2 对恶性肿瘤的系统分析：泛癌分析

伊远学、徐建、申友锋、高悦益
重庆精准医疗研究院

目的 为了筛选新的肿瘤标志基因，用于肿瘤的早期筛查，我们通过比对 GTEx、CCLE、TCGA 数据库中多个肿瘤中差异表达基因情况。发现 AP1M2 在乳腺浸润癌中显著差异表达，因此本研究对 AP1M2 基因与患者的生存率、免疫浸润、肿瘤新抗原等的关联性进行泛癌分析。
方法 我们使用 GTEx、CCLE、TCGA 泛癌数据库分析了 AP1M2 基因表达在肿瘤组织及其对照正常组织的分布。使用卡普兰-迈耶生存率图和 COX 回归分析来评估 AP1M2 对肿瘤患者临床预后的影响。然后我们研究了不同类型肿瘤中 AP1M2 表达与免疫浸润水平的相关性。此外，我们还研究了 AP1M2 与肿瘤免疫新抗原、微卫星不稳定性、DNA 修复基因、DNA 甲基转移酶之间的相关性，分析了各种肿瘤中 AP1M2 基因突变的频率。使用 GSEA 富集分析方法对不同类型的肿瘤进行了功能富集分析。
结果 AP1M2 在大多数癌症中高度表达，其表达水平和肿瘤患者的预后之间存在明显的联系。在 AP1M2 对肿瘤患者临床预后和免疫浸润影响的研究中，我们发现 AP1M2 在乳腺浸润癌中的表达与患者总生存率和巨噬细胞和树突细胞、CD4+T 细胞、CD8+T 细胞以及 B 细胞的浸润水平显著相关。同时乳腺浸润癌中 AP1M2 表达与肿瘤免疫新抗原和微卫星不稳定性呈显著相关 。GSEA 分析是为了确定 AP1M2 对肿瘤的影响，结果表明在多数肿瘤中的 ACE2 的表达水平影响了肿瘤相关的途径和免疫相关的途径的激活。
结论 这些发现表明，AP1M2 的表达水平与大多数癌症类型的预后与免疫浸润水平显著相关，包括 CD8+T 细胞、CD4+T 细胞、巨噬细胞、中性粒细胞和树突细胞，特别是乳腺癌患者。这些发现表明，AP1M2 可能会影响乳腺浸润癌患者的肿瘤环境，很有可能作为乳腺浸润癌的早期筛查甚至治疗靶点，有助于提高乳腺浸润癌早期筛查效率和患者的总体生存率。

PO-0564

A Nomogram Based on Clinicopathological Characteristics for Predicting the Risk of Lymph Node Metastasis in Small Size Non-small Cell Lung Cancer

Yuan Hong、Yong Duan
The First Affiliated Hospital of Kunming Medical University

Background Accurate lymph node metastasis (LNM) prediction is critical for therapeutic decision-making and prognostic evaluation, particularly in small-size non-small lung cancer (NSCLC) patients. The purpose of this study was to design and evaluate a nomogram for the dynamic preoperative prediction of LNM in patients with small-size NSCLC.
Method The primary size ≤ 2 cm NSCLC patients were selected from the Surveillance, Epidemiology, and End Results (SEER) database from 2010–2015 and randomly divided into a training cohort and an internal validation cohort according to the ratio of 7:3. External validation was performed using data from Kunming Medical University's First Affiliated Hospital. Seven variables were screened by Lasso-logistic regression analysis on the training cohort as potential predictors. The nomogram was developed based on these predictors and was validated by both the internal and external cohorts. As a result, evaluate the performance of the model through calibration curve, C-index, the area under the receiver operating characteristic curve (AUC), and decision curve analysis (DCA).
Results A total of 8,614 patients were included in the study, of whom 13% (1,112/8,614) were confirmed with positive LNM. Age, pathological grade, laterality, histology, T-status, size and pleural invasion were determined as independent predictors and used to plot a nomogram. The C-index was 0.717 and model's AUC was 0.717 (95% CI: 0.677-0.648). The model was further validated in the internal and external cohorts with AUC 0.680 (95% CI: 0.418-0.859) and 0.732 (95% CI: 0.753-0.727) and provided excellent calibration. We also conducted a DCA, which showed that our nomogram adds more net benefits than the treat-none and treat-all lines in the decision curve.

PO-0565

METTL3 介导的 CYP2B6 基因 m6A 甲基化修饰位点研究

逯素梅[1]、李永清[2]、张丹彤[1]、马万山[1,2]
1. 山东第一医科大学第一附属医院(山东省千佛山医院)
2. 山东大学附属千佛山医院

实验目的 RNA 序列不变的情况下，在 RNA 上进行化学修饰调控 RNA 的分子功能，进而调控生命发生发展的一系列研究被称为表观转录组学。其中 N6-methyladenosine (m6A)修饰是目前认为的真核生物中信使 RNA(mRNAs)、长链非编码 RNA (LncRNA)和微小 RNA (miRNAs)上最普遍的修饰。课题组前期研究发现，高脂饮食诱导下，肝组织 CYP2B6 基因 m6A 甲基化修饰水平显著升高，且受 METTL3 调控。本研究旨在明确 m6A 甲基化转移酶 METTL3 介导下的 CYP2B6 基因 m6A 甲基化修饰位点。
实验方法 培养人正常肝细胞 LO2，借助小干扰 RNA（siRNA）或者慢病毒载体进行甲基化酶 METTL3 的干扰表达或者过表达实验。设计多个不同的 CYP2B6 m6A 甲基化位点特异性引物，提取 RNA 后进行 MeRIP-qPCR 实验。
实验结果 小干扰 RNA 干扰 METTL3 的效果（对照组=1.0, METTL3-/- 组=0.22±0.048, P<0.05）与慢病毒感染过表达 METTL3 的效果(对照组=1.0, METTL3+/+ 组=29.36±5.84, P<0.05）显著。在干扰 METTL3 实验中(METTL3-/-)，位点 66 bp 处对照组 input%=3.494±1.081，METTL3-/- 组 input%=1.490±0.562，m6A 修饰水平下降显著(P<0.05）；位点 1291/1391/1561/1601 bp 的对照

组 input%=6.986±1.384，METTL3-/-组 input%=3.203±0.845，m6A 修饰水平下降显著(P<0.05）；而基因位点 425 bp, 812 bp 处修饰水平无明显差异(P>0.05）。同样，在过表达 METTL3 实验中(METTL3+/+)，位点 66 bp 的对照组 input%=4.389±1.532, METTL3+/+组 input%=8.962±2.064 (P<0.05); 位点 1291/1391/1561/1601 bp 的对照组 input%=11.344±3.673, METTL3+/+ 组 input%=24.486±6.382 (P<0.05），而基因位点 425 bp, 812 bp 处变化不明显(P>0.05）。
实验结论 METTL3 介导的 CYP2B6 基因 m6A 甲基化修饰位点主要发生在 5'-UTR 的 66bp 和 3'-UTR 的 1291/1391/1561/1601 bp 处。

PO-0566

Detecion of peripheral basophils in adult-onset minimal change disease

Qingjun PAN、Huanqin Han、Shuzhen Liao、Hua-feng Liu
Affiliated Hospital of Guangdong Medical University

Nowadays, the pathogenesis of minimal change disease (MCD) is still not well-known, and the current understanding on MCD is mainly based on data derived from children, and very few adults. Here, we comprehensively analysed the correlation between the changes of peripheral basophils and the incidence rate and relapse of adult-onset MCD. The results showed that in patients at the onset of MCD, the ratio and activation of basophils were all higher than those of healthy controls (all P < .05). In vitro test results showed that basophils from healthy controls can be activated by the serum taken from patients with MCD. Among 62 patients at the onset of MCD, with complete remission after treatment and 1 year of follow-up, the relative and absolute basophil counts before treatment were higher in the long-term remission group (n = 33) than that of the relapse group (n = 29). The basophil counts were significantly higher in the infrequent relapse group (n = 13) than that of the frequent relapse group (n = 16; P < .05). These findings suggested that basophil may play a pathogenic role in adult-onset MCD, and the increased number and activation of peripheral basophils could predict recurrence in adult MCD.

PO-0567

Detection of IgG4 Autoantibodies in Systemic Lupus Erythematosus Patients

Qingjun PAN、Lei Shi、Jun Cai、Yiming He、Hua-feng Liu
Affiliated Hospital of Guangdong Medical University

Pathogenic autoantibodies can cause inflammation and tissue injury in systemic lupus erythematosus (SLE). Although IgG4 is considered non-inflammatory owing to the unique structure of its hinge region, the role of IgG4 autoantibodies in SLE remains largely unknown. The titers of serum anti-nuclear-IgG antibodies (ANA-IgG) and anti-nuclear-IgG4 antibodies (ANA-IgG4) in newly diagnosed SLE patients were detected. The effects of IgG4 purified from SLE patients (SLE IgG4) and healthy controls on complement consumption and inflammatory cytokine production were evaluated in vitro. The therapeutic effects of mouse IgG1 (functionally resembles human IgG4) purified from lupus-prone MRL-lpr/lpr mice (lupus IgG1) and control mice on disease progression were examined in MRL-lpr/lpr mice. The results showed that SLE patients with equal titers of total serum ANA-IgG (1:3,200) were divided into group I with lower ANA-IgG4 titers (≤ 1:10) and group II with higher ANA-IgG4 titers (≥ 1:100), and disease activity, inflammatory cytokine production, complement consumption, and renal-function parameters in group I SLE patients were more severe than those in group II. Further, compared with control IgG4, SLE IgG4 inhibited complement consumption by autoantibody-autoantigen immune

complexes, and also inhibited inflammatory cytokines production by SLE PBMCs in vitro. Moreover, compared with control IgG1, lupus IgG1 exhibited a therapeutic effect on lupus by attenuating disease progression in MRL-lpr/lpr mice. These findings, for the first time, suggest that IgG4 autoantibodies can attenuate SLE progression by suppressing complement consumption and inflammatory cytokine production. Hence, this study may provide novel therapeutic strategies against SLE and other autoimmune diseases.

PO-0568

衰老机体内炎性因子的变化及二甲双胍抗衰老机制研究

张丽霞
山西医科大学第二医院

目的 本课题拟研究老年人体内促炎因子肿瘤坏死因子-α（Tumor Necrosis Factor α, TNF-α）以及抗炎因子白介素-10（Interleukin-10, IL-10）与机体衰老之间的潜在关联，并建立老年小鼠模型进一步验证 TNF-α 及 IL-10 与衰老过程中肝损伤之间的病理生理关系，通过给予衰老小鼠补充二甲双胍（Metformin, Met），探究 Met 是否可以通过调控炎性因子的变化对衰老过程中肝损伤发挥一定的保护作用。
方法 实验一：招募 2017 年 1 月至 6 月在山西医科大学第二医院健康查体的人员共 62 名，其中年龄在 20-35 岁的青年人与年龄在 60-75 岁的老年人各 31 名。收集两组人群基本信息包括年龄、性别、身高、体重，测量空腹血糖、血压，酶联免疫吸附实验检测两组人群血清中 TNF-α 以及 IL-10 的含量；实验二：3 组雌性昆明小鼠分别为：对照组（Control 组，月龄=2 月）、老年组（Aging 组，月龄=20 月）、二甲双胍治疗组（Aging+Met 组，16 月龄开始补充二甲双胍，连续给药 16 周），每组各 8 只。检测小鼠体重及肝脏重量计算肝脏系数；HE 染色观察肝细胞病理损伤；β 半乳糖苷酶染色观察肝细胞衰老程度；免疫组织化学法以及 Western blot 测肝脏中 TNF-α、IL-10 的含量；生化定量法检测肝脏谷胱甘肽（glutathione, GSH）及丙二醛（malondialdehyde, MDA）含量。
结果 临床研究发现，与青年组相比，老年人群体质指数、平均动脉压以及空腹血糖含量升高，血清中 TNF-α 水平升高，IL-10 水平降低，差异具有统计学意义（$P<0.05$）；动物实验中发现，与对照组相比，衰老小鼠肝系数显著下降；肝细胞胞浆疏松，局部炎性细胞浸润明显；SA-β-Gal 表达量增高；肝脏中 TNF-α 水平升高而 IL-10 水平下降；GSH 水平降低，MDA 水平升高。与衰老组相比，补充 Met 可抑制肝脏萎缩；肝细胞胞浆丰富，细胞排列趋近整齐；SA-β-Gal 表达量降低；肝组织内 TNF-α 水平降低而 IL-10 水平升高；肝脏中抗氧化物酶 GSH 含量升高，MDA 水平降低。
结论 结合临床研究和动物实验，本课题揭示了老年机体内存在促炎因子 TNF-α 表达的上调以及抗炎因子 IL-10 表达的下调，这种促-抗炎性细胞因子的失衡可能是引起机体炎性老化的关键；外源性给予二甲双胍可通过调控炎性因子的改变，重塑促-抗炎细胞因子的平衡，减轻氧化应激引起的损伤，从而达到干预衰老的目的。

PO-0569

6σ 质量管理规则在内分泌项目的质量策略优化中的应用

翟媛媛、马瑾、贺娇
西安市第十医院西安市精神卫生中心

目的 根据两种不同的总允许误差标准(TEa)确定不同的西格玛值，绘制性能验证图并分析质量目标指数（QCI），改进我院内分泌项目的质量控制策略。
方法 分别以我国卫生部临检中心室间质量评价标准和生物学变异的“最适”标准的总允许误差（TEa）为性能规范目标，以 2020 年半年间我院在新产业生物 MAGLUMI-2000PLUS 和采用迈瑞 CL6000i

化学发光免疫分析仪上测定的 11 个内分泌项目的累积在控室内质控是数据计算不精密度（CV），以 2020 年第一次卫生部临检中心室间质评偏倚数据的加权均值为偏倚（Bias）来源，计算 σ 值，应用标准化西格玛性能验证图选择合适的质量控制规则，并计算各项目的质量目标值指数（QGI），分析项目性能不佳的原因，提出优化方法。
结果 按照 NCCL 的标准，11 个内分泌项目中 3σ 以下的项目占比为 9.09%；按照生物学变异标准，10 个内分泌项目 3σ 以下的项目占比 50%；加权合成 σ 总后，3σ 以下的项目没有变化；按照 NCCL 的标准，针对不同的 σ 值选择不同的质控策略。其中，FT4、TT4、TSH、P、T 需改进精密度，FT3、TT3 需改进精密度和正确度。
结论 精神专科医院可以综合应用合适的 6σ 质量规范，科学的评价内分泌项目的性能指标，优化质控策略，保证检测项目的质量水平。

PO-0570

武汉火神山医院应急检验保障体系的建设与思考

夏欣一
中国人民解放军东部战区总医院

新型冠状病毒流行期间，检验科在诊断、疗效评估、预后判断等环节上发挥了重要作用。通过分析火神山医院应急检验保障体系的建设经验，为突发疫情下新建传染病医院的应急检验保障体系的建设提供思路和参考。1.选址设计：远离人流、工作流密集交叉的独立区域。实验室内部三区两通道模式设计，兼顾人流、物流、标本流及医疗垃圾运送通道。设施区域间的压力梯度，保证空气由洁净区流向污染区；2. 组织体系建设：建立感控小组，明确主任为科室感控工作的第一责任人，建立联络员制度，确保感控工作的上传下达和制度的末端落实；3.实验室管理：建立应急状态下严格执行的检验科质量管理体系、检验危急值报告制度、核酸标本采集转运流程等规范性文件，明确划分清洁区、半污染区、污染区，中间设置缓冲区，工作人员均实行 3 级防护，全程建立常态化感控培训机制；4.工作流程：火神山医院检验科迅速完成仪器设备安装调试、人员培训、信息系统建设。后续检验项目分阶段逐步展开，一期开展血细胞分析、临床生化、免疫学，输血相关检验，二期开展核酸、微生物免疫学、细胞因子、流式细胞分析，三期开展抗体分型、定量及多种病原核酸检测。5.临床保障：检验团队 3 天内展开 9 大项 208 个基础检验项目，9 天内拓展至 35 大项近 500 小项，累计检测各种临床标本 5 万余件。全程“零暴露”“零感染”。讨论与思考：1.应急体系的建设是必要手段：建立一套科学先进的应急体系，系统规范管理突发卫生事件，提升应急工作效率和质量；2.分阶段重点建设是关键：早期工作保障临床急需项目，后续针对临床诊治提出的新需求，积极拓展；3.优化人员配置是核心：遵循“平战结合”的战略原则，平时应加强人员的培训和演练，建立应急梯队；4.生物安全是底线：建立健全相关管理制度，严格规范操作。

PO-0571

IFN 诱导 AML 细胞 SARI 表达及其作用水平和 STAT1 通路的探讨

江贤栋、刘书涵、陈巧倩、郑志远
福建医科大学

目的 1 分析 IFN 对 AML 细胞株 SARI mRNA 和蛋白的表达变化情。 2 探讨 IFN 诱导的 SARI 基因对 AML 细胞生物学活性的影响。3 探讨 IFN 诱导 AML 细胞 SARI 表达是否激活 STAT1 通路。
方法 1 采用 RT-PCR 和 qPCR 筛选 SARI mRNA 中、低表达的 HL60 和 NB4 细胞作为实验细胞株；在不同时间选取不同浓度的 IFN-β/γ 处理 HL60 和 NB4 细胞，通过 qPCR 和 Western blot 检测 SARI mRNA 和蛋白的表达水平。 2 采用 MTS 法、细胞克隆形成实验及 AnnexinV-PE/7-AAD 双染

法检测 HL60 和 NB4 细胞增殖、凋亡等生物学活性指标的改变。3 运用 WB 检测 IFN-β/γ 对 HL60、NB4 细胞 STAT 信号通路蛋白 STAT1、STAT3、STAT5 及其磷酸化蛋白和 SARI 蛋白的影响；采用 WB 检测氟拉达滨和 IFN-β/γ 同时作用 HL60、NB4 细胞后，STAT1、p-STAT1 和 SARI 蛋白的表达变化。
结果 1 在 3 种 AML 细胞株中，SARI mRNA 表达水平为 Kasumi-1＜NB4＜HL60，且低于正常外周血细胞的 SARI mRNA 表达水平。 2 不同剂量的 IFN-γ 和 IFN-β 分别作用 HL60、NB4 细胞，其 SARI mRNA 的表达水平均显著高于对照组（p＜0.05）。 3 IFN-γ 和 IFN-β 分别作用 HL60 和 NB4 细胞 12h、15h，在 12h 时加药组的 SARI 蛋白表达水平显著高于对照组（p＜0.05），相比 15h 的 SARI 蛋白表达水平没有明显变化（p>0.05）。 4 与对照组相比：MTS 比色法显示，加药组细胞增殖速度减缓（P＜0.05）；克隆形成实验，加药组细胞克隆形成率明显减低（P＜0.05）；流式细胞术凋亡检测，加药组细胞总凋亡率增加（P＜0.05）。5 IFN-γ 组和 IFN-β 组的 STAT1、p-STAT1 和 SARI 蛋白的表达水平显著高于对照组（P＜0.05）；氟拉达滨可以降低 STAT1 蛋白的表达；IFN-γ+Flu 组和 IFN-β+Flu 组的 STAT1、p-STAT1 蛋白表达水平显著低于 IFN-γ+DMSO 组和 IFN-β+DMSO 组（P＜0.05）。
结论 1 IFN-γ 和 IFN-β 可以上调 HL60、NB4 细胞的 SARI mRNA 和蛋白表达水平。 2 IFN-β/γ 诱导的 SARI 表达明显抑制 HL60 和 NB4 细胞增殖，诱导细胞凋亡，主要为早期凋亡。3 氟拉达滨可以降低 IFN-β/γ 上调的 HL60、NB4 细胞 STAT1 和 p-STAT1 蛋白的表达，提示 IFN-β/γ 可能是通过激活 STAT1 通路诱导 SARI 表达。

PO-0572

第三方医学实验室快速响应新冠疫情

杨思雨
沈阳金域医学检验所有限公司

目的 本文介绍在新冠疫情期间第三方实验室如何快速响应支持政府筛查工作。
方法 政府要求所有可以承接新冠筛查检测的实验室应具备有效性，准确性，安全性以及时效性。为能达到相关要求，本公司于相关职能部门表达能够提供的检验能力及水平并配备适宜的人员，设备和设施等资源，建立质量关系体系以及管理文件，建立内外部的沟通制度。为实现日检测量最大化，采取多种管理模式，在疫情期间，各部门全员配合，除三大部门（实验室，业务部，物流部）以外，其他部门参与辅助工作，包括枪头的摆放，试剂的拆箱和标本的摆放等工作。实验室常规项目采取外包设置，全员参与到新冠检测当中，将全部人员分为三个班次，分别为早班、中班、晚班进行全天轮转工作。分析结果的人员为本班次检测负责人，负责处理检测过程中出现的问题。检测室设有小组长，负责检测中的各项问题。采用全自动加样系统提升检测效率，调取大区内可调控的检测资源，实现产能最大化。
结果 有效并准确完成政府分配的所有任务。在原有基础上，此轮转机制更是提升了日检测的效率。
结论 在疫情期间，做到了快速响应政府筛查号召，为精准施策、救治关口前移赢得了宝贵时间。

PO-0573

新冠疫情下儿童常见呼吸道病毒的流行病学变化特征

柳鹏程、徐梦华、曹凌峰、苏犁云 、卢丽娟、贾然、董妞妞、徐锦
复旦大学附属儿科医院

目的 新冠疫情期间，国家采取了各种公共卫生干预手段，如居家隔离、关闭公共娱乐场所和学校、戴口罩等，这些措施不仅有效限制了新冠病毒的传播，对其他常见呼吸道病毒的流行也会产生影响。

本研究旨在阐述新冠疫情防控常态化下的人为公共卫生干预手段对儿童常见呼吸道病毒流行特征的影响。
方法 收集 2019 年（疫情前）和 2020 年（疫情期间）于复旦大学附属儿科医院就诊，临床诊断为下呼吸道感染（LRTIs）的住院患儿的呼吸道标本（鼻咽抽吸物/肺泡灌洗液）。使用直接免疫荧光法检测呼吸道合胞病毒（RSV）、腺病毒（ADV）、副流感病毒 1-3 型（PIV1-3）、甲型流感病毒（FluA）、乙型流感病毒（FluB）、偏肺病毒（MPV），使用实时荧光定量 PCR 检测鼻病毒（RV），并比较分析 2020 年和 2019 年的病毒检测结果。
结果 研究共纳入 7107 例患儿，其中 2019 年 4600 例，2020 年 2507 例。相比较于 2019 年，2020 年 RSV、ADV、FluA、FluB、和 MPV 的检出率显著下降，即使在 6 月份中小学复学后，这些病毒的检出率仍未见上升。然而，2020 年 RV 的检出率却增高，特别在复学后显著上升。此外，PIV 的检出率在 2020 年 9 月后出现上升趋势，并且呈现与 2019 年不同的流行趋势。2020 年的混合感染率相比较于 2019 年显著下降。
结论 新冠疫情防控常态化下的人为公共卫生干预措施对儿童常见呼吸道病毒的流行特征产生显著的影响。在大部分呼吸道病毒流行降低的情况下，我们仍需警惕个别病毒像 PIV 和 RV 一样“复现”，并且这种“复现”可能会呈现与以往不同的流行趋势。

PO-0574

新型冠状病毒实验室核酸检测过程生物安全防护措施探讨

周明莉
成都市第三人民医院

目的 探讨和制订适合新型冠状病毒核酸检测实验室核酸检测过程的生物安全防护措施，为临床实验室实施核酸检测提供行之有效的生物安全防护。
方法 参考国家卫生健康委员会颁布的新型冠状病毒感染的肺炎诊疗方案及国家相关法律法规及专家共识等，对新型冠状病毒核酸检测实验室核酸检测过程的生物安全防护进行阐述。
结果 从标本采集，样本运输、接收及保存、核酸检测整个过程，废弃物的处理等环节，根据实际情况制定了合理、切实可行的生物安全防护流程。
结论 通过制定并实施新型冠状病毒核酸检测实验室的核酸检测过程生物安全防护措施，有效地降低感染传播风险，预防控制新型冠状病毒对实验室环境和人员的感染。

PO-0575

苏州某三甲医院污水中产 TMexCD-TOprJ 耐碳青霉烯类革兰阴性杆菌的分布及其特征研究

朱婕、杜鸿
苏州大学附属第二医院

目的 替加环素是治疗碳青霉烯酶耐药革兰阴性杆菌（carbapenem-resistant gram-negative bacteria，CR-GNB）的为数不多的有效药物之一，2020 年有报道发现一种新型的介导替加环素耐药的 RND 型外排泵基因簇 tmexCD-toprJ。目前，tmexCD-toprJ 样基因簇主要在中国养鸡场中传播，并已扩散至人，本研究旨在分析产 TMexCD-TOprJ 的 CR-GNB（TMexCD-TOprJ-producing CR-GNB，TMCR-GNB）在苏州某三甲医院污水中的流行情况。
方法 通过聚合酶链反应（PCR）对 2019 年医院污水中初筛的 CR-GNB 检测 tmexCD-toprJ 基因携带情况；通过微量肉汤稀释法进行药敏实验；通过二代测序技术获得菌株的全基因组数据，通过系统发育分析对 tmexCD-toprJ 进行分型，通过精细注释分析其遗传学特征。

结果 从苏州某三甲医院污水中分离出 5 株 TMCR-GNB：1 株为携带 tmexCD2-toprJ2、blaIMP-4、blaNDM-1 的解鸟氨酸拉乌尔菌，这是 blaIMP-4、blaNDM-1 共存于解鸟氨酸拉乌尔菌的首次报道；其余 4 株为携带 tmexCD3-toprJ3 的假单胞菌属菌株，同时分别携带 blaIMP-1、 blaVIM-2 中一种碳青霉烯酶基因。5 株 TMCR-GNB 均表现出对头孢菌素类、β 内酰胺类、氨基糖苷类等多种类抗生素耐药。碳青霉烯酶基因 blaIMP-4、blaNDM-1 、blaIMP-1、 blaVIM-2 均位于各自所携带的质粒上，基因簇 tmexCD-toprJ 位于解鸟氨酸拉乌尔菌的质粒及假单胞菌属菌株的染色体上，其周围骨架基因排列构成相似，位于转座子 Tn6855 上，推测其携带 tmexCD-toptJ 基因簇在染色体和质粒间移动或造成进一步传播，而假单胞菌属菌株可能成为该外排泵基因簇的储存库。
结论 质粒介导的碳青霉烯酶基因、新型替加环素耐药基因已经传播至医院污水中，这突出了对环境中携带外排泵基因簇 tmexCD-toprJ 的监测的重要性，虽然目前 tmexCD-toprJ 仅在中国检出，但其可能通过全球人口流动、鸟类迁徙造成全球流行。

PO-0576

普通人群 SAR-CoV-2 核酸筛查 PCR 结果分析

朱爱兰、郑登滋、徐丛荣、李秀兰、王清泰、江芳华
福建中医药大学附属第二人民医院

目的 分析普通人群 SAR-CoV-2 核酸筛查 PCR 异常扩增曲线产生的原因，并采取相应的处理措施
方法 统计分析本实验室 2021 年 3 月异常扩增曲线出现的频率和类型。
结果 本实验室 SAR-CoV-2 核酸扩增检测无效率为 0.63%（79/12513），质控内标污染占比为 0.93%（116/12513），扩增曲线受到抑制占比为 1.34%（168/12513），SAR-CoV-2 核酸 ORF1ab 假阳性占比为 0.04%（5/12513），SAR-CoV-2 核酸 N 基因假阳性占比为 0.04%（5/12513）。
结论（1）试剂尽量不要反复冻融；混匀样本，加样准确，尽量避免吸入痰液可以减少内标出现无效扩增及扩增受抑制的情况。（2）实验室要注意通风透气，防止气溶胶聚集太多。每次实验完毕都要及时消毒可以避免假阳性出现。

PO-0577

Contribution of BDNF/TrkB signalling in the rACC to the development of pain-related aversion via activation of ERK in rats with spared nerve injury

Le Zhang 、Chuan Wang
The Second Hospital, Cheeloo College of Medicine, Shandong University

Purpose Neuropathic pain resulting from peripheral nerve injury is a serious clinical problem that is clinically expressed as allodynia and hyperalgesia. In fact, patients with persistent pain frequently suffer from a series of aversive emotions including anxiety, fear and depression, which are more distressing than the pain itself. It is well acknowledged that the rACC is a key structure in the processing of affective pain, but the underlying molecular mechanism of how neuropathic pain-related aversive states arise in the rACC is still unclear. Brain-derived neurotrophic factor (BDNF), a member of the neurotrophin family of proteins, is widely distributed in the pain-related pathway and limbic system of the central nervous system, suggesting that it is likely to play a crucial role in pain-related functions. Although a large number of studies have focused on the generation of persistent pain mediated by BDNF/TrkB signalling, knowledge of the role of this signalling in the rACC in relation to the development of neuropathic pain-related aversion is still largely incomplete. Previously, we have demonstrated that BDNF/TrkB signaling participates in

spontaneous pain-related aversion via NR2B receptors. It was recently reported that the increased number of pERK positive cells in the rACC of inflammatory rats could be completely suppressed by an administration of a TrkB receptor antagonist. Therefore, in this study, we aim to investigate whether this BDNF signalling in the rACC contributes to the formation of pain-related negative emotions via activation of ERK in rats with peripheral nerve injury.
Methods A spare nerve injury (SNI) was done in rats to imitate NP model. Paw withdrawal threshold (PWT) was used for evaluation of hypersensitivity in NP, and conditioned place avoidance (CPA), a behavioural phenotype was conducted to reflect pain-related aversion. qRT-PCR, western blot, ELISA, immunofluorescence and immune-histochemistry were performed to determine the quantity of involved genes in NP.
Results Compared with that in the sham-operated group, the mRNA and protein level for BDNF were markedly increased in the rACC of surgical rats. The SNI rats showed increased CPA score when compared with controls. However, the increased CPA score could be blocked by CTX-B, a highly selective TrkB receptor antagonist, suggesting BDNF participates in the acquisition of CPA via its high affinity receptor TrkB. Subsequently, we found administration of exogenous BDNF into the rACC of intact rats also induced CPA, which further demonstrated that BDNF was the key factor in producing pain-related aversion. Thereafter, blockage of BDNF/TrkB signaling could downregulate the activation of ERK.
Conclusion Our study showed that enhanced BDNF expression in the rACC participates in the aversive state of neuropathic pain, and activated ERK is an indispensable downstream effector of the BDNF/TrkB signalling pathway. This research is clinically significant and suggests that a new strategy targeting BDNF-related signalling in the rACC is likely to be useful for the alleviation of pain-related emotional disturbance due to peripheral nerve injury.

PO-0578

E-钙粘蛋白在三维球形体培养维持间充质干细胞的干性中的作用

张世昌、梁婷婷
江苏省人民医院（南京医科大学第一附属医院）

目的 体外球形体培养能有效维持间充质干细胞（MSCs）的干性，本研究探讨 E-钙粘蛋白在三维球形体培养维持间充质干细胞的干性中的作用。
方法 以旋转生物反应器内培养的三维球形体 MSCs 为研究对象，利用 RT-PCR、western blot、免疫组化染色观察球形体培养 MSCs 中 E-钙粘蛋白表达的变化，采用基因转染和 shRNA 干扰技术改变球形体培养 MSCs 的 E-钙粘蛋白表达，检测球形体培养 MSCs 细胞增殖、克隆形成、多向分化潜能等干性指标的变化。
结果 RT-PCR、免疫组化染色、western blot 结果显示三维球形体培养显著提高 E-钙粘蛋白在 MSCs 中的表达；基因转染上调 E-钙粘蛋白的表达可显著提高 MSCs 形成球形体的数量，shRNA 下调 E-钙粘蛋白的表达可明显减少 MSCs 形成球形体的数量，提示 E-钙粘蛋白在 MSCs 的球形体形成中发挥重要作用；过表达 E-钙粘蛋白表达可显著提高球形体培养 MSCs 的增殖能力、克隆形成率、干性相关基因和多向分化潜能，shRNA 抑制 E-钙粘蛋白表达可显著降低球形体培养 MSCs 的增殖能力、克隆形成率、干性相关基因和多向分化潜能，表明 E-钙粘蛋白的表达有利于球形体培养 MSCs 的干性维持，提示 E-钙粘蛋白在生物反应器内球形体培养 MSCs 的干性维持中发挥关键作用。
结论 生物反应器内球形体培养通过提高 E-钙粘蛋白的表达，促进体外培养 MSCs 的干性维持，有利于建立既能大规模扩增又能维持 MSCs 干性的体外培养方法，为 MSCs 的临床转化奠定基础。

PO-0579

Trichostatin A, a histone deacetylase inhibitor, suppresses proliferation and promotes apoptosis of esophageal squamous cell lines

Junfen Ma
the First Affiliated Hospital of Zhengzhou University

Aim Histone deacetylases (HDACs)-mediated epigenetic modification plays crucial roles in numerous biological processes. The tumorgenesis and development esophageal squamous cell carcinoma (ESCC) are involved in both genetic and epigenetic mechanisms. However, the effects of the HDACs inhibitor on ESCC are not fully investigated. Here, we treated ESCC cells with trichostatin A (TSA) and evaluated its antitumor effects and related mechanism.
Methods The proliferative ability of the ESCC cells treated with different concentrations of TSA (0.1–5.0μM) was assessed by the MTT. The cell cycle phase distribution of ESCC
was measured by flow-cytometry. The cell apoptosis in ESCC cell lines treated with different dose of TSA for 48h was evaluated by apoptosis assay. The protein levels of p21, p27, Bcl-2 and Bax were investigated by western-blot.
Results Our results indicated that TSA can suppress the proliferation of ESCCs, cause G1 phase arrest through inducing the expression of p21 and p27. TSA can also induce cell apoptosis through enhancing the expression of proapoptotic proteins Bax and decreasing the expression of antiapoptotic protein Bcl-2. Furthermore, we found that TSA inhibited the expression of PI3K, and reduced the phosphorylation of Akt and ERK1/2 in both EC9706 and EC1cell lines. The high levels of acetylated histone H4 were detected in TSA-treated ESCC cell lines.
Conclusion These results indicate that TSA supresses ESCC cells growth by inhibiting the activation of the PI3K/Akt and ERK1/2 pathways. TSA can also promote cell apoptosis through epigenetic regulation the expression of apoptosis.

PO-0580

miR-106a 通过靶向 LKB1 调控 HPV 16 阳性宫颈癌细胞的增殖和自噬

陈翰祥
山东第一医科大学第一附属医院（山东省千佛山医院）

目的 探讨 miR-106a 在 HPV 16 阳性宫颈癌恶性转化中的作用及机制。
方法 收集 56 例因子宫良性病变切除子宫患者的 HPV 阴性的正常宫颈组织（对照组）及 78 例 HPV 16 阳性宫颈癌患者的宫颈癌组织（宫颈癌组），采用实时荧光定量 PCR (RT-qPCR)检测 miR-106a 在组织及细胞中的表达。统计分析 miR-106a 在组织两组间的表达差异，并验证 miR-106a 与患者临床病理学参数的关系。采用 ROC 曲线评估 miR-106a 的诊断价值。通过 CCK-8，平板克隆，EdU 实验检测 miR-106a 对宫颈癌细胞增殖的影响。Western blot 检测 miR-106a 作用后宫颈癌细胞自噬相关蛋白的变化，并采用共聚焦显微镜观察自噬体的形成。通过生物信息学软件预测 miR-106a 的靶基因，并使用双荧光素酶实验验证。使用 Western blot 验证 miR-106a 调节的信号通路。构建 HPV16 E6/E7 稳定表达细胞系，探究 HPV 对 miR-106a 的影响。
结果 miR-106a 在 HPV 阳性宫颈癌组织和细胞中高表达，且 miR-106a 主要由 E7 致癌基因激活，表达差异有统计学意义。miR-106a 高表达与 HPV 阳性宫颈癌患者的肿瘤大小、FIGO 分期、淋巴结转移、脉管浸润以及低组织学分级呈显著相关性(P 均<0.05)，且 miR-106a 的表达达可以明显地区分对照组和肿瘤组。miR-106a 通过靶定抑癌基因 LKB1 促进宫颈癌细胞增殖抑制自噬，并激活 AMPK/mTOR 信号通路。

结论 miR-106a 在宫颈癌恶性转化过程中可能发挥了重要作用。miR-106a 有望成为 HPV 感染相关宫颈癌的潜在诊断标志物和治疗靶点。

PO-0581

Puerarin exhibits antiinflammatory properties in gunpowder smog-induced acute lung injury in rats via regulation of the renin-angiotensin system and the NFκB signaling pathway

Fan Zhang [2]、Yu Wang[1]、Peipei Liu[1]、Ping Di[1]、Mianyang Li[1]、chengbin Wang[1]
1. Chinese People's Liberation Army General Hospital
2. 解放军总医院第一医学中心检验科

Puerarin, which is a widely used in Traditional Chinese Medicine, was previously demonstrated to regulate the subsets of CD4+ lymphocytes in gunpowder smog-induced acute lung injury (ALI). However, the underlying mechanism remains largely unknown. Previous studies on autoimmune diseases have revealed that the renin-angiotensin system (RAS) and NF-κB participate in regulating the levels of CD4+ T lymphocytes. The aim of the present study was to further investigate the mechanisms underlying the protective effects of puerarin. Wistar rats were randomly divided into four groups as follows: Normal control, puerarin control, smoke inhalation injury and puerarin treatment plus smoke inhalation injury groups. The levels of angiotensin II (Ang II) in lung tissue and in the circulation, and the levels of interleukin (IL)-6, IL-1β, IL-17A and tumor necrosis factor (TNF)-α in the bronchoalveolar lavage fluid (BALF) were assayed using ELISA kits. The expression of Ang II type 1 receptor (AT1-R), angiotensin-converting enzyme (ACE) and ACE2 were examined by immunohistochemical analysis and western blotting. Phosphorylated (p-) NF-κB p65 and NF-κB inhibitor α (IκB-α) protein expression levels were also determined using western blotting. Puerarin treatment reduced the levels of inflammatory cytokines in the BALF. Furthermore, puerarin treatment significantly decreased the levels of Ang II, AT1-R and ACE, which were increased following smoke inhalation. Conversely, puerarin treatment upregulated the expression of ACE2, which was downregulated following smoke inhalation. Additionally, puerarin decreased the expression of p-NF-κB p65 and increased that of IκB-α. Thus, the antiinflammatory effects of puerarin were partly mediated via the RAS and via regulation of the NFκB signaling pathway in rats with gunpowder smog-induced ALI.

PO-0582

Prevalence and genotypes of human papillomavirus among men in Yunnan province, China

Ya Xu [1]、Yu Zhang[2]、Xin Fan[1]、Guiqian Zhang[1]、Ziqin Dian[1]、Yi Sun[1]
1. the First People's Hospital of Yunnan Province
2. 昆明理工大学

Human papillomavirus (HPV) infection is one of the most common sexually transmitted infections. Persistent infection is associated with the development of cervical cancer. Men could serve as a medium for HPV transmission among women, and little is known about the prevalence and genotypes of HPV infection among men in Yunnan province. This study is designed for investigating these parameters among men in this region. Clinical information was collected from January 2015 to May 2020, and a total of 369 men who sought to get tested for HPV were included in this study. HPV screening was performed using the HPV GenoArray Test Kit and the anatomical site of sample collection is urethra. The mean age was 36.15 ± 9.08 years. Our

results revealed that the prevalence of HPV infection among men was 23.8% in Yunnan Province, and there was no association between age and HPV prevalence in men. There were 72 (81.81%) individuals positive for a single HPV type and 16 (18.19%) positive for multiple types. The highest prevalent oncogenic HPV types were types 52, 51, and 16. The prevalence of HPV in men was relatively high, and the most prevalent types of HPV infection were similar between men and women from this region.

PO-0583

The association between gut microbiome and blood glucose in pig

Haiyue Liu[1,2]、Guolin Hong[1,2]
1. The Department of Laboratory Medicine, the First Affiliated Hospital of Xiamen University, Xiamen, China；Xiamen Key Laboratory of Genetic Testing, Xiamen, China.
2. 厦门市基因检测重点实验室

Background The present study compared the diversity of gut microbiota in Bama pig (pig) with or without high glucose. Diabetes or prediabetes is a disease with elevation of blood glucose and would finally lead to various cardiovascular diseases (CVDs). Importantly, diabetes is prevalence in China in recent years due to unhealthy life style and dietary habits. More importantly, the popularizing and treatment rate are extremely low in China. Previous studies in pig models of metabolic diseases and nutrient abortion had leaded a fulfillment of the translational gap to develop new therapies for better human health. Metabolic disorder is commonly accompanied with abnormal blood glucose or diabetes. Previous study have use pig model to search for the metabolic pathway of small intestine epithelial cells blood glucose level, which provided novel and significant insights into the control of blood sugar during the absorption stage in the intestine. Additionally, some researchers suggested that pig models is good for the study on metabolic syndrome and obese type 2 diabetes. These studies have shown pig to be suitable models for glucose-related disease. It was reported that pig gut microbiota showed enriched function in metabolic pathways, which could be influenced by the age, genetics, diet and environmental factors. And, some metabolic-related dietary components such as cholesterol, affected the intestinal microbiota in a major way to regulate the metabolism. But there is lack of data about the porcine gut microbiome at different blood glucose levels. The cause and effect of gut microbiota and diabetes were depicted in recent years. Exploring and unveil the underlying mechanism in gut microbiota and diabetes would provide some attracting therapeutic targets for the diagnosis and treatment of diabetes or prediabetes. In the present study, we aim to explore the relationship between blood glucose and gut microbiome.
Methods First, the fecal samples of pig were collected. Second, 16S rRNA V4 hyper-variable DNA regions from the pig were amplified using the stool metagenomic DNA and sequenced with MiSeq sequencing platform. Briefly, all animals were anesthetized for blood sampling and single housed for fecal collection. All fecal samples from experimental animals were collected randomly by trained person from the SPF Experimental Animal Center and stored at -20 degree for short time (less than 12 hr) and then stored at -80 degree until DNA extraction.
Results And the male pig have a consist higher alpha diversity than the female ones when statistic with Shannon, Chao1, observed_species, PD_Whole_tree index, with a significantly different in Shannon diversity (T-Test). We further used LefSe to pick the biomarkers between high and normal blood glucose groups of each gender. We found that female pig had more biomarkers than the male pig with increased (20 vs. 12) and decreased (3 vs. 1) taxa in high blood glucose group compared to normal blood glucose group. None of the biomarkers were coexisted in female and male pig. Butyricimonas, Campylobacterales, Catenibacterium, Clostridiaceae, Epsilonproteobacteria, Helicobacter, Heliobacillus, Methanobacteria, Methanobacteriales, Methanobrevibacter, Mobiluncus, Natronincola, Porphyromonas, Veillonella were high abundant in female pig with high blood glucose, while Prevotella, Ruminococcaceae,

Robinsoniella were high abundant in normal blood glucose group. Whereas, in male groups Chloroplast, Cloacibacillus, Cyanobacteria, Gracilibacteraceae, Neisseriaceae, Neisseriales, Peptostreptococcaceae, Porphyromonas, Pseudomonadaceae, Streptophyta Peptoniphilus were abundant in high blood glucose group and Anaerovorax found to be abundant in normal blood glucose group.
Conclusion The gut microbiota were different in pig with or without high glucose.

1. 天津医科大学医学检验学院
2. 天津医科大学医学检验学院

目的 金黄色葡萄球菌（金葡菌）是严重危害人类生命健康的一种革兰阳性病原菌。本课题组前期研究发现，Syk 及 JNK 在金葡菌感染过程中发生磷酸化，进而激活 NLRP3 炎症小体，上调 IL-1β 等炎性因子的分泌过程，然而其具体机制尚不明确。且 caspase-1 可触发细胞焦亡过程，引起胞膜成孔，进而交换细胞内外物质。因此本课题拟探讨 Syk、JNK 在胞外菌金葡菌感染过程中对细胞焦亡关键蛋白 GSDMD 及 IL-1β 等炎性因子分泌的调控作用，以便为金葡菌感染提供新的治疗靶点。
方法 1.金葡菌感染 Syk/JNK 抑制剂及 siRNA 预处理的小鼠单核巨噬细胞（J774A.1 cells）及小鼠腹腔巨噬细胞（PECs）24h 后，western blot 检测 NEK7、IL-1β 及焦亡蛋白表达水平的变化。RT-PCR 检测 NEK7、IL-1β 及 GSDMD mRNA 表达水平的变化。Co-IP 检测 NLRP3-NEK7 复合物水平。
2.金葡菌感染 Syk/JNK 抑制剂预处理的 J774A.1 cells 及 PECs 48h 后，ELISA 检测细胞上清液中 IL-1β 及 IL-18 水平变化。
3.金葡菌感染 NEK7-siRNA 预处理的 J774A.1 cells 及 PECs 24h 后，western blot 检测细胞裂解物中 NEK7、IL-1β 表达水平的变化。RT-PCR 检测细胞中 NEK7、IL-1β 及 GSDMD mRNA 表达水平的变化。
4.Western blot 检测 IL-1β 及焦亡蛋白 GSDMD 在金葡菌感染 J774A.1 cells 过程中的时间变化趋势。
结果 1.与未处理组相比，Syk/JNK 抑制剂及 siRNA 处理组中 NEK7 蛋白及 mRNA 表达水平明显回升，伴随 IL-1β 蛋白及 mRNA 水平明显降低及 GSDMD mRNA 水平明显降低；Co-IP 结果表明，Syk/JNK 抑制剂处理组中 NLRP3-NEK7 复合物的形成明显低于未处理组。
2.与未处理组相比，Syk/JNK 抑制剂及 siRNA 处理组中细胞上清液中 IL-1β 及 IL-18 蛋白水平明显减少。
3.与未处理组相比，NEK7-siRNA 处理组中 IL-1β 蛋白及 mRNA 水平明显降低， GSDMD mRNA 水平明显降低。
4.Western blot 结果表明，随着 GSDMD-N 表达逐渐增多，细胞内 IL-1β 蛋白水平先增多后逐渐降低的趋势。
结论 Syk/JNK/NEK7 参与调控金葡菌感染过程中细胞焦亡关键蛋白 GSDMD 的表达及 IL-1β 炎性分子分泌过程。

PO-0585

基于信息化平台的临床实验室质量管理探索

杨悦林、钱净、张鸿伟、黎海生、赵晓丽、胡大春
昆明市第一人民医院

目的 探索基于信息化平台的临床实验室质量管理。
方法 利用计算机编程技术设计不同功能模块，构建信息化平台。采集实验室一定时期内的质量体系运行原始数据，应用该平台统计分析检验前标本可接受性、检验后不正确检验报告、样本实验室内周转时间、室内质量控制效能等多维度质量指标。
结果 2018 年度的质量指标分析表明，实验室的检验前标本可接受性为 99.92%。进一步的多维度质量分析显示，抗凝样本发生凝聚在样本不合格原因中排名第一（占比 53%）；不正确检验报告率为 0.006%。临床血液体液组不正确报告占比高达 33.3%；急诊/住院样本在实验室内的周转时间(中位数，分钟)分别为：生化检验组 198/57、自动化免疫检测组 306/63、三大常规检测组 37/14、凝血组 90/56；实验室不同定量项目室内质控开展率 100%、定量项目 CV%达标率 88.89-100%、偏倚达标率 75-100%、总误差达标率 86.68-100%、六西格玛达标率 62.5-100%。
结论 本研究建立的临床实验室质量管理信息化平台既能实现质量体系中大量复杂数据的快速和真实获取，也能辅助实验室人员对质量问题进行更深层次的挖掘分析。

PO-0586

探讨第三方医学实验室在大规模人群新型冠状病毒核酸筛查中的生物安全防护措施

魏琦、都伟杰、王倩倩、李志强、毛源
合肥金域医学检验实验室有限公司

目的 探讨第三方医学实验室在大规模人群新型冠状病毒核酸筛查期间如何做好实验室日常生物安全防护措施。
方法 第三方医学实验室在检测能力和服务网络等方面有特殊优势，近期安徽省六安市新冠疫情期间，本实验室根据国家、省、市卫建委有关文件要求，积极开展新冠核酸的检测工作。从标本的运输、检验前、检验中、检验后、突发事件等各个环节均涉及生物安全防护措施。例如物流运输整个过程秉持“合法合规、全面防护”，包括承运资质、人员防护、包装防护等；检验前的样本灭活；检验中个人防护用品的穿、戴；检验后样本的处理；空气消毒、物体表面及地面的消毒；实验室新冠标本溢洒事故的处理。
结果 此次六安市大规模人群新型冠状病毒筛查，本实验室严格按照防护措施做好每日生物安全工作，共检测 16 万份样本，未发生医务人员感染事件。
结论 本实验室生物安全防护措施对防止医务人员感染有良好的预防和控制效果，可以为新冠疫情期间各实验室做好生物安全防护提供参考作用。

PO-0587

中国主要 HIV-1 亚型和亚簇在抗病毒治疗期间免疫恢复差异研究

葛章文
贵州省人民医院

研究目的 CRF01_AE 和 CRF07_BC 是在中国流行的主要 HIV-1 亚型。然而，在接受联合抗逆转录病毒治疗（cART）后，我们还不清楚病毒的亚型、亚簇和相应的嗜性类型是否是导致免疫恢复差

异的影响因素。我们对在中国流行的主要 HIV-1 亚型、亚簇进行调查研究，分析在 cART 治疗期间与免疫恢复相关的因素，为精准的 cART 方案的制定提供科学依据。
研究方法 我们对 cART 期间不同亚型、亚簇和嗜性感染者之间 CD4+T 细胞的恢复过程以及达到免疫恢复和早期免疫恢复所需的时间进行了深入分析。广义估计方程用于分析与 CD4+T 细胞恢复时计数变化相关的因素；K-M 用于分析随治疗时间达到免疫恢复或早期免疫恢复的比例；Cox 用于分析影响免疫恢复速度快慢的相关因素。
研究结果 （1）与 CRF07_BC 和 CRF01_AE 5 簇人群相比，CRF01_AE 和 CRF01_AE 4 簇感染者在 cART 期间呈现出更差的免疫恢复：CD4+T 细胞计数更低（P ≤ 0.003），免疫恢复速度更慢（P ≤ 0.022），达到免疫恢复的患者百分比更低（P < 0.001）以及达到免疫恢复的平均时间更长（P < 0.001）。（2）与 CCR5（R5）嗜性病毒相比，CXCR4（X4）嗜性病毒在 CRF01_AE（P < 0.001）、4 簇（P < 0.001）和 5 簇（P ≤ 0.029）中均表现出更差的免疫恢复。此外，在 CRF01_AE、CRF01_AE 4 簇、达到免疫恢复的 CRF01_AE 4 簇和达到早期免疫恢复的 CRF01_AE 4 簇中发现 X4 嗜性的比例明显高于对应的 CRF07_BC（P < 0.001）、CRF01_AE 5 簇（P < 0.001）、达到免疫恢复的 CRF01_AE 5 簇（P < 0.001）和达到早期免疫恢复的 CRF01_AE 5 簇（P < 0.001）。（3）相对于 CRF07_BC 和 CRF01_AE 5 簇病毒，我们在 CRF01_AE（P < 0.001）和 CRF01_AE 4 簇（P≤0.004）病毒人群基因组中发现更高比例的 X4 嗜性倾向的氨基酸编码基因。
研究结论（1）我们的研究表明，在 cART 的中国患者中，CRF01_AE 亚型和 CRF01_AE 4 簇与 CRF07_BC 亚型和 CRF01_AE 5 簇相比免疫恢复更差。（2）CRF01_AE 和 CRF01_AE 4 簇免疫恢复更差的原因是两者中含有更高比例的 X4 嗜性病毒。（3）将来为了提高治疗的效果，我们建议在中国各地区的 cART 方案中应考虑当地 HIV-1 的亚型和亚簇类型。此外，我们研究结果还提示将来 cART 中应谨慎使用 CCR5 抑制剂。

PO-0588

原发免疫性血小板减少症患儿血小板相关抗体及淋巴细胞亚群的变化及临床意义

张加勤、洪国斧
厦门大学附属第一医院

目的 免疫性血小板减少症（ITP）是一种常见的获得性自身免疫性血液系统疾病， ITP 的发生、发展与患者免疫状态密切相关，患者体液免疫和细胞免疫均存在不同程度的异常，尤其是与淋巴细胞各亚群含量及功能的改变密切相关。然而，较少关注患者外淋巴细胞亚群各细胞数量的变化。为此，本研究检测 ITP 患儿及健康对照者白细胞总数及其分类、血小板相关抗体（PA-Ig）和 T 淋巴细胞、NK 细胞、B 细胞数量及其百分比的变化趋势，以探讨其在 ITP 发病中的作用及临床意义。
方法 选取 2014 年 1 月~2016 年 12 月初次就诊于本院的血小板减少症患者，其中 ITP 患者，67 例，男 36 例，女 31 例，年龄 1 月~12 岁，中位年龄 4.35 岁。利用全自动血细胞分析仪分别对 67 例 ITP 患儿和 42 例健康对照者外周血进行血细胞计数及分类；流式细胞术检测两组 PA-Ig、淋巴细胞亚群含量，采用双平台法计算淋巴细胞各亚群的绝对数量。应用 SPSS 19.0 软件包进行统计学分析，淋巴细胞各亚群含量及细胞计数进行正态和方差齐性检验后，数值用`χ± s 表示，两组间比较采用 t 检验，三组间比较采用单因素方差分析（One-Way ANOVA），多组样本两两比较采用最小显著差（the least significant difference，LSD） t 检验，计数资料比较采用 χ2 检验，P< 0.05 为差异有统计学意义。
结果 ITP 患儿外周血血小板平均数量明显低于正常对照组(P<0.05)，白细胞平均数量差异不具统计学意义(P>0.05)，而淋巴细胞平均含量和平均数量与健康对照组相比均显著降低（P<0.05）；ITP 患儿 PA-IgG、PA-IgM、PA-IgA 阳性率分布为为 89.55%（60/67）、46.27%（31/67）和 34.38%（23/67）,各类型抗体阳性率比较不具统计学差异（P>0.05）；ITP 组 PA-Ig 显著高于健康对照组

（P<0.05），且 ITP 组血小板平均数量与 PA-Ig 水平均呈负相关；与健康对照组相比，ITP 组 CD3+ 淋巴细胞、CD4+ 淋巴细胞、CD3-CD（16+56）+ NK 百分比和数量及 CD4+/CD8+ 的比值均显著降低（P < 0.05），CD8+T 淋巴细胞百分比略升高（P<0.05），CD19+B 淋巴细胞百分比和数量则显著升高（P< 0.05）。

结论 细胞免疫及体液免疫异常是 ITP 发生、发展的病理基础，PA-Ig 及淋巴细胞亚群的变化可较好地反映 ITP 的病理进程, 可为 ITP 诊断和疗效观察提供依据。

PO-0589

一例单核细胞增多类白血病反应

王科勇
西安医学院第一附属医院

一、病例资料

患者男，93 岁，因无诱因出现抽搐于 2020 年 8 月 31 日急诊入院，入院查体：营养不良，慢性病容，未见明显异常。既往结核病史 50 年已治愈，前列腺增生 10 年，2 型糖尿病 10 年。辅助检查：维生素 B12 100.62pg/mL；β-羟丁酸 1.49mmol/L；胃蛋白酶原 1237.6mcg/L,胃泌素 179.93pmol/L，初步诊断：1.慢性硬膜下血肿；2.中度贫血；3 维生素 B12 缺乏症；4.低钾血症；5.低钠血症；6.心律失常，心房颤动；7.2 型糖尿病。予以调节胃肠道功能、促进胃肠动力，补液，等对症治疗。入院第二日血常规检查显示白细胞 11.87x10^9/L，单核细胞比例 34.7%，形态学检查可见单核细胞比例明显升高，胞体大，多不规则，胞浆丰富，灰蓝色或灰红色，可见明显颗粒及空泡，染色质纤细网状，部分细胞形似幼单细胞。未行骨髓穿侧检查。经对症治疗好转出院，一月后又以“低血容量休克”入院，基本状况同前，血常规显示白细胞 27.04x10^9/L，单核细胞比例 71.7%。对症治疗后血象恢复正常

二、讨论

单核细胞显著升高一般多见于血液系统恶性肿瘤，但根据该患者具体临床情况分析，并不考虑血液病。由于患者年龄较大，造血功能明显减低，髓系增生减低，导致红细胞计数减少，血红蛋白水平减低，血小板显著减少，引起单核细胞比例相对升高。另外一方面，该患者中期白细胞总数升高，单核细胞比例达到 71.7%，考虑为感染并发症引起，单核细胞是最重要的抗原递呈细胞, 在机体损伤治愈、抗御病原的入侵和对疾病的免疫方面起着重要的作用，患者出现外周血单核细胞计数的增加以及部分幼稚单核细胞与感染并发症的发生有关, 其原因可能为下丘脑-垂体-肾上腺皮质轴和交感神经系统激活, 刺激骨髓池中幼稚的单核细胞释放入外周血，综上所述，该患者可能为单核细胞型类白血病反应。类白血病指在原发病的基础上，机体在某些病理因素刺激下表现出来的一种类似白血病的血象反应，刺激因素去除后即可恢复，与该患者病情基本相符。

PO-0590

Outcomes of Methadone Maintenance Therapy Combined with Rilpivirine/Efavirenz in Treatment-Naive HIV-Infected Patients

Cuixian Yang 、Huiqin Li
Yunnan Infectious Diseases Hospital

Background Injecting drugs is associated with a high risk of HIV infection, alongside the risk of a drug overdose and mental health problems.

Objective To evaluate the effect of methadone maintenance treatment (MMT) combined with rilpivirine (RPV)-based regimens on drug use of HIV individuals.

Methods This study was a prospective, open-label, controlled, drug-drug interaction trial at a single center for 24 weeks. Participants on stable MMT were randomly divided into two groups administered RPV/TDF/3TC (RPV group) and EFV/TDF/3TC (EFV group), respectively. Adjustment doses of methadone were monitored for 12 weeks. HIV-1 RNA was used to evaluate the effects of antiretroviral therapy at week 24. Acute opioid withdrawal-, drug craving questionnaire- and MOS-HIV scales were used to assess study outcomes.
Results 22 and 18 cases of HIV-infected drug users were recruited in the RPV and EFV groups, respectively. Thirty-one cases had completed monitoring and clinical evaluation at week 24. In the RPV and EFV groups, 32% and 56% of the participants had methadone dose adjustment, respectively, indicating a significantly lower rate in the RPV group. The rates of individuals with HIV RNA levels from 50-500 copies/ml were 94% (RPV group) and 90% (EFV group). The drug craving questionnaire scale scores decreased in both groups. After one week of treatments, acute opioid withdrawal scale scores increased in both groups, with no significant difference between them.
Conclusion Concomitant administration of RPV does not significantly affect methadone and could decrease withdrawal symptoms. An RPV-based regimen may be used as first-line treatment in IDUs with HIV-infection.

PO-0591

m6A 甲基化修饰调控去卵巢骨质疏松大鼠 BMSCs 中特定 lincRNA 的表达

曹成建[1,2]、张芳[2]、刘伟平[1]、陈喻[1]、万科幸[1]、王昕[1]、宋耀辉[1]、殷明刚[1,2]
1. 自贡市第一人民医院检验科
2. 自贡市第一人民医院，自贡市医学科学院

目的 RNA m6A 修饰是近年才深入研究的表观遗传学调控机制，课题组前期筛选出去卵巢（OVX）绝经后骨质疏松（PMOP）大鼠模型骨髓间充质干细胞（BMSCs）差异表达的长链非编码 RNA lincRNA7140，本课题拟探讨 m6A 修饰是否参与调控了 lincRNA7140 的表达。
方法 SD 雌性大鼠 20 只随机平均分成假手术对照组（Control）及去卵巢组（OVX）组，采用 OVX 建立 PMOP 大鼠模型，microCT 验证模型是否成功建立。分离原代培养两组大鼠 BMSCs，并用流式及免疫组化验证 BMSCs。生物信息学分析 lincRNA7140 上可能的 m6A 状态及位点。m6A 甲基化定量测定试剂盒分析两组 BMSCs 中整体 RNA m6A 甲基化水平，RNA 甲基化免疫共沉淀结合 qPCR 方法（MeRIP-qPCR）检测两组细胞中 lincRNA7140 m6A 修饰水平。
结果 microCT 显示成功建立 PMOP 大鼠模型，流式细胞术及免疫组化也显示分离培养的为 BMSCs。生物信息学分析推测 lincRNA7140 上存在 4 个可能的 m6A 修饰位点。与 Control 组相比，OVX 组整体 RNA m6A 甲基化水平偏低，而 MeRIP-qPCR 分析显示 OVX 组 lincRNA7140 m6A 水平下调，差异均具有统计学意义（$P<0.05$）。
结论 PMOP 大鼠 BMSCs 中特定 lincRNA（lincRNA7140）的表达受到了 m6A 甲基化的调控，这可能在其骨质疏松状态中发挥关键的调控作用。

PO-0592

一项基于不同科室及不同标本类型中 EB 病毒核酸检测情况的大样本数据分析

孙奎霞、孙立颖
北京大学第一医院

目的 了解不同科室送检样本的 EB 病毒核酸检出情况，分析 EB 病毒核酸在不同标本类型中的检出率，帮助临床医师选择更合适的标本送检。
方法 收集 5494 份我院各科室自 2015 年 1 月~2021 年 3 月送检样本的 EB 病毒核酸检测数据，根据荧光定量 PCR 检测结果，分析来自各科室送检样本的 EB 病毒核酸阳性检出率，以及不同标本类型（血清、血浆、淋巴细胞、支气管肺泡灌洗液、脑脊液、拭子、羊水、乳汁、引流液等其他体液）中 EB 病毒核酸阳性检出率。
结果 5494 份样本中，EB 病毒核酸阳性的检出率为 13.7%（750/5494）。3093 份男性患者的样本中，EB 病毒核酸阳性检出率为 14.9%（460/3093），2401 份女性患者的样本中，EB 病毒核酸阳性检出率为 12.1%（290/2401））。送检样本最多的科室为儿科（29.2%，1602/5494），其次为血液科（20.0%，1098/5494）。EB 病毒核酸阳性检出率最高的为血液科（27.1%，298/1098），其次为皮肤科（21.0%，12/57）。儿童患者标本 EB 病毒核酸阳性检出率为 10.5%（168/1602)，成人患者标本检出率为 15.0% (582/3892)。送检最多的标本类型是血清标本（74.4%，4086/5494），其次为淋巴细胞（15.7%，865/5494）。EB 病毒核酸阳性检出率最高的标本类型为淋巴细胞（48.0%，415/865），其次为肺泡灌洗液（35.3%，88/249）和咽拭子（31.8%，7/22），而送检最多的血清样本 EB 病毒核酸阳性检出率仅为 5.6%（228/4086）。
结论 成人和儿童均应重视 EB 病毒核酸检测，提高重点相关科室的送检率。选择送检样本时应根据疾病情况，尽量送检淋巴细胞、肺泡灌洗液及咽拭子等标本进行检测以提高 EB 病毒核酸检出率。

PO-0593

低氧环境下绒毛膜外滋养细胞的自噬功能受损与子痫前期的关系

龙安雄、田春杰、钟国梁、何秋阳、马顺高
大理白族自治州人民医院

目的 研究子痫前期患者胎盘滋养细胞的自噬水平以及低氧环境下绒毛膜外滋养细胞自噬受损对其细胞功能的影响。
方法 首先收集子痫前期患者及正常孕妇分娩后的胎盘组织，免疫组化检测自噬抑制相关标记物 SQSTM1 的表达；其次利用 2%氧气浓度模拟孕早期母胎界面低氧环境，建立该条件下滋养细胞系 HTR8/SVneo 的单培养及其与子宫微血管内皮细胞的共培养模型，利用 3-MA 作为自噬抑制剂，分为正常对照组和自噬抑制组，免疫组化检测滋养细胞中自噬相关蛋白 LC3Ⅱ的表达，transwell 小室和流式细胞术分别检测滋养细胞的侵袭性以及血管细胞的凋亡。
结果 子痫前期患者胎盘组织中 SQSTM1 的表达显著高于正常孕妇（P＜0.05）；低氧条件下，单培养和共培养的 HTR8/SVneo 细胞中的 LC3Ⅱ的表达显著高于自噬抑制组（P＜0.05）；单培养组中，自噬抑制组中穿过 transwell 小室的 HTR8/SVneo 细胞数量显著小于对照组（P＜0.05），共培养组中，自噬抑制组内皮细胞的凋亡水平显著小于对照组（P＜0.05）。
结论 子痫前期患者胎盘滋养细胞的自噬功能受抑制，低氧条件下滋养细胞自噬功能受损能够引起该细胞的侵袭功能下降及抑制该细胞诱导血管内皮细胞的凋亡，该机制可能参与了子痫前期的发生发展。

PO-0594

A Scoring Model Based on 4 Immune-Related LncRNA Subtypes and Tumor-Infiltrating Immune Cells Predicts the Prognosis and Drug Sensitivity of Breast Cancer

Zhaolei Cui 、Yan Chen
Fujian Cancer Hospital

Background Immune-related long non-coding RNAs (lncRNAs) are involved in the occurrence and development of breast cancer (BC). We sought to develop a prognostic risk model based on an immune-related lncRNA signature combined with tumor-infiltrating immune cells and evaluate its performance in predicting BC prognosis and tumor sensitivity to immunotherapy and chemotherapy.
Methods The gene expression profiles and clinical data of BC patients were downloaded from The Cancer Genome Atlas (TCGA), and immune-related lncRNAs were screened using co-expression network analysis. We utilized clustering analysis to identify potential lncRNA subtypes associated with BC. Their differences in underlying mechanisms involved in carcinogenesis were analyzed by GSEA. BC patients were randomly assigned to a training cohort and a validation cohort, and a least absolute shrinkage and selection operator (LASSO)-derived risk model was constructed using a training cohort and validated in the validation cohort. The RiskScore of each patient was calculated for risk stratification of BC patients. Then, the performance of the risk model was assessed in low- and high-risk patients using survival analysis, and PD-L1 and PD-L2 expressions, as well as tumor sensitivity to the chemotherapy agents paclitaxel and rapamycin, were compared between the two groups. Finally, the correlation between the signature-calculated RiskScore and tumor-infiltrating lymphocytes was evaluated.
Results Ultimately, 815 immune-related lncRNAs associated with BC were identified based on transcriptome and clinical data of 1,109 BC tissues and 113 normal controls. All BC patients were clustered into Cluster 1 (n=996 cases) and Cluster 2 (n=73 cases). Patients in Cluster 1 exhibited enhanced PD-L1 and PD-L2 gene expressions versus those in Cluster 2. GSEA enrichment analysis showed that the JAK-STAT signaling pathway was a principal mechanism responsible for functional differences between the two Clusters of BC. Four immune-related lncRNA subtypes (MAPT-AS1, LINC01871, AC110995.1, and ST7-AS1) were selected and subject to LASSO regression to construct a prognostic model. This effectively predicted longer survival of low-risk patients compared with high-risk individuals. Univariate and multivariate COX regression revealed that the model could serve as an independent prognostic predictor. Besides, high-risk patients had lower PD-L1 and PD-L2 expression levels and lower IC50 values of paclitaxel and rapamycin versus low-risk patients. The RiskScore was associated with distinct tumor-infiltrating immune cell subpopulations in the low- and high-risk groups.
Conclusion This risk model based on 4 immune-related lncRNA subtypes is highly practical and accurate in predicting BC prognosis, which can be used to guide the choice of immunotherapies and chemotherapies in BC.

PO-0595

Identification of Adriamycin Resistance Genes in Breast Cancer based on Microarray Data Analysis

Yingfeng Lin、Zhaolei Cui、Yan Chen
福建省肿瘤医院

Objective Breast cancer is a common malignant tumor with increasing incidence worldwide. This study aimed to investigate the molecular mechanisms of the adriamycin (ADR) resistance in breast cancer.
Methods The GSE76540 dataset downloaded from the National Center for Biotechnology Information (NCBI) Gene Expression Omnibus (GEO) database was adopted for analysis. Differentially expressed genes (DEGs) in chemo-sensitive cases and chemo-resistant cases were identified using the GEO2R online tool respectively. Go analysis and KEGG enrichment analysis of DEGs were carried out by using the DAVID online tool. The protein-protein interaction (PPI) network was constructed using the Search Tool for the Retrieval of Interacting Genes (STRING) and visualized with Cytoscape software. The impact of key tumor genes on the survival and prognosis were described.
Results A total of 1481 DEGs were excavated, including 549 up-regulated genes and 932 down-regulated genes. According to the GO analysis, the DEGs were significantly enriched in: extracellular matrix organization, positive regulation of transcription from RNA polymerase II promoter, lung development, positive regulation of gene expression, axon quidance and so on. The results of KEGG pathway enrichment analysis showed that the most enriched DEGs can be detected in: pathways in cancer, PI3K AKT signaling pathway, focal adhesion, ras signaling pathway and so on. In the PPI network analysis, hub genes of CDH1, ESR1, SOX2, AR, GATA3, FOXA1, KRT19, CLDN7, AGR2, ESRP1, RAB25, CLDN4, IGF1R, CLDN3 and IRS1 were detected. Finally, there is a correlation filter out these hub genes in resistance of ADR.
Conclusions Hub genes associated with ADR resistance were identified using bioinformatic techniques. The results of this study may contribute to the development of targeted therapy for breast cancer.

PO-0596

科学城地区新型冠状病毒灭活疫苗接种后中和抗体阳性率评价

王芳、方堃、刘阳、王丹、陈沂、袁丹
四川省科学城医院

目的 分析科学城地区 111 名成年人新型冠状病毒灭活疫苗接种后中和抗体产生的阳性率，为新型冠状病毒疫苗免疫接种管理提供参考。
方法 选取科学城地区于 2021 年 1 月-3 月完成全程接种且自愿中和抗体检测的人员 111 名，采集空腹静脉血，采用磁微粒化学发光免疫分析法进行血清中和抗体定量检测，同时收集接种者的基本信息和疫苗接种情况，将按照第 2 针接种后第 3、7、14、28 天分组和年龄、性别分组，对中和抗体产生的阳性率进行统计分析。
结果 111 名接种人员中和抗体阳性人数为 96 名，阳性率为 86.5%。性别和年龄分组差异无统计学意义（P>0.05）。按接种完成间隔时间分组，其中接种第 3 天中和抗体阳性率为 23.1%（3/13），第 7 天中和抗体阳性率为 100%（14/14），第 14 天中和抗体阳性率为 96.8%（30/31），第 28 天中和抗体阳性率为 92.5%（49/53）。经比较，差异有统计学意义（$\chi 2=51.333$， $P<0.05$）。
结论 新型冠状病毒疫苗接种后产生中和抗体的时间不一，其中第 7 天中和抗体产生的阳性率最高，随后有降低的趋势，应结合实际情况适时检测中和抗体水平，加强免疫，以降低新型冠状病毒肺炎的感染。

PO-0597

ARA55 participates in TGFβ1-induced epithelial-mesenchymal transition in CNE2 nasopharyngeal carcinoma cells

Zhaolei Cui 、Xiaoqin Xin、Yan Chen
Fujian Cancer Hospital

Objective ARA55 (androgen receptor coactivator 55kDa protein) was first identified as a TGFβ1-inducible protein and function as a molecular scaffold in coordinating protein-protein interactions. Herein, we focused on validating the functional role of ARA55 in TGFβ1-induced epithelial-mesenchymal transition (EMT) in human CNE2 nasopharyngeal carcinoma cells.
Methods Expression of ARA55 in the CNE2 cells was stimulated by TGFβ1 (5ng/ml), and a commercial RNA interference plasmid (siRNA-ARA55) was utilized to silence ARA55 expression in response to TGFβ1 induction.
Results Our results manifested that forced expression of ARA55 enhances growth as well as migration and invasion of the CEN2 cells. In contrast, cells depleted of ARA55 resulted in suppressed cell proliferation and metastasis capability, along with a down-regulation of N-cadherin and up-regulation of Claudin-1. Further co-immunoprecipitation analysis exhibited that induced ARA55 yields a direct physical interaction with Smad7 in TGFβ1 signaling.
Conclusions Our data demonstrate that ARA55 exerts a causative role and functions as a critical regulator in TGFβ1-mediated EMT in CNE2 nasopharyngeal carcinoma cells through binding with Smad7.

PO-0598

A novel peptide binding to the C-terminal domain of connective tissue growth factor for the treatment of bleomycin-induced pulmonary fibrosis

Han Xiao
Zhongda Hospital Southest University

Objective Idiopathic pulmonary fibrosis is known to be a chronic symptom of a deadly interstitial lung disease with a poor prognosis and few treatment options. It is commonly believed that collagen is secreted to repair lung damage due to various causes. However, pulmonary fibrosis and collagen deposition occurs if damage is insufficiently repaired and, as a consequence, the accumulation of excessive proliferation of fibroblasts and super-abundant extracellular matrix leads to tissue stiffness. Connective tissue growth factor (CTGF) is a multifunctional, cysteine-rich, heparin-binding protein, with a molecular weight of 38 kDa, and was first described by Bradham et al in 1991. CTGF is induced by TGF-β, which is an important downstream mediator that induces fibrosis by regulating secretions of fibroblasts and maintenance of the extracellular matrix. In the present study, we screened positive phage clones from a random dodecapeptide library with a CTGF/C domain, and determined the coding sequence of small peptides 810A using sequencing. Treatment with 810A in vitro and vivo to investigate whether it can anti-pulmonary fibrosis in mice.
Methods Using phage display technology, we screened a small peptide 810A that can be specific bind characteristics with CTGF. Then we applied to Human bronchial epithelial cells (16HBE cells) to evaluate its function towards cells by MTT testing, cell migration experiment and western blot. 810A in mouse model of bleomycin (BLM)-induced pulmonary fibrosis was evaluated by leukocyte counts in bronchoalveolar lavage fluid (BALF), hydroxyproline contents and pathological examination.

Results Biopanning of phages specifically bound to CTGF/C from peptide library and their immunoreactivity assay

Enriched phage at a concentration of 1.9×106 pfu·mL-1 were obtained after 4 rounds of panning and screening. Sequencing of 10 randomly positive phage clones revealed that a peptide, 810A, was confirmed in 8 sequencings, and two peptides, termed 810B and 810C, were each confirmed in one sequencing. The phage clone 810A demonstrated specific binding characteristics to PKW-CTGF and TrxA-CTGF and the DNA concentration of 810A cloned phages bound to PKW-CTGF and TrxA-CTGF was 8.456 ± 0.546 μg·mL-1, 8.663 ± 0.207 μg·mL-1 respectively, which was significantly higher than 810B and 810C ($P<0.05$). 810A exhibited the highest immunoreactivity compared with 810B and 810C, and also had a dose-dependent relationship between OD450 value and 810A concentration ($Y = -0.033X2 + 0.4297x + 0.0587$ [$R2 = 0.988$]), and the concentration for 50% of maximal effect (EC50) of 810A was 2.547 ± 0.092 μg·mL-1.

810A effectively inhibited CTGF-induced proliferation and migration of 16HBE cells

To investigate the inhibitory effect on cell proliferation induced by CTGF at 0.1 μg·mL-1, 810A was added at the indicated concentrations, and cellular growth was determined using the MTT assay. Under continuous incubation for 24, 48, and 72 h, 810A at a concentration of 10 μg·mL-1 significantly inhibited the proliferation of cells induced by 0.1 μg·mL-1 CTGF. In the cell migration assay, CTGF at 1 μg·mL-1 significantly promoted cell migration, and this phenomenon could be inhibited after the addition of 810A at concentrations > 0.1 μg·mL-1. The 810A peptide at concentrations of 10–1000 μg·mL-1 demonstrated an inhibition rate > 70% in the cell migration assay, similar to that of CTGF-monoclonal antibody, with a half maximal inhibitory concentration (IC50) of 1.612 ± 0.1549 μg·mL-1.

Intervention with 810A attenuated changes in pulmonary index and hydroxyproline content in mice

The anti-fibrotic effects of 810A in BLM-induced pulmonary fibrosis model C57BL/6 mice were further studied. The 810A interventional group demonstrated a certain degree of reduction in lung wet-dry weight ratio and pulmonary index compared with the BLM model group; moreover, the pulmonary index in the intervention group was significantly down-regulated at day 28. On days 14 and 28, 810A intervention clearly reduced the levels of hydroxyproline production compared with the positive control. These results were highly consistent with the pulmonary index data.

Effect of 810A intervention on lung histopathology

The effects of 810A intervention on pulmonary fibrosis was further evaluated using histopathological analysis. Uniform and small alveoli were observed in the negative control group, and severe alveolitis and lung fibrotic injury in the BLM group manifested as interalveolar inflammation, obliteration of the alveolar space, and continuous collagen deposition. After 810A intervention, these histopathological findings were significantly attenuated. Masson’s trichrome staining to detect collagen deposition in the lung tissues confirmed similar results. In the quantitative histological analysis of fibrotic changes, a numerical fibrotic scale was used in a subset of animals. The BLM group demonstrated significantly higher Ashcroft scores of fibrosis at 7, 14, and 28 days compared with the control group ($P < 0.05$). In contrast, the 810A treatment group demonstrated significantly lower Ashcroft scores in fibrosis compared with the untreated groups. Furthermore, after giving 810A i.p. CTGF levels were significantly reduced at 810A interventional group in 28 days.

Conclusions In summary, a CTGF/C-specific binding peptide (i.e., 810A), was screened using phage display techniques, and could effectively inhibit the proliferation, migration, and expression of TGF-β and α-SMA in cells pretreated with CTGF. In in vivo experiments using an animal model of BLM-induced pulmonary fibrosis, the peptide demonstrated similar effects, which effectively reduced the onset and development of pulmonary fibrosis in mice.

PO-0599

生物信息学分析 BATF2 在头颈部肿瘤的表达及其预后价值

林莺莺、崔兆磊
福建省肿瘤医院

目的 通过 TCGA 和 GEPIA 数据库分析 BATF2(basic leucine zipper transcription factor, ATF-like 2)在头颈部鳞状细胞癌(head and neck squamous cell carcinoma，HNSCC)中的表达和预后价值。
方法 利用 TCGA 数据库、GEPIA 数据库分析 BATF2 在不同癌症组织中的表达进行对比；在 TCGA 数据的基础上，通过 R 语言进行 BATF2 与基因的共表达及相关性分析，分析这些基因与 BATF2 可能存在的相互作用通路。通过 UALCAN 数据库分析 BATF2 的表达情况与 HNSCC 生存期的关系，评估预后价值，得到预后风险比（HR）森林图。
结果 BATF2 在 HNSCC 中的表达处于中等水平，WARS、GBP5、GBP1 与 BATF2 相关性最强，呈正相关；BATF2 表达与丝氨酸蛋白酶抑制剂因子 Serpin B3 呈正相关（r=0.13,P=0.0025）。BATF2 的表达在 HNSCC 患者预后评估中不具有统计学意义。
结论 BATF2 在 HNSCC 中呈中低水平表达，对 HNSCC 中所有癌种的生存期评估尚无统计学差异。

脂肪细胞促进肿瘤 PD-L1 表达的作用及干预策略研究

张猜
郑州大学第一附属医院

肥胖增加患癌危险及癌症相关的病死率已是不争事实，但其深层机制尚未阐明，探究肥胖促进肿瘤生长的机制并研发有效药物十分必要。
目的 研究 PMQ 对脂肪细胞促 B16F1 细胞 PD-L1 表达的影响。
方法 （1）采用 Cocktail 法诱导 3T3-L1 前脂肪细胞分化，油红 O 染色检测 3T3-L1 前脂肪细胞分化 6 天后胞内脂质蓄积情况。收集分化第 7 ~ 8 天的培养基上清配制不同比例的分化成熟 3T3-L1 脂肪细胞条件培养基，未分化的前脂肪细胞条件培养基以同样条件干预 B16F1 细胞作为对照。条件培养基干预 B16F1 细胞 48 h 后采用 Western blot 检测 B16F1 细胞 PD-L1 蛋白表达。（2）MTT 和 EdU 法检测 PMQ 干预 B16F1 细胞 48 h 对其细胞活力和增殖的影响，并检测 B16F1 细胞 PD-L1 的 mRNA 和蛋白表达。
结果（1）3T3-L1 脂肪细胞条件培养基（25%，50%）可上调 B16F1 细胞 PD-L1 蛋白表达，3T3-L1 前脂肪细胞条件培养基（25%，50%）无此作用；（2）PMQ（1、3、10 μM）干预 48 h 不影响 B16F1 细胞活力和增殖；（3）PMQ（1、3、10 μM）干预 48 h，浓度依赖性地下调 B16F1 细胞 PD-L1 的 mRNA 和蛋白表达水平。
结论（1）3T3-L1 脂肪细胞条件培养基可上调 B16F1 细胞 PD-L1 蛋白表达；（2）PMQ 不影响 B16F1 细胞活力和增殖，可浓度依赖性地下调 B16F1 细胞 PD-L1 水平。

PO-0601

EGCG 通过阻断 HDAC6-PI3K/AKT/mTOR 信号轴激活小胶质细胞自噬过程和 Aβ 清除

陈妍、洪宏海、张宗桃
广州医科大学附属第三医院

目的 通过体内外实验研究 EGCG 对小胶质细胞 Aβ 清除的调控作用，阐明其分子机制及其对 AD 治疗的潜在价值。
方法 1.通过动物行为学实验观察 EGCG 能否改善 AD 小鼠的认知障碍；
2.利用 ThS 染色和免疫荧光染色方法观察 EGCG 治疗小鼠的 $A\beta_{1-42}$ 沉积和胶质细胞激活情况；
3.利用 MTT 法检测药物处理后细胞的活性情况；
4.利用 Western blot 检测药物处理后细胞中各种蛋白的表达水平。
结果 1. EGCG 改善 AD 小鼠的认知功能障碍；
2. EGCG 促进小胶质细胞增殖，保护小胶质细胞免受 $A\beta_{1-42}$ 诱导的毒性损害；
3. EGCG 促进小胶质细胞摄取细胞外 $A\beta_{1-42}$，且没有引起炎症反应；
4. EGCG 通过抑制 PI3K/AKT/mTOR 通路来诱导小胶质细胞自噬作用进而降解细胞内 $A\beta_{1-42}$；
5. EGCG 通过下调组蛋白去乙酰化酶 6（HDAC6），来促进 $A\beta_{1-42}$ 的摄取和自噬、促进小胶质细胞 $A\beta_{1-42}$ 的清除；
6. EGCG 通过调控小胶质细胞 $A\beta_{1-42}$ 清除作用来保护神经元细胞免受 $A\beta_{1-42}$ 毒性损害。
结论 EGCG 通过对 HDAC6 的调控，一方面上调 RAGE 受体的表达，增加小胶质细胞对胞外 Aβ 的吞噬，另一方面抑制 PI3K/AKT/mTOR 信号通路，促进小胶质自噬及随后的 Aβ 胞内降解，最终保护小胶质细胞及周围的神经元细胞免受 Aβ 毒性的损害。

PO-0602

贵州省黔西南地区儿童地中海贫血发病情况及基因分布分析

杜林、吴海婴、王曼丽
兴义市人民医院

目的 调查黔西南地区儿童地中海贫血发病情况，并分析其基因分布。
方法 选择黔西南州区内儿童为研究对象，共纳入 48930 名儿童。对研究对象进行地中海贫血初筛，根据筛查结果，对可疑地中海贫血患儿进行基因诊断，并进行基因分型。
结果 48930 名儿童初筛共 1002 例为可疑地中海贫血，其中男性和女性 α 地中海贫血检出率有显著差异(P <0.05)、β 地中海贫血检出率无显著差异(P >0.05)。465 例初筛为可疑 α 地中海贫血，经基因诊断确诊 149 例，筛检阳性比例为 32%；537 例初筛为可疑 β 地中海贫血，经基因诊断确诊 162 例,筛检阳性比例为 30.2%。α 地中海贫血中，东南亚--SEA 基因型构成比最高(48.9%)，其次为-α3,7 基因型(26.5%)和 CS 基因型（16.4%）；β 地中海贫血中，17N 基因型最高(57.3%)，其次为 41-42N 基因型(27.6%)和 654M 基因型（9.9%）。α 地中海贫血基因检出--SEA 等位基因数频率最高，检出频率 61.2%；β 地中海贫血 17N 等位基因数最高，检出频率 58.6%。
结论 黔西南地区儿童地中海贫血发病率较高，基因分布情况复杂，且与贵州其他少数民族聚居区发病基因型存在较大差距，应加强常规筛查及基因学诊断，找到地贫基因频率分布的民族依赖性、性别依赖性或地区依赖性证据。

PO-0603

艰难梭菌抗原和毒素因子检测质控品的研制和临床应用

王庆忠、刘学杰、张敏敏、夏启航
上海市临床检验中心

目的 研制生物安全合格，稳定性强，通用性好的艰难梭菌（*Clostridium difficile*）谷氨酸脱氢酶抗原及毒素检测质控品，用于临床医疗机构实验室室间质量评价。
方法 采用本中心实验室保存的艰难梭菌 ATCC9689 标准菌株作为出发菌株，厌氧培养。收集培养得到的菌体，制备菌悬液，后经超声处理。检测所得破壁悬液的蛋白浓度和细菌培养活性。系列稀释得到最终工作浓度的质控品。采用美国 Alere 艰难梭菌谷氨酸脱氢酶抗原及毒素检测试剂盒评估研制质控品的稳定性和均匀性。所得质控品经本中心室间质量评价网，分发到临床医疗机构实验室，经所在实验室采用各自的检测系统检测回报结果，评价其临床应用价值。
结果 出发菌株经厌氧培养得到合适的菌悬液。经超声处理，破壁悬液蛋白浓度达到 0.56mg/ml。经 4 万倍稀释，试剂盒测定为抗原和毒素阳性，厌氧和好养菌检测，均未检测到细菌生长。制备的质控品在 37℃条件下可稳定 2 周，在-4℃条件下，可稳定 12 月。经质控网络实验室回报数据，2019 年 9 家实验室，2020 年 18 家实验室和 2021 年 23 家实验室，5 批次质控数据，临床检测所采用的酶联免疫层析法和酶联免疫荧光法均质评合格。
结论 本中心自制的艰难梭菌谷氨酸脱氢酶抗原及毒素检测质控品具有 生物安全合格，稳定性强，通用性好的特点。

PO-0604

KCTD12 loss promotes RhoA/RhoB/Rac1-dependent cervical cancer cell metastasis

Liping Li[1]、mei xue[1]、miao juan chen[2]
1. Department of Clinical Laboratory, The Third Affiliated Hospital of Nanchang University, Jiangxi, Nanchang
2. 广州市妇女儿童医疗中心

The metastasis of early stage cervical tumor remains the primary cause of recurrence of cervical cancer. However, its mechanisms is still unclear. To find the key molecular markers for the recurrence and treatment of cervical cancer is the key to reduce the postoperative recurrence rate and mortality.

Our previous studies found that blocking KCTD12 (potassium channel tetramerization domain containing 12) promotes the metastasis of cervical cancer cells. In addition, the negative correlations between the expression of KCTD12 and clinical staging was identified in cervical cancer tissues. Differential proteomics analysis was applied to probe the regulatory mechanism of KCTD12 on the metastasis of cervical cancer cells. The results indicated ARHGEF2, RhoA, RhoB and Rac1 play roles in promoting metastasis of silencing KCTD12 cells. To probe the regulatory effect and molecular mechanism of KCTD12 on the metastasis of cervical cancer cells, real-time fluorescence quantitative PCR, luciferase reporter gene system, co-immunoprecipitation, immunofluorescence localization and other experimental techniques were studied systematically by using in vivo and in vitro cell function experiments.

It was found that blocking KCTD12 enhanced the density and length of filopodia in cervical cancer cells, as a result of promoting the metastasis in cervical cancer cells. And higher expression KCTD12 inhibited the density and length of filopodia and metastasis and in cervical cancer cells. The mechanism study further found that KCTD12 protein regulates the filopodia and metastasis of cervical cancer cells through the activation of RhoA, RhoB and Rac1, which depends on the expression of ARHGEF2. Further research also confirmed silencing KCTD12

stimulates the HDAC6 expression and acetylation of tubulin, which results in ARHGEF2 released from tubulin and functions as activator for RhoA, RhoB and Rac1.

KCTD12 downregulation promotes HDAC6 protein expression, facilitates tubulin deacetylation and depolymerization, which leads to ARHGEF2 releasing from tubulin, which in turn activates RhoA/RhoB/Rac1-GTP and promotes cellular metastasis. KCTD12 therefore constitute an inhibition target in the treatment of cervical cancer.

PO-0605

新冠疫情下实验室认可对完善检验科质量管理体系的价值分析

孙昭辉、公衍文
山东大学第二医院

目的 实验室认可是实现医院检验科质量管理标准化的有效路径，也是完善检验质量体系的重要手段，探讨新冠疫情下 ISO15189 实验室认可在医院检验科质量管理体系完善中的作用。
方法 实验室认可是实验室质量管理的有效手段，在实验室质量管理过程中，依据实验室认可规则和要求，通过采取 PDCA 的方法，按照认可文件中质量体系要求，进一步规范室内质量控制等记录表格、完善仪器设备和检验项目的标准化操作规程（SOP）、程序文件以及质量手册等。根据监督评审中发现的问题，追本溯源，加以整改完善。加强督导检查和培训考核。并对 P、D、C、A 的每一个环节逐项检查，有检查，有追踪，有落实，最终达到质量管理体系逐渐完善的目标。
结果 通过采取上述措施，利用 PDCA 管理手段，在人、机、料、法、环、测等 6 个环节得到明显改善。（1）人员方面：通过持续强化培训考核，实验室人员能够按照分工，岗位职责明确，人员的责任心得到明显提升，室内质量控制失控纠正及时率明显提升，错误报告率明显降低。（2）仪器设备的使用、维护保养方面：能够按照仪器手册，进行系统验证，保证检测系统的良好状态。（3）试剂和耗材：对在用试剂进行准确度、精密度、干扰实验等各项性能验证，保证结果的可靠性。在新冠疫情防控要求下，实验室采取更加严格规范的操作程序，从标本采集开始，直到检验报告的审核签发，每一个环节都采取上述措施进行日常监督和专项督导，使得质量体系文件在各个环节得到有效执行，并加以完善，显著提高了检验质量。
结论 质量体系建设与完善是实验室认可的目标，是提升检验工作质量的主要手段。

PO-0606

重组慢病毒颗粒构建 LONP1 低表达稳转胰腺癌细胞株模型

王海、李丽
东南大学附属中大医院

目的 采用重组慢病毒构建 LONP1 蛋白低表达稳转胰腺癌 PANC1 和 BxPC3 细胞株模型。
方法 在 12 孔培养板中接种靶细胞，待细胞融合率 40%左右时加入吉玛基因公司构建的重组慢病毒颗粒感染靶细胞 PANC1 和 BxPC3，用 1ug/mL 嘌呤霉素进行抗性细胞筛选。在不同时间段用倒置荧光显微镜观察荧光效率，并用 Western Blot 和 PCR 方法检测 LONP1 基因表达水平以验证获得的慢病毒稳转细胞株。
结果 与对照组比较，胰腺癌 PANC1 和 BxPC3 慢病毒稳转细胞株低表达 LONP1 mRNA 和蛋白质水平。
结论 用重组慢病毒颗粒能成功构建 LONP1 低表达胰腺癌 PANC1 和 BxPC3 细胞株模型。为进一步研究 LONP1 基因在胰腺癌中的调控作用奠定基础。

PO-0607

系统性红斑狼疮早期肾损害不同诊断指标临床比较及意义

杨志鹏
山东大学第二医院

目的 探讨不同血清指标单独及联合检测在狼疮肾炎诊断中的临床意义。
方法 纳入 2020 年 1 月---—2020 年 11 月于 风湿免疫科确诊的新发狼疮肾炎住院患者 50 例为观察组，同期系统性红斑狼疮（肾脏未累及）住院患者 50 例为病例对照组，同期健康体检者 50 例为正常对照组。3 组均采用免疫比浊法检测血清补体 C1q、补体 C3、补体 C4、免疫球蛋白 IgG，采用 ELISA 法检测血清抗 C1q 抗体、抗核小体抗体水平，采用受试者工作特征曲线（ROC 曲线）分析评价各检测指标单独及联合检测在狼疮肾炎诊断中的应用价值，差异性分析采用 t 检验，以 P<0.05 为差异有统计学意义。
结果 观察组血清补体 C1q（118.00±30.50mg/L）、补体 C3（0.775±0.182g/L）及补体 C4（0.070±0.013g/L）水平明显低于病例对照组和健康对照组，阳性率（分别为 80.0%、70.0%、84.0%）则明显升高（P<0.05）；观察组血清免疫球蛋白 IgG（22.11±4.87g/L）、抗 C1q 抗体（89.30±20.34Au/ml）及抗核小体抗体（76.85±18.34Ru/ml）水平和阳性率（分别为 76.0%、88.0%、90.0%）均明显高于病例对照组和健康对照组（P<0.05），血清补体 C1q、补体 C3、补体 C4、免疫球蛋白 IgG、抗 C1q 抗体、抗核小体抗体单独检测诊断狼疮肾炎的曲线下面积（AUC）分别为 0.819、0.705、0.742、0.702、0.851、0.894；血清补体 C1q、补体 C4、免疫球蛋白 IgG、抗 C1q 抗体、抗核小体抗体联合检测诊断狼疮肾炎的 AUC 为 0.997。
结论 各血清指标单独检测均有较好的敏感性，具有一定的诊断效能，联合应用多项血清指标具有更高的诊断价值，对 LN 的诊断及治疗有重要临床意义。

PO-0608

高敏肌钙蛋白 I 与核素运动心肌显像相互关系研究

杨冰花、蔺亚晖、周洲
中国医学科学院阜外医院

目的 核素心肌灌注显像（MPI) 能准确诊断心肌缺血及心肌缺血的部位、程度和范围。高敏肌钙蛋白可用于评估运动所致的心肌受损。因此在运动负荷试验的前提下分别进行核素心肌灌注显像（MPI）和高敏肌钙蛋白 I（hs-cTnI)检查，分析不同运动负荷等级下 MPI 结果与 hs-cTnI 浓度值的相关关系。
方法 选择 2019 年 1-12 月有 MPI 检查和 hs-cTnI 浓度结果的患者 532 例，排除需要进一步做心肌显像确诊和结果不确定的患者后剩余 522 例。MPI 检测方法选用踏车运动，按起始负荷量 25W 随后每级增加 25W 将运动级别分为 1，2，3，4，5，6 级。hs-cTnI 检测选用雅培平台。将 MPI 结果与 hs-cTnI 浓度检测结果进行统计学分析。
结果 心肌显像正常患者 hs-cTnI 浓度均值 3ng/l，心肌显像异常患者 hs-cTnI 浓度均值 5ng/l，表明心肌显像异常 hs-cTnI 浓度值越高；运动级别 2,3,4,5,6 分别对应的 hs-cTnI 浓度均值为 3.8ng/l,2.8ng/l,2.7ng/l,2.9ng/l,2.1ng/l,得出运动级别越低，hs-cTnI 浓度值越高；心肌显像异常但心电图正常时，hs-cTnI 浓度均值为 4ng/l,心电图阳性 hs-cTnI 浓度均值为 6ng/l，表明心肌显影异常且心电图阳性时 hs-cTnI 浓度值越高。
结论 在踏车运动负荷试验后，心肌显像异常比心肌显像正常时 hs-cTnI 浓度值高；运动级别越低相对应的 hs-cTnI 浓度值越高；心肌显影异常且心电图阳性时与 hs-cTnI 浓度成正相关。

PO-0609

TBHQ attenuates ferroptosis against 5-fluorouracil induced intestinal mucositis via Nrf2/HO-1 pathway

Li Li
The First Affiliated Hospital of Chengdu Medical

Purpose Intestinal mucositis is a common side effect caused by chemotherapy and radiotherapy. Nevertheless, there are limited drugs that can ameliorates intestinal mucositis efficiently. Tert-butylhydroquinone (TBHQ) is a wildly used food preservative with known immunomodulatory activity. However, whether TBHQ has an effect on intestinal mucositis is still unknown.
Methods We investigated the role and mechanism of TBHQ on 5-fluorouracil (5-FU) induced intestinal epithelial cell injury and intestinal mucositis in mice. We established a model of intestinal epithelial cells (HIECs) injury and a mice model of intestinal mucositis.
Results TBHQ significantly ameliorated 5-FU-induced intestinal epithelial cell damage in vitro and intestinal mucositis in vivo. Moreover, ferroptosis was proved to be involved in 5-FU-induced intestinal mucositis and TBHQ markedly hampered the activation of ferroptosis. Mechanistically, TBHQ effectively activated Nrf2/HO-1 pathway in vitro and in vivo, and selective knock down of Nrf2 significantly abolished the anti-ferroptotic functions of TBHQ in 5-FU treated HIECs.
Conclusion TBHQ attenuates ferroptosis against 5-FU induced intestinal mucositis, identifying TBHQ as a novel potential protective agent for intestinal mucositis.

PO-0610

FGA Knock-out via CRISPR-Cas9 in a Mouse Model Promotes Hepatocellular Carcinoma Metastasis

Xiaoli Zhou[1]、Renwei Jing[2]
1. Department of Laboratory Medicine, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China.
2. Department of Cell Biology and Key Laboratory of Immune Microenvironment and Disease (Ministry of Education), Tianjin Medical University, Qixiangtai Road, Heping District, Tianjin, 300070, China

PurposeIt is critical to find out new targets for hepatocellular carcinoma therapy. FGA gene has been identified to be related to lung metastasis in non-small-cell lung cancer(NSCLC). However, the function of FGA gene in HCC is still unknown. CRISPR-Cas9-based genetic editing is a powerful tool for generating loss-of-function mutations.
Methods We constructed the murine HCC cell line Hepa1-6 stablely expressing Cas9. Then the FGA-KO cell line was generated with the clustered regularly interspaced short palindromic repeat (CRISPR)-Cas9 system. Single-guide (sg) RNA targeting the FGA gene was designed, and introduced into the Hepa1-6 cell line with Cas9 expression (Hepa1-6-Cas9) by lentivirus infection.
Results Analysis based on the data-mining of ONCOMINE revealed that FGA gene was down-regulated in the HCC compared with the normal liver, indicating its tumor suppressive role. FGA gene, which is frequently mutated in various cancer types in TCGA, was found significantly associated with a poor overall survival and predicted a poor relapse-free survival. Moreover, the knock-out of FGA gene promoted the metastasis of HCC.
Conclusions Using both in vitro and in vivo approaches, we described the profound role of FGA gene. This study verified the potential role of FGA in liver cancer and provided novel candidate target on treatment and therapy of HCC metastasis.

PO-0611

过酸或过碱尿液调整 pH 复测干化学的必要性探讨

丁荣
东南大学附属中大医院

目的 尿干化学蛋白模块易受尿液 pH 值影响，验证调整尿液 pH 值是否能排除过酸或过碱尿液对干化学检测结果的影响。
方法 选取我院住院患者尿液 pH≤5.5 且沉渣结果管型阳性标本 5 例；pH≥8.0 且干化学尿蛋白阳性标本 5 例，分别用磺基水杨酸法、贝克曼库尔特 AU5800 全自动生化分析仪进行尿蛋白检测，在 pH 计辅助下，用 NaOH 或冰乙酸分别调整 pH 至 6.0~6.5，再次进行干化学、磺基水杨酸法、生化分析仪法进行检测，比较调整 pH 前后结果差异，分析是否有必要对过酸或过碱尿液调整 pH 值进行干化学复测。
结果 五例 pH≤5.5 且尿沉渣结果管型阳性标本调整 pH 值前生化分析仪结果四例阳性，其中磺基水杨酸法三例阳性；调整 pH 值后干化学、生化分析仪、磺基水杨酸法结果均四例阳性。五例 pH≥8.0 且干化学蛋白阳性标本调整 pH 值前生化分析仪法四例阳性，其中磺基水杨酸法三例阳性；调整 pH 后生化分析仪法、磺基水杨酸法、干化学法均四例阳性，且其中两例干化学尿蛋白阳性程度明显减低，更符合生化分析仪定量结果。
同时发现 pH≥8.0 三例尿路感染标本中两例白细胞酯酶结果在调整 pH 值后阳性程度有所减低。
磺基水杨酸法不不符合的两例尿液标 pH 计测定结果分别为 4.13、9.48，过低或过高的 pH 值对磺基水杨酸检测造成干扰。
结论 pH≤5.5 且尿沉渣结果管型阳性的标本，四例干化学结果为假阴性，一例磺基水杨酸法为假阴性，调整 pH 值后均可纠正。pH≥8.0 且干化学尿蛋白阳性的标本，一例为干化学结果假阳性，一例磺基水杨酸法为假阴性，调整 pH 值后均可纠正，且干化学尿蛋白结果更符合生化分析仪定量结果。调整 pH 值后干化学尿蛋白、白细胞酯酶结果更符合尿沉渣结果，且操作简便，因此可作为尿干化学结果的纠正手段。

PO-0612

F7 mutation spectrum and molecular characteristics in Chinese factor VII deficiency patients

can Lou、guanqun Xu、yu Liu、jing Dai、qiulan Ding、xuefeng Wang、wenman Wu
ruijin hospital

Introduction Hereditary factor VII (FVII) deficiency is an autosomtic recessive bleeding disorder caused by mutations on F7 gene with a prevalence of 1/500 000.
Aim Current study investigated the genetic variations and the clinical phenotypes associated with FVII deficiency in 56 unrelated Chinese patients to describe the mutation spectrum of F7 gene.
Methods The nine exons, exon-intron boundaries and the 5′ untranslated region of F7 gene was directly sequenced by PCR and the mutation was confirmed by reverse PCR. To investigate the pathogenicity of some identified and novel mutations, we characterised the missense mutations in CHO-K1 cells transiently transfected with expression vectors harboring the wild-type FVII cDNA (FVIIwt) or possessing the p.Ser342Gly, p.Cys238Phe, p.Gly420Asp, p.Gly432Ser, p.Ala252Val and p.Val336Met mutations.
Results Totally 29 different mutations, including 20 missense mutations and 6 splicing mutations, had been identified on the F7 gene. The nucleotide transition c.1224T>G (p.His408Gln) in exon 8 constitutes a hotspot of mutation, with 19 patients harboring the genetic variance. 8 novel mutations, Ser342Gly, Cys238Phe, Gly420Asp, Gly432Ser, Ala252Val, Val336Met, IVS1a+4C>T and c.146delA, were revealed. Compared with the FVIIwt, we found that the secretion of mutants except p.Val336Met were significantly reduced and that of p.Gly432Ser was slightly decreased.

The mutations of p.Cys238Phe, p.Ala252Val and p.Gly420Asp could be classified as type I mutations based on their recombinant expression data of antigen and activity.
Conclusion The severity of bleeding diathesis was not correlated with FVII:C levels detected in patients, and the deficiency of FVII did not prevent patients developing venous thrombosis. Few patients were homologous or compound heterozygous for major gene rearrangements including nonsense mutation, large insertion or deletions, indicating that complete deficiency of FVII was not compatible with life.

PO-0613

External Quality Assessment (EQA) program for autoantibodies assays: a 5-years experience in Chongqing

Qiongwen Hu、Pu Liao
Chongqing General Hospital, University of Chinese Academy of Sciences,

Objective Autoantibodies assays play a very important role in the diagnosis and treatment of autoimmune diseases. In recent years, more and more clinical laboratories have carried out autoantibody assays. Participation to External Quality Assessment (EQA) programs is an essential requirement for laboratories. In this study, we aimed to report an overview of the EQA results of autoantibodies detection in Chongqing between 2017 and 2021.
Methods These EQA programs was implemented twice a year from october 2017 through may 2021, including anti-CCP and antinuclear antibodies (anti-dsDNA, anti-ENA, ANA). The proficiency testing （PT） database was reviewed and analyzed to assess the testing performance of the participating laboratories and the impact of the program over time.
Results The number of laboratories participated in the EQA program of anti-CCP increased from 14 in 2017 to 33 in 2021. The number of laboratories participated in the EQA program of antinuclear antibodies increased from 16 in 2017 to 30 in 2021. Most participating laboratories had a PT score of 80% or above and they were recognized as qualified. The laboratory methodology of ANA, anti-ENA and anti-dsDNA was relatively simple between these participations. Indirect immunofluorescent assay (IIFA) was the main test method of ANA. Immunoblotting (IBT) was the main test method of anti-ENA. IBT and IIFA were main test methods of anti-dsDNA. However, there were various detection methods of anti-CCP. The number of laboratories using enzyme-linked immunosorbent assay (ELISA) and chemiluminescence immunoassay (CLIA) have significant difference between 2017 and 2021. The number of laboratories using ELISA in may 2021 was less than that in october 2017 (P=0.026). The number of laboratories using CLIA in may 2021 was more than that in october 2017 (P=0.043). The HEp-2 cell patterns of ANA included Nuclear Speckled, Nuclear Centromere, Nuclear Homogeneous, Nuclear Nucleolar and Cytoplasmic Speckled during these EQA programs. The proportion of correct laboratories is between 76.5% and 100.0%.
Conclusion In conclusion, we reported the development of EQA program for autoantibodies assays in Chongqing between 2017 and 2021. The number of autoantibodies testing laboratories is increasing year by year. The laboratory methodology is constantly improving. Most of the participant laboratories had satisfactory performance for the results in these EQA schemes.

PO-0614

一例 DNMT3A 基因杂合缺失导致的 Tatton-Brown-Rahman 综合征的遗传学分析

余秀蓉、王志红
联勤保障部队第九〇〇医院

目的 对一个临床表现为说话和语言发育延迟、智力障碍、运动发育延迟、脑发育不全、全面性发育迟缓、身材高大的先证者及其家系进行遗传学分析。
方法 收集先证者表型，分别采集先证者及其父母（表型正常）的外周血，通过 Trio-WES+Trio-CNVseq 寻找可疑的致病变异，然后对发现的可疑致病变异进行致病性分析。
结果 Trio-WES 结果显示先证者 DNMT3A 基因 EXON:2-23 杂合缺失，其父母亲均为野生型。Trio-CNVseq 结果显示先证者染色体核型 46,XY，染色体微缺失/微重复检测结果 seq[GRCH37]del(2)(p24.1p23.3)(chr2:23608318-25907862)位置存在约 2.30Mb 的可能致病性的杂合缺失，该区域包含 DNMT3A 基因，其父母亲均为野生型。DNMT3A 基因变异导致的 Tatton-Brown-Rahman 综合征临床表现为身材高大、巨头畸形、圆脸、睑裂狭小、视神经发育不全、智力障碍、癫痫发作、全身性低张力、脐疝、房间隔缺损、脊柱侧弯、小脑扁桃体下疝畸形 I 型、脑软化、小睑裂等。经查阅 HGMD、OMIM 和 Clinvar 数据库，先证者的杂合缺失为未报道过的新发（denovo）变异。根据 ACMG 遗传变异分类标准与指南，该变异符合 PVS1+PS2+PM2，可以判断为致病性变异。此外，先证者突变符合 Tatton-Brown-Rahman 综合征常染色体显性遗传（AD）疾病发病机制，先证者及其家系成员符合表型及基因型的共分离。
结论 根据生物学致病性分析、遗传模式以及临床表型基因型比对，提示先证者 DNMT3A 基因变异的危害性与其表型存在相关性，即先证者 DNMT3A 基因杂合缺失导致 Tatton-Brown-Rahman 综合征可能性大。DNMT3A 基因新发致病性变异的检出为该家系的遗传咨询和分子诊断提供了可靠依据，丰富了该基因的突变谱。

PO-0615

免疫固定电泳在异体干细胞移植后寡克隆条带检测中的应用

林炜炜[2]、徐燕萍[1]、李敏[1]、沈莉菁[3]
1. 上海交通大学医学院附属仁济医院 检验科
2. 上海交通大学医学院附属仁济医院 检验科
3. 上海交通大学医学院附属仁济医院 血液科

目的 明确免疫固定电泳在异体干细胞移植后中寡克隆条带检测意义。
方法 取我院在 2020 年 3 月后行异体干细胞移植的 8 例多发性骨髓瘤（MM）患者，利用免疫固定电泳技术对移植前及移植后不同时间点进行免疫球蛋白克隆检测。在免疫固定电泳结果中出现的与初诊 M 蛋白不同，且彼此分开、比较狭窄而不连续的 3 个或 3 个以上的区带定位寡克隆条带。
结果 8 例多发性骨髓瘤患者包括 3 例 IgG kappa 型，2 例 IgG lambda 型和 2 例 IgA kappa 型，1 例未分泌型。8 例患者均接受了异体骨髓干细胞移植治疗。移植后，有 4 例患者血清出现了明显的克隆转换和寡克隆免疫球蛋白，移植后出现的寡克隆条带均为 IgG 型。最早出现在移植后 2 个月（见附图），最晚在移植后 5 个月出现，其余病例在继续随访中。4 例移植后寡克隆条带均在 M 蛋白减弱期间出现，并随 M 蛋白的消失，寡克隆条带逐渐增强。
结论 免疫固定电泳是随访异体干细胞移植患者免疫重建的有效方法。

PO-0616

扩张型心肌病候选基因多态性的最新研究进展

施小晴
郑州大学第一附属医院

扩张型心肌病（DCM）的发病率和病死率很高，是引起心力衰竭（心衰）和心脏移植的主要原因。ＤＣＭ 的发病机制有很多种，其中遗传因素起关键作用，许多单核苷酸多态性（ＳＮＰ）位点已被发现与 ＤＣＭ 相关。本篇综述概括了近几年 ＤＣＭ 的遗传研究进展，并总结了截止到目前发现的与 ＤＣＭ 易感性相关的 ＳＮＰ，旨在为ＤＣＭ 的预防和控制提供参考。

PO-0617

ODF1 基因多态性与断头精子发生的关系

张朵
中国人民解放军联勤保障部队第 900 医院

目的 探讨 ODF1 基因变异与人类断头精子发生的关系。
方法 收集断头精子（acephalic spermatozoa syndrome, ASS）患者精液和血液标本，提取精子中的 RNA，通过 RT-PCR 的方法扩增 ODF1 cDNA，Sanger 测序对扩增产物进行检测。提取血细胞 DNA，针对 ODF1 cDNA 中发现的变异位点设计扩增 ODF1 DNA 相应位点的引物，PCR 扩增后，Sanger 测序对 DNA 扩增产物进行检测。生物信息学分析 ODF1 基因变异位点可能对蛋白质高级结构产生的影响。100 名已生育男性的血液 DNA 作为对照。
结果 10 例 ASS 患者中，3 例携带 ODF1 基因一处 27bp 纯合缺失（c.760T_787Gdel，p.Asn219_Cys227del），3 例患者为该位点杂合子携带者，10 例 ASS 患者的变异频率为 0.450。其中纯合子占 30%。100 例对照中，该位点的变异频率为 0.321，其中纯合子仅占 1.9%。生物信息学分析发现该缺失为一基因多态性（rs568456031），在千人数据库中的变异频率为 0.313。在人类疾病数据库中，未对该多态性做注释。
结论 ODF1 基因多态性（rs568456031）可能对 ASS 患者发病起某种程度辅助作用，是 ASS 发病的修饰基因。

PO-0618

消化道粘液腺癌卵巢转移伴睾酮增高 1 例

王宁、王承缙、张月香
天津市中心妇产科医院

本文中患者女，47 岁，主因“查体发现盆腔肿物”入院，彩超提示：子宫上方略偏右侧至子宫上方可见一 109×109×81mm 肿块，内大部分为中强回声团块。入院后查肿瘤标记物：CA199：35U/ml，睾酮：433.0ng/dl，择日行开腹探查术，术中见：宫底部及后壁可见浆膜下子宫肌瘤，直径分别 1cm，右卵巢囊实性肿物 12×11×10cm 大小，表面光滑，直肠前壁及右骶韧带处可见病灶，质硬，直径均 2+cm 大小，膀胱腹膜折返病灶直径 1.5cm。考虑右侧卵巢肿物，切除右附件送冰冻结果为（右侧附件肿物）腺癌，部分呈肠型上皮，不除外转移性。术中快速免疫组化结果显示：CK7（部分+），CK20（部分+），Pax-8（-），CDX-2（小灶弱+）。病理回报右侧卵巢肿物：粘液腺癌（肠型），组织学形态及免疫表型均支持为消化道来源，其中直肠前壁病灶癌组织达两侧边缘（肌层及浆膜侧），卵巢肿瘤间质内可见较多散在或小团黄素化间质细胞，符合功能性间质。术后复查患者睾酮下降至 32.3ng/dl。卵巢转移瘤最常起源于胃肠道，尤其是胃和结肠，且卵巢粘液

性肿瘤常常伴有功能性间质，导致雌激素升高表现，但消化道粘液腺癌卵巢转移伴睾酮增高报导较少。本患者术前由于功能间质分泌导致睾酮升高，术后睾酮较前明显下降，为存在功能间质的消化道粘液腺癌卵巢转移患者的早期诊断和术后治疗效果评估提供了新思路。

PO-0619

3 个多囊肾病家系的胚胎植入前遗传学诊断

张在卉、王志红
联勤保障部队第九〇〇医院

目的 探讨携带多囊肾病（polycystic kidney disease，PKD）致病基因突变的家系中，胚胎植入前遗传学诊断（preimplantation genetic diagnosis，PGD）技术在帮助实现孕育正常后代、阻断 PKD 致病基因垂直传递中的可行性及效果。
方法 选择 3 个已明确分子诊断并要求 PGD 助孕的 3 个 PKD 家系，ADPKD 家系 1： PKD2 基因 IVS10+2T>C 杂合突变；ADPKD 家系 2： PKD2 基因 c.602delG 杂合突变；ARPKD 家系 3：PKHD1 基因 c. [889T>A];[11314C>T]复合杂合突变），采用囊胚滋养外胚层细胞活检、单细胞全基因组扩增（whole genome amplification，WGA）及 NGS（Next-generation sequencing）平台，运用联合诊断单基因病和染色体病非整倍体高通量测序与连锁分析（mutated allele revealed by sequencing with aneuploidy and linkage analyses，MARSALA）策略进行胚胎植入前遗传学诊断，挑选健康胚胎进行移植，在孕中期行羊水穿刺产前诊断，新生儿出生后进行跟踪随访。
结果 3 个家系 4 个 PGD 周期共检测 15 枚囊胚，每个家系均获可移植胚胎，其中包括正常基因型的整倍体胚胎 6 枚，表型正常的 ARPKD 携带者基因型的整倍体胚胎 2 枚。家系 1 先后移植 3 枚胚胎但未受孕，家系 2,3 移植正常胚胎后成功受孕，羊水产前诊断结果与 PGD 结果一致，且已生育健康后代，生后随访一切正常。
结论 对于明确致病基因突变的 PKD 家庭，基于 MARSALA 策略的 PGD 技术能够阻断致病基因的垂直传播，帮助生育健康胎儿。

PO-0620

端粒保护蛋白在肿瘤发生和治疗中的作用机制

高川力
川北医学院

端粒保护蛋白组成了蛋白复合物 shelterin，shelterin 是由六个端粒保护蛋白所构成的，其功能复杂多种多样。但该蛋白复合物有一重要的功能就是能够维持染色体末端稳定性。当端粒保护蛋白对端粒保护不足时则会引起 DNA 双链断裂等情况，从而产生 DNA 损伤等，使端粒暴露在有害环境下，这可能导致端粒和基因组完整性受损，进而引发肿瘤。在现代生活中，由于生活压力增大，生存环境不良，食品安全得不到保障等因素，人们所患癌症的几率越来越高，所患癌症的种类越来越多样。目前对于肿瘤的治疗主要有放射疗法和化学疗法两种，肿瘤放射治疗是利用放射线治疗肿瘤的一种局部治疗方法，而化学疗法则是利用化学药物清除癌细胞的一种治疗方式。这两种方式对癌细胞的作用都可能导致癌细胞突变或者死亡。癌细胞中 DNA 损伤修复反应（DDR）的结果是放射治疗和化学治疗后癌症发展和癌症结局的重要决定因素。DNA 损伤修复反应（DDR）与癌症发展的易感性有关，它可能导致对治疗的敏感度上升，从而可以用来改善癌症；它也可能突变后产生耐药性，使我们治疗癌症的难度加大。鉴于端粒保护蛋白与 DDR 之间的关系，端粒保护蛋白可能会成为治疗癌症新的靶点，通过端粒保护蛋白来增强对放射疗法和化学疗法的肿瘤敏感性，以此提高癌症治疗效果。

PO-0621

环状 RNA hsa_circ_0008591 在乳腺癌中的表达及功能研究

董相君、孔雪、王传新
山东大学第二医院

目的 乳腺癌是全球最常见的恶性肿瘤，严重危害女性健康。环状 RNA（circular RNA, circRNA）是一种具有连续闭合环状结构的非编码 RNA，不易被核酸外切酶降解，在生物体内更加稳定，这使其具有成为生物标志物的潜能。然而，circRNAs 在乳腺癌进展中的作用尚未完全阐明。本研究旨在探讨新型 circRNA hsa_circ_0008591 在乳腺癌中的表达水平及其生物学功能。
方法 选取 6 对乳腺癌组织与对应癌旁正常组织进行高通量 circRNA 芯片检测，根据 fold change>2 或＜0.5、p 值＜0.05 且转录本长度在 500-1500nt 的标准，对组织中差异表达的 circRNA 进行初步筛选。使用 GO 和 KEGG 分析，进一步选取与细胞周期、细胞增殖等生物学作用相关的 circRNAs，采用实时荧光定量 PCR（quantitative real-time PCR， qRT-PCR）对 circRNAs 在细胞系及血清样本中的表达水平进行验证，最终选定候选分子。通过 sanger 测序确定其环化位点，利用 RNA 酶、放线菌素 D 实验验证其环状特性及稳定性。使用质粒转染的方式，在乳腺癌细胞 MDA-MB-231 中过表达 hsa_circ_0008591。通过 RTCA 实时细胞检测技术评估 hsa_circ_0008591 对乳腺癌细胞增殖能力的影响。采用 TargetScan、miRDB、miRTarbase、Tarbase 四种数据库预测其下游靶基因并利用 cytoscape 软件构建其 ceRNA 互作网络。
结果 根据 circRNA 芯片结果和初步筛选标准，发现 2656 个在乳腺癌组织中差异表达的 circRNAs。GO 和 KEGG 分析结果显示，共有 19 个 circRNAs 与细胞周期和增殖作用相关，其中有 6 个上调和 13 个下调。qRT-PCR 结果表明，乳腺癌细胞株 hsa_circ_0008591 的表达水平明显低于正常乳腺上皮细胞，其在乳腺癌患者血清样本的表达也明显低于健康对照者，这与芯片数据一致，作为最终研究对象。qRT-PCR 显示转染了过表达质粒后，乳腺癌细胞系 MDA-MB-231 中 hsa_circ_0008591 的表达水平明显升高。RTCA 结果证实，过表达 hsa_circ_0008591 后，乳腺癌细胞的增殖能力明显减弱。TargetScan、miRDB、miRTarbase、Tarbase 数据库及互作网络提示其可能通过 ceRNA 机制调控下游靶基因从而抑制乳腺癌的增殖作用。
结论 研究表明 hsa_circ_0008591 在乳腺癌中低表达并可抑制乳腺癌的增殖，可作为乳腺癌患者潜在诊断的分子标志物及治疗靶点。

PO-0622

The Relation of Coagulation Test with Varying Levels of Thyroid Stimulat-ing Hormone

Guangzhen Fu 、Liang Ming
The First Affiliated Hospital of Zhengzhou University

Aim To investigate the changes in coagulation test results in subjects with varying serum levels of thyroid stimulating hormone.
Methods We performed a one-year retrospective analysis to retrieve combined results of activated partial thromboplastin time (APTT), prothrombin time (PT), fibrinogen (Fib), D-dimer, free thyroxine (fT4), tri-iodothyronine (fT3), and thyroid stimulating hormone (TSH) from inpatients who were referred by general practitioners for routine blood testing. Cumulative results were retrieved for 2794 such inpatients.
Results Patients with a TSH level <0.34 μIU/mL had higher PT values (10.43±1.02 vs 10.27±0.91) and Fib values (3.00±0.92 vs 2.7±0.56) compared with patients with 0.34 μIU/mL < TSH < 5.6 μIU/mL. Conversely, the PT values (10.01±0.95 vs 10.27±0.91) were lower and APTT (33.70±4.17 vs 32.56±4.12) values higher in patients with TSH > 5.6 μIU/mL compared to patients with 0.34 μIU/mL < TSH < 5.6 μIU/mL.

Conclusions There are changes in coagulation test results in subjects with varying levels of thyroid stimulating hormone.

PO-0623

Infectious endophthalmitis caused by Abiotrophia defectiva after penetrating injury in Child：A case report and case review

Jin Deng、mei kang、quanfeng liao、weili zhang、siying wu、ya liu
west china hospital of sichuan university

Background There have been few reports of endophthalmitis caused by Abiotrophia defectiva. We report a case of infective endophthalmitis caused by Abiotrophia defectiva in a 7-year-old Tibetan girl with a pencil injury. We aim to understand that Abiotrophia defective can also cause eye infections, and this pathogen should be covered during empirical antibiotic treatment.
Case presentation: A 7-year-old girl was stabbed with a pencil on her left eye. She developed vision loss, redness, and eye pain. The vitreous humor was taken from the left eye during vitrectomy and lens extraction and sent for examination and culture. Abiotrophia defectiva bacteria were isolated in the specimen.
Conclusions In addition to being known to cause infective endocarditis, Abiotrophia defectiva can also cause potentially infectious endophthalmitis. In addition, clinicians should send samples to infected patients in time, look for evidence of disease, make accurate pathogen diagnosis, and change the treatment plan in time based on the results of drug sensitivity tests.

PO-0624

胰腺癌来源的外泌体表型质谱分析

李雁儒
山东大学第二医院

肿瘤细胞来源的外泌体蕴含丰富的蛋白和特异性核酸等物质，在磷脂双分子层膜的保护作用下稳定存在于多种体液，实时反映机体荷瘤状态，被认为是液体活检最佳对象。

我们通过超速离心法对 8 对健康和胰腺癌患者血清进行外泌体富集，通过透射电镜和纳米颗粒跟踪分析对富集的外泌体进行表征，Western blot 验证其表面蛋白的存在。然后进行液相色谱串联质谱分析，筛选差异表达的蛋白分子，Western blot 及流式细胞术验证蛋白表达差异及亚细胞定位。最后通过大样本检测，构建联合诊断模型进行疾病诊断。

通过数据库、Western blot 及流式细胞术等多轮验证，最终筛选出 2 个定位于外泌体膜表面的蛋白分子，分别是 MUC5AC、LRG1。最终构建可用于癌症诊断的联合诊断模型。

PO-0625

6s 管理在临床实验室分析前质量管理中的应用

陈姝樾
重庆市人民医院

分析前质量管理具有影响质量因素的多环节性、复杂性、质量缺陷的隐蔽性、以及质量保证工作中非检验人员完全可控性、工作责任难确实性等特点。为保证检验质量更好的起到支持和辅助疾病的临床诊疗作用，临床实验室必须进行严格而全面质量管理，须贯穿于检验分析前、分析中、分

析后持续改进的过程。本文结合实验室管理经验，将 6s 管理法应用于临床实验室管理，从分析前流程的各个要素入手阐述对临床实验室分析前质量管理心得。
目的 探索 6s 管理法在临床实验室管理中的应用；
方法 将 6s 管理法中对各种生产要素（如人员、机器、材料、方法等）以整理（Sort）、整顿（Straighten）、清扫（Shine）、清洁（Standardize）、素养（Sustain）、安（Safety）为核心的管理模式应用于临床实验室分析前质量管理过程中，探索应用 6s 管理优化实验环境和流程前后对实验室分析前阶段质量管理的影响；
结论 在引入 6S 管理后优化了工作环境，提高了工作效率，提升了员工的综合素养，多维度降低了标本不合格率，使服务水平跃上了新台阶。

PO-0626

产 KPC-2 肺炎克雷伯菌 ST11 在重症监护室病人胃肠道的分布调查及遗传相关性分析

曹小利[1]、李阳[2]
1. 南京大学医学院附属鼓楼医院
2. 南京鼓楼医院

目的 分析产 KPC-2 肺炎克雷伯菌 ST11 在我院重症监护室住院病人胃肠道的定植情况，并分析 blaKPC-2 阳性肺炎克雷伯菌 ST11 菌株之间的遗传相关性。
方法 采集我院重症监护室 ICU 病人的肛拭子，使用含有 0.5%美罗培南的麦康凯平板筛选碳青霉烯不敏感肺炎克雷伯菌，K-B 法测定其对临床常用抗菌药物的敏感性；采用 PCR 法和 DNA 测序技术检测 blaKPC-2 基因；多位点序列分型技术分析利用 blaKPC-2 阳性肺炎克雷伯菌菌株的序列分型（ST），筛选出 ST11 菌株。脉冲场凝聚电泳(PFGE)技术分析产 blaKPC-2 肺炎克雷伯菌 ST11 菌株之间的遗传相关性。
结果 总共 收集肛拭子 125 个，阳性培养细菌中，30 株为碳青霉烯耐药肺炎克雷伯菌。27 株为肺炎克雷伯菌 ST11，26 株细菌携带 blaKPC-2 基因,25 株细菌为产 KPC-2 肺炎克雷伯菌 ST11。PFGE 结果显示 19（76%）株产 KPC-2 肺炎克雷伯菌 ST11 菌株之间有很大的遗传相关性。
结论 产 blaKPC-2 肺炎克雷伯菌 ST11 在我院重症监护室病人胃肠道中定植广泛，可能是其感染的主要病原菌，需加强感染控制措施。

PO-0627

碳青霉烯耐药大肠埃希菌的基因组学特点分析，重在关注 NDM 和 KPC-2 的共存

曹小利
南京大学医学院附属鼓楼医院

目的 分析碳青霉烯耐药大肠埃希菌（CREC）的基因组流行病学特征，调查共携带 blaNDM 和 blaKPC 的大肠埃希菌在我院的流行情况，并分析该类细菌的播散特点。
方法 对 2015 年从江苏南京 6 家医院收集的 11 株 CREC 菌株，进行全基因组测序组装后，分析耐药基因、毒力因子、多位点序列型（MLST）、血清型和 FimH 型的分布并构建系统发育树。对于从我院 2013-2017 年期间收集的 CREC 菌,使用 PCR 和 DNA 测序法筛选共携带 blaNDM 和 blaKPC 的菌株,使用脉冲场凝聚电泳技术（PFGE）进行遗传相关性分析；使用接合实验分析基因的可转移性。

结果 所有的 CREC 都携带了至少一种碳青霉烯酶编码基因，其中，9 株 CREC 细菌携带 blaNDM-5，3 株携带 blaKPC-2，2 株携带 blaNDM-1，3 株同时携带 blaNDM-5 和 blaKPC-2。11 株 CREC 株中，有 10 株携带 blaCTX-M 基因。MLST 分析发现 7 种不同的序列分型（ST），2 株细菌为 ST410，其余的 6 种 ST 型依次为 ST3489、ST156、ST683、ST297、ST167 和 ST361；其次，11 株细菌中鉴定出 6 种不同的血清型和 8 种 Fim 型；11 株细菌的质粒图谱虽然呈多样性，但每株细菌都含有质粒复制子 IncX3。系统发育分析表明，11 个 CREC 分离株之间有很大的遗传多样性；脉冲场凝胶电泳显示 6 株共携带 blaNDM 和 blaKPC 的分离株之间都存在较大的遗传多样性。结合实验表明 blaNDM 是可转移的，但与 blaKPC 基因不在同一质粒。
结论 blaNDM 是 CREC 中主要的碳青霉烯酶基因，blaNDM-5 是主要的 blaNDM 基因，可能通过 IncX3 质粒水平传播。MLST、Fim 分型、血清分型和进化树发育表明了 CREC 的遗传多样性。

PO-0628

Impact of environmental cleaning on the colonization and infection rates of multidrug-resistant Acinetobacter baumannii in patients within the intensive care unit in a tertiary hospital

xiaoli cao[1]、Yang Li[2]
1. Nanjing Drum Tower Hosiptal
2. 南京鼓楼医院

Objective To continuously evaluate the effect of environmental cleaning on the colonization and infection rates of multidrug-resistant Acinetobacter baumannii (MDR-AB) in the patients within an intensive care unit (ICU).
Methods Environmental cleaning on the high-touch clinical surfaces (HTCS) within a comprehensive ICU was evaluated through monitoring fluorescent marks when the overall compliance with hand hygiene during 2013-2014 was monitored. Meanwhile, samples from the HTCS and inpatients were collected and sent for bacterial culture and identification. The drug susceptibility testing was further implemented to monitor the prevalence of MDR-AB. The genetic relatedness of MDR-AB collected either from the HTCS or inpatients was analyzed by pulsed field gel electrophoresis (PFGE) when an outbreak was doubted.
Results The overall compliance with hand hygiene remained relatively stable during 2013-2014. Under this circumstance, the clearance rate of fluorescence marks on the environmental surfaces within ICUs significantly increased from 21.9% to 85.7%, and accordingly the colonization and infection rates of MDR-AB decreased from 16.5‰ to 6.6‰ and from 7.4‰ to 2.8‰, respectively, from the beginning to the end of 2013. However, during 2014, because of frequent change and movement of cleaning workers, the clearance rate of fluorescence marks decreased below 50%, and the overall colonization and infection rates of MDR-AB correspondingly increased from 9.1‰ to 11.1‰ and from 1.5‰ to 3.9‰, respectively. PFGE displayed a high genetic relatedness between the MDR-AB strains analyzed, indicating a dissemination of MDR-AB during the surveillance period.
Conclusion For the easily disseminated MDR-AB within ICUs, the clearance rateof fluorescence labeling on HTCS is negatively correlated with the hospital infection rate of MDR-AB. Such an invisible fluorescence labelling is an effective and convenient method to continuously monitor cleanness of medical environment within hospitals.

PO-0629

铁死亡相关基因对 EMT 的作用及其氧化机制的研究

孙露露
德州市人民医院

目的 转化生长因子-β1 (TGF-β1)诱导的上皮-间充质转化(EMT)被认为参与肺纤维化的发病机制。新出现的证据表明，铁死亡和肺纤维化发生之间存在共同的原因。
方法 通过检测 a-平滑肌动蛋白(a-SMA)、e -钙粘蛋白(E-cadherin)、溶质载体家族 7 成员 11 (SLC7A11)和谷胱甘肽过氧化物酶 4 (GPX4)的含量以及测定活性氧(ROS)、丙二醛(MDA)和谷胱甘肽(GSH)来探知 EMT 与铁死亡的相互作用及其机制。并分别用显微镜和透射电镜(TEM)观察细胞形态和线粒体的超微结构。
结果 Erastin 可诱导 A549 细胞发生铁死亡，使 A549 细胞中 E-cadherin、a-SMA、SLC7A11 表达水平降低，伴 ROS 和 MDA 水平升高以及谷胱甘肽的减少。TGF-β1 促进线粒体超微结构的变化和铁死亡相似，同时 A549 细胞在 EMT 过程中，间充质细胞形态发生改变，GSH 含量降低，SLC7A11，ROS 和 MDA 表达增加。Fer-1 恢复了 erastin 诱导的铁死亡，而对 TGF-β1 引起的形态学变化无影响。此外，Fer-1 还能减少 ROS 和 MDA，早期 SLC7A11 表达增加，随后 GSH 表达增加。然而，Fer-1 对上述指标的影响随时间的不同而不同。TGF-β1 诱导的 A549 细胞中 EMT 和 Erastin 诱导的铁死亡中 GPX4 表达无显著性差异。
结论 Erastin 促进肺上皮细胞去上皮化，但抑制肌成纤维细胞的分化过程；Fer-1 能部分抑制 TGF-β1 诱导的 EMT，但能逆转 Erastin 诱导的铁死亡。TGF-β1 能延缓铁死亡，但不能预防铁死亡。脂质过氧化，谷胱甘肽消耗和 SLC7A11 抑制是 A549 细胞 EMT 和铁死亡的常见原因，但在特异性上有所不同。GPX4 在 A549 细胞中参与 EMT 和铁死亡的确切作用有待进一步研究。

PO-0630

中部地区 2020 年 300 例腺样体肥大患儿的血清过敏原分析

马翔、柯欢、曾叶、刘翔、向赟
华中科技大学同济医学院附属武汉儿童医院

目的 探讨中部地区 2020 年腺样体肥大患儿的血清过敏原分布情况及其检测的临床意义。
方法 应用江苏浩欧博过敏原体外诊断试剂检测门诊及住院 300 例腺样体肥大患者和随机筛选的 300 例非腺样体肥大儿童的血清中常见的吸入性和食物性过敏原特异性 IgE 水平，比较两组病例的过敏原特异性 IgE 水平差异性。
结果 腺样体肥大组，126 例(42.0%)存在 1 级以上过敏原，27 例(9.0%)存在 2 级及以上过敏原，非腺样体肥大对照组，57 例(18.0%)存在 1 级以上过敏原，14 例(4.7%)存在 2 级及以上过敏原。腺样体肥大组血清过敏原特异性 IgE 阳性率由高低的顺序为屋尘螨占 17.0%，粉尘螨占 14.0%，虾占 12.5%，牛奶占 11.3%，鸡蛋占 7.5%，屋尘占 6.1%，螃蟹占 5.1%，交链孢霉占 3.2%，猫上皮占 2.9%，狗上皮占 1.8%，蟑螂占 1.1%。
结论 腺样体肥大患儿的过敏原特异性 IgE 水平阳性率明显高于对照组。吸入性尘螨和食物性鸡蛋白是腺样体肥大患儿最常见的过敏原，腺样体肥大发病率可能与过敏反应之间有密切关系。

PO-0631

临床实验室人事管理系统的开发和应用

承宝贵、郭非凡、姚恒、吕康琪、李敏、熊丹、张秀明
深圳市罗湖医院集团

目的 在经济快速发展的现代，互联网的出现给社会以及人民大众带来了巨大的好处。其中之一就是通过运用网络，使得各种管理越来越方便。由于经济的发展，人才流动不再受地域限制，并且流动量较大。因此对于一些“以人为本”的企业、政府、实验室等来说，人才非常的重要。需要在现有的人事管理系统基础上，结合计算机以及相关的专业知识，开发一套适用于实验室的人事管理系统。
方法 通过研究国内外的开发背景，对实验室中人事管理的应用进行概述，阐述其应用特点、优势以及开发前景。
结果和结论 根据 ISO15189 中的人员准则条款对员工进行管理。在人事管理系统中可以很清晰的查看到员工的教育经历、工作经历、培训记录、任职等情况。人事管理系统的功能是将实验室内部员工的全部信息进行系统性的集中管理，并对信息进行编号管理，通过电脑能够对信息进行查询、保护信息的安全， 为实验室在人事管理工作上提供便利。与其他人事管理系统相比，实验室人事管理系统有操作方便、保密性强、存储量大等优点。本系统是从实验室人事管理实际需求进行开发的，适用于不同的实验室。

PO-0632

临床实验室流程式电子记录系统的开发和应用

郭非凡、承宝贵、姚恒、吕康琪、李敏、熊丹、张秀明
深圳市罗湖医院集团

目的 为了使临床实验室适应于不断发展变革的大环境，满足实验室实验、管理等需求，讨论研究智能化管理在临床实验室管理中的应用模式，结合临床实验室的目的需求，提出了“标准化智慧实验室管理平台”系统。该系统通过利用互联网技术与实验室相关管理相结合，从而实现了实验室管理的信息化与高效化。基于“标准化智慧实验室管理平台”的理念，设计了多种模式板块，其中电子记录系统在传统纸质记录的基础上运用互联网技术实现信息快速高效查找，进一步提高了管理效率。此次就“标准化智慧实验室管理平台”中的电子记录系统的开发与应用进行讨论。
方法 通过研究电子记录系统的开发背景，对电子记录系统的概述以及应用进行研究，阐述临床实验室流程式电子记录系统的应用特点及其发展前景。
结果与结论 电子记录系统依据 ISO15189《医学实验室质量和能力认可准则》“管理记录”和“技术记录”的每个条款要求将所有表格电子化。依据互联网对实验室中的人员数据的存档、查询、统计等以及对实验室中仪器数据的查询、监控、统计等以电子形式存在的信息，从而起到更为及时清晰准确的监察与提醒作用。电子记录系统不仅可以实现对指南文档等的 记录，也实现了对于日常工作中的直观电子化记录。相较于纸质记录，电子记录可操作性强、保存期限长，并且还可以实现查询功能、数据统计功能与提醒监督功能。电子记录系统不仅可以作为“标准化智慧实验室”的特色模块，其本身也可以作为一种独立的系统板块。

PO-0633

浅谈检验医师如何发挥在临床诊疗中的积极作用

沈国银
上海市第一人民医院嘉定分院

随着医学技术的飞速发展，医学检验已经发展成为包含临床血液学检验、临床体液学检验、临床生化检验、临床微生物学检验、临床免疫学检验、分子生物学检验等多门亚专业学科组成的独立的一级临床学科---检验医学。实验室检查在疾病的临床诊断、疗效观察，预后评估等方面发挥着越来越重要的作用。现代医学的发展离不开检验医学，但在临床诊疗的过程中，由于医生和检验人员专业信息结构的不对等，当临床医生对于某个患者的检验结果有异议时，检验人员却无法给出合理的解释。长此以往两者之间将产生不信任和隔阂。2003 年国际标准化组织发布的 ISO15189：2003《医学实验室---质量和能力的专用要求》、《医疗机构临床实验室管理办法》中第 20 条规定都提出：医疗机构临床实验室除对患者的标本进行各种检测外，还应当提供临床检验结果的解释和咨询服务。这时就需要检验医师积极参与到临床诊疗中，作为桥梁作用，将有限的检验数据转化为有价值的临床诊断信息。2003 年中国医师协会检验医师分会在北京成立，标志着检验医师队伍正式诞生。

本文从以下几个方面探讨在新医科背景下检验医师如何发挥在临床诊疗中的积极作用，从而提高检验医师在医疗过程中的职业满足感和价值感。

1. 培养检验医师人才，提高检验医师人文文化素质和临床思维。
2. 检验医师参与整个检验过程，包括分析前，分析中，分析后三个阶段。
3. 检验医师作为临床和检验沟通的桥梁，与临床的沟通方式可以多样化。

3.1 检验医师在审核报告的过程中发现异常报告或怀疑的结果直接电话与临床沟通。

3.2 解释性报告、诊断报告的签发是检验医师直接参与临床决策的一种方式，检验医师对异常结果能根据疾病的发生发展与检验指标的关系，给出书面解释分析以及进一步检查的建议。

3.3 检验医师参与临床查房和 MDT，提高检验在临床诊断治疗中的参与度。

3.4 由医教科牵头组织，定期开展与临床交流的沟通会议。

3.5 举办检验医学学术讲座，向临床介绍推广检验新技术新方法。

3.6 通过院内 OA 系统、微信公众号等现代化自媒体，设检验专栏，包括国内外检验动态、检验案例分析等。

3.7 加强与临床医生的科研合作，利用实验室检测技术上的优势，申请并参与临床科研课题。

4. 检验科开设检验咨询门诊，有助于减轻临床医生的负担，提升检验医学科的影响力。

综上，我国检验医师的培养尚处于起步阶段，国家卫健委和教育部应从政策层面给予扶持，提高检验医师认同度，医院清晰界定检验医师和技师的岗位职责。检验与临床平等对话，临床接纳检验医师参与临床诊疗，才能更好地为患者服务，共同促进医学的进步发展。

PO-0634

Analysis of blood specimen rejection in the preanalytical phase to improve specimen quality

Keping Chen
Zhongda Hospital, School of Medicine, Southeast University

Background The preanalytical phase is liable for the most errors in the clinical laboratory. This study analyzed the causes and frequencies of specimen rejection in preanalytical phase and aimed to improve the specimen quality and patients' safety.

Methods The records of rejected blood specimens from the clinical laboratory of Zhongda Hospital between January 2014 and December 2018 were collected, and the causes, frequencies,

and sources of rejected specimens were further analyzed. The delayed time was also investigated to estimate the impact of different errors on the turnaround time.
Results Insufficient specimen was the major error causing rejection, accounting for 49% of the total 27,110 rejected specimens. This error often happened in the otorhinolaryngology head and neck surgery department. The second common error was clotted specimens, followed by hemolyzed specimens. The Neonatal Intensive Care Unit (NICU) had the highest frequency of specimen rejection. The medical examination department had the longest delayed time. Compared with other errors, the average delayed time caused by collecting specimens in wrong containers ranked first, and there was a significant difference in the quartile distribution of delayed time for each error type ($p \leq 0.001$).
Conclusions The identification and management of specimen errors in preanalytical phase were crucial activities to improve the specimen quality and patents' safety. To continuously improve specimen quality, the education to the nurses and other medical staff were needed to short the turnaround time.

PO-0635

Epidemiological and clinical characteristics of respiratory viruses in 4403 pediatric patients from multiple hospitals in Guangdong, China

Yajie Zhang
Department of Laboratory Medicine, Nanfang Hospital, Southern Medical University, Guangzhou

Background Acute respiratory infections (ARI) cause considerable morbidity and mortality worldwide, especially in children. Unfortunately, there are limited multi-center data on common viral respiratory infections in south China.
Methods A total of 4403 nasal swabs were collected from children in 10 cities in Guangdong, China in 2019. Seven respiratory viruses, influenza A virus (IFA), influenza B virus (IFB), respiratory syncytial virus (RSV), adenoviruses (ADV) and parainfluenza virus types 1–3 (PIV1, PIV2 and PIV3), were detected by direct immunofluorescence antibody assay. The personal information and clinical characteristics were recorded and analyzed.
Results The results showed that at least one virus was detected in 1099 (24.96%) samples. The detection rates of RSV, IFA, ADV, PIV3, PIV1 and PIV2 were 7.13% (314/4403), 5.31% (234/4403), 4.02% (177/4403), 3.04% (134/4403), 1.70% (75/4403) and 1.16% (51/4403), respectively. The detection rate of RSV was highest in 0–6-month-old children at 18.18% (106/583), while the detection rate of IFA was highest in 12–18-year-old children at 20.48% (17/83). The total detection rates in winter and spring were 35.67% (219/614) and 34.56% (403/1166), higher than those in summer, 17.41% (284/1631), and autumn, 19.46% (193/992).
Conclusions RSV and IFA were the main respiratory viruses in children. With increasing age the detection rate of RSV decreased in children, but the trends for the detection rates of IFA and IFB were the opposite. This study provided the viral etiology and epidemiology of pediatric patients with ARI in Guangdong, China.

PO-0636

m6A 甲基化修饰促进结直肠癌奥沙利铂耐药的分子机制及在耐药预测中的应用价值研究

齐秋晨
山东大学第二医院

目的 探讨 m6A 甲基化修饰促进结直肠癌奥沙利铂耐药的分子机制及在耐药预测中的应用价值。
方法 采用 Dot blot、Western blot 法分析结直肠癌奥沙利铂耐药及其亲代细胞中 m6A 水平差异和甲基转移酶及去甲基化酶的表达变化；体内外功能实验分析 m6A 修饰对结直肠癌奥沙利铂耐药的影响；利用耐药细胞 HCT116/OXA 及其亲代细胞 HCT116 进行 MeRIP-seq 和 RNA-seq 联合分析，利用生物信息学技术筛选耐药细胞中 m6A 修饰及转录水平均特异性上调的基因，并应用耐药及其亲代细胞，通过 qRT-PCR 和 MeRIP-qPCR 等验证，筛选 m6A 调控奥沙利铂耐药的潜在靶基因。
结果 建立的奥沙利铂耐药的结直肠癌细胞中 RNA 的 m6A 修饰水平显著上调，并且伴有甲基转移酶 METTL3 表达的异常升高。体内外功能实验表明，过表达野生型 METTL3 后 m6A 水平增加，并且显著降低了结直肠癌细胞对奥沙利铂的敏感性。MeRIP-seq 测序结果显示耐药细胞中 89 个 m6A 特异性上调的基因，联合 RNA-seq 测序分析，获得 24 个耐药细胞中 m6A 修饰及转录水平同时上调的候选基因，GO 富集分析显示候选基因大多与 EMT 相关。
结论 m6A 甲基化修饰上调能够促进结直肠癌奥沙利铂耐药，其可能通过增加 EMT 相关基因的 m6A 修饰水平，促进 EMT 从而促进奥沙利铂耐药。

PO-0637

检验科投诉原因分析及防范措施探讨

赵晓丽、钱净、阳春丽、马永鑫、徐跃轩、黎海生、张鸿伟
昆明市第一人民医院

目的 分析检验科投诉产生的原因及预防措施，并对防范措施有效性进行评价。
方法 将检验科近 4 年接受的 43 例投诉，分两个阶段来分析，第一阶段：2016 年 1 月～12 月，总结归类分析投诉的原因，制定预防措施，第二阶段：2017 年 1 月～2019 年 12 月，对不同阶段投诉发生率、投诉构成比变化进行比较，并评定各种预防措施的有效性、可行性。
结果 1. 2016 年 1 月～12 月我科共接到有效投诉 20 例，总结归类分析投诉的原因，其中前五位投诉内容为：报告发放不及时 4 例，采血时等候时间长 4 例，检验结果不准确 3 例，手工计费失误 3 例，危急值漏报 2 例。2. 采取预防措施后，2017-2019 年每年投诉量均较 2016 年明显减低，分别为：2017 年 7 例，2018 年 8 例，2019 年 8 例。3. 2017-2019 年的年投诉量较 2016 年降低 60%以上，至 2019 年 “ 报告发放不及时”、“ 采血时等候时间过长”、“手工计费失误”等投诉发生率为 0。
结论 分析投诉的产生原因，制定行之有效地预防措施并实施，可进一步规范检验流程，提高检验质量和服务质量，完善质量管理体系。

PO-0638

基于患者风险管理的自动审核规则设置

李云飞、马建锋
江苏省人民医院（南京医科大学第一附属医院）

目的 设计实验室检测结果自动审核规则，在避免错误结果被误审发出报告的前题下，提高自动审核率，减轻员工工作强度。

方法 排查临床检测过程中，检测结果发生错误的原因，评估错误产生的可能性，可能导致的严重程度，通过认真讨论研究，征询临床专家建议，规定在室内质控合格，样本采集、运输、接收等满足质量要求条件下，符合以下条件时，仍强制执行人工审核程序：1 有项目结果达到规定限值样本；2 重症监护病房患者样本；3 脑脊液样本；4 与前回结果比较，同一项目两次结果有一次超过正常参考区间，且变化大于规定的百分偏差和/或绝对偏差；5 反映临床诊治密切相关联项目变化幅度，其中一项结果超过正常参考上限 1 倍，其它项仍有在正常区间内；6 有逻辑关系项目，结果不符合逻辑关系；7 婴幼儿（3 岁以下）和老年人（85 岁以上）。要求员工进行纠正或强烈关注，据此设定自动审核规则，再次评价规则设定后的剩余风险，保证临床诊治风险在可控范围内。
结果 该规则能有效地降低导致临床诊疗错误报告发出的风险，剩余风险在可控范围内。
结论 实验室可以通过设置自动审核规则，建立安全高效智能审核系统，并通过人工审核规避不可控风险，提高工作效率，保障临床诊安全。

PO-0639

circNEIL3 functions as a ceRNA by mediating pyroptosis via PIF1 upregulation in lung adenocarcinoma radiotherapy

Ting Zhang
The First Affiliated Hospital of Chengdu Medical College

Background Lung cancer remains the leading cause of cancer-related mortality worldwide, constituting 18% globally and 19% of all cancer-related deaths in China. It is estimated that 85% of human lung cancers are non-small cell lung cancer, with lung adenocarcinoma (LUAD) being the predominant subtype, accounting for 50% of cases. Radiotherapy is widely used in the treatment of clinical tumors, related to lung cancer, prostate cancer, kidney cancer, and many others. However, ionizing radiation can cause a range of opportunistic infections and systemic inflammation, with life-threatening tumor recurrence and metastasis still prevalent in patients. Although radiotherapy has been widely used in the treatment of lung adenocarcinoma (LUAD), the curative effects are relatively poor and further improvements are required. Circular RNAs (circRNAs) represent a category of non-coding RNAs that are abundant, stable, and specific in organisms, and thus may have great potential in cancer treatment. However, little is known about the role of circRNAs during radiotherapy in LUAD.
Methods We established and explored the expression profiles of 1875 dysregulated circRNAs in non-irradiated and irradiated A549 cells by RNAseq and verified 10 circRNAs by RT-qPCR. Then, gain-of-function and loss-of-function experiments of circNEIL3 in LUAD were performed. The competing endogenous RNA network and its heatmap were used to identify the downstream targets of circNEIL3. Luciferase reporter assay and AGO2 immunoprecipitation were conducted to evaluate the interaction between circNEIL3, miR-1184, and PIF1. Functional experiments were performed using LDH, IL-1β, and IL-18 release assays, flow cytometry, western blotting, and RT-qPCR.
Results We identified circNEIL3 as a significantly downregulated circRNA in both A549 and H1299 LUAD cells treated with 0, 2, or 4 Gy of radiation, respectively. circNEIL3 knockdown promoted radiation-induced cell pyroptosis, whereas circNEIL3 overexpression had the opposite effects. Importantly, the effects of circNEIL3 overexpression on inhibiting pyroptosis were reversed by PIF1 knockdown. Mechanistically, circNEIL3 can mediate pyroptosis by directly binding to miR-1184 as a sponge and release inhibition of miR-1184 on PIF1. In addition, our experiments further demonstrated that circNEIL3 mediates radiation-induced cell pyroptosis by regulating the DNA damage repair pathway, and finally impacts LUAD survival.
Conclusion We demonstrated that circNEIL3 exerted its function as a ceRNA by directly binding to miR-1184, and then abrogated the endogenous inhibitory effect of miR-1184 on the target gene PIF1. Low-expression PIF1 could weaken DNA damage repair and drive cell pyroptosis, ultimately affecting survival in lung cancer treatment with radiation. These results suggest that the circNEIL3/miR-1184/PIF1 axis mediates cell pyroptosis by regulating the DNA damage repair

pathway. Therefore, circNEIL3-related pyroptosis induction may serve as a potential therapeutic target to enhance radiotherapy of lung cancer.

PO-0640

胶质母细胞瘤进展相关 lncRNA 预后风险评估模型的构建

李小萌
山东大学第二医院

目的 通过 TCGA 数据库构建胶质母细胞瘤进展相关的 lncRNA 预后风险评估模型。
方法 从 TCGA 数据库下载胶质母细胞瘤和低级别胶质瘤样本的表达数据及临床信息，通过 R 语言分析筛选胶质母细胞瘤和低级别胶质瘤中差异表达的 lncRNA 分子，使用单因素 cox 回归分析筛选出于预后相关的分子，通过多因素 cox 回归进一步筛选出分子建立风险评估模型，使用 K-M 生存分析和 ROC 曲线对模型的预测效能进行验证，使用基因本体(GO) 、京都基因与基因组百科全书(KEGG)预测模型的功能。
结果 以| log2 fold change |＞2 且 FDR＜0.01 为标准筛选出 259 个进展相关差异表达的 lncRNA 分子，经过单因素 cox 回归分析，得到 19 个预后相关分子，通过多因素 cox 回归分析最终获得了 4 个进展及预后相关分子构建了预后风险评估模型，风险评分 =0.1202×HOXC-AS2+0.1195×SMIM25+0.1501×AGAP2-AS1+0.1577×OSMR-AS1。K-M 分析表明高风险组的患者生存明显短于低风险患者且有统计学意义。在测试集、验证集和 TCGA 总集中 3 年 AUC 值分别为 0.952、0.804 和 0.905，5 年 AUC 值分别为 0.929、0.844 和 0.882。KEGG 和 GO 分析结果显示，模型中 lncRNA 分子可能参与了免疫分子相关的肿瘤代谢通路。
结论 由 HOXC-AS2、SMIM25、AGAP2-AS1、OSMR-AS1 分子构成的进展相关 lncRNA 预后风险评估模型能够预测患者预后，有望成为临床预后评估的新靶点。

PO-0641

Survival analysis of immune-related lncRNA in glioblastoma

xiaomeng li
The Second Hospital of Shandong University

Background A variety of regulatory approaches including immune modulation have been explored as approaches to either eradicate antitumor response or induce suppressive mechanism in the glioblastoma microenvironment. Thus, the study of immune-related long noncoding RNA (lncRNA) signature is of great value in the diagnosis, treatment and prognosis of glioblastoma.
Methods Glioblastoma samples with lncRNA sequencing and corresponding clinical data were acquired from the Cancer Genome Atlas (TCGA) database. Immune-lncRNAs co-expression networks were built to identify immune-related lncRNAs via Pearson correlation. Based on the median risk score acquired in the training set, we divided the samples into high- and low-risk groups and demonstrate the survival prediction ability of the immune-related lncRNA signature. Both principal component analysis (PCA) and gene set enrichment analysis (GSEA) were used for immune state analysis.
Results A cohort of 151 glioblastoma samples and 730 immune-related genes were acquired in this study. A five immune-related lncRNA signature (AC046143.1, AC021054.1, AC080112.1, MIR222HG, and PRKCQ-AS1) was identified. Compared with patients in the high-risk group, patients in the low-risk group showed a longer overall survival (OS) in the training, validation and entire TCGA set (P=1.931e-05, P=1.706e-02 and P=3.397e-06, respectively). Additionally, the survival prediction ability of this lncRNA signature was independent of known clinical factors and

molecular features. The area under ROC curve (AUC) and stratified analyses were further performed to verify its optimal survival predictive potency. Of note, the high- and low-risk groups exhibited significantly distinct immune state according to the PCA and GSEA analyses.
Conclusions Our study propose that a five immune-related lncRNA signature can be utilized as a latent indicator of prognosis and potential therapeutic approach for glioblastoma.

PO-0642

SUN5 介导精子头尾连接的分子机制：基于 Sun5 基因敲除小鼠的研究

张芸飞[1]、杨林飞[1]、黄利华[1]、刘刚[2]、张新星[1]、邢晓为[1]、聂新民[1]
1. 中南大学湘雅三医院
2. 中南大学基础医学院

目的 无头精子症是一种罕见的遗传和生殖疾病。研究表明，大约 33~47%的无头精子症发病由 *SUN5* 突变导致，但其分子机制尚不清楚。本研究通过 *Sun5* 基因敲除小鼠模型，探究 Sun5 介导精子头尾连接的分子机制，对了解无头精子症的发病机制和临床治疗具有重要意义。
方法 1. 建立 *Sun5*$^{-/-}$小鼠模型，通过 HE 染色和透射电镜对 *Sun5*$^{-/-}$小鼠的表型进入深入分析。
2. 通过免疫共沉淀(co-IP)和免疫荧光探究 Sun5 与 Nesprin3 之间的相互作用。
3. 通过免疫荧光和透射电镜观察 *Sun5* 基因敲除对 Nesprin3 和中心体在精子形成中定位的影响。
4. 通过 iTRAQ 检测 *Sun5* 基因敲除对睾丸蛋白表达谱的影响，并对差异蛋白进行生物信息学分析。
结果 1. *Sun5*$^{-/-}$小鼠 Sun5 蛋白表达缺失。HE 染色显示 *Sun5*$^{-/-}$小鼠睾丸沿管腔排列的精子头明显减少；附睾管腔中可见大量的精子尾部，少见精子头。*Sun5*$^{-/-}$小鼠附睾的精子头尾连接断裂。进一步超微结果显示小鼠精子的头尾连接装置在精子形成的 9-10 期远离细胞核，在 13-14 期出现了完全的断裂。
2. Co-IP 结果显示，SUN5 和 Nesprin3 能够相互作用；进一步免疫荧光实验结果显示 Sun5 和 Nesprin3 共定位于精子的头尾连接处，表明 Sun5 和 Nesprin3 相互作用形成 LINC 复合物介导精子头尾连接。
3. 免疫荧光实验结果显示 *Sun5* 缺陷使 Nesprin3 在精子形成过程中在核后极植入窝处的定位发生改变；超微结构显示 *Sun5*$^{-/-}$小鼠中心体与细胞核的距离增大。表明 Sun5 缺陷引起 Nesprin3 定位改变，导致中心体及尾部结构不能锚定于植入窝，引起精子头尾连接断裂。
4. 通过 iTRAQ 技术筛选了 103 个差异蛋白，其中 47 个上调蛋白，56 个下调蛋白。生物信息学结果表明，这些差异蛋白参与细胞蛋白复合物组装、精子运动等多个生物学过程。
结论 1. *Sun5* 基因敲除导致小鼠精子头尾连接断裂，出现无头精子症的表型，说明 *SUN5* 基因是无头精子症的致病基因之一。
2. Sun5 与 Nesprin3 形成特异性的 LINC 复合物定位于精子头尾连接处，介导精子的头尾连接。
3. Sun5 对 Nesprin3 和中心体的定位是必须的。Sun5 缺陷导致 Nesprin3 在精子发育过程中不能锚定植入窝，从而导致中心体失去了和细胞核的联系，引起精子头尾断裂，这可能是 Sun5 缺失导致精子头尾断裂的重要机制之一。
4. *Sun5* 基因敲除改变了小鼠睾丸蛋白的表达谱。这些与精子发生过程相关的下调蛋白可能也参与了精子的头尾连接的组装，可能是引起精子头尾连接断裂的另一重要原因。

PO-0643

非高密度脂蛋白胆固醇（Non-HDL-C）临床应用价值探索

蒙立业、张禾、干伟、贺勇
四川大学华西医院实验医学科

目的 探索非高密度脂蛋白胆固醇（Non-HDL-C）在动脉粥样硬化患者中的诊断价值，并建立数据模型，验证 Non-HDL-C 在不同模型中预测动脉粥样硬化的价值。
方法 收集 2021 年 1 月至 2021 年 4 月四川大学华西医院临床诊断为动脉粥样硬化患者的血脂检测结果，同时收集同期健康体检人群血脂实验室检测结果。非高密度脂蛋白胆固醇计算方法为：Non-CHOL-C=总胆固醇（CHOL） -高密度脂蛋白胆固醇（HDL-C）。通过 ROC 分析 Non-HDL-C 在诊断动脉粥样硬化中的 cutoff 值，以及通过 logistic 回归分析 Non-HDL-C 在不同模型中预测动脉粥样硬化的价值。
结果 ROC 分析结果显示 Non-HDL-C 在诊断动脉粥样硬化 AUC 为 0.73（95%CI:0.72~0.74），P 值小于 0.01，cutoff 值为 2.68 mmol/L；TG 在诊断动脉粥样硬化 AUC 为 0.71（95%CI:0.70~0.72），P 值小于 0.01，cutoff 值为 1.54 mmol/L；CHOL 在诊断动脉粥样硬化 AUC 为 0.79（95%CI:0.78~0.80），P 值小于 0.01，cutoff 值为 3.86 mmol/L；HDL-C 在诊断动脉粥样硬化 AUC 为 0.77（95%CI:0.76~0.78），P 值小于 0.01，cutoff 值为 1.08 mmol/L；LDL-C 在诊断动脉粥样硬化心脏病 AUC 为 0.80（95%CI:0.79~0.81），P 值小于 0.01，cutoff 值为 2.19mmol/L。Non-HDL-C 在预测动脉粥样硬化时，相比较于正常人群，其比值比（OR）为 2.53（95%CI：2.38~2.70）；Non-HDL-C 联合 LDL-C 模型预测动脉粥样硬化的 ROC 曲线下面积 0.87（95%CI：0.86~0.88）。Non-HDL-C 联合 CHOL 模型预测动脉粥样硬化的 ROC 曲线下面积 0.82（95%CI：0.81~0.83）。Non-HDL-C 联合 LDL-C、CHOL 模型预测动脉粥样硬化的 ROC 曲线下面积 0.88（95%CI：0.87~0.89）。
结论 Non-HDL-C 在预测动脉粥样硬化心脏病中存在一定的应用价值，联合动脉粥样硬化心脏病血脂指标能提高其诊断价值。

PO-0644

溶血对脑脊液生化检测项目的干扰研究

刘静、杨伟明、王小中、吕娇凤
南昌大学第二附属医院

目的 探讨脑脊液（CSF）标本溶血对 CSF 常用生化检测项目总蛋白（TP）、微量蛋白（mALB）、乳酸脱氢酶（LDH）、天门冬氨酸氨基转移酶（AST）、肌酸激酶（CK）和葡萄糖（Glu）的干扰情况。
方法 选择 TP、mALB、LDH、AST、CK 和 Glu 浓度分别接近正常参考区间上限的 CSF 标本各 1 例，外观清亮，经 Sysmex 全自动血细胞分析仪检测 CSF 标本中血红蛋白（Hb）含量为 0g/L，此为基础样品。同时收集同一病人的血常规标本制备溶血干扰原液。按照 WS/T 416-2013《干扰实验指南》，首先制备干扰物高实验浓度样品（H）与低实验浓度样品（L），再将 H 和 L 样品按照梯度比例混合得到实验样品系列。用 Beckman AU5400 全自动生化分析仪按照升序、降序、升序进行 3 次检测，记录结果计算干扰效果并进行回归分析。
结果 溶血对 TP、LDH、AST 和 CK 等项目的检测有明显的正向干扰效果，溶血程度越高干扰越明显，呈线性相关；对 mALB、Glu 的干扰效果不明显（最大干扰物浓度为 8.75g/L），溶血程度与干扰效果之间无相关性。
结论 溶血脑脊液标本不适合于 TP、LDH、AST 和 CK 等项目的检测；当溶血脑脊液标本中 Hb 浓度≤8.75g/L 时，可用于 mALB 和 Glu 的检测。

PO-0645

COVID-19-another influential event impacts on laboratory medicine management

yuntao luo、jinghua wang、minmin zhang、qingzhong wang、rong chen、xueliang wang、hualiang wang
Shanghai center for clinical laboratory

Back ground Before public health emergencies became a major challenge worldwide, the scope of laboratory management was only related to developing, maintaining, improving and sustaining the quality of accurate laboratory results for improved clinical outcomes. Indeed, quality management is an especially important aspect and has achieved great milestones during the development of clinical laboratories.
Current status However, since the coronavirus disease 2019 (COVID-19) pandemic continues to be a threat worldwide, previous management mode inside the separate laboratory could not cater to the demand of the COVID-19 public health emergency. Among emerging new issues, the prominent challenges during the period of COVID-19 pandemic are rapid-launched laboratory developed tests (LDTs) for urgent clinical application, rapid expansion of testing capabilities, laboratory medicine resources and personnel shortages. These related issues are now impacting on clinical laboratory and need to be effectively addressed.
Conclusion Different from traditional views of laboratory medicine management that focus on separate laboratories, present clinical laboratory management must be multidimensional mode which should consider consolidation of the efficient network of regional clinical laboratories and reasonable planning of laboratories resources from the view of overall strategy. Based on relevant research and our experience, in this review, we retrospect the history trajectory of laboratory medicine management and also, we provide existing and other feasible recommended management strategies for laboratory medicine in the future.

PO-0646

Hypermethylation-mediated silencing of CCBE1 drives change of mitochondrial activity to promote HCC progression via TGF-β signaling pathway

Guangang Tian、Qian Gong
Clinical Laboratory, Zhongshan Hospital Qingpu Branch, Fudan University

Purpose Hepatocellular carcinoma (HCC) is a complex and heterogeneous tumor driven by multi steps and tumor microenvironment do an important role in the development and progression of cancer. Extracellular matrix (ECM) proteins, as part of tumor microenvironments, play crucial roles in tumor development and metastases. CCBE1, as a 44-KD extracellular matrix glycoprotein, modulates lymphangiogenesis through promoting the formation of mature VEGF-C from pro-VEGF-C. Whereas, none study was performed to clarify the role of CCBE1 in HCC. Here, we aim to uncover the underlying functions of CCBE1 and its mechanism involved in the initiation and development of HCC.
Methods Real-time PCR, western blotting and immunohistochemistry were used to test CCBE1 expression. Cell proliferation was determined by CCK8, colony-forming and subcutaneous injection assays. Transwell assay and in vivo metastasis assays were performed to test the ability of cell motion. Bisulfite sequencing was adopted to explore the methylation level of CCBE1. Mitochondrial tracker, JC-10 and seahorse XF24 extracellular flux analyzer were implemented to determine the mitochondrial activity, including mitochondrial morphology, mitochondrial membrane potential and oxygen consumption rate (OCR), et.

Results In this study, we first reported that CCBE1 expression was significantly down-regulated in tumor compared non-tumor tissues by data mining, as well as verified in HCC tissues. Additionally, poor prognosis emerged in the CCBE1 low expression patients. Following, the mechanism of CCBE1 down regulation resulted from higher methylation level of CCBE1 promoter by bisulfite sequencing PCR (BSP) in HCC cells lines and tissues, which could be confirmed by DCA treatment in HCC cells. Furthermore, in vitro and in vivo assays found that CCBE1 overexpression or treatment with recombined CCBE1 protein dramatically suppressed HCC cell proliferation, migration and invasion. Interestingly, the GSEA analysis showed that CCBE1 was related with parkinson's disease, a mitochondrial dysfunction disease. Hence, mitochondrial activity was selected to study. And the results showed that CCBE1 dysregulation destroyed mitochondrial dynamic equilibrium and mitochondrial membrane potential. Meanwhile, we found that CCBE1 overexpression could decrease OCR of HCC cells, while no effect was done on Extracellular acidification rate (ECAR), which further indicates that CCBE1 may affect mitochondrial activity. Further research found that CCBE1 overexpression could decrease the Phosphorylation level of Drp1 via inhibiting the TGF-β signaling pathway. Moreover, it could reverse the phosphorylation of Drp1 treatment with TGF-β.
Conclusions In this study, we describe CCBE1 as a key mediator in the development of HCC. Under hypermethylation level of CpG island in promoter, HCC cells acquire growth and metastasis advantage by impaired mitochondrial activity via TGF-β signaling pathway in the CCBE1 deficient microenvironment. Significantly, our researches provide new evidence for epigenetic control of tumor microenvironment, and suggest matricellular protein CCBE1 may serve as a novel prognostic marker and act as a HCC suppressor.

PO-0647

护理人员培训模式对检验标本不合格率的影响分析

朱宇、高佳、李佳、王宗丹、郑翠玲、崔巍
国家癌症中心/国家肿瘤临床医学研究中心/中国医学科学院北京协和医学院肿瘤医院检验科

目的 探讨护理人员培训模式在检验分析前质量控制中的作用。
方法 分别于不同时间段采用护士长集中培训和病区针对性培训两种模式对护理人员进行标本采集注意事项培训，分析培训前、后 3 个月患者检验标本不合格率及类型变化。
结果 护士长集中培训前、后 3 个月的标本总不合格率分别为 0.251%（646/257641）和 0.238%（572/240569），呈下降趋势但无统计学差异（X^2=0.858，P=0.354）。病区针对性培训前、后 3 个月的标本总不合格率分别为 0.225%（708/314756）和 0.169%(511/302776)，总不合格率显著下降（X^2=24.710，P<0.001）；其中，乳糜血（0.032% vs.0.004%，X^2=64.595，P<0.001）、溶血（0.052% vs.0.019%，X^2=46.618，P<0.001）和采集量错误（0.038% vs.0.028%，X^2=4.112，P=0.043）标本不合格率显著减少。
结论 病区针对性培训在降低检验标本不合格率中的作用优于护士长集中培训。检验科应根据培训目的及效果不断优化培训模式，促进检验质量不断提升。

PO-0648

i2000SR 全自动免疫分析仪检测高敏肌钙蛋白 I 的性能评价

刘春燕、葛若卿、刘爽、李晓苗、张新
新疆生产建设兵团医院

建立及评价 i2000SR 全自动免疫分析仪(简称 i2000SR)检测高敏肌钙蛋白 I(hs-cTnI)的功能灵敏度(FS)、精密度、空白限(LoB)、检出限(LoD)、定量检测限(LoQ)和线性范围。

方法 参照美国临床实验室标准化协会(CLSI)EP17-A 文件和相关文献，将 hs-cTnI 空白样本和系列浓度样本在 i2000SR 上进行检测，采用统计学方法确定血清 hs-cTnI 的 FS、精密度、LoB、LoD、LoQ 及线性范围。
结果 i2000SR 检测 hs-cTnI 的功能灵敏度为 1.93pg/ml。高值样品(15100.0pg/ml)批内变异系数(CV)和批间 CV 分别为 1.52%和 3.54%；中值样品(190.0pg/ml)批内 CV 和批间 CV 分别为 2.90%和 3.83%；低值样品(20.0pg/ml)批内 CV 和批间 CV 分别为 7.60%和 0.82%。按 CLSI EP17-A 文件建立的 LoB、LoD、LoQ 分别为 0.45pg/ml、1.45pg/ml 和 1.90pg/ml。在检测范围内，i2000SR 预期值和实测值的线性方程为 Y=0.937X+1428.727，R2=0.997。
结论 i2000SR 检测 hs-cTnI 的高值不精密度低于厂家说明书提供的值，中值和低值的不精密度高于说明书的值；本研究所得 LoB、LoD、LoQ、FS 与厂家说明书提供的基本一致；为临床的诊断治疗提供准确、可靠的检验结果。

PO-0649

中性粒细胞与淋巴细胞比值和血小板与淋巴细胞比值对 HIV/AIDS 相关弥漫大 B 细胞淋巴瘤患者预后的作用

张米、杨翠先、董兴齐、张玮
云南省传染病医院

目的 现有的 HIV+弥漫大 B 细胞淋巴瘤(DLBCL)预后标志物不能准确预测患者的预后。本研究旨在分析中性粒细胞与淋巴细胞比值(NLR)和血小板与淋巴细胞比值(PLR)对 EB 病毒阳性 HIV/AIDS-DLBCL 患者预后的影响。
方法 本研究纳入了 2014-2017 年 45 例新诊断的 HIV/ AIDS-DLBCL 患者，其中 EB 病毒阳性患者 30 例，EB 病毒阴性患者 15 例。对临床资料进行回顾性分析。
结果 45 例 HIV/AIDS-DLBCL 患者中，EB 病毒阳性组和阴性组间的 1-、3-、5 年总生存率两两比较差异有统计学意义(P<0.05);NLR 组与 PLR 组总生存期比较差异有统计学意义(P<0.05)， PLR 组与 EB 病毒阳性组总生存期比较差异有统计学意义(P<0.05)。Cox 回归分析发现 NLR 和 PLR 是 HIV/ AIDS 相关性 DLBCL 的独立预后指标。
结论 中性粒细胞与淋巴细胞比值(NLR)和血小板与淋巴细胞比值(PLR)在 EB 病毒阳性的 HIV/AIDS 相关 DLBCL 患者中具有预测预后的价值，可作为疾病监测和疗效评价的重要依据。

PO-0650

动态监测 EB 病毒持续感染在 HIV/AIDS 相关弥漫大 B 细胞淋巴瘤患者中的临床意义

杨翠先、张玮、董兴齐
云南省传染病医院

目的 分析 EB 病毒 DNA 水平变化对 HIV/AIDS 相关弥漫大 B 细胞淋巴瘤患者临床预后的影响。
方法 本研究采用双向研究方法，以云南省传染病医院 2014 年 1 月-2019 年 6 月收治的艾滋病相关 DLBCL 患者为研究对象。应用 SPSS23.0 中 t 检验、Kaplan-Meier、Cox 回归模型分析，应用 Graphpad Prism 8.0 中的 Survival 方法绘制生存曲线。
结果 根据纳入和排除标准，本研究共入组 45 例 AIDS-DLBCL 患者，其中初诊时 EBV（-）组 15 例，EBV（+）组 30 例，且均已经完成至少 3 次 CHOP21/R-CHOP21 治疗。入组患者中 80.0%患者为男性，主要为汉族患者（80.0%），平均年龄 48.96±11.45 岁，其中 EBV（+）组平均年龄 49.30±11.61 岁。45 例 AIDS-DLBCL 患者的 1 年、3 年和 5 年总生存率分别为 71.1%、59.4%和

42.1%。其中 1 年总生存率与 5 年总生存率相比，其差异有统计学意义（P=0.029）。在 1 年生存率中，EBV（+）组生存率（60.0%）明显低于 EBV（-）组（93.3%）（P=0.020），而两组的 3 年生存率和 5 年生存率差异均无统计学意义。[罗兰 1] 总生存期的分析中，EBV（+）组总生存期显著短于 EBV（-）组（P=0.022），其中位生存时间分别为 14 个月和 27 个月；EBV（+）组中的治疗后转阴的患者有 14 例，治疗后持续阳性/反复阳性的患者有 16 例，而治疗后转阴的患者的总生存期显著长于治疗后持续阳性/反复阳性的患者（P<0.001），其中位生存时间分别为 7 个月和 22 个月）。

结论 EB 病毒感染与 HIV/AIDS 相关弥漫大 B 细胞淋巴瘤患者的临床预后相关，且是影响患者临床预后的相关危险因素，在临床诊疗过程中应加强 EB 病毒感染的监测。

PO-0651

县级医院临床实验室检验质量专项检查的结果分析

于登程
夏津县人民医院

目的 本次实验分析县级医院临床实验室检验质量专项检查的结果。

方法 本次实验组建了 5 个专家组，对我省 50 家县级医院临床实验室检验质量进行了专项检查，具体从量体系、室内质控、室间质评、性能验证与比对试验、现场考核五项条目进行，并统计县级医院临床实验室检验质量专项检查得分；并通过主观考察方式总结县级医院临床实验室检验质量存在的问题。

结果 县级医院临床实验室检验质量专项检查优秀医院 30 家，合格医院 18 家，不合格医院 2 家；县级医院临床实验室检验质量存在的问题主要有部分实验室的质量体系概念模糊、部分实验人员质量控制意识薄弱且技能欠缺、大部分实验室参加的专业科目较少、大部分实验室并没有实现规划化管理、部分专业科目检验存在问题、部分医院实验室条件较差。

结论 县级医院临床实验室检验质量总体较为良好，但是存在个别医院专项检查不合格，并且还存在较多问题有待解决。

PO-0652

HCV 基因分型和肝纤维化血清学指标的研究

邓洪荣[1]、陈冉[2]
1. 昆明医科大学
2. 昆明医科大学第二附属医院

目的 研究丙型肝炎病毒（Hepatitis C Virus，HCV）感染者不同基因型的临床特征，观察天冬氨酸氨基转移酶/血小板比值(APRI 评分)、4 因子的纤维化指数(FIB-4 指数)联合诊断肝纤维化的潜在诊断价值，为临床诊疗奠定基础。

方法 收集昆明医科大学第二附属医院 98 例 HCV 感染者的临床资料以及血清学指标，根据基因分型将研究对象分为 GT1b 组、GT2a 组、GT3a 组、GT3b 组、GT6a 组，使用统计分析软件对其性别、年龄、病毒载量、ALT、AST、APRI 评分、FIB-4 指数进行差异性分析。以 B 超或肝组织病理学诊断肝硬化、肝癌为金标准，绘制 APRI 评分、FIB-4 指数以及联合诊断的受试者工作特征曲线（Receiver operating characteristic curve,ROC）曲线，评价 APRI 评分、FIB-4 指数对肝纤维化的诊断效能。

结果 98 例患者，GT3b 型占比最高（46.8%）；HCV 感染者多分布在 40-59 岁，不同基因型的 HCV 感染者年龄差异有统计学差异（P<0.001）。不同基因型的丙肝相关肝硬化患者的 APRI 评分有统计学意义（P=0.031）。其中，GT 6a 的 APRI 评分显著高于 GT 1b、GT 3a，差异有统计学

意义（P=0.031）。APRI 评分、FIB-4 指数以及其联合诊断肝纤维化的 ROC 曲线下面积（Area Under Curve,AUC）分别为 0.66、0.77、0.79（P<0.05），APRI 评分和 FIB-4 指数单独诊断肝纤维化时的诊断界值分别为 0.99、1.97；其所对应的灵敏度分别为 82.6%、97.8%；而两者联合诊断时灵敏度和特异度分别为 87.0%，69.2%。

结论 HCV 感染者基因分型以 3b 型为主，男性较女性多，感染者呈中老年人群分布。HCV GT6a 的 APRI 评分较 GT1b、GT3a 高，可能与 GT 6a 高度遗传异质性和耐药相关替代突变率高有关。在使用 APRI 评分诊断肝纤维化时，GT6a 型的诊断界值是否有必要较 GT1b、GT3a 型高仍需进一步研究探讨。此外，FIB-4 指数可能对丙肝相关肝硬化有潜在重要的筛查价值，APRI 评分和 FIB-4 指数两者联合诊断较单独诊断肝硬化的价值高。通过对 HCV 基因型分布以及相关血清学指标的研究，有望为慢性丙肝防控给予帮助。

PO-0653

跨膜型 TNF-α 通过正向信号和反向信号促进活化诱导的细胞死亡

张萌[1]、王晶[2]、李卓娅[2]
1. 郑州大学第一附属医院
2. 华中科技大学同济医学院

目的 已知分泌性肿瘤坏死因子 α (sTNF-α)介导活化诱导细胞死亡(AICD)。然而，tmTNF-α 在 AICD 中的作用仍不清楚。

方法 我们利用 PHA 诱导 Jurkat 细胞死亡建立 AICD 模型，转染 AS 或 siRNA 沉默相应基因，利用 Annexin-V-FITC/PI 标记和流式细胞术检测凋亡，利用 real time PCR 和 western blot 分别检测 mRNA 和蛋白水平。

结果 我们发现，在 Jurkat 和原代人 T 细胞 AICD 过程中，tmTNF-α 的表达显著增加，并伴随着凋亡增强。抑制或增强活化 T 细胞中 tmTNF-α 的表达分别抑制或促进 AICD。用外源性 tmTNF-α 处理活化的 T 细胞可显著增加 AICD，提示 tmTNF-α 作为效应分子介导 AICD。由于 tmTNF-α 具有受体功能，我们使用一种抗 TNF-α 的多克隆抗体来触发 tmTNF-α 的反向信号转导，可上调 FasL、TRAIL 和 tmTNF-α 的表达来增强 AICD，并通过上调 DR4、TNFR 1 和 TNFR2 而增强活化 T 细胞对 AICD 的敏感性。敲除 TNFR1 或 TNFR2 的表达几乎完全阻断了 tmTNF-α 反向对 sTNF-α 或 tmTNF-α 增强 AICD 的敏感性。

结论 我们的结果表明，tmTNF-α 作为一个死亡配体介导 AICD，作为一个受体增强活化 T 细胞对 AICD 的敏感性。靶向活化的 T 细胞的 tmTNF-α 可能有助于治疗自身免疫性疾病。

PO-0654

男男性接触者不当的直肠冲洗器具使用可能是导致 HIV 感染风险高的机制之一

楚振兴、徐俊杰
中国医科大学附属第一医院

背景 在全球范围内 HIV 影响着男男性接触者(MSM)的健康。直肠冲洗 (Rectal douching，RD)是 MSM 为了直肠的清洁，在肛交前后被广泛采用，报道提示 RD 与感染 HIV 的风险增加相关。 然而 RD 如何增加 HIV 感染风险的机制并不十分清楚，并且在我国 MSM 中的 RD 行为研究数据有限。该研究旨在评估 RD 行为与 MSM 的感染 HIV 的内在关系。

方法 2017 年 8 月至 2018 年 12 月，在沈阳对成年 MSM 进行了一项横断面研究。通过面对面访谈问卷的形式收集了研究对象的人口统计学、性行为和最近一次肛交的 RD 的数据。采用多因素 logistic 回归分析并确定 HIV 感染有关的影响因素。
结果 研究期间总共有 515 名符合条件的 MSM 参与了调查（中位年龄：31 岁）。在最近一次肛交中，28.3%(146/515) 进行了无安全套被插入性肛交(CRAI)，超过一半(61.6%,317/515)在肛交前或之后发生了 RD。在进行 RD 的 MSM 中，96.8%(307/317）在肛交前进行了 RD，而 62.5%（198/317）在肛交后进行 RD。使用的辅助冲洗设备主要是淋浴管 (85.3%, 262/307)，仅 8.1%(25/307)在性行为前使用商业化 RD 辅助器。RD 的主要原因是(95.5%)为了个人卫生，14.1%因他们性行为时没有使用安全套并认为 RD 可以将直肠内 HIV 病毒冲洗掉，预防 HIV 感染。HIV-1 和梅毒的患病率分别为 11.7%(60/515)和 13.2%(68/515)。HIV 感染与 RD 呈正相关(adjusted odds ratio(AOR),2.8;95% CI,1.4–5.4)，性交前进行 RD(AOR,2.2;95%CI,1.2–4.2)，RD 和 CRAI 之间的交互作用(AOR,3.5;95% CI,2.0–6.2)，使用淋浴管(VS.商品化冲洗器)辅助 RD(AOR,3.3;95% CI,1.0–11.3)等因素也与 HIV 感染存在统计学关联，其他危险因素包括肛交后进行 RD，无套肛交，使用亚硝酸盐吸入剂和梅毒感染。
结论 本次调查发现 RD 在沈阳 MSM 中使用率高。非商业性 RD 工具不当使用（如淋浴管，具有锋利的边缘），RD 与 CRAI 的交互作用与 HIV 感染相关。建议针对性交前/后使用淋浴软管进行 RD 和 CRAI 的 MSM 进行相关健康教育。这可能有助于 MSM 了解 RD 与 HIV 感染之间的关系，以减少 HIV 在 MSM 人群中的传播。毕竟横断面研究对因果关系的论证存在方法学限制，未来需要前瞻性队列研究的开展来进行因果验证。

PO-0655

用于 SARS-CoV-2 污染环境洗消的新型光敏式病毒消杀技术及其应用

苏宁、蒋元素、种慧敏、李文满、孙献歌、尚美云、李博文、魏昆、邓少丽、鲁卫平、黄庆
中国人民解放军陆军特色医学中心

目的 快速、高效切断病原体传播途径是遏制疫情蔓延的有效手段。早在新型冠状病毒肺炎(COVID-19)疫情初期，已根据以往冠状病毒对理化因子的抗力经验制定了相应的消毒措施与方案，但是不合理的消毒剂使用方式存在巨大的安全隐患。因此，现行消毒措施显然无法满足目前疫情常态化对消毒安全性的需求。光化学法具有反应条件温和、高效、无害化等显著特点，已被证实是抗病毒药物的有效替代品。本课题组基于新型冠状病毒(SARS-CoV-2)及其模式生物，系统地评价了几种临床常用光敏剂的生物安全性，成功筛选到一种安全性极高的新型光敏剂，并建立了适用于新型冠状病毒污染环境的新型光敏式病毒消杀技术。
方法 根据细胞活性、凋亡和周期结果，基于生物安全性最高的新型光敏剂，经田口实验优化，确定光敏剂浓度、光照时间与光照功率的最佳组合参数，最终结果由生物安全 3 级实验室进行验证。
结果 成功筛选到一种生物安全性高于亚甲蓝、新亚甲蓝及甲苯胺蓝的新型光敏剂，构建了适用于新型冠状病毒污染环境的新型光敏式病毒消杀技术，并成功研制光敏式病毒灭活仪科研样机及其配套设备。相关技术及设备对 SARS-CoV-2 及其模式生物消杀效率达 99.99%以上；同时，SARS-CoV-2 核酸检测实验室现场测试结果显示，物表及空气中的细菌消杀率达到 99.9%以上，消杀率符合《医疗机构消毒技术规范》相关规定。
结论 本课题组所研发的新型光敏式病毒消杀技术和科研样机生物安全性高，对以 SARS-CoV-2 为代表的 RNA 包膜类病毒具有特异性杀灭作用，可对污染区和潜在污染区，特别是工作人员作业、穿脱防护用具等情况下代替常规洗消技术，避免传统消毒技术对人体造成的刺激、伤害及潜在安全隐患，实现真正意义“人机共存”。

PO-0656

云南高血压患者 NPR-C 配体 ANP 水平研究

赵晓丽、钱净、朱丹、杨如风、田敏、黎海生
昆明市第一人民医院

目的 观察云南原发性高血压患者外周血中 ANP 水平的变化，探讨其与原发性高血压发病机制之间的关系。
方法 收集 2019 年 6 月至 9 月在我院心内科诊断的原发性高血压患者 44 例，设为病例组，收集我院体检中心的健康体检患者 44 例，作为健康对照组。采用 ELISA 方法检测研究对象外周血中 ANP 水平。
结果 原发性高血压患者外周血中 ANP 水平显著低于正常人（p<0.05）；以高血压病发生与否为因变量，以血清 ANP 为自变量进行 logistic 回归分析，结果显示 ANP 与高血压偏回归系数为 0.071，P 值为 0.002（P<0.05），具有统计学意义；采用 person 相关性分析分别对 ANP 与 SBP/DBP 进行分析，结果显示 ANP 与 SBP 的相关系数为-0.374，P 值为 0.000（P＜0.05）；ANP 与 DBP 的相关系数为-0.331，P 值为 0.002（P＜0.05），都具有统计学意义，但是相对于 DBP,ANP 与 SBP 的相关性更显著。
结论 外周血中 ANP 浓度降低与血压升高密切相关；NPR-C 配体 ANP 参与了原发性高血压的发病；ANP 影响着 SBP/DBP 的水平变化，尤其对 SBP 的影响更为显著。

PO-0657

TROP2 靶向的 ICG@PLGA 纳米粒子的构建及对三阴乳腺癌协同诊断与治疗研究

张雷、金岳心子、徐娟、孙子微、林明鑫、魏嘉、陈文秀
江苏省人民医院（南京医科大学第一附属医院）

目的 制备可靶向三阴乳腺癌(TNBC)，同时具有检测与治疗功能的靶向纳米粒子，并验证其功能。
方法 以羧基端 PLGA 为原料，复乳溶剂挥发法制备内部包裹 ICG 的纳米粒子，通过酰胺反应在纳米粒子表面连接可靶向人滋养层细胞表面抗原 2（TROP2）的单克隆抗体。紫外-可见 (UV-Vis) 分光光度计检测 ICG 的释放，激光共聚焦显微镜观察靶向纳米粒子体外结合人乳腺癌细胞 MDA-MB-231 的能力，小动物活体成像观察靶向纳米粒子在裸鼠原位肿瘤模型中的运行分布规律。红外光照射后，检测靶向纳米粒子对肿瘤细胞的杀伤及抑制肿瘤生长的能力。
结果 所制备的靶向纳米粒子为规则圆形，粒径在 200nm 左右，体外可与乳腺癌细胞结合或被吞噬进入肿瘤细胞内，红外线照射后会产热至培养液温度升高，杀伤肿瘤细胞。肿瘤模型鼠体内，靶向纳米子可靶向至肿瘤组织，通过活体成像可对肿瘤进行诊断，并可通过红外照射产热，杀伤肿瘤细胞，抑制肿瘤组织生长。
结论 本项目构建的 ICG@PLGA 纳米复合体，可通过 TNBC 细胞过表达的 TROP2 抗原靶向至肿瘤组织，同时通过纳米粒子中 ICG 的光热效应和成像功能，实现集诊断、靶向性治疗、热疗于一体的精准诊断与治疗。

PO-0658

Nomograms incorporating marital status can predict overall survival among patients with colorectal cancer

Hua Wang
Department of Laboratory Medicine, Renji Hospital, School of Medicine, Shanghai Jiaotong University

Background Marital status is an independent prognostic factor for many cancers, although there are no studies that have described using nomograms that incorporated marital status to predict survival after surgery for colorectal cancer (CRC). This study aimed to determine whether nomograms that included marital status could predict overall survival (OS) among patients with CRC.
Methods Data were extracted from the Surveillance, Epidemiology, and End Results database for 8,375 patients who were diagnosed with CRC between 2010 and 2014. Univariate Cox regression analyses were performed to select variables for inclusion in the nomograms. Significant variables from the univariate analyses were entered into multivariate Cox proportional hazards models. Predictive values were evaluated on the basis of the areas under receiver operating characteristic curves (AUCs) and Harrell's concordance index (c-index).
Results Married patients with CRC had significantly better 5-year OS than unmarried patients ($P < 0.001$). The AUCs for predicting 5-year OS using the multivariate Cox regression models were 0.749 for all patients, 0.707 for single patients, 0.719 for married patients, and 0.718 for divorced patients. Nomograms were developed to predict 5-year OS according to marital status, and the c-index values for predicting 5-year OS were 0.695 among all patients (95% confidence interval [CI]: 0.679–0.711), 0.729 among single patients (95% CI: 0.697–0.759), 0.716 among married patients (95% CI: 0.696–0.735), and 0.728 among divorced patients (95% CI: 0.687–0.769).

PO-0659

Ct 通过激活经典和非经典炎症小体通路诱发 GSDMD 介导的细胞焦亡

唐玲丽、方奕元、冯晓晶、蒋萍
中南大学湘雅二医院

目的 研究 GSDMD 介导的细胞焦亡在沙眼衣原体（Chlamydia trachomatis, Ct）繁殖发育周期中的作用及机制，为进一步深入探究防治沙眼衣原体的感染提供新思路。
方法（1）利用 L2 血清型 Ct 感染 HeLa 细胞，在感染过程中不同时间点（0h、12h、24h、36h、48h），于光学显微镜和电镜下观察细胞形态的改变；检测培养上清中 LDH 和 IL-1β，IL-18 的水平；Western blot 检测细胞裂解液焦亡效应蛋白 GSDMD、GSDME 的表达及活化情况。（2）加入 GSDMD-NT 打孔活性抑制剂 NSA 干预，以间接免疫荧光染色法观察子代 EB 的释放和再感染情况。（3）NLRP3 抑制剂 MCC950 和 Caspase-4 抑制剂 Z-LEVD-FMK 分别对 Hela 细胞进行预处理，在 Ct 感染 36h 时分别收集细胞裂解和培养液，Western Bolt 和自动生化仪分别检测细胞焦亡经典和非经典通路指标 NLRP3、Caspase-1、Caspase-4、GSDMD 的表达及 LDH 水平的变化。
结果（1）Ct 感染 HeLa 细胞 24h 后，观察到细胞呈肿胀膨大、气泡状突起的细胞焦亡样改变；LDH 和 IL-1β、IL-18 水平较阴性对照组显著升高（$P<0.001$）；GSDMD 全长表达逐渐降低，其活化片段开始表达，并且随着时间逐渐增强，未检测出 GSDME 活化。（2）GSDMD 打孔活性抑制剂 NSA 干预后，上清液中子代 Ct 感染率较正常感染组降低。（3）抑制剂 MCC950 和 Z-LEVD-FMK 分别干预后，GSDMD 活化片段呈剂量依赖性逐渐减弱，LDH 水平降低（$P<0.001$）。
结论 Ct 可能通过激活经典和非经典炎症小体通路诱发 GSDMD 介导的细胞焦亡促进沙眼衣原体的感染播散。

PO-0660

伴有红细胞和血小板异常的家族性高胆固醇血症临床特征及基因研究

李佳明[1]、王学锋[1]、彭真萍[2]、丁秋兰[2]
1. 上海交通大学医学院附属瑞金医院输血科
2. 上海交通大学医学院附属瑞金医院检验科

目的 研究一个伴有红细胞和血小板异常的家族性高固醇血症家系的临床及分子生物学特征。
方法 回顾性分析 1 例家族性高胆固醇血症患者及家系成员的临床资料；应用高效液相色谱法检测血清中豆固醇和谷固醇含量；二代基因测序技术检测先证者和家系成员基因变异情况，并复习国内外相关文献进行探讨。
结果 先证者自幼贫血合并多部位黄色瘤，35 岁因反复胸闷行冠脉造影示冠状动脉三支严重病变，腹部超声示：脾肿大，低密度脂蛋白、豆固醇和谷固醇均升高，血常规示：贫血合并血小板低下，血涂片可见口型、靶型红细胞，大血小板散在可见。进一步行二代基因测序及基因预测模型提示：患者存在 LDLRAP1 基因纯合突变。该突变形成的蛋白截断体丢失多个稳定蛋白结构区域，不具备正常功能。 LDLRAP1:NM_015627.2:exon4:c.C415T:p.Q139X，为该家系的致病基因变异。父母近亲结婚，均为杂合突变。携带 LDLRAP1 基因变异的 3 例家系成员其低密度脂蛋白轻度增高。同时，患者也存在 ABCG8 基因变异，ABCG8:NM_022437.3:exon13:c.T1895C:p.V632A,ABCG8:NM_022437.3:exon8:c.C1199A:p.T400K。父母为纯合突变。其中 3 例携带 ABCG8 基因变异的家系成员豆固醇和谷固醇轻度增高，2 例家系成员出现高密度脂蛋白增高。患者经降脂治疗后，贫血及血小板减少均有所改善。
结论 植物固醇血症与家族性高胆固醇血症临床症状相似，极容易混淆，尤其患者合并贫血及血小板减少。基因检测作为家族性高胆固醇血症诊断及鉴别诊断的金标准，可提高诊断准确率。本例患者同时出现 LDLRAP1 及 ABCG8 基因变异，其临床表现及治疗方案的选择更加复杂，应结合低密度脂蛋白及植物固醇浓度测定，综合考虑，以免耽误最佳治疗时机。

PO-0661

METTL3 介导的 m6A 修饰对电离辐射诱导的非小细胞肺癌 EMT 和侵袭转移中的作用机制及临床价值研究

齐秋晨
山东大学第二医院

目的 探讨 METTL3 对电离辐射诱导的非小细胞肺癌（NSCLC）EMT 和侵袭转移中的作用及机制，并探讨其作为放疗预后标志物的临床价值。
方法 采用划痕实验和 Transwell 小室迁移和 Matrigel 侵袭实验检测电离辐射对 NSCLC 细胞迁移侵袭能力的影响；采用免疫荧光法、qRT-PCR、Western blot、Dot blot 检测电离辐射对 NSCLC 细胞 EMT、 METTL3 表达及 m6A 修饰水平的影响；构建构建 METTL3 过表达和 RNAi 慢病毒载体，分析辐照后各组肺癌细胞模型 EMT 标志物表达的变化；利用 MeRIP-seq 及生物信息学分析技术挖掘出辐射过程中 METTL3 介导的 m6A 修饰调节的候选基因，对其进行功能鉴定，并进一步研究其 mRNA 甲基化调控的机制。
结果 X 射线辐照后 NSCLC 细胞 RNA m6A 修饰上调，且 m6A 转移酶 METTL3 表达异常增加；下调 METTL3 可以阻止 IR 诱导的 m6A 甲基化，且电离辐射诱导的 A549 细胞 EMT 及迁移侵袭能力明显减弱。MeRIP-seq 及 MeRIP-qPCR 验证 TGFβ2 是辐射过程中 METTL3 介导的 m6A 修饰调控的靶基因，机制研究表明电离辐射通过 METTL3 诱导 TGFβ2 的 m6A 修饰增加，通过 m6A-IGFBP2 依赖机制抑制 TGFβ2 的降解，激活下游 Smad3 通路，促进 NSCLC 细胞的 EMT 及侵袭

转移。临床价值评估发现 NSCLC 患者 METTL3 高表达与放疗后生存期呈负相关，有望成为潜在的放疗预后标志物。
结论 METTL3 是电离辐射诱导 NSCLC 细胞 EMT 和侵袭转移的关键蛋白，为放疗后 NSCLC 转移的防治提供新的研究靶点。

PO-0662

Re-evalute the Prognostic Value of Absolute Lymphocyte Count in Children with Immune Thrombocytopenia

ximei yang
Jiangxi children's Hospital

Objective Different from the report that absolute lymphocyte count (ALC) can predict the prognosis of children with Immune Thrombocytopenia (ITP), the aim of this study was to prove that the difference of ALC between acute and chronic/persistent ITP children was caused by age.
Methods We collected the datas of 1060 children diagnosed as ITP from january 2015 to december 2019 from hospital information system of Children's Hospital of jiangxi province, China. Of them, 242 children who were initial diagnosed as ITP and treated with immunoglobulin and hormone were selected as the study objects. Of 242 children, 141 were diagnosed as acute ITP, 101 were diagnosed as chronic/persistent ITP. According to age and gender, 58 healthy children were matched to the acute ITP group as the normal group 1 and 37 healthy children matched to chronic/persistent ITP group as the normal group 2. All subjects were divided into four groups according to their age, which were ≤12 months group, ≤24 months group, ≤72 months group and > 72 months group. Then the ALC of acute and chronic/persistent ITP children in different age groups were analyzed and compared, as well as the comparison between acute and chronic/persistent ITP children and normal control group.
Results Before age stratification, there were significant differences in ALC between acute ITP group and chronic/persistent group (P= 0.000). However, we found that the median age of acute ITP group (18months) was younger than that of chronic/persistent group(46months). After age stratification, 44.7% (63 / 141) and 12.80% (18 / 141) of children with acute ITP were in ≤12 months group and ≤24 months group, while 47.5% (48 / 101) and 29.7% (30 / 101) of children with chronic ITP were in ≤72 months group and > 72 months group, respectively. The median ALC of acute ITP in ≤12 months, ≤24 months, ≤72 months and >72 months were 6.28*109/L, 5.91*109/L, 3.77*109/L and 1.87*109/L, respectively. The median ALC of chronic/persistent ITP were 4.54*109/L, 4.03*109/L,3.15*109/L and 1.95*109/L, respectively. No matter acute ITP (P=0.000)or chronic/persistent ITP(P=0.000), there were significant differences in the median ALC among the four age groups. But there were no significant difference in the same age group between acute group and chronic/persistent ITP(≤12 months group: P=0.052, ≤24 months group: P=0.518, ≤72 months group: P=0.209, > 72 months group: P=0.622). In addition, we found that when the age was > 72 months, the median ALC of both acute and chronic ITP patients was significantly different from that of the normal control, but there was no difference when the age < 72 months.
Conclusion ALC has no value in predicting the prognosis of ITP in children, the difference bwteen the acute ITP and chronic/persistent ITP may be due to the difference of age.

PO-0663

采用间接法建立乌鲁木齐地区三碘甲状腺原氨酸、甲状腺素、促甲状腺激素的参考区间

宋雪、黄睿、王昌敏
新疆维吾尔自治区人民医院

目的 采用间接法建立乌鲁木齐地区甲状腺功能三碘甲状腺原氨酸（T_3）、甲状腺素（T_4）、促甲状腺激素（TSH）指标的人群参考区间，并与厂家提供的参考区间进行比较，以验证间接法建立人群甲状腺功能指标参考区间的可靠性。
方法 选择 2021 年 1 月至 5 月在新疆维吾尔自治区人民医院体检中心进行体检的健康人群的 T_3、T_4 和 TSH 数据。使用 SPSS 17.0 统计软件，通过 Kolmogorov-Smirnov（K-S）检验分析其数据的正态性，性别间比较采用 Mann-Whitney *U* 检验。非正态数据使用 Minitab 软件进行 Box-Cox 转换成近似正态分布的曲线。采用 Turkey 法剔除异常离群值后建立参考区间，以 $P_{2.5}$ 和 $P_{97.5}$ 作为项目的参考区间上、下限。并与现有厂商的参考区间比较计算相对偏差 d（difference）和参考变化值（reference change value，RCV）。相对偏差低于 RCV（d＜RCV）认为自建参考区间与厂商给定的参考区间之间差异无统计学意义，高于 RCV（d＞RCV）则认为两者间差异有统计学意义。
结果 经 K-S 正态性检验，T_3、T_4 和 TSH 三个项目的数据均不服从正态性分布。本研究初步纳入 6335 人，经 Box-Cox 转换以及用 Turkey 法剔除离群值后，T_3 组最终纳入 6244 人，T_4 组最终纳入 6230 人，TSH 组最终纳入 6140 人。性别间比较，T_3 和 TSH 在性别间参考区间的建立上具有统计学意义（P＜0.001）。采用间接法建立乌鲁木齐地区参考区间，其中，T_3：男性 0.82~1.86 ng/mL，女性：0.80~1.86 ng/mL；T_4：5.57~10.47μg/dL；TSH：男性：0.801~5.660 uIU/mL，女性：0.918~6.746 uIU/mL。参考区间与厂商相对偏差及参考变化值 RCV 的比较**结果** T_3：男性相对偏差：（$d_{上}$=2.5%，$d_{下}$=7%），女性相对偏差：（$d_{上}$=0%，$d_{下}$=7%），RCV：30.97%；T_4：相对偏差：（$d_{上}$=9.2%，$d_{下}$=25.74%），RCV：9.15%；TSH：男性相对偏差：（$d_{上}$=196%，$d_{下}$=34.76%），女性相对偏差：（$d_{上}$=240%，$d_{下}$=65%），RCV：12.05%。由此可知，T_4 和 TSH 的参考区间与厂商的参考区间存在明显差异，T_3 的参考区间与厂商的参考区间无差异。
结论 相比于直接应用厂商的参考区间，采用间接法建立的参考区间的方法较为可靠，具备经济、简便且更贴近受检人群的特点。

PO-0664

儿童 20556 例食物过敏原与 19453 例吸入过敏原定量检测及流行特征分析

郑力胜[1]、李会强[2]、沈永明[1]
1. 天津市儿童医院
2. 天津医科大学医学检验学院

目的 探讨儿童特异性过敏原的检测结果分布和其规律，为儿童过敏性疾病的预防和诊疗提供科学的参考依据。
方法 应用酶联免疫捕获法，定量检测过敏原特异性 IgE，，对 2019 年 1 月至 2020 年 3 月就诊于天津市儿童医院患儿的 20556 例食物过敏原组合与 19453 例吸入过敏原组合的数据进行统计分析。通过大量数据，分析基于儿童特点，不同性别、年龄等因素的过敏原流行特征。
结果 食物过敏原组合阳性率 64.05%（13167/20556），吸入过敏原组合阳性率 50.47%（9818/19453），食物性过敏原阳性率前三位依次是鸡蛋（49.71%，10219/20556）、牛奶（29.43%，6050/20556）、小麦面粉（18.92%，3889/20556），吸入性过敏原阳性率前三位依次是屋尘（31%，6031/19453）、交链孢霉（21.62%，4206/19453）、粉尘螨（12.59%，

2450/19453），食物过敏原组合中不同性别阳性率为男（63.08%，7845/12436）,女（65.54%，5322/8120），吸入过敏原组合中不同性别阳性率为男（51.92%，6145/11835）,女（48.21%，3673/7618），食物过敏原组合中不同年龄组阳性率为<1 岁（42.54%，1401/3293），1-3 岁（78.14%，5731/7333）,4-6 岁（68.37%，4078/5965），＞6 岁（49.39%，1958/3964）。吸入过敏原组合中不同年龄组阳性率为<1 岁（19.72%，489/2480），1-3 岁（49.55%，3459/6981）,4-6 岁（58.03%，3468/5976），＞6 岁（59.81%，2402/4016）。

结论 不同性别、年龄组中过敏原阳性率有显著性差异，有必要视流行病学特征，指定合理规避高风险过敏原，对过敏性疾病的预防、诊断和治疗有着重要的临床义。

PO-0665

PGRN 在 GGN-ADC 增殖中的作用及机制研究

皇改改、周宇、陈蓉、赵富锋、闫兰芳、郑川、马铭
成都市双流区第一人民医院

研究背景 随着多层螺旋 CT 的广泛普及、人民健康意识的增强以及新型冠状病毒肺炎（corona virus disease 2019,COVID-19）疫情形势的严峻,使肺部局灶性磨玻璃结节（ground glass nodule，GGN）的检出率明显升高。研究发现，肺多发 GGN 手术切除的病灶多数为肺腺癌（adenocarcinoma，ADC）或者癌前病变（占 98.9%）。GGN-ADC 是肺癌的一种早期表现形式，其生物学行为属于惰性，早期手术治疗后的 5 年生存率基本可达 100%，但目前 GGN-ADC 的相关机制仍不清楚。近年来，越来越多的证据证明感染在 GGN-ADC 中发挥着重要的作用，颗粒蛋白前体(progranulin, PGRN)是一种抗感染调控因子, 由 GRN 基因编码、593 个氨基酸组成的外分泌蛋白。PGRN 普遍存在，于肺、脂肪等多种组织和细胞中都有表达, 在抗炎、癌症等多种疾病中扮演着重要的角色，因此我们猜想 PGRN 可能可通过抗炎从而抑制 GGN-ADC 的发生发展。

研究方法 取正常和 GGN-ADC 肺组织（N=3）,采用免疫组化及 Western blot 检测正常组和 GGN-ADC 组中 PGRN、TNF-α 和 Ki-67 的表达；采用 I 型胶原酶连续消化法分离 GGN-ADC 组的肺癌细胞，Western blot 检测肺癌细胞中 PGRN 的表达情况；转染腺病毒 Ad-PGRN 过表达 PGRN，克隆形成实验检测增殖能力，qPCR 和 Western blot 检测 TNF-α 和 Ki-67 的水平。

研究结果 与正常肺组织相比，GGN-ADC 肺组织和细胞中 PGRN 的水平均明显降低，TNF-α 和 Ki-67 的表达显著增加；过表达 PGRN 抑制 GGN-ADC 的增殖，TNF-α 和 Ki-67 的基因和蛋白水平均降低。

研究结论 PGRN 可抑制炎症，对 GGN-ADC 的增殖发挥负向调控作用。

PO-0666

检验科人员职业倦怠状况及其影响因素分析

邓冯莉[1,2,3]、刘子杰[1,2,3]
1. 昆明医科大学第一附属医院医学检验科
2. 云南省检验医学重点实验室
3. 云南省实验诊断研究所

背景 检验人员职业倦怠所造成的检验质量的下降，不仅关系到患者对医院的满意度还影响诊疗质量，因此检验人员职业倦怠研究具有重要意义。

目的 调查检验人员职业倦怠状况及影响因素，为针对性职业倦怠管理及实验室管理提供科学依据。

方法 采用网络问卷调查的形式对国内三甲医院的 300 名在职在岗的检验人员进行调查，获得人口学等基本情况、职业倦怠情况、职业倦怠影响因素等资料；运用描述性统计分析、t 检验及方差分析等统计方法，探索检验人员职业倦怠情况及与各影响因素之间的关系。

结果 共获得有效问卷 280 份。49%的检验人员伴有职业倦怠，其中轻度、中度占 41%。其在“情绪耗竭感、行为不当、成就感低、及倦怠总分在性别、工作年限、是否正式编制、婚否以及是否有子女等人口学因素亚组中存在显著差异（p＜0.05）。女性检验人员职业倦怠受个人因素影响的程度略高于男性，未婚人员的职业倦怠高于已婚人员，合同制人员的职业倦怠高于编制内人员。有子女人员职业 倦怠高于无子女职业倦怠。

结论 检验人员职业倦怠较严重，且在性别，婚姻状况、是否有编制及有无子女为主要差异。人员的素质是保证检验质量的关键因素，在今后的工作中应重视检验人员职业倦怠监控，及时给与针对性的辅导和干预。

PO-0667

BNP 在亚临床甲状腺功能减退和甲状腺功能减退患者中的特征分析

高章伟、蔺亚辉
中国医学科学院阜外医院

目的 脑钠肽（BNP）由心室心肌细胞分泌，用以调节血压和血容量的稳态，充血性心力衰竭时血浆 BNP 水平升高。本研究的目的是通过分析亚临床甲状腺功能减退、甲状腺功能减退患者中 BNP 水平差异，评估患者甲状腺功能减低状态对血浆 BNP 水平的影响。

方法 回顾性分析 2018 年 1 月至 2019 年 1 月期间于我院内分泌科住院的患者的病历共 447 人作为研究对象，将患者分为确诊为亚临床甲状腺功能减退（61 例）、甲状腺功能减退（344 例）和甲状腺功能正常对照（42 例）三组，比较三组患者的一般临床资料，分析三组患者生化指标特征差异及其与各组分的相关性。

结果 亚临床甲状腺功能减退组血浆 BNP 水平显著高于甲状腺功能减退组以及对照组。三组患者 BNP 浓度分别为：亚临床甲状腺功能减退组 793.85±1230.68 pg/ml，甲状腺功能减退组 228.72±571.46 pg/ml，健康对照组 344.32±753.10 pg/ml，三组间 BNP 浓度有显著性差异（P<0.05）；多重线性回归分析提示亚临床甲状腺功能减退组 BNP 水平与 FT4 值具有独立相关性（r^2=0.2750，p<0.001）。

结论 血浆 BNP 的水平受甲状腺的功能状态影响，BNP 水平在亚临床甲状腺功能减退组升高，提示亚临床甲状腺功能减退发生心力衰竭的风险更高。

PO-0668

重庆市某三甲综合医院 2020 年细菌耐药性分析

唐朋、王晶晶、全念、邱宗文、张立群
陆军军医大学第二附属医院检验科

目的 了解陆军军医大学第二附属医院 2020 年常见病原菌的分布和耐药情况，指导临床合理使用抗生素，辅助抗感染治疗。

方法 搜集本院 2020 年 1 月-12 月住院和门诊患者送检的临床样本中分离的菌株，参考美国临床和实验室标准协会（CLSI）2019 年抗菌药物敏感性试验执行标准（M100-29th）对药敏结果进行判断，并采用 WHONET5.6 软件对分离菌株的来源和耐药性进行分析。

结果 2020 年共检出非重复菌株 4125 株（真菌除外）。其中革兰氏阳性菌 1340 株，占 32.5%；革兰氏阴性菌 2785 株，占 67.5%。全院分离病原菌排列前 5 位分别是大肠埃希菌、肺炎克雷伯菌、铜绿假单胞菌、金黄色葡萄球菌和鲍曼不动杆菌，病原菌来源主要以痰液、尿液、无菌体液为主。耐药数据分析显示：耐甲氧西林金黄色葡萄球菌（MRSA）和耐甲氧西林凝固酶阴性葡萄球菌（MRCNS）检出率分别为 25.7%和 71.2%；未检出万古霉素耐药的肠球菌，利奈唑胺耐药的屎肠

球菌检出率为 1.5%；碳青霉烯耐药的鲍曼不动杆菌（CRABA）和碳青霉烯耐药的铜绿假单胞菌（CRPAE）检出率分别为 85.3%和 12.9%；碳青霉烯耐药的肠杆菌目细菌（CRE）总检出率为 12.3%，其中碳青霉烯耐药的大肠埃希菌（CRECO）、肺炎克雷伯菌（CRKPN）和阴沟肠杆菌（CRECL）检出率分别为 1.6%、28.1%和 13.8%。

结论 细菌耐药形势严峻，尤其以碳青霉烯耐药的鲍曼不动杆菌、肺炎克雷伯菌、铜绿假单胞菌和阴沟肠杆菌为主，必须进一步加强多重耐药菌监测和院感控制，防止耐药菌在院内广泛传播，同时需要进一步规范抗菌药物合理使用。

PO-0669

表面增强拉曼散射技术无标记检测乳腺癌细胞来源外泌体

王新慧
山东大学第二医院

外泌体含有不同的双分子特征，反映了释放细胞的成分，成为液体活检的重要物质。为了区分不同的细胞来源的外泌体，表面增强拉曼光谱（SERS）已被应用于检测癌细胞来源的（MCF-7）外泌体和正常细胞来源的（MCF-10A）外泌体。从细胞培养基的上清液中分离外泌体。结果表明，外泌体在 800~1 800 cm-1 区域具有自己独特的特征拉曼光谱。与 MCF-10A 来源的外泌体的光谱相比，MCF-7 来源的外泌体核酸的相对拉曼峰强度明显更高，脂质的相对拉曼峰强度有所降低或拉曼峰消失。 结果表明，SERS 技术可以高灵敏度地检测来自不同细胞的外泌体的细微分子变化，并区分乳腺癌细胞来源的外泌体和正常细胞来源的外泌体。 SERS 技术可以为癌症的早期诊断提供一种快速、无标记、无损的检测方法

PO-0670

Westgard 西格玛规则在急诊生化分析项目质控管理中的应用

张鸿伟、敖帅、张社强、钱净
昆明市第一人民医院

目的 通过对我科急诊生化分析项目进行 Westgard 西格玛性能评价，选择个性化的质控规则，确定合适的分析批长度，并根据质量目标指数（QGI）提出改进方向，指导质量持续改进。

方法 收集我科急诊生化检测系统 21 个分析项目所涉及两个批号的 22 个月的质控数据所得到的累积不精密度 CV、与对等组的偏倚 BIAS 以及我科设定的允许总误差 TEa，将数据输入我科的 Unity Real Time 质控管理平台，系统会根据 Westgard sigma 规则自动计算出 σ 值、推荐的质控规则、假失控率和误差检出率等性能特征；并根据最新推出的分析批长度 Westgard Sigma 规则流程图，评估、确定各分析项目的合适的分析批长度；而对于 σ＜6 的分析项目，通过计算其 QGI，查找方法性能不佳的原因进行持续改进。

结果 1. 21 个生化分析项目的实际 CV、实际 BIAS 和实际总误差 TE 均小于质量目标,其中：有 4 个项目 σ≥6,采用单规则, 3 个项目 5≤σ<6,采用单规则, 4 个项目 4 ≤σ< 5,采用四规则, 8 个项目 3≤σ< 4,采用多规则，实现了个性化质控规则的选择；2. 21 个生化分析项目的分析批长度不尽相同，其中分析批长度为 1000 的有 4 个项目，分析批长度为 450 的 3 个项目，分析批长度为 200 的有 4 个项目，分析批长度为 45 的有 8 个项目；3.对于 σ＜6 的 17 个分析项目中，QGI<0.8 有 16 个项目,提示优先改进精密度；1 个项目 QGI>1.2,提示优先改进正确度。

结论 可以通过对定量检测项目进行 Westgard 西格玛性能评价，根据性能特征来选择个性化的质控规则，根据分析批长度 Westgard Sigma 规则流程图评估、确定合适的分析批长度，并根据质量目标指数 QGI 进行质量持续改进，确保病人检测结果的质量。

PO-0671

microRNA-4731-5p suppresses breast cancer cell glycolysis and reverse epithelial-mesenchymal transition through regulation of PAICS-induced phosphorylation of FAK

lei lang[1]、jing tao[2]、chaomei yang[1]、wei li[1]
1. Chongqing Emergency Medical Center
2. 重庆医科大学附属儿童医院

Background microRNAs (miRNAs) are differentially expressed in breast tumor and serve as tumor promoters or suppressors. In this study, we aim to find out the function of miR-4731-5p in breast cancer progression.
Methods A total of 50 breast cancer patients were enrolled for sample collection followed by determination of expression of miR-4731-5p, PAICS and FAK. Besides, the miR-4731-5p and PAICS expression in breast cancer cells was also detected with its role in glycometabolism, migration, invasion, epithelial-mesenchymal transition (EMT) of breast cancer cells analyzed through gain- and loss-of function assays. The targeting relation between miR-4731-5p and PAICS was confirmed by dual-luciferase assay. Xenograft tumor in nude mice was constructed to observe the tumorigenesis and metastasis ability of breast cancer cells.
Results Decreased miR-4731-5p expression and increased PAICS expression was observed in breast cancer tissues and cells. PAICS was confirmed as the potential target of miR-4731-5p. miR-4731-5p was demonstrated to inhibited glycolysis, EMT, migration and invasion in breast cancer cells through inhibition of PAICS-dependent phosphorylation of FAK. In vivo assay also confirmed the regulatory role of miR-4731-5p/PAICS/FAK axis in in vivo tumorigenesis in breast cancer.
Conclusion Our results indicated that miR-4731-5p inhibits breast cancer cell glycolysis and EMT through inhibition of PAICS-dependent phosphorylation of FAK, suggesting that miR-4731-5p and its targets may serve as therapeutic targets in breast cancer treatment.

PO-0672

白藜芦醇预处理脐带 MSCs 源性 exosomes 调控 Wnt/β-catenin 信号抑制肺癌转移

尹磊
苏州大学附属儿童医院

目的 干细胞经不同因素（如缺氧、炎症、细胞因子、药物）刺激会呈现不同的表型和功能，其分泌的外泌体（exosomes，Ex）组分和功能也会随之改变。因此，可干预干细胞的表型，调控其分泌的 Ex 的组分，进而增强 Ex 的疗效。我们前期发现白藜芦醇（resveratrol，Res）处理人脐带间质干细胞（human umbilical cord-derived mesenchymal stem cells，hucMSCs），可促进其增殖、分化，分泌更高水平的 PDGF-DD，增强其对顺铂诱导的肾毒性的保护作用。在此，我们探究能否通过 Res 调控 hucMSCs 的表型影响其分泌的 Ex 的组分和功能。
方法 Res 处理 hucMSCs，CCK8、成骨成脂诱导实验检测检测其增殖和分化，Luminex、ELISA 、WB、IF、qRT-PCR 技术检测 hucMSCs 蛋白和 mRNA 改变； 超速离心法收集 Res 预处理 hucMSCs 的 Ex（Res-Ex），透射电镜、NanoSight LM10 系统、CD63、CD81 检测对其进行表征和鉴定；小鼠肺癌转移瘤实验和细胞实验对 Res-Ex 的功能和组分进行研究。
结果 Res 处理可增加 hucMSCs 的细胞活性，促进其成骨成骨成脂分化，抑制炎症因子分泌和 Wnt/β-catenin 信号， 增强 Wnt/β-catenin 信号抑制因子 DKK3 的表达。Res 处理不影响 hucMSCs

Ex 分泌、粒径分布及表面分子（CD63、CD81）表达，促进 Ex 转运 DKK3。Res-Ex 作用肺癌细胞或肺癌模型，可拮抗 Wnt/β-catenin 信号，抑制肺癌转移。
结论 Res 调控 hucMSCs 促进其 Ex 转运 DKK3 失活 Wnt/β-catenin 信号，抑制肺癌转移。

PO-0673

竞争 ELISA 法检测 COVID-19 患者血清靶向 RBD 中和抗体水平及影响因素分析

陈晓玲、郑友限、陈秋婷、陈明春、刘建忠
泉州市疾病预防控制中心

目的 基于竞争 ELISA 法检测靶向新型冠状病毒受体结合域 （RBD）的中和抗体，探讨新型冠状病毒肺炎（COVID-19）患者血清中和抗体水平及其影响因素。
方法 收集 2020 年 2 月 24 日前国家传染病信息报告系统中泉州地区 37 例 COVID-19 患者的 65 份血清，同时选取 39 例已完成新型冠状病毒疫苗接种者血清和 44 例疫情爆发前完成采集的健康体检者血清作为对照；采用竞争 ELISA 法检测靶向 RBD 中和抗体；组间比较采用非参数 Kruskal-Wallis 检验，并用广义线性混合模型进行影响因素分析。
结果 COVID-19 患者及疫苗接种者靶向 RBD 中和抗体水平均显著高于健康体检者（Z=78.498、61.242，P 均=0.000）；COVID-19 患者靶向 RBD 中和抗体水平男性高于女性，未复阳组高于复阳组，重型低于轻型、普通型，差异有统计学意义（t=2.235、-9.104；-2.210、-2.526，P 均＜0.05）；核酸检测 CT 值越大（即病毒载量越低），或治疗前 LC 越低、CRP 越高，则患者靶向 RBD 中和抗体水平越高（t=6.156、-6.695、-4.219，P 均＜0.05）；是否复阳与核酸检测阳性持续时间交互作用的影响有统计学意义（t=8.218，P＜0.05）；距离发病时间可显著影响靶向 RBD 的中和抗体水平（β=0.065,t=505.326,P＜0.05），发病 5-10 天可检测到靶向 RBD 中和抗体并增长，15-25 天达峰值进入平台期。
结论 COVID-19 患者在感染后产生新型冠状病毒中和抗体水平随时间改变，且与性别、病毒载量、治疗前 LC 与 CRP 水平及病情转归相关。

PO-0674

新型冠状病毒持续存在状态下医学实验室的安全管理

谢滨姣、祖爽、谢盼盼、张俊涛
黑龙江金域医学检验实验室有限公司

目的 近两年来全球疫情形式严峻，国内多地反复发现确诊病例，颇有类似流感病毒一样长期传播存在的趋势。由于新冠病毒有 1-14 天的潜伏期，第三方检验实验室的委托客户很可能不具备检测新型冠状病毒的条件，或者患者处于潜伏期，病毒拷贝数较低无法检测识别出来。因此第三方检测实验室存在接收的每一例样本均有可能是携带新型冠状病毒的，实验室随时可能面临病原微生物暴露的院感风险。如何能够在隐形安全风险下安全运营，成为目前实验室安全管理的重要课题。
方法 由实验室安全主任召集安全委员会进行风险评估研讨会，针对本课题进行讨论。
讨论内容共分以下几个方面：1.标本收取的安全管理；2.标本检测的安全管理；3.实验室消毒的相关要求。
结果 1.标本收取的安全管理：应将所有设有发热门诊的客户建立清单，发放给物流和实验室员工，要求发热门诊客户所有患者必须送检新冠病毒核酸检测，对于发热门诊的标本专人收取，采用三级个人防护，配备负压运输车，并匹配相应的消毒剂供收取标本后进行防护设施、标本箱、运输车消杀使用；未设有发热门诊的客户应保持对新冠病毒发病早起的临床症状及检测项目结果趋势的敏感

度，如有疑似病例，建议在送检普通项目的同时加做新冠病毒核酸检测，同时将可疑情况反馈给委托实验室，匹配发热门诊标本的接收配置，以保障标本收取人员的安全。
2.标本检测的安全管理：应建立实验室专项课题组，收集文献、教材等相关资料，分析各个检测项目标本是否能够进行灭活，并积极开展灭活与非灭活标本的比对实验；对于无法进行灭活的标本，应在离心、检测等步骤中尽可能的避免气溶胶的产生，尽可能在生物安全柜内操作标本。
3.实验室管理的相关要求：在实验室整体管控上，应不断完善文件体系，针对不同风险点均设立应急预案；同时加强人员培训，通过应急演练加强人员应对突发情况的应变能力。应做好每日现场环境、仪器设备、废弃标本等的消毒方案及应急处理；所有安全相关设备的定期维护保养、校准核查，判定设备处于异常状态的标准文件及应急预案；建立实验室环境洁净度监控的工作频次、流程制度，并按期执行，以保证实验室的安全运营。
结论 疫情持续存在的前提下，实验室的生物安全工作成为运营管理的首要任务，实验室管理层应不断完善文件体系及工作流程，防范于未然。

PO-0675

Oxidized ATM enhances triple negative breast cancer cell invasion via the p-EGFR/MEK/ERK signaling pathway during hypoxia

lei lang[3]、tenghua yu[1]、jing tao[2]、weijie fu[3]、shenshen zhi[3]、wei li[3]
1. 江西省肿瘤医院
2. 重庆医科大学附属儿童医院
3. 重庆市急救医疗中心

BACKGROUND Ataxia-telangiectasia mutated protein kinase (ATM) is activated upon DNA damage and plays an anti-tumorigenic role by repairing DNA double-strand breaks (DSBs). However, recent reports have shown a DNA damage-independent activity of ATM (called oxidized ATM) under hypoxia promoting tumor cell growth and invasion in several cancers, including breast cancer. However, the role of oxidized ATM in triple negative breast cancer (TNBC) progression remains unclear.
METHODS Immunohistochemistry and western blotting were applied to detect the levels of oxidized ATM in different breast tissues and cell lines. Transwell assay was used to detect the cell invasion abilities in different treatments. We validated the molecular mechanism of our results through immunohistochemistry and Western blot analysis in vitro and in vivo.
RESULTS In the absence of DNA damage, enhanced oxidized ATM protein exists not only in breast cancer tissues, but also in TNBC cell lines. ATM knockdown or inhibition of p-ATM reduce the expression of p-EGFR protein level and weaken the invasiveness of TNBC cell lines under hypoxia. And exogenous EGF or Honokiol (an activator of ERK) can rescue the invasiveness of breast cancer cells under hypoxia. Mechanically, we reveal that oxidized ATM enhances cell invasion via the p-EGFR/MEK/ERK signaling pathway in vitro and in vivo.
CONCLUSIONS Our research provides novel insight into the role of oxidized ATM in promoting tumor metastasis via p-EGFR/MEK/ERK signaling pathway and its possible role as a therapeutic target in TNBC.

PO-0676

Role of ErbB3 overexpression in tumor metastasis of ErbB2-positive breast cancer and its preliminary molecular mechanisms

Ruxue Jia[1,2]、Zhuolin Li[1,2]、Yating Wu[1,2]、Qun Ren[1,2]、Tingting Lin[1,2]、Huimin Niu[1,2]、Xiaoming Huang[1,2]、Shenghang Zhang[1,2]、Shuiliang Wang[1,2]
1. Affiliated Dongfang Hospital of School of Medicine, Xiamen University
2. 联勤保障部队第九〇〇医院检验科

Objective ErbB2 positive breast cancer is a type of breast cancer with higher malignancy. However, our understanding of the molecular mechanism of breast cancer metastasis is still very limited. Here, we mainly investigate the role of ErbB3 overexpression in the metastasis of ErbB2 positive breast cancer and other malignant biological phenotypes.
Methods ErbB3 overexpressing ErbB2 positive breast cancer cell lines were constructed by lentivirus transduction; MTS and cell cloning assay were used to detect the effect of ErbB3 overexpression on the proliferation of ErbB2 positive breast cancer; The effect of ErbB3 overexpression on metastasis and invasive growth of ErbB2 positive breast cancer was detected by Transwell and Transwell invasion assay; Western blot analyses were performed to determine the expression and activation of proteins; qRT-PCR was carried out to analyze the mRNAs and miRNAs expression levels; Clinical samples of ErbB2 positive breast cancer were analyzed by immunohistochemical assay.
Results ErbB3 overexpression not only significantly promoted the growth and proliferation of ErbB2 positive breast cancer, but also significantly enhanced its invasion and migration. The preliminary mechanism investigation showed that ErbB3 overexpression could not only significantly induce the up-regulation of transcription factors such as ZEB1 in ErbB2-positive breast cancer cells to promote the EMT phenotype, but also significantly promote the up-regulation of MMP2 and MMP9 expressions with activation of downstream Akt and MAPK signalling pathways at the same time. In addition, RT-qPCR analysis also confirmed that ErbB3 overexpression down-regulated the expression of miR-203 and miR-542-3p, both of which may target ZEB1 and other EMT-regulating transcription factors. Analysis of clinical samples preliminarily suggested that ErbB3 overexpression may be associated with clinical metastasis in patients with ErbB2-positive breast cancer.
Conclusion Our data strongly suggest that ErbB3 overexpression can significantly enhance ErbB2 positive breast cancer metastasis and other related malignant biological phenotypes through the formation of ErbB2 / ErbB3 heterodimer.

PO-0677

9 号染色体嵌合重复伴超雄综合征的细胞遗传学分析一例

耿丹、杜荷香、潘璠、霍志连、李清鲜
太原金域临床检验所有限公司

染色体疾病是由于生物个体在生殖遗传中出现染色体数目或结构异常，而引起的流产、死胎、先天畸形、发育迟缓、不孕不育等一系列临床症状的疾病，是造成出生缺陷的重要因素之一，因此借助染色体核型分析及高通量测序技术等协助诊断尤为重要。

目的 通过对一例呼吸窘迫综合征、左侧肾上腺囊肿的早产儿进行染色体核型分析及遗传病全外显子组基因测序，明确发病原因，并探究临床病因与染色体变异的相关性，同时评估传统核型分析与高通量测序技术的应用价值。

方法 首先对患儿进行外周血染色体 G 显带核型分析，其次利用高通量测序技术（二代测序）进行全外显子组测序检测，明确致病基因。

结果 患儿传统染色体核型分析结果为 47,XYY[36]/48,XYY,+mar[34]/46,XY[20]，考虑此核型中存在嵌合超雄综合征核型及常染色体不平衡变异。高通量测序结果提示该患儿 Y 染色体拷贝数为 2，9 号染色体 p21.1p13.1 区域存在约 6.2Mb 片段重复，且 11 号染色体发生大片纯合现象。
结论 该患儿的临床病因与基因拷贝数变异相关，综合传统核型分析结果及全外显子组基因测序结果，考虑传统核型中的标记染色体为 9 号染色体重复片段，11 号染色体发生大片纯合现象可能为 11 号染色体发生部分单亲二倍体，这可能导致该区域隐性遗传病的发病风险增加，也可能是整条 11 号染色体发生单亲二倍体，同时存在超雄综合征核型。9 号染色体嵌合重复、11 号染色体发生单亲二倍体是导致该患儿发育异常、呼吸窘迫、左侧肾上腺囊肿、夭折等临床症状的主要因素。传统核型分析可检测患儿染色体的具体形态，但不能精准识别标记染色体，具有一定的局限性。而高通量测序技术可精准地检测覆盖范围内的绝大多数（约 98%）点突变及大多数（90%）的致病性拷贝数变异。两种检测技术相结合，可精准检测致病基因以协助诊断，在出生缺陷领域颇有临床意义。

PO-0678

长沙县妇幼保健院孕妇缺铁性贫血及铁缺乏的现状分析

杨牡丹[1]、周珂[2]
1. 长沙县妇幼保健院
2. 湖南师范大学医学院

目的 研究长沙县妇幼医院缺铁性贫血及铁缺乏的现状。
方法 选取 2020 年 1 月-2020 年 12 月在长沙县妇幼医院门诊进行产检的孕妇 14018 例为研究对象，通过孕妇年龄、孕周、血常规、血清铁蛋白含量、铁剂补充类型等指标，统计分析孕妇铁缺乏、贫血、缺铁性贫血患病率及铁剂补充情况。
结果（1）产检孕妇妊娠期贫血的患病率为 31.3%（4382/14018），其中缺铁性贫血占 57.8%（2534/4382），缺铁性贫血及铁缺乏的患病率分别为 18.1%（2534/14018）和 49.8%（6986/14018）。（2）孕妇铁缺乏、贫血及缺铁性贫血的患病率随孕周增长均呈上升趋势，三个不同孕期组比较差异均有统计学意义（$P < 0.05$）；三个不同年龄组比较差异均无统计学意义（$P>0.05$）。（3）随孕周的增长，孕妇血清铁蛋白及血红蛋白浓度均呈下降趋势，差异有统计学意义（$P < 0.05$）。（4）全部孕妇中补充了铁剂有 9426 例，占 67%，其中最常用的为琥珀酸亚铁片和多糖铁复合物胶囊。
结论 本地区的孕妇铁缺乏、贫血及缺铁性贫血的患病率仍处于较高水平；尤其是随孕周增长，孕妇对铁的需求量也持续增加，铁缺乏、贫血及缺铁性贫血患病率均上升，血清铁蛋白及血红蛋白浓度均下降；科学补铁对改善孕期保健质量、防治妊娠期缺铁性贫血意义重大。

PO-0679

血清异常凝血酶原与甲胎蛋白对肝癌诊断价值的比较——荟萃分析

阳迎
中国人民解放军陆军军医大学第二附属医院

背景与目的 肝癌（HCC）是常见的恶性肿瘤之一，其早期诊断对患者行早期根治切除术及相应放化疗、延长患者生存期、提高患者生活质量有极大帮助，其早期诊断方法包括超声、CT、血清学检查等，血清学标志物包括应用最为广泛的甲胎蛋白（AFP）、异常凝血酶原（DCP）、甲胎蛋白异质体比例(AFP-L3%)等等，本文旨在比较 DCP 与 AFP 对肝癌的诊断价值，明确其在临床诊断中的应用价值。

方法 在中国知网、万方数据库、中国生物医学数据库、PubMed、Medline 及 Cochrane Library 数据库中系统的检索有关 AFP 及 DCP 对肝癌诊断价值的文章，通过制定的纳入排除标准进行筛选，通过 QUADAS-2 对纳入的文献进行质量评价，最终通过 Meta Disc 进行数据合并。
结果 最终我们共纳入了 19 篇文章，AFP 及 DCP 对肝癌诊断价值中汇总的灵敏度、特异度、阳性似然比、阴性似然比分别为（0.63，0.85，4.64，0.42）、（0.68，0.89，6.40，0.34），AFP 受试者工作特征曲线下面积（AUC）为 0.81，DCP 的 AUC 为 0.89。
结论 在肝癌诊断中，异常凝血酶原与甲胎蛋白相比具有较高的灵敏度及特异度。

PO-0680

53244 例山西省女性人乳头瘤病毒感染率及型别分布情况分析

吴佳丽、畅锴
太原金域临床检验所有限公司

人乳头瘤病毒（huamn papillomavirus，HPV）属 DNA 病毒，具有多种不同的型别，是人类乳头状瘤、疣等疾病的致病原因。根据导致疾病的不同分为高危型和低危型。高危人乳头瘤病毒(high risk-huamn papillomavirus，HR-HPV)持续感染与宫颈癌、阴茎癌、外阴癌、阴道癌和肛门癌、复发性呼吸道乳头状瘤病和某些头颈部恶性肿瘤相关，尤其与宫颈癌的发生关系密切。
目的 通过分析山西省地区女性 HPV23 分型感染情况及亚型分布特点，了解山西地区 HPV 感染分布情况，从而为宫颈癌的预防提供重要依据。
方法 收集山西地区 53244 例女性标本，通过聚合酶链式反应（PCR）体外扩增技术和 DNA 反向点杂交法相结合的 HPV 基因分型检测技术方法，检测 53244 例山西省女性标本 HPV 感染率及型别分布情况分析。
结果 53244 例女性送检标本中共检出 HPV 阳性标本为 14494 例，阳性率为 27.22%，其中 HR-HPV 检出 14494 例（78.90%）、LR-HPV 检出 3872 例（21.10%），其感染的的主要基因分型占比总标本的比例分别为 HPV16 型（4.15%）、HPV52 型（4.24%），HPV53 型 （2.54%）、HPV58 型（2.65%）、HPV51 型（2.04%）、HPV42 型（2.16%）、HPV81 型（2.22%）；不同年龄组别感染 HPV 分型不同，其中≤30 岁、31~40 岁和>50 岁年龄组以 HPV52 型为主，感染率依次分别为 4.69%、3.69%和 5.35%；41~50 岁年龄组以 HPV16 型为主，感染率为 3.84%。山西各地区间 HPV 感染率及型别分布情况分析，差异具有统计学意义(P <0.05) 。
结论 山西省女性人群感染的分型类型主要为 HPV16、52、53、58、51、42、和 81 型最为常见，为指导山西地区女性进行预防 HPV 感染筛查提供理论依据，对宫颈癌的早期诊断、疫苗接种和研发也有非常重要的意义。

PO-0681

岳阳市 6700 例人群血清中 25-羟基维生素 D 含量的检测结果分析

陈静、蒋华科、龚燕飞
岳阳市第一人民医院

目的 探讨岳阳市不同年龄阶段人群血清中维生素 D 的含量，分析原因并寻找有效防治措施。
方法 高效液相色谱串联质谱法检测血清标本中 25-羟基维生素 D 的含量并对检测结果进行统计分析。
结果 岳阳市地区 6700 例开展了维生素 D 检测项目的人体中，血清 25-羟基维生素 D 平均水平为 21.75+9.35ng/mL，结果显示严重缺乏 356 人（5.31%）、缺乏 2940 人（43.88%）、不足 2388 人（35.64%）、正常 1016（15.16%）、过量 0 人，其中男 2203 人（24.75+9.41ng/mL），女 4497 人（20.63+9.10ng/mL）。14 岁及其以下年龄人群的平均维生素 D 含量为

(26.04±10.36)ng/mL，14 岁以上年龄的人群体内平均维生素 D 含量为 (20.25±8.50)ng/mL。综上所述，男性含量稍高于女性，14 岁及其以下年龄的人群含量稍高于 14 岁以上人群，但是整体处于含量不足的状态。

结论 岳阳市地区的人群随着年龄的增长，体内血清中 25-羟基维生素 D 含量正常水平比率逐渐降低，建议在日常生活中，应多外出活动，并且注意对维生素 D 进行合理补充，从而维持体内维生素 D 的正常含量。

PO-0682

记录上墙对实验室人员质量意识提升的探究

杨国青、王慧
贵州金域医学检验中心有限公司

目的 为了更好的促进实验室质量建设、提升人员质量意识，有效降低因人员疏漏造成的记录缺失，确保记录能够连贯完整，保障实验室质量体系的健康运行。

方法 回顾性分析 2015-2020 年贵州金域医学检验中心实验室各种质量体系检查（包括 ISO15189、内审、集团巡检、日常检查、飞行检查、监管检查）开具的不符合项，分析记录上墙实施前后上墙记录开具的不符合项的变化情况，以及实施记录上墙后未上墙记录开具的不符合项的变化趋势和实施记录上墙后每年开具的不符合项数量变化情况的相关性。

结果 ①记录上墙后上墙的记录不符合项较之前下降 23%，两年后上墙记录不符合项数量降为 0；②实施记录上墙后，未上墙记录的不符合项数量逐年减少，下降幅度≥6%；③实施记录上墙后，每年开具的不符合项数量逐年降低，下降幅度≥10%，降低趋势高于未上墙记录的不符合项。

结论 记录上墙后，促使工作人员每日自我检查记录是否填写完整，同时其他人员也可以一目了然的看到其记录是否漏填，起到间接监督作用。随着人员自我检查习惯的形成，其他未上墙的记录的及时填写也得到了持续的改善，因记录问题被开具的不符合项的直接下降，形成了良性的自我激励和奖励机制，反促其自觉的去审视自查自纠存在的质量问题，不符合项数量不断下降，质量体系持续完善。说明记录上墙的实施，对实验室人员的质量意识提升起到了明显的促进作用并在其过程中形成了质量体系自查自纠持续改善的长效机制。

PO-0683

Monocyte to Lymphocyte Ratio and Red Cell Width Distribution to Lymphocyte Ratio were Useful Markers in Assessment of Disease Prognosis and Diagnosis Value in Primary Biliary Cirrhosis Patients

Yanting Jiang、Xi Li、Wei Zhou、Sihui Li、Min Jin、Jian Wang
First Affiliated Hospital of Guangxi Medical University

Objective Although there have been extensive investigations on monocyte to lymphocyte ratio (MLR) and red cell width distribution to lymphocyte ratio (RLR), their roles in Primary Biliary Cirrhosis(PBC) remain unclear. The purpose of the present study was to evaluate MLR and RLR levels in adult PBC patients and explore their clinical significance.

Methods A retrospective study involving 71 patients with PBC and 170 patients with Autoimmune hepatitis (AIH) were collected, and 170 healthy subjects were included as healthy control group (HC group). All clinical characteristics of the PBC patients were extracted from their medical records. MLR and RLR levels among PBC patients, AIH patients and HC group were compared,

and receiver operating curve (ROC) was used to evaluate the diagnostic value of each index in the diagnosis of PBC.
Results MLR and RLR in PBC group was higher than that in AIH group and in HC group (each P<0.05). The area under ROC curve (AUC) of MLR and RLR in diagnosis of PBC were 0.821 and 0.797 respectively (each P < 0.05). The combination of MLR and RLR increases the diagnostic performance of PBC (AUC=0.868, P<0.05). Spearman correlation analysis showed that RLR was negatively correlated with C3 (r=−0.384, p<0.01) and C4 (r=−0.321, p=0.03), and positively correlated with Mayo score (r=0.618, p<0.01). There was a positively correlation between MLR and Mayo score (r=0.354, p<0.01). In PBC patients with Child-pugh classification, MLR and RLR levels in B+C group were significantly higher than that in A group (each P <0.05).
Conclusion Elevated levels of MLR and RLR may prove to be a useful marker for estimating the prognosis of PBC disease, and the combined detection of MLR and RLR has certain clinical diagnostic value in patients with PBC.

PO-0684

Comparison of two different systems for testosterone measurement

Wei Zhang
Jiangsu Province Hospital (The First Affiliated Hospital with Nanjing Medical University)

Objective To evaluate the concordance of two different detection systems of CLIA in the testosteronelevels measurement.
Methods Serum specimens from 155 patients were collected at Jiangsu Province Hospital June 2018. Testosterone levels were assayed using two different chemiluminescence immunoassays on platforms manufactured by Roche and Beckman. Liquid chromatography with tandem mass spectrometry (LC-MS/MS) were used to reanalyze the top ten serum sample which had the maximum difference between Beckman and Roche. Passing-Bablok regression equations, Spearman correlation coefficient (r) and Bland-Altman plots were used to estimate the relationship and bias among the testosterone results obtained with the different analyses. The χ2 test was performed to analyze the results from the different methods.
Results The regression equation (y = 0.538 + 1.020 x) highlighted the presence of proportional systematic difference, there was significant deviation from linearity (P < 0.01). The Spearman correlation coefficient (r= 0.971, P < 0.001) indicated that the results of Beckman and Roche had good correlation. The Bland-Altman plot analysis showed a significant systematic difference in the two methods, Beckman measurements were in average 22.4% (95% CI, 7.88 to 36.83) higher compared to Roche ones. The overall coincidence rate was 91.84% between the Beckman and Roche methods.
Conclusions Two detection systems do not have the consistency of the testosterone assays, it is recommended to use LC-MS/MS to confirm the testosterone level.

PO-0685

男性激素五项参考区间的建立及其临床价值

王希部
深圳市罗湖区人民医院

目的 建立深圳罗湖区实验室男性激素五项的适合参考区间，探究其在男性不育症的临床价值，为临床诊疗提供帮助。
方法 采集 2020 年 5 月-10 月在深圳罗湖区人民医院体检表观健康的男性成人 399 例静脉全血，然后离心取血清。被检者年龄在 17-56 岁之间，将其分为≤30 岁，30-40 岁，＞40 岁三组，采用美国

雅培发光仪检测雌二醇（E2）、促卵泡成熟激素（FSH）、促黄体生成素（LH）、泌乳素（PRL）、睾酮（TESTO）的水平，并同时取精液进行精液常规分析，标准按 WHO 底五版要求进行。另外选取同期不育患者 30 例作为对照。

结果 促卵泡成熟激素（FSH）、促黄体生成素（LH）、泌乳素（PRL）三个年龄组别间水平分布具有差异，部分年龄组之间有统计学差异（P<0.05）。睾酮（TESTO）、雌二醇（E2）不同年龄组之间未见明显差异（P>0.05）。除 PRL 外，精液正常男性与少弱精症不育男性激素水平不同，具有统计学差异（P<0.05）。建立了成年男性激素五项的本地区参考区间。

结论 不同种族、地区人群，男性激素水平并不完全一致。应建立本地区实验室的参考区间，能更好的指导临床在不育症患者中的诊断和治疗。

PO-0686

Does Maternal Hypothyroidism during Pregnancy have Association with Autism Spectrum Disorder in the Offspring? A systematic review and Meta-analysis

Haolong Li
Department of Clinical Laboratory, Peking Union Medical College Hospital, Peking Union Medical College and Chinese Academy of Medical Sciences, Beijing, China

Objective Hypothyroidism is a common disorder appeared in pregnant women, which has been proved to cause autism spectrum disorder (ASD) in their offspring by several studies. The aim of this study is to systematically evaluate the association of maternal hypothyroidism during pregnancy and ASD in offspring by using available data.

Methods Four electronic databases were searched up to October 20,2019 respectively, including PubMed, EMBASE, Web of Science and Scopus. Two investigators independently extracted data by using a standard form that covered essential information on the eligible studies: first author, publication year, country, study period, study design，patient groups, sample size，maternal thyroid status, diagnostic standards of ASD and maternal hypothyroidism, effect size with 95% CI (preferentially adjusted effect size), and potential confounders considered. We used the STATA 15 to combined and analyzed the data from included studies to calculate the relationship between maternal hypothyroidism and ASD. Hazard ratio and relative risk were assumed equal to OR when we computed the pooled effect size.

Results Seven observational studies were included. Maternal hypothyroidism during pregnancy was associated with the ASD in offspring in our main meta-analysis (OR=1.29, 95%CI: 1.07-1.56). In subgroup analysis, there was a strong association between maternal hypothyroidism during pregnancy and ASD in the offspring in Asian population (OR=4.46, 95% CI: 1.67–11.90), whereas the association in western population did not significantly change (OR=1.27, 95% CI: 1.15–1.40). The results of sensitivity analysis were robust and no publication bias was detected.

Conclusion In conclusion, maternal hypothyroidism during pregnancy could increase the risk of ASD in the offspring. More studies are needed to further confirm whether pregnant women received the treatment could decrease the risk of ASD in the offspring.

PO-0687

miR-142a-3p enhances FlaA N/C protection against radiation-mediated intestinal injury by modulating IRAK1/NF-kB signaling pathway

Teng Liu
The First Affiliated Hospital of Chengdu Medical College

Purpose Investigate the role of FlaA N / C protein - mediated pyroptosis inhibition related miRNA in radiation protection.
Methods Mice and HIEC cells were received 10 Gy irradiation after FlaA N / C pretreatment or IRAK-1/4 Inhibitor I treatment or PDTC treatment . CCK-8 assay was used to evaluate cell viability, LDH relase was used to analyze cytotoxicity, caspase-1 activity assay, IL-1β level, flow cytometry were used to analyze pyroptosis in cells, HE staining was used to evaluate the damage of intestinal tissue, CO-IP was used to detect the activation of inflammation, immunohistochemistry, western blot analysis and immunofluorescence were used to analyze activation of pyroptosis -related proteins the activation of NF-kB signaling pathways, real time PCR was used to detect expression of IRAK1 and miR-142a-3p, Mouse & Rat miRNA OneArray was used to determine the change of relevant miRNA after FlaA N / C pretreatment, Luciferase reporter assay and FISH were used to detect the interaction between miR-142a-3p and IRAK1.
Results FlaA N/C reduces radiation-induced pyroptosis in vivo and vitro, miR-142a-3p expression increased after FlaA N / C pretreatment. Up regulating the expression of miR-142a-3p inhibits radiation-induced pyroptosis in HIEC, down regulating the expression of miR-142a-3p leads to radiation-induced pyroptosis in HIEC after FlaA N/C pretreatment. IRAK1 is a direct target of miR-142a-3p and plays an important role in radiation-induced pyroptosis in HIEC. Inhibiting IRAK1 can reduce radiation-mediated pyroptosis in mice intestinal. MiR-142a-3p down regulation IRAK1 suppressed the NF-kB pathway. Inhibiting NF-kB signaling pathway can reduce radiation-mediated pyroptosis in mice intestinal.
Conclusion Flagellin A N/C regulates miR-142a-3p to inhibit radiation-induced pyroptosis via IRAK1/NF-kB signal pathway in intestine cells.

PO-0688

瘦素、血栓素 B2 以及白细胞计数对 2 型糖尿病合并冠心病的预测价值研究

李海霞、魏静、李萍、贾彩霞、严辰媛、马菲菲、魏书瑶、冯珊珊、哈小琴
中国人民解放军联勤保障部队第九四〇医院

目的 通过分析 2 型糖尿病合并冠心病（T2DM 合并 CHD）患者脂联素（ADP）、瘦素（LEP）、内皮素 1（ET-1）、前列腺素 I2（PGI2）、血栓素 B2（TXB2）等血管内皮细胞损伤标志物以及白细胞计数和淋巴细胞计数的变化，为 T2DM 合并 CHD 的诊断预测提供参考依据。
方法 选择兰州市某三甲医院 2020 年 7 月-11 月期间确诊的 T2DM 合并 CHD 和 2 型糖尿病（T2DM）患者各 50 例，收集两组患者的基本资料，酶联免疫吸附法（ELISA）检测两组患者的血管内皮损伤指标。Logistic 回归分析 T2DM 合并 CHD 的影响因素，ROC 曲线分析各影响因素对 T2DM 合并 CHD 的预测价值，以 P<0.05 为差异具有统计学意义。
结果 年龄（OR=1.120，95%CI：1.026~1.223，P=0.011）、LEP（OR=1.706，95%CI：1.146~2.542，P=0.009）、TXB2（OR=1.024，95%CI：1.002~1.047，P=0.031）和白细胞计数（OR=2.514，95%CI：1.131~5.590，P=0.024）是 T2DM 患者合并 CHD 的危险因素，ADP（OR=0.403，95%CI：0.197~0.825，P=0.013）、eGFR（OR=0.929，95%CI：0.869~0.994，

P=0.034）和淋巴细胞计数（OR=0.089，95%CI：0.013~5.596，P=0.013）是 T2DM 患者合并 CHD 的保护因素。年龄、LEP、TXB2 以及白细胞计数的 AUC 曲线下面积较大分别为：0.818（95%CI：0.736~0.899，P<0.001）、0.688（95%CI：0.580~0.796，P=0.001）、0.753（95%CI：0.658~0.847，P<0.001）、0.689（95%CI：0.585~0.793，P=0.001）。

结论 年龄、LEP 和白细胞计数是 T2DM 合并 CHD 的危险因素，ADP、eGFR 和淋巴细胞计数是 T2DM 合并 CHD 的保护因素。年龄、LEP、TXB2 以及白细胞计数的 AUC 曲线下面积较大，可能对 T2DM 合并 CHD 具有一定的预测价值。

PO-0689

TM、TAT、PIC 和 t-PAIC 对 2 型糖尿病血栓的诊断价值研究

李萍、严辰媛、贾彩霞、孙志鹏、马菲菲、冯珊珊、魏书瑶、何斯、李香影、刚乔建、李海霞、魏静、哈小琴
中国人民解放军联勤保障部队第九四〇医院

目的 探讨 TM、TAT、PIC 和 t-PAIC 对 2 型糖尿病和 2 型糖尿病合并血栓性疾病的诊断价值。

方法 选取兰州市某三甲医院的 2 型糖尿病患者（T2DM 组），2 型糖尿病合并血栓患者（T2DM+T 组）以及其他非相关疾病者（Control 组）作为研究对象。用全自动分析仪检测研究对象的血糖，血脂以及凝血指标，用化学发光免疫法检测血栓四项水平。用 ROC 曲线分析各指标对研究疾病的诊断预测价值。

结果 三组间在 FPG、GSP、TG、TC、HDL、LDL、HCY、SOD、APTT、PT、FIB、FDP 和 D-Dimer 上的差异均具有统计学意义（P＜0.05）；T2DM+T 组和 T2DM 组血栓四项水平均高于 Control 组（P＜0.05）。ROC 曲线分析显示对 T2DM 具有诊断价值的指标有 FPG、GSP、TG、FIB、FDP、D-Dimer、TM、TAT 和 PIC，血栓四项联合诊断的价值仅次于 FPG 和 GSP，特异度达 89.8%；对 T2DM+T 具有诊断价值的指标有 FPG、GSP、TG、LDL、HCY、PT、FIB、FDP、D-Dimer、TM、TAT、PIC 和 t-PAIC，且血栓四项联合诊断的价值较高，AUC=0.902，敏感度和特异度均为 837%。

结论 TM、TAT、PIC 和 t-PAIC 对 2 型糖尿病合并血栓患者的诊断价值高于对 2 型糖尿病患者的诊断价值，有望在临床推广此项检测，提高对 2 型糖尿病合并血栓疾病的早期预防和诊疗效能。

PO-0690

19646 例门诊妇女阴道微生态特征分析

韩阳
西安医学院第一附属医院

目的 分析妇科门诊不同症状患者的阴道微生态特征，对临床诊疗提供指导。

方法 回顾性分析 2019 年 01 月至 12 月西安医学院第一附属医院妇科门诊因不同症状就诊患者的阴道微生态（菌群密集度、多样性、优势菌、病原菌、Nugent 评分、菌群功能及炎症反应指标）检测结果。

结果 19646 例患者年龄范围为 16-87 岁，平均年龄（32.94±9.67）岁。其中，阴道微生态正常者 1043 例（5.31%）,阴道微生态异常者 18603 例（94.69%）。在阴道微生态异常的患者中，不能通过镜检明确病原菌者 12926 例（94.69%）；通过镜检发现明确病原菌者 5677 例（28,90%），其中包括单纯性阴道炎 5308 例（5308/18603，28.53%），混合性阴道炎 369 例（369/18603，1.98%）。单纯性阴道炎中以外阴阴道假丝酵母菌病（Vulvovaginal Candidiasis, VVC）为主（3015/5308，56.80%），其次为细菌性阴道炎（Bacterial Vaginosis, BV）（2025/5308，38.15%）。混合性阴道炎中含两种者以 BV+VVC 为主（319/369，86.45%），其次为 TV+BV（43/369, 11.65%），TV+VVC 仅占 1.36%；含三种者为 BV+VVC+TV （2/369，0.54%）。

结论 阴道微生态异常在妇科门诊患者发生率高，未明确感染的阴道微生态失调患者构成比最高，有明确病原菌诊断的部分患者存在混合感染；阴道微生态评价能够指导临床医师全面评价阴道微生态状况。

PO-0691

散射比浊法测定尿游离轻链、尿微量白蛋白及尿 α1-微量球蛋白在肾损伤疾病中的应用

刘红、刘颖、李巧霞、黄国虹、王昌敏
新疆维吾尔自治区人民医院

目的 探讨散射比浊法测定尿游离轻链、尿微量白蛋白及尿 α1-微量球蛋白在肾损伤疾病中的应用。
方法 选择我院住院的慢性肾脏病患者 100 例为病例组，男 60 例，女 40 例，年龄 25～72 岁。健康体检者 50 例为对照组，男 21 例，女 29 例，年龄 23～75 岁，均无急、慢性肾脏病、糖尿病、高血压、血液病及其他严重疾病，近期未服用肾毒性药物。所有入选本组受试者经知情同意后，均留取新鲜晨尿 10 ml，3000 r/min 离心 5 min，取上清液进行检测。采用双光径免疫浊度分析系统(贝克曼公司生产的 IMMAGE 特种蛋白分析仪)及其随机配套试剂。两组采用速率散射比浊法检测尿 κ 与 λ 轻链、尿 mALB 及尿 α1-MG 的浓度水平，并对两组检测结果进行比较，以受试者工作特征（ROC）曲线及曲线下面积（AUC）评价各项指标在肾脏疾病中的敏感性。
结果 两组性别、年龄等一般资料差异无统计学意义（P>0.05）。病例组尿 κ 和 λ 轻链，尿 mALb，尿 α1-MG 的阳性率明显高于对照组，通过 ROC 曲线、诊断试验结果显示：尿 κ 与 λ 轻链、尿 mALb 和 α1-MG 的尿液浓度 AUC 及 95%CI 分别为 0.766(0.708~0.818)、0.546(0.465~0.625)、0.855(0.810~0.898)、0.806(0.765~0.859)，联合 4 种尿液指标分析得到的最优化的 AUC 及 95%CI 为 0.906(0.870~0.955)，差异具有显著性（P＜0.001）。
结论 尿游离轻链 κ 与 λ 联合尿 mALB 和 α1-MG 的检测可以作为肾脏疾病的诊断指标，为肾脏病的临床诊断，疗效的观察和预后的判断，预防早期发生及其发展趋势以及治疗提供科学依据，对临床研究具有重要的价值。

PO-0692

Health economic evaluation of noninvasive prenatal testing and serum screening for Down syndrome

Gefei Xiao
Zhuhai Center for Maternal and Child Healthcare

Background Down syndrome (DS), also known as trisomy 21 (T21), is the most common genetic disorder associated with intellectual disability. There are two methods commonly used for prenatal testing of DS: serum screening (SS) for biomarkers in maternal serum and noninvasive prenatal testing (NIPT) for aneuploidy by cell-free DNA (cfDNA) in maternal plasma. However, cost-effectiveness analyses of these two methods are mostly based on data derived from simulations with various models, with theoretical values calculated. In this study, we statistically analyzed clinical DS screening data and pregnancy outcomes during the follow-up of pregnant women in Zhuhai City, China. The economics of the two mainstream prenatal DS screening methods was evaluated from a public health perspective.
Methods A retrospective analysis was performed on the data of 17,363 pregnant women who received SS and NIPT during gestation in Zhuhai from 2018 to 2019, and a cost-effectiveness analysis was performed with four screening strategies. In strategy I, all pregnant women received SS, and those with T21 risk ≥1/270 had invasive prenatal diagnosis (IPD). In strategy II, all

pregnant women received SS, those with T21 risk ≥ 1/270 had IPD, and those with 1/270 > T21 risk ≥ 1/1,000 had NIPT; then, women at high risk based on NIPT also had IPD. In strategy III, all pregnant women received SS, and those with T21 risk ≥1,000 had NIPT; then, women at high risk based on NIPT results had IPD. In strategy IV, all pregnant women received NIPT and those at high risk based on NIPT results had IPD. Finally, to assess the cost and effectiveness of DS screening, the total costs were calculated as the sum of screening and diagnosis as well as the direct and indirect economic burden during the average life cycle of DS patients.
Results A total of 22 of the 17,363 (1/789) pregnant women had DS, of which only one woman was over 35 years of age. SS detected 1,024 cases at high risk of T21 (≥1/270), 8 cases were true positive, with a positive predictive value of 0.78% and a detection rate of 36.4%. NIPT detected 27 cases at high risk of T21 (Z ≥ 3) and 22 cases of DS, with a positive predictive value of 81.5% and a detection rate of 100%. Strategy I had the largest total cost of 65.54 million CNY, strategy II and III had similar total costs of 40 million CNY, and strategy IV had the lowest total cost of 14.91 million CNY. By comparison, the screening strategy with NIPT alone had the highest health economic value for DS.
Conclusions SS was greatly affected by nuchal translucency and the accuracy of gestational age measured by ultrasonography. Unstandardized ultrasonography was an important reason for the low DS detection rate with SS. The influence of interfering factors on NIPT was much lower than in SS. NIPT can be used as an alternative to SS and as a primary screening strategy of prenatal DS screening for secondary prevention and control of birth defects. NIPT greatly decreased the frequency of IPD and the miscarriages associated with IPD, saved the limited medical and health resources, and greatly increased DS detection rate. Therefore, NIPT has great social and economic benefits.

PO-0693

PD-L1 expression on CTCs in breast cancer patients and its clinical value

Xueling Liu[1,2]、Qing Li[2]、Zhen Cai[1]、Jinghui Hou[2]
1. Nanfang Hospital, Southern Medical University
2. 中山大学孙逸仙纪念医院

Objective To investigate the expression and clinical value of PD-L1 on circulating tumor cells (CTCs) in peripheral blood of breast cancer patients.
Methods 100 patients with newly diagnosed breast cancer were selected to study the expression of PD-L1 on CTCs in peripheral blood,and analyze the relationship between the number and EMT typing of $CTCs^{PD\text{-}L1(+)}$ in peripheral blood,the mean expression level of PD-L1 on CTCs and the clinicopathological characteristics of the patients.50 breast cancer patients in treatment were selected to compare the changes in the total number of CTCs,the number of $CTCs^{PD\text{-}L1(+)}$,mean expression level of PD-L1 on CTCs and serum tumor markers (CEA, CA125, CA153 and CYFRA21-1) levels before and after a fresh round of treatment.
Results The mean expression level of PD-L1 on mixed-type CTCs（0.88）was significantly higher than that on epithelial-type CTCs（0.57）and mesenchymal-type CTCs（0.40),and the mean expression level of PD-L1 on CTCs in breast cancer patients with mixed-type CTCs as major type was dramatically higher than other types of patients as well.The typing of $CTCs^{PD\text{-}L1(+)}$ was associated with the age,HER-2 status,Ki-67 status,molecular classification,tumor size, lymph node metastasis,TNM staging,CA153,CYFRA21-1 and LDH of breast cancer patients($P<0.05$).No correlation was found between the mean expression level of PD-L1 on CTCs,the total number of $CTCs^{PD\text{-}L1(+)}$ and the clinicopathological characteristics of breast cancer patients ($P>0.05$). However,significant linear correlations were observed between epithelial-type $CTCs^{PD\text{-}L1(+)}$and serum ALP levels($r=-0.213$,$P=0.034$), mesenchymal-type $CTCs^{PD\text{-}L1(+)}$ and quantity of metastatic foci($r=0.197$,$P= 0.049$), mixed-type $CTCs^{PD\text{-}L1(+)}$ and Ki-67 status ($r=-0.213$, $P=0.034$).There were statistically significant differences ($P<0.05$) in the total number of CTCs,the

number of CTCs$^{PD\text{-}L1(+)}$ and the mean expression level of PD-L1 on CTCs of breast cancer patients before and after treatment, while the differences in changes of the serum tumor markers (CEA, CA125, CA153 and CYFRA21-1)levels were not statistically significant (P>0.05).
Conclusion PD-L1 expression on CTCs might play an important role in promoting the process of epithelial-mesenchymal transition of CTCs.The EMT typing of CTCs$^{PD\text{-}L1(+)}$ was related to some clinicopathological characteristics of breast cancer patients, and the progression of breast cancer could be estimated based on this.The expression of PD-L1 on CTCs in peripheral blood of breast cancer patients was more sensitive than serum tumor markers in the assessment of efficacy.Therefore,PD-L1 on CTCs could be used as an important indicator for the choice of treatment options,efficacy assessment and progression monitoring of breast cancer.

PO-0694

M2 样肿瘤相关巨噬细胞通过增加胶质瘤 IL-6 的表达促进血管拟态的形成

张琳
山东大学齐鲁医院

背景 胶质瘤是一种高度血管化的恶性脑肿瘤，因此，靶向内皮细胞的抗血管生成药物备受瞩目。然而，近期数据发现，这种看似非常具有潜力的抗血管疗法，临床应用后却出现了疗效短暂和疗效欠佳的问题。血管拟态概念的提出，使人们意识到在肿瘤组织中除了由内皮细胞构成的血管外，还有由肿瘤细胞构成的功能类似于正常血管的血供形式，即血管拟态（VM）。然而，到目前为止，VM 在胶质瘤中的形成机制尚未十分明确。作为肿瘤微环境免疫浸润的重要组成部分，巨噬细胞已被证明在肿瘤生长和血管生成中起重要作用。然而，巨噬细胞是否会在胶质瘤 VM 形成过程中发挥着关键作用，目前尚不清楚。
目的 探索血管拟态和 CD163+巨噬细胞在胶质瘤组织中的表达情况，分析 M2 样巨噬细胞是否会影响胶质瘤血管拟态的形成，并探讨其相关的作用机制。
方法 本研究回顾性纳入行胶质瘤切除术的患者 87 例。采用免疫组化的方法检测血管拟态和 CD163+巨噬细胞在胶质瘤中的表达情况，并分析两者之间的相关性。采用成管实验检测血管拟态的形成。利用 qRT-PCR 和 Western Blot 检测血管拟态相关指标的表达。利用 qRT-PCR 和 ELISA 检测 IL-6 的表达。采用成管实验、qRT-PCR、ELISA 以及 Western Blot 检测相关的信号机制。
结果 在本课题中，我们发现，VM 数目和 CD163+细胞浸润密度均与肿瘤级别呈正相关，与患者生存期呈负相关。体外实验结果显示，M2 样巨噬细胞可以促进胶质瘤 VM 的形成。同时，M2 巨噬细胞可以显著促进胶质瘤细胞 IL-6 的分泌。此外，IL-6 中和抗体可阻断 M2 样巨噬细胞介导的 VM 形成。使用 PKC 抑制剂可以抑制 M2 诱导的 IL-6 上调，进一步抑制胶质瘤 VM 形成。
结论 总之，我们的研究结果表明，M2 样巨噬细胞通过激活 PKC 信号通路促进胶质瘤细胞 IL-6 的分泌，进而促进胶质瘤 VM 的形成。

PO-0695

昆明某院肾移植受者 HLA-A、B、DRB1 抗原分布频率分析

蒲丹
昆明市第一人民医院

目的 分析昆明某院肾移植受者 HLA-A、B 和 DRB1 抗原分布频率，为肾移植 HLA 组织配型提供可靠的科学数据。
方法 收集 2016 年 4 月至 2021 年 5 月昆明市第一人民医院 1934 例肾移植受者 HLA 抗原检测数据，分析 HLA-A、B 和 DRB1 抗原种类和分布频率。

结果 HLA-A 抗原出现 19 种，其中 A11、A2 和 A24(9)抗原分布频率较高，分别为 29.87%、23.62%和 17.34%。HLA-B 抗原出现 38 种，其中 B46、B62(15)和 B60(40)抗原分布频率较高，分别为 11.19%、10.88%和 8.96%。HLA-DRB1 抗原出现 16 种，其中 DR12(5)、DR4 和 DR15(2)分布频率较高，分别为 20.47%、13.84%和 10.76%。
结论 肾移植受者 HLA-A、B 和 DRB1 抗原中，A11、B46 和 DR12(5)分别为分布频率最高的抗原，符合南方汉族人群 HLA 基因多态性分布。

PO-0696

2015-2020 年产妇围产期血培养感染病原体细菌分布和耐药性分析：一项多中心回顾性研究

邹琴[1]、邹华[1]、申燕[1]、余浪[1]、周玮[1]、盛成林[2]、廖昂[3]、李春莉[1]
1. 重庆市妇幼保健院
2. 万州妇幼保健院
3. 永川妇幼保健院

Bloodstream infections (BSIs) cause morbidity and mortality in postpartum patients, resulting in poor prognosis for both mother and neonate. This study retrospectively analyzed the pathogen distribution and drug sensitivity among postpartum patients with BSIs to identify appropriate antibacterial agents for perioperative therapy. All bacteremia cases between January 2015 and December 2020 from three Health Centers for Women and Children in Chongqing, China, were retrospectively reviewed. The present data showed that E. coli dominated BSIs during the past 6 years at our study centers. Additionally, an increasing trend in anaerobic bacteria detection in BSIs was observed.The increasing resistance rate of E. coli against fourth-generation cephalosporins needs additional attention.

PO-0697

粪肠球菌利奈唑胺低水平耐药生物膜形成及细胞壁厚度相关性研究

高睿
重庆市人民医院

目的 观察低水平耐药粪肠球菌生物膜形成及细胞壁厚度，探索其耐药机制是否与生物膜形成及细胞壁厚度改变相关。
方法 5 株利奈唑胺低水平耐药粪肠球菌（MIC：4-16 mg/L）体外诱导至高水平耐药，采用结晶紫染色方法对耐药菌诱导前后生物膜形成能力进行半定量分析；采用透射电子显微镜观测耐药粪肠球菌的细胞壁厚度。
结果 结晶紫染色生物膜半定量试验结果显示 MIC 为 16 mg/L 的耐药粪肠球菌生物膜形成能力为弱阳性，而 MIC 为 8 mg/L 的耐药菌以及标准野生株 ATCC 29212 生物膜形成为阴性。低水平耐药菌诱导利奈唑胺 MIC 大于 256 mg/L 后生物膜形成能力依旧为阴性和弱阳性。透射电镜观察结果显示利奈唑胺低水平耐药菌与敏感菌 ATCC 29212 细胞壁厚度无明显差异，耐药菌在含有菌体 1/2 MIC 利奈唑胺培养下，细菌细胞壁厚度与无抗生素培养细菌细胞壁厚度存在显著性差异，具有统计学意义。
结论 生物膜形成可能并不是造成粪肠球菌对利奈唑胺产生耐药的原因，利奈唑胺作用下细胞壁增厚仅适量的减少细菌对利奈唑胺的敏感性，但并非造成利奈唑胺耐药的主导因素。

PO-0698

Extracellular Vesicles Derived From Talaromyces marneffei Yeasts Mediate Inflammatory Response in Macrophage Cells by Bioactive Protein Components

Biao Yang
Zhujiang Hospital, Southern Medical University

Extracellular vesicles (EVs) loaded with proteins, nucleic acids, membrane lipids, and other virulence factors could participate in pathogenic processes in some fungi such as Cryptococcus neoformans and Candida albicans. However, the specific characteristics of EVs derived from Talaromyces marneffei (TM) still have not been figured out yet. In the present study, it has been observed that TM-derived EVs were a heterogeneous group of nanosized membrane vesicles (30–300 nm) under nanoparticle tracking analysis and transmission electron microscopy. The DiI-labeled EVs could be taken up by RAW 264.7 macrophage cells. Incubation of EVs with macrophages would result in increased expression levels of reactive oxygen species, nitric oxide, and some inflammatory factors including interleukin-1b, interleukin-6, interleukin-10, and tumor necrosis factor.Furthermore, the expression of co-stimulatory molecules (CD80, CD86, and MHC-II) was also increased in macrophages stimulated with EVs. The level of inflammatory factors secreted by macrophages showed a significant decrease when EVs were hydrolyzed by protease, while that of DNA and RNA hydrolase treatment remained unchanged. Subsequently, some virulence factors in EVs including heat shock protein,mannoprotein 1, and peroxidase were determined by liquid chromatography–tandem mass spectrometry. Taken together, our results indicated that the TM-derived EVs could mediate inflammatory response and its protein would play a key role in regulating the function of RAW 264.7 macrophage cells.

PO-0699

青海省海南州某地区藏族健康人群中 25-羟维生素 D 调查研究

韩启福
青海省人民医院

目的 了解青海省海南州某地区藏族健康人群中 25-羟维生素 D[25-hy droxyvitamin D,25-(OH)D]水平。
方法 收集 2017 年 3 月至 2017 年 4 月在青海省海南州某地区长期居住的藏族健康人群血清标本 429 例。根据年龄、性别进行分组。采用化学发光免疫分析法测定 25 羟维生素 D。
结果 调查的 429 名藏族人群中，425 人存在维生素 D 缺乏，占 99.06%；3 人存在维生素 D 不足，占 0.69％；维生素 D 充足者仅 1 人，占 0.23％。研究对象年龄与维生素 D 水平呈弱负相关（R＝0.275；P＝0.076）。
结论 青海省海南州某地区藏族人群中血清维生素 D 平均水平低下，普遍存在维生素 D 缺乏或不足，应加强健康教育，提高社区居民对维生素 D 不足现况的认识。

PO-0700

女性生殖道支原体感染和耐药性临床分析

童梦佳
重庆金域医学检验所有限公司

支原体是一种无细胞壁的原核生物，呈多态性，一般有球形、双球形和丝状三种基本形态，可通过除菌滤器，是能在无生命的培养基中生长繁殖的最小原核细胞型微生物。大小是在细胞与病毒之间，在电子显微镜下支原体细胞膜的超微结构分三层，内、外层为蛋白质和糖类，中间层为脂类，其中胆固醇含量最多，故支原体的代谢活动很有限。而支原体科分为两个属，即支原体属解脲支原体（UU）是非淋球菌性泌尿生殖器炎症的主要病原体，在妇科方面其中解脲支原体（M.urealyticum）和人型支原体（ Mycoplasma hominis）是人类泌尿生殖道常见且公认有致病作用的支原体，已成为性传播疾病最常见的病原体之一。除了尿道炎之外，尚可导致男性附睾炎，前列腺炎，女性白带增多，子宫内膜炎，腹痛，宫颈炎，盆腔炎，更可导致不孕和流产，以及新生儿眼炎和肺炎等，受到人们广泛的关注。因此，了解女性生殖道支原体感染的临床分析情况具有重要的临床意义。由于广谱抗生素的滥用，使耐药菌日益剧增，给临床诊断和治疗带来了较大的困难，并且多数女性感染者症状轻微或无症状常被忽视，目前该病的患病率呈上升趋势。因此，了解女性生殖道支原体感染的临床和耐药性分析情况具有重要的临床意义。

PO-0701

青海省临床实验室临检专业急诊标本 TAT 调查分析

韩启福
青海省人民医院

目的 调查青海省临床实验室临检专业急诊标本检验前和实验室内周转时间现状，分析急诊标本检验前和实验室内周转时间的影响因素，为实验室质量改进提供依据。
方法 通过网络平台向参加 2019 年青海省临床检验中心开展室间质量评价计划的 138 家临床实验室发放调查表，各临床实验室按要求统计 2019 年 3 月份数据，在线填报临床检验专业质量指标调查表，用 WPS 软件对回报数据的三大常规和凝血专业 TAT 相关信息进行统计分析，统计 TAT 在不同时间段内的实验室比率（数量）及超出阈外值的实验室比率（数量）。
结果 本次向全省临床实验室共发放调查表 138 份，实验室填报率 100%(138/138)，填写不完整或填写数据无效的实验室共 16 家。调查结果显示我省实验室三大常规急诊标本检验前 TAT（P90）、中位数在 60min 内的实验室分别约占 90.9%(110/121)和 97.58%(121/124)；三大常规急诊标本实验室内 TAT（P90）、中位数在 30min 内的实验室分别约占 35.54%(43/121)和 52.42%(65/124)，超出阈外值(≥30min)的实验室分别约占 64.46%(78/121)和 47.58%(59/124)。实验室凝血专业急诊标本检验前 TAT（P90）、中位数在 60min 内的实验室分别约占 89.19%(99/111) 和 97.34%(110/113)；凝血专业急诊标本实验室内 TAT（P90）、中位数在 60min 内的实验室分别约占 81.08%(90/111)和 88.35%(99/112)，超出阈外值(≥60min)的实验室分别约占 18.92%(21/111)和 11.61%(13/112)。
结论 青海省临床实验室三大常规和凝血专业急诊标本实验室内周转时间（TAT）超出阈外值的实验室较多，部分实验室需要优化标本周转环节，缩短标本 TAT，应根据自己实验室的情况，建立自己的目标 TAT。

PO-0702

新生儿遗传代谢病筛查的分析前质量控制

高娜娜、王青、彭德志、王佳佳
济南金域医学检验中心有限公司

新生儿遗传代谢病筛查是出生缺陷三级防控的重要组成部分,严格的分析前质量控制对于保证筛查结果的准确性、避免假性实验结果有重要意义，分析前质量控制主要包括标本采集、递送、验收和储存等环节。本文通过评估分析前各环节，找出新生儿遗传代谢病筛查项目分析前过程中易出错点，同时规范分析前操作流程，提高新生儿遗传代谢病筛查准确率，推动妇幼卫生的三级预防措施。

PO-0703

Ferroptosis is critical in diabetic atherosclerosis through HMOX1 regulated lipid peroxidation pathway

Fan Ai[2]、Zhijun Meng[1]、Hongping Liang[1]
1. Clinical laboratory, Shanxi provincial people's hospital
2. Clinical laboratory, Shanxi provincial people's hospital

Introduction The patients with diabete dramatically accelerate atherosclerosis. Although improved diabetes treatment strategy has prevented the pathogenesis, diabetic atherosclerosis is still the main causes of morbidity and mortality. It is urgent to clarify its in-depth mechanism and to identify new therapeutic targets for preventing diabetic atherosclerosis.
Hypothesis We assessed the hypothesis that ferroptosis and HMOX1 may be implicated in diabetes atherosclerosis through comprehensive in-depth bioinformatics analysis.
Methods and Results Analysis of gene expression profiles (GSE30169 and GSE6584) provided a total of 91 differentially expression genes (DEGs) including 68 up-regulated and 23 down-regulated genes (A). Ferroptosis, a pathway of programmed cell death dependent on iron, and HMOX1, a kind of heme oxygenase, were identified as key factors in diabetes atherosclerosis (B). To explore the potential mechanism, we measured the iron content and the reactive oxygen species (ROS) generation and conducted a lipid peroxidation assay. Compared with animals on normal diet (ND), ferroptosis and HMOX1 expressiones in $ApoE^{-/-}$ mice on high fat diet (HFD) were significantly increased (C, n = 8). Ferroptosis inhibitor ferrostatin-1 (Fer-1) effectively attenuated the diabetic atherosclerosis area in HFD animals (D, n = 10, $P < 0.01$ vs HFD). In addition, Fer-1 restored the ferroptosis related proteins (GPX4 and SLC7A11) with high glucose high lipid (HGHL) treatment in mouse arterial endothelial cells (MAECs) (E, n=6). Furthermore, HMOX1 deficiency rebalanced Fe^{2+} overload, decreased iron content, reduced ROS, and alleviated the lipid peroxidation, which led to the reduction of ferroptosis in diabetic endothelial cells (F).
Conclusions The present study demonstrates that ferroptosis is critical in diabetic AS progression and that HMOX1 is an implicated factor responsible for ferroptosis in diabetic AS development, suggesting that HMOX1 may serve as a potential detection or drug development target.

PO-0704

髋关节置换术后血液嗜冷杆菌致感染 1 例

何文燕、郭洪
重庆金域医学检验所有限公司

髋关节置换发展至今已有 60 余年，目前该技术已经相当成熟；但髋关节置换术后易出现假体松动，甚至炎症反应严重时需要进行手术治疗。进行相应治疗前，均需进行诊断明确松动部位，如内衬、髋臼、股骨柄。同时也要找到病因，如是否为细菌感染导致的松动，通过实验室检查来进行鉴别诊断明确病因。根据病人实际情况来选择适宜的治疗方案。出现假体松动一定要重视，积极进行诊治，不要让病情日益发展，耽误合适治疗时机。本司微生物室于 2021 年 4 月 21 日从左髋关节置换术后假体松动后采集到的组织标本内分离培养到血液嗜冷杆菌，该菌为临床罕见菌，并通过组织病理检查和 DNA-病原微生物宏基因组检测，确认是否为该菌的感染。

PO-0705

Sysmex XN-1000 血液分析仪在临床体液检测中的性能评估

杨亚平
陆军军医大学第一附属医院（西南医院）

目的 通过临床体液标本细胞计数评估 Sysmex XN-1000 血液分析仪的体液检测功能。
方法 Sysmex XN-1000 在体液模式下检测脑脊液标本（n=86）、胸水标本（n=53）和腹水标本（n=67），根据美国临床实验室标准化委员会(NCCLS)有关指南文件 Ep9-A 对 Sysmex XN-1000 血液分析仪进行空白计数，精密度，线性范围等参数进行性能评价，再与显微镜手工计数结果进行比对。
结果 Sysmex XN-1000 检测非血性脑脊液，胸水和腹水标本白细胞计数和红细胞计数的空白计数极低；精密度较高(CV%〈10.0%)；线性良好(相关系数 r〉0.990)；以上参数符合仪器检测要求；与手工计数法结果进行秩和检验，差异无统计学意义(P〉0.05)。
结论 Sysmex XN-1000 全自动血细胞分析仪体液检测模块的主要评估指标均能够满足临床实验室需求，可以直接用于非血性脑脊液、胸水和腹水等体液标本的检测，对于血性体液标本可以结合手工计数法进行判读。

PO-0706

胃肠间质瘤基因突变特点及其与临床病理特征关系

王梦莹
攀枝花市中心医院

目的 分析胃肠间质瘤患者基因突变特点及其与临床病理特征之间的关系。
方法 收集西南地区某医院确诊的胃肠道间质瘤患者基因检测结果与临床病理资料，并分析两者间的关系。
结果 1.270 例患者中男 133 例，女 137 例。中位发病年龄为 58 岁。发病部位为胃的 144 例，小肠 94 例，直肠 9 例，结肠 4 例，其他部位 19 例。肿瘤最大径以≥5cm，＜10cm 为主，核分裂象以＜5 个/50HPF 为主。
2.270 例患者中 220 例检测到 c-kit 突变，其中 c-kit11 外显子突变 190 例，9 号外显子突变 26 例，13 号外显子突变 9 例， 17 号外显子突变 6 例。9 号外显子突变均为 A502-Y503 重复突变，主要发病部位为小肠。11 号外显子突变类型多样，主要为缺失突变和点突变，突变绝大部分发生于

550-580 位点，其中以 557-560 位点最突出。而 13 号和 17 号外显子均为点突变。7 例检测到 PDGFRA 突变，其中 3 例为 12 号外显子突变，4 例为 18 号外显子突变。
3.女性患者肿瘤最大径小于 5cm 比例高于男性患者。野生型患者核分裂象＜5/50HPF 的比例明显大于发生 c-kit 和 PDGFRA 突变的患者。野生型患者 CD117 阳性率低于突变型。野生型患者 SMA 阳性率高于突变型，PDGFRA 突变患者大于 50 岁的频率高于其他突变的频率。c-kit9 突变发生在小肠上的的频率大于其他突变。c-kit11 突变中点突变和混合突变发生在胃上的概率小于其他类型突变。
结论 胃肠间质瘤最好发部位为胃，c-kit 的 11 外显子突变是 GIST 最常见的基因突变类型。绝大多数 GIST 病例 CD117 与 DOG-1 为阳性。c-kit11 突变类型与发病部位有关。PDGFRA 突变患者可能较 c-kit 突变患者预后差，c-kit9 突变的患者原发部位多在小肠上，野生型患者预后较突变型患者好，联合基因检测和免疫组化结果可以更好地诊断 GIST。

PO-0707

重庆市渝中区人群 SLCO1B1 和 ApoE 基因多态性分析及与血型的相关性探索

王丽英[1]、王梦艳[2]
1. 重庆市人民医院
2. 重庆医科大学

目的 分析重庆市渝中区人群中 SLCO1B1 和 ApoE 基因频率分布特点，验证基因型与血脂之间的关系，并探索基因多态性与血型之间的相关性。
方法 回顾性分析 2020 年 5 月-2021 年 1 月于重庆市人民医院渝中院区就诊的 760 例人群 SLCO1B1 和 ApoE 基因型别数据，并统计研究对象的 TG、TC、LDL-C 以及 HDL-C 等血脂数据，计算不同基因型分布概率，分析基因多态性与血脂水平的相关性。进而抽样测定 226 例研究对象的血型，探索 ApoE 和 SLCO1B1 基因型别分布与血型型别之间的关联性。
结果 SLCO1B1 各基因型所占比例为：*1a/*1a 型 5.00%，*1a/*1b 型 30.53%，*1b/*1b 型 39.21%，*1a/*15 型 4.34%，*1b/*15 型 19.21%，*15/*15 型 1.71%；ApoE 各基因型频率为：E2/E2 型 0.92%、E2/E3 型 14.47%、E2/E4 型 1.58%、E3/E3 型 65.93%、E3/E4 型 15.92%、E4/E4 型 1.18%。统计学分析显示：SLC01B1 基因多态性与 HDL-C 浓度水平呈负相关，相关系数为 0.072，而与 TG、TC、LDL-C 浓度水平均不具有相关性；ApoE 基因多态性与 HDL-C 呈负相关，相关系数为 0.088，与 LDL-C 呈正相关，相关系数为 0.105，但 ApoE 基因与 TG、TC 二者无相关性。SLCO1B1 和 ApoE 基因多态性分布与血型型别之间无相关性（P>0.05）。
结论 SLC01B1 和 ApoE 基因频率分布存在明显不均，二者基因多态性与血脂水平有相关性。SLC01B1 和 ApoE 基因型与血型分布无相关性。

PO-0708

降钙素原在骨髓移植后细菌血流感染患者感染菌群的特点及预后的相关性

王春燕
北京大学人民医院

目的 本研究回顾性分析了 197 例骨髓移植术（HSCT）后血培养阳性的细菌血流感染患者，探讨了 PCT、CRP、D-Dimer 和 WBC 等指标水平在全身细菌感染的表现及预后的相关性。

方法 选取 2016 年 10 月至 2020 年 5 月，北京大学人民医院血液科 197 例接受异体骨髓移植手术（HSCT）后血培养阳性的细菌血流感染患者参与研究。收集其临床资料，检测炎症及生化指标。根据患者是否粒细胞缺乏、感染细菌类型、感染部位及感染预后分别将患者分为两组。比较两组的各项指标的不同，分析其临床意义。

结果 粒细胞缺乏组的 PCT[1.64(0.25,10.12) ng/ml]明显高于非粒细胞缺乏组[0.76(0.28-2.72) ng/ml]，（p<0.05）；粒细胞缺乏组 D-Dimer[455(272,868) ng/ml]明显低于非粒细胞缺乏组[918.5(446,3716) ng/ml]，（p<0.05）。骨髓移植术后细菌血流感染患者革兰氏阳性菌感染组 PCT[0.31(0.19,1.32) ng/ml], 革兰氏阴性菌感染组[1.96(0.38,7.92) ng/ml]，真菌感染组[0.87(0.15,1.69) ng/ml]，（p<0.05）。骨髓移植术后细菌血流感染患者革兰氏阳性菌感染组 WBC[1.35(0,5.30) 10^9/L], 革兰氏阴性菌感染组[0.02(0,0.68)10^9/L]，真菌感染组[0.06(0,4.77)10^9/L]，（p<0.05）。具体感染部位主要集中在肺部(26 例)，肛周（25 例）及消化系统（19 例），不同感染部位之间 PCT 差异不明显；Kaplan-Meier 生存曲线分析提示患者预后，PCT 值越低，患者的生存率越高。

结论 骨髓移植术后细菌血流感染患者中，血清 PCT、D-Dimer、WBC 及生化指标的变化对患者感染细菌类型感染部位及疾病预后有辅助判断价值。

PO-0709

影响尿液检验分析前质量的因素及应对措施

张异、丁少君、陈博文
杭州迪安医学检验中心有限公司

目的 从检验项目的要求、患者准备、样本采集、标本运送四个环节来总结影响尿液检验前质量的因素并提出应对措施。

方法 对 2020 年 7 月 1 日至 2020 年 12 月 31 日，共计 8414 份尿液样本进行回顾性的分析。

结果 不合格的尿液样品标本共占总样本数量的 5.35%，主要为标本受到污染（31.1%）、尿液样本量不足（26.2%）、标记不明确的尿样（11.1%）。

结论 在实验中要加强检验人员、医护人员与患者之间的沟通，改善实验室规章制度及监督制度，不断提高自身专业领域知识和解决学术问题；保证尿液检验分析前质量的标准要依靠整个医疗过程中每一个人的努力,确保把尿液标本不合格率作为临床质量考核的标准，要不断深入研究与探索检验质量和各种影响因素之间的关系，这样才能提高尿液检验的质量和效率。

PO-0710

NR4A2 促进幽门螺杆菌诱导的炎癌恶性转化

冯一民
山东大学第二医院

目的 探讨 NR4A2 在幽门螺杆菌感染所致的慢性炎症到癌症恶性转化中的作用，为寻求新的胃癌防治生物靶标提供理论依据。

方法 1. NR4A2 在幽门螺杆菌感染胃部组织标本中的表达分析: 通过 Real-time PCR 及免疫组化检测幽门螺杆菌感染阳性的癌旁正常组织、浅表性胃炎、萎缩性胃炎伴肠化生及胃癌组织病例标本中 NR4A2 的表达水平。2. 体外分析幽门螺杆菌及其毒力因子 CagA 调控 NR4A2 对胃癌细胞增殖的影响: 通过 Real-time PCR 及 western blot 检测幽门螺杆菌感染及 CagA 转染对 NR4A2 的表达影响；利用细胞克隆形成实验及 MTT 实验验证幽门螺杆菌及 CagA 对细胞增殖的影响；通过细胞转染 NR4A2 siRNA 及过表达质粒证实 NR4A2 参与幽门螺杆菌诱导的细胞增殖。3. 动物实验分析 NR4A2 在幽门螺杆菌感染所致炎癌恶性转化中的作用：利用幽门螺杆菌标准菌株 SS1 进行蒙古沙

鼠灌胃造模，筛选稳转细胞系进行裸鼠皮下种植成瘤实验，检测幽门螺杆菌对细胞增殖及炎癌恶性转化的影响，并揭示 NR4A2 在此过程中的作用。
结果 1. 组织标本检测中，NR4A2 的表达升高不仅发生在胃部肿瘤组织中，也发生在胃炎标本中，NR4A2 的异常表达是一个早期事件。2. 幽门螺杆菌感染胃癌上皮细胞可以诱发 NR4A2 表达的上调，NR4A2 促进幽门螺杆菌感染引发的细胞增殖。3. 动物实验表明幽门螺杆菌可以引起胃炎直至胃癌的发生，而 NR4A2 促进此过程的发生。
结论 NR4A2 的活化存在于幽门螺杆菌感染所致的炎症早期，先于肿瘤的发生而存在，提示 NR4A2 作为胃癌早期检测与诊治的潜在靶点，在胃癌的预防、预后及治疗中具有广泛的应用前景。

PO-0711

m6A 去甲基化酶 ALKBH5 在胃癌中的表达与预后的相关性研究

冯一民
山东大学第二医院

目的 探索 m6A 去甲基化酶 ALKBH5 在胃癌组织中的表达，及其与胃癌病理分级、临床分期和预后的相关性。
方法（1）采用 TCGA 数据库中 183 例胃癌病例数据，分析 ALKBH5 在胃癌中的表达情况，分析 ALKBH5 表达与病理分级，临床分期和疾病预后的关系；
（2）采用 RT-PCR 和免疫组化方法检测 80 对胃癌/正常胃粘膜组织中 ALKBH5 表达情况，分析 ALKBH5 表达与病理分级、临床分期和疾病预后的关系；
结果（1）RT-PCR 和免疫组化结果显示，ALKBH5 在胃癌组织中的表达量低于正常胃部组织，$p<0.005$；
（2）根据病理分级，恶性程度越高的病例，ALKBH5 蛋白表达越低。胃癌 TNM 分期病程越晚期，ALKBH5 蛋白表达越低
（3）分析 TCGA 数据，结果显示：低表达组生存期较高表达组短，$p<0.01$。
结论 ALKBH5 在胃癌中低表达，且其表达水平与临床分期、病理分级及预后等负相关。ALKBH5 表达减少可能与胃癌的发生发展相关。

PO-0712

2 种不同方法消除脂血对生化项目检测干扰的对比分析

范雯雯
潍坊医学院附属医院

目的 探讨稀释法和高速离心法消除脂血对生化项目检测干扰是否具有可比性；为日常检验工作中脂血标本检测提供有效的方法。
方法 随机抽取 50 例脂血标本，经常规离心后用日立 7600 全自动生化仪检测丙氨酸氨基转移酶（ALT）、天门冬氨酸氨基转移酶（AST）、γ-谷氨酰基转移酶（GGT）、前白蛋白（PA）、C 反应蛋白（CRP）、β2 微球蛋白（BMG）。分别经高速离心后和生理盐水 1:9 稀释后再次检测以上项目。比较高速离心前后、生理盐水稀释前后结果的差异。
结果 ALT、AST、GGT 三项经高速离心处理后检测结果差异有统计学意义。PA、CRP、BMG 三项经生理盐水稀释处理后检测结果差异有统计学意义。
结论 对酶类项目可采取高速离心法消除脂血对检测结果的影响；免疫比浊法项目可以用生理盐水稀释法减少脂血的影响。

PO-0713

Identification of costimulatory molecules based signatures for predicting prognosis risk and immune infiltration in patients with Clear cell renal cell carcinoma based on TCGA

Chengjiang Wu
The Second Affiliated Hospital of Soochow University

Objective To explore the prognostic value of costimulatory molecules genes in the Clear cell renal cell carcinoma (ccRCC) patients and its effect on immune cell infiltration.
Methods Gene expression and clinical characteristics of patients with ccRCC were acquired from TCGA. A total of 60 costimulatory molecule genes were also obtained from TCGA-ccRCC including 13 genes of B7/ CD28 costimulatory molecules family and 47 genes of TNF family. The least absolute shrinkage and selection operator (LASSO) Cox regression model was utilized to construct a multigene signature in the TCGA cohort. Data processing and drawing were based on R and Perl programming languages. Real-time PCR and immunohistochemistry were used to verify the expression of differentially expressed genes.
Results The initial dataset in the study was consisted of 539 ccRCC samples and 72 normal samples. The expression of 55 costimulatory molecule genes in ccRCC and normal tissues were obviously differential which met the condition of FDR<0.05. LASSO Cox regression analysis results indicated that 13 risk genes were optimally used to construct prognostic model of ccRCC. Patients in the high-risk group showed significantly reduced OS compared with patients in the low-risk group. Receiver operating characteristic (ROC) curve analysis confirmed the predictive value of prognosis model of ccRCC (AUC>0.7). There are substantial differences in immune cell infiltration between high- and low-risk groups. Functional analysis revealed that immune-related pathways were enriched, and immune status were different between two risk groups. The genes and proteins expression from Real-time PCR and immunohistochemistry were consistent with DEGs from TCGA.
Conclusions By stratifying patients with all independent risk factors, the prognostic score model developed in this study may improve the accuracy for prognosis prediction to patients with ccRCC. The difference in the distribution of immune cells between two risk groups confirmed that costimulatory molecules could be used as targets and prognostic markers for immunotherapy.

PO-0714

Circular RNA circ_0001073 suppresses the progression of non-small cell lung cancer via miR- 582-3p/RGMB axis

Xuefen Jing、Cuifeng Wang
The First Affiliated Hospital of Baotou Medical College, Inner Mongolia University of Science and Technology

Background Reportedly, circular RNAS(circRNAs) exert a crucial regulatory role in cancer. circ_0001073 is derived from exons 3-5 of the ACVR2a gene, which inhibits cancer progression. However, the role and mechanism of circ_0001073 in non-small cell lung cancer(NSCLC)is unclear.
Methods Microarray analysis was employed to filter differentially expressed circRNAs in NSCLC tissues.Circ_0001073, microRNA-582-3p(miR-582-3p)and repulsive guidance molecule b(RGMB)mRNA expression was examined by qRT-PCR analysis. Cell multiplication was measured by the CCK-8 experiment. The Scratch-healing experiment and Transwell experiment were adopted to evaluate cell migration and invasion, respectively. Flow cytometry was applied to analyze the apoptosis. Western blot was employed to assess RGMB protein expression.

Additionally, dual-luciferase reporter gene experiments and RIP experiments were applied to probe the binding sites betweer miR-582-3p and circ_0001073 or RGMB, respectivel.
Results Circ_0001073 was remarkably under-expressed in NSCLC tissues and cells .Circ_0001073 overexpression impeded the multiplication, migration and invasion of NSCLC cells in vitro and enhanced the apoptosis. circ_0001073 directly bound to miR-582-3p and acted as a miRNA sponge to regulate RGMB expression. Besides, miR-582-3p overexpression or knockdown of RGMB remarkably reversed the malignant phenotypes of NSCIC cells induced by up-regulation of circ_0001073.
Conclusion circ_0001073 up-regulates RGMB expression through adsorbing miR-582-3p to inhibit NSCLC progression, suggesting its potential as an innovative therapeutic target in NSCLC.

PO-0715

军队援鄂医疗队组建新冠专科医院检验科的实践与启示

谢志雄
联勤保障部队第 909 医院

针对新型冠状病毒肺炎疫情，军队援鄂医疗队承担了湖北省妇幼保健院光谷院区新冠专科医院的诊疗任务。40 名检验人员进驻后迅速进行检验科建设并开展临床检验，为新冠专科医院临床科室的诊疗工作提供了有力的保障。文章从检验科实验室改造、仪器试剂采购、培训和工作方式、质量管理、感控防护等方面，总结新冠专科医院检验科组建和开展工作的经验，提出高效的卫勤组织指挥体系、军民深度融合卫勤保障机制、严密组织和科学管理模式对新冠专科医院检验科建设的重要性，为提升军队机动卫勤力量检验科在执行多种军事或非军事行动中的综合能力提供经验借鉴。

PO-0716

不合格标本拒收后的风险管理

张艳
新疆生产建设兵团医院

目的 探讨及评估本院由于不合格标本拒收后导致危急值延迟报告的风险。
方法 应用失效模式与效应分析（FMEA）方法评估 2017 年 12 月至 2018 年 09 月，新疆生产建设兵团医院分析前不合格检验标本拒收导致的 41 例危急值延迟报告的风险。利用头脑风暴及经验制定改进措施，通过两个月的实施后，进行实施前后的数据对比（实施后数据为 2018 年 12 月至 2019 年 09 月）并进行效果确认。
结果 本院分析前过程中潜在的失效模式共 23 项，其中不可接受风险有 11 项，需采取措施降低风险有 3 项。其他为可接受风险。标本采集不合格拒收后导致危急值延迟报告的有 41 例标本，均为失效模式中不可接受的风险。改进措施实施后共 33 例危急值延迟报告数据，较实施前下降 19.5%。
结论 因此，通过风险管理可减少因不合格标本拒收导致的危急值延迟报告，为临床提供即时、准确和可靠的检验数据。

PO-0717

后疫情时代下重庆市医学检验实验室应对突发公共卫生事件生物安全现状调查

徐兰兰、万雅芳
重庆市人民医院

目的 了解 SARS-CoV-2 后疫情时代下重庆市医学检验实验室应对突发公共卫生事件生物安全现状。
方法 同时对重庆市 341 家医学检验实验室发放调查问卷，调查内容包括实验室生物安全设施设备配置、实验室生物安全体系文件运行，实验室风险评估及应急体系运行，实验室开展病原微生物核酸检测情况、实验室个人防护用品配置、实验室应对突发公共卫生事件能力等，在规定时间内所有实验室均有效回报。
结果 341 家医学检验实验室包括：二级医疗机构占比 66.0%，三级医疗机构占比 24.6%，独立医学检验中心占比 9.4%；所有实验室均为生物安全二级实验室（BSL-2）；所有实验室均具有生物安全二级实验室要求的基本仪器设备配置，13.7%实验室未按照国家相关要求进行安装和年度维护检验；21.4%实验室具有负压条件的核心工作区；60.3%实验室具有完整的体系文件且全员培训知晓；80.0%实验室定期进行风险评估，并对识别的风险执行有效的预防和改进措施；89.6%实验室制定了各种突发事件应急预案，并进行全员培训演练； 60.1%实验室已开展新型冠状病毒核酸检测；64.0%实验室储备的防护物资可满足突发公共卫生事件应急状态下 2 周以上工作需要；目前 44.8%实验室的设施设备条件和 28.3%实验室人员储备不能满足应对突发公共卫生事件需要。
结论 新冠背景下重庆市医学检验实验室在实验室基础设施和检测能力建设、生物安全管理能力等方面已有了很大提升，为贯彻《中华人民共和国生物安全法》，完善风险防控体系和提高应急能力，各实验室还需加强设施设备投入和人员储备，以应对各种突发公共卫生事件需要。

PO-0718

岳阳地区儿童急性呼吸道感染病毒的检测情况分析

李童、杨昊
岳阳市妇幼保健院

目的 分析急性呼吸道感染住院患儿中常见呼吸道病毒流行病学特征。
方法 回顾性分析 2020 年 11 月-2021 年 1 月岳阳市妇幼保健院住院的 ARTI 患儿 528 例作为研究对象。采用直接免疫荧光法检测患儿鼻咽分泌物中呼吸道合胞病毒 (respiratory syncytial virus, RSV)、副流感病毒 (parainfluenza virus，PIV)1、2、3 型、腺病毒 (adenovirus，ADV)、流感病毒 (influenzavirus，Flu)A 型和 B 型这 7 种常见呼吸道病毒的抗原。
结果 528 例住院患儿中，病毒检出阳性 154 份，总检出率为 29.17%；其中 PIV-1 检出 8 份 (5.19%)，PIV-3 检出 52 份 (33.77%)，RSV 检出 88 份 (57.14%)，ADV 检出 5 份 (3.25%)，还有 1 例混合感染标本 RSV+ PIV-1 (0.65%)。154 例阳性样本中，男 94 例，女 60 例，男女比例：1.57:1。男性患儿病毒检出阳性率 (30.52%) 与女性患儿 (27.28%) 相比差异无统计学意义 ($P > 0.05$)。肺炎 (47.22%) 和支气管肺炎 (33.44%) 等下呼吸道感染的疾病表现最常见，且 RSV 在下呼吸道感染患者中的阳性检出率均最高。总病毒阳性检出率在不同临床诊断 ARTI 中差异有统计学意义($P < 0.05$)。
结论 本研究表明在该地区 ARTI 患儿主要感染病毒种类为 RSV，其次是 PIV-3。且常见呼吸道病毒检出率在下呼吸道感染患儿中明显高于上呼吸道感染患儿。患儿感染呼吸道病毒后常见的临床表现主要为肺炎，其次是支气管肺炎。

PO-0719

中国西部汉族人群的 WDFY4 多态性与肺结核易感性的相关性研究

黄杰、黄利君、刘莉萍、张静、何秋蓉
四川大学华西第四医院

目的 验证在中国西部汉族人群中单核苷酸多态性（Single Nucleotide Polymorphisms，SNPs）位点 rs148252819 和 rs147766980 与结核易感性的相关性。
方法 本研究共招募了中国西部地区 899 例活动性结核病患者和 1535 例健康对照。采用改进后的多重 SNP 分型试剂盒对 2434 个样本的 WDFY4 的 rs148252819 及 rs147766980 位点进行分型。使用 PLINK version 1.09 进行 SNP 多态性分析。
结果 在 WDFY4 基因上的 rs148252819 位点中，以 G 等位基因为参照等位基因，携带 A 等位基因可能降低结核病的患病风险（OR=0.3388，95%CI=0.1295-0.8865，P=0.021）；相较于 GG 基因型，AA 基因型和携带 A 等位基因的基因型的发病风险降低（显性模型：OR=0.3369，95%CI=0.1285-0.8832, P=0.027）。而 rs147766980 中，以 G 等位基因为参照等位基因，携带 A 等位基因可能增加结核病的患病风险（OR= 1.418，95%CI=1.016-1.98，P=0.039）；相较于 GG 基因型，AA 基因型和携带 A 等位基因的基因型均可能增加结核病的发病风险（显性模型：OR=1.449，95%CI=1.029-2.041, P=0.034）。
结论 WDFY4 中的 rs148252819 及 rs147766980 位点在中国西部人群中均与结核病易感性的相关，提示我们这个 SNP 可能是潜在的预测结核发病风险的标志物。

PO-0720

临床检验危急值分析及持续改进效果评估

肖春梅、柴华、李富荣、朴文花
宁夏回族自治区人民医院

目的 对本院检验科 2019 年及 2020 年危急值数据进行回顾性统计分析，评估危急值持续改进效果，分析当前危急值的临床适宜性，探讨医学检验危急值持续改进的管理方法。
方法 收集我院 2019 年及 2020 年所有危急值报告数据，利用瑞美实验室管理系统（LIS）对危急值项目发生率、科室分布率、报告频率较高的危急值项目的科室分布率及血液内科、重症医学科危急值调整前后的报告频率进行统计。
结果 2020 年危急值报告发生率为 1.46%，与 2019 年（1.56%）相近。危急值报告最多的项目依次为 MYO（18.7%）、TNT-HS（18.1%）、NT-proBNP（10.72%）；2020 年危急值在临床科室报告频率较高的前五位科室依次为：重症医学科（20.6%）、急诊科（18.4%）、心血管内科（11.5%）、呼吸内科（7.78%）、肾内科（7.6%）；20 年 MYO 在重症医学科报告频率（27.1%）最高；TNT-HS 在心血管内科报告频率（28.6%）最高；NT-ProBNP 在重症医学科报告频率（20.4%）最高，其次为心血管内科（19.3%）；血液内科 PLT、NEU#、WBC 危急值报告频率调整前依次为 50.2%、33.4%、23.4%；调整后依次为 23.7%、NEU#15.6%、12.5%；调整后较调整前大幅下降；重症医学科 MYO、TNT-HS、NT-ProBNP 危急值报告频率调整前依次为：32.2%、25.8%、30.1%；调整后依次为 27.1%、20.4%、20.4%；调整后较调整前明显降低。
结论 血液内科和重症医学科危急值持续改进效果明显，MYO、TNT-HS、NT-proBNP 危急值项目上报率高，可能与危急值界限的设置及疾病种类有关，需要调整和优化。建议三级甲等医院按照科室、病种、年龄对危急值实施精细化设置和管理。

PO-0721

艾滋病病毒抗体筛查试验假阳性的原因分析

来金欣、李正康、邓倩昀、张玉、甘慧泉、顾兵
[广东省人民医院(广东省医学科学院) 检验科

目的 分析艾滋病病毒抗体筛查试验假阳性的原因。
方法 回顾性分析 2017 年 1 月至 2020 年 1 月到我院进行人艾滋病病毒（HIV）抗体检测的患者临床资料。
结果 总共 170 260 例进行 HIV 抗体检测的标本纳入分析，74 例临界值标本复测后结果为阴性。在最初筛查有反应的 404 例样本中，真阳性和假阳性的比率分别为 26.24％（106/404）和 69.80％（282/404），女性的假阳性率 89.93％（125/139）显著高于男性（59.25％，157/265）（χ2=40.71，P <0.001）。男性与女性的特异性均超过 99%，但男性的阳性预测值（37.94％，95％CI：36.98％～38.90％）高于女性（7.41％，95％CI：7.04％～7.78％）。当 COIs≥70 时，有 97.26％（71/73）的病例确证感染了 HIV。通过对基础疾病和年龄进行分层分析发现，假阳性率随着年龄的增长而增加，在 60 岁以上（39.01％，110/282）或心血管疾病（31.56％，110/282）的患者中发现假阳性率最高。一例患者被证实是异嗜性抗体的干扰导致假阳性结果。
结论 女性、高龄、异嗜性抗体是 HIV 筛查试验假阳性反应的潜在干扰因素,重视这些潜在的干扰因素可以更好的为临床医生与患者正确解释结果提供依据。

PO-0722

基于生物信息学的非小细胞肺癌诊断及预后关键基因研究

翟秀明[1]、周丹丹[2]
1. 重庆医科大学附属第三医院（捷尔医院）
2. 重庆市中医院

目的 探讨非小细胞肺癌的潜在关键基因及其在诊断与预后方面的价值。
方法 从 GEO 数据库下载数据集 GSE18842、GSE19188、GSE30219 和 GSE40791，应用 R 软件 limma 包进行标准化及差异表达基因的筛选。应用 DAVID 数据库对差异表达基因进行 GO（Gene Ontology）分析和 KEGG（Kyoto Encyclopedia of Genes and Genomes）通路分析。运用 STRING 和 Cytoscape 软件构建差异表达基因的蛋白质-蛋白质相互作用网络，应用 MCODE 及 cytohubba 插件筛选出与非小细胞肺癌相关的最显著模块及枢纽基因。在 GEPIA 和 Kaplan Meier plotter 数据库中验证枢纽基因的表达及预后情况。
结果 通过对四个数据集分析，共获得 258 个差异表达基因，包括 91 个上调基因和 167 个下调基因。GO 分析和 KEGG 通路富集分析表明，差异表达基因在细胞周期、细胞分裂、有丝分裂核分裂、蛋白激酶结合、肝素结合等方面显著富集。通过蛋白互作网络鉴定出 10 个与非小细胞肺癌相关的枢纽基因，包括 RRM2、CDK1、UBE2C、MAD2L1、BUB1B、CCNA2、KIF20A、BUB1、KIF11、CCNB2。GEPIA 数据库证明 RRM2、UBE2C、MAD2L1、KIF20A、CDK1、CCNB2 的表达在非小细胞肺癌患者中显著增高(P<0.05)，而 KIF11、CCNA2、BUB1B 和 BUB1 仅在肺鳞癌中具有统计学意义（P < 0.05），在肺腺癌中无统计学意义（P > 0.05）。Kaplan Meier plotter 数据库表明，仅 RRM2 和 KIF11 与非小细胞肺癌患者的生存预后相关(P<0.05)。
结论 RRM2 可能在非小细胞肺癌的发生过程中起重要作用，有望成为非小细胞肺癌的个体化诊断、预后评估的潜在生物标志物。

PO-0723

新型冠状病毒 2019-nCov 核酸检测实验室核酸污染监测及解决办法

李文静、刘萍、穆红
天津市第一中心医院

聚合酶链反应（ Polymerase Chain Reaction， PCR）是敏感性极高的核酸扩增反应，能将极少量的 DNA 扩增数百万倍。实验过程中的任何一个环节可能发生的极其微量的污染，都足以导致假阳性的结果的产生。

目的 结合本实验室的环境污染监测实际，对核酸实验室环境污染的监测、发现和清除提出一些处理策略。

方法 采用新型冠状病毒 2019-nCov 核酸检测试剂盒（荧光 PCR 法-达安基因）进行核酸污染监测，包括 2019-nCov ORF 基因、N 基因以及内标基因，核酸提取采用达安基因核酸提取试剂盒（磁珠法）。环境污染监测采用物表监测和空气监测，物表监测（每周一次）采用采样管拭子蘸取灭菌重蒸水后，分别各采样点位进行涂抹采样，尽可能大的范围内往返涂抹，之后将拭子置于病毒采样管中按照病人标本流程进行标准操作；实验室空气监测（每日），在实验室每个位点放置敞盖的灭菌蒸馏水，静置过夜，第二天跟着病人标本同时进行扩增。

结果 对实验室进行了 4 次物表监测和 30 次空气监测，ORF 基因、N 基因结果均为阴性，内标基因在第 3 次物表以及第 18 次空气检测出现阳性，阳性为点位为生物安全柜台面及生物安全内部空气，ct 值分别为 39.46 和 38.44，为弱阳性结果。立即对整个提取室进行过氧化氢空气消毒，消毒过程生物安全柜面板抬到最高，30%过氧化氢喷 30min，密闭 1 小时后开窗通风 24 小时，实验室再次使用之前进行物表及空气监测，结果均为阴性。

结论 核酸实验室有必要进行定期的核酸污染监测，过氧化氢对消灭核酸污染效果显著。

PO-0724

血液检测指标与贝伐珠单抗联合化疗治疗卵巢癌预后的相关性探讨

王旭
天津医科大学肿瘤医院

目的 本研究以联合应用贝伐珠单抗与化疗的卵巢癌(OC)患者为研究对象，根据对患者的病理特征、肿瘤标志物、血清生化、血常规、出凝血等血液学参数进行分析，探索影响卵巢癌(OC)患者预后的危险因素，寻找联合贝伐珠单抗和化疗的最大获益人群，便于临床制定诊疗方案。

方法 回顾性收集 2019 年 6 月至 2020 年 12 月于天津市肿瘤医院接受贝伐珠单抗联合化疗的 90 例卵巢癌（OC）患者的临床资料、复发情况并进行电话随访。收集首次入院时和用贝伐珠单抗前患者的肿瘤标志物、血清生化、血常规、出凝血等血液学参数，应用单因素 Cox 回归分析分别与生存和进展情况进行生存分析，并将影响因素进行多因素 Cox 回归分析确定预后的独立危险因素。

结果 1.以中位数为截断值进行单因素 Cox 分析，首次入院时 ALB<40g/L、CA125>450U/L、HE4>218U/L 和 Fbg>3.12g/L 与总生存时间相关；2.连续变量单因素 Cox 分析，首次入院时 LDH、FDP 和 D-二聚体与无进展生存时间相关，中性粒与淋巴细胞比值>4.5 是无进展生存时间的影响因素；3. 以中位数为截断值进行单因素 Cox 分析，用贝伐珠单抗前 ALB<44g/L、HCT<36.5%和 HGB<120g/L 与总生存时间相关；4.通过多因素 Cox 分析，首次入院时只有 HE4>218U/L 是总生存时间的独立危险因素；LDH 是无进展生存时间的独立危险因素；用贝伐珠单抗前 ALB<44g/L 是总生存时间的独立危险因素。

结论 首次入院时 HE4 和用贝伐珠单抗前 ALB 水平与总生存时间相关，首次入院时 LDH 为无进展生存时间的独立危险因素，这三个血液检测指标有望成为预测联合贝伐珠单抗和化疗的卵巢癌患者预后的生物学标志物。

PO-0725

高血清核黄素与结直肠癌风险

马妍慧
上海交通大学医学院附属新华医院

目的 本研究是一项回顾性研究。
方法 我们分析了 2019 年 1 月至 2020 年 3 月，上海交通大学医学院新华医院结直肠外科 83 名 CRC 患者和 307 名对照者血清核黄素水平与 CRC 风险之间的关系。年龄、性别、体重指数、腺瘤息肉切除和疾病状况作为混杂因素进行了调整，以平滑样条图、亚组分析和多变量逻辑回归分析以估计核黄素和 CRC 风险之间的相对风险。
结果 充分调整混杂因素后，血清核黄素是 CRC 患者的危险比（OR=1.08[1.01,1.15]，P=0.0310）。与正常水平核黄素相比，高水平的核黄素（OR = 2.17 [1.02, 4.61], P = 0.0434）与 CRC 发生显著相关。
结论 高水平的血清核黄素是结直肠癌的危险因素， CRC 患者核黄素水平高的意外发现值得进一步调查。

PO-0726

CD74 regulates cellularity and maturation of medullary thymic epithelial cells partially by activating the canonical NF-κB signaling pathway

Hongxia Wang
Laboratory Medicine Center, Nanfang Hospital, Southern Medical University

Thymic epithelial cells (TECs) are indispensable for T cell development, T cell receptor (TCR) repertoire selection, and specific lineage differentiation. Medullary thymic epithelial cells (mTECs), which account for the majority of TECs in adults, are critical for thymocyte selection and self-tolerance. CD74 is a nonpolymorphic transmembrane glycoprotein of major histocompatibility complex class II (MHCII) that is expressed in TECs. However, the exact role of CD74 in regulating the development of TECs is poorly defined. In this research, we found that loss of CD74 resulted in a significant diminution in the medulla, a selective reduction in the cell number of mature mTECs expressing CD80 molecules, which eventually led to impaired thymic CD4+ T cell development. Moreover, RNA-sequence analysis showed that CD74 deficiency obviously downregulated the canonical NF-κB signaling pathway in mTECs. Our results suggest that CD74 positively controls mTEC cellularity and maturation partially by activating the canonical NF-κB signaling pathway.

PO-0727

External Quality Assessment for Severe Acute Respiratory Syndrome Coronavirus 2 RNA Detection in Chongqing, China

Yuanyuan Guo
Department of Laboratory Medicine ,Chongqing General Hospital, University of Chinese Academy of Sciences, Clinical Laboratory Centre of Chongqing City.

Background Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) poses a huge threat to public health. Therefore, clinical laboratories must have the ability to detect SARS-CoV-2 RNA. With the enhanced detection in Chongqing, many laboratories rapidly implemented assays for the molecular detection of SARS-CoV-2 based on real-time reverse transcription polymerase chain reaction(rRT-PCR) assays. This study aimed to improve the detection capabilities of clinical laboratories by evaluating their performance for SARS-CoV-2 RNA detection through the external quality assessment (EQA) programs of 2020 in Chongqing to contribute to the prevention of this epidemic.
Methods The EQA panels consist of eight positive samples with concentrations within 2.7–5.0 log10 copies/mL quantified by digital PCR and two negative samples with other human coronaviruses clinicallyvalidated by four commercial assays. All 21 samples from four rounds were distributed to the participating laboratories through cold-chain transportation.Depending on the results from each sample, laboratories were asked to use one or two assays to detect SARS-CoV-2 RNA. Test results and raw data were also required. All data were evaluated, and the testing performance of commercial assays was compared. For the rounds, all laboratories used commercial assays.
Results Four rounds of EQA programs were performed, and the percent agreements of participants were 97.5% (39/40), 97.5% (39/40), 98.9%(88/89), 100.0% (131/131). Only three false negative results and one false positive result were obtained. Statistical significance in the Ct values of ORF region and N region of SARS-CoV-2-RNA was found by using one-step, one-step concentration, and magnetic bead methods ($P<0.05$). The Ct values of ORF region of SARS-CoV-2-RNA in P5 and P6 were significantly different in the different batches of reagent A ($P<0.05$). The ORF region of SARS-CoV-2-RNA was not detected in a batch of reagentB.
Conclusions The majority of laboratories in Chongqing have reliable diagnostic ability for SARS-CoV-2 detection. Our data emphasized the importance of EQA for monitoring the performance of clinical laboratories. However, clinical laboratories must first effectively evaluate the performance of reagents prior to their usage.

PO-0728

中国东部啮齿动物携带巴尔通体物种的分析

秦祥荣
山东大学第二医院

巴尔通体（Bartonella）是一种通过媒介传播的革兰氏阴性兼性细胞内寄生细菌。在全球范围内，巴尔通体物种分布与啮齿动物及跳蚤寄生虫有关。目前中国的啮齿动物携带巴尔通体物种的率以及基因多样性尚不清楚。我们调查了来自中国东部的啮齿动物中巴尔通体物种的携带率和以及遗传多样性。我们从 2015 年至 2016 年在山东省胶南县捕获了啮齿动物，并通过 PCR 扩增柠檬酸合酶（gltA）基因和 RNA 聚合酶 β 亚基（rpoB）基因检测了啮齿动物脾脏中的巴尔通体。我们发现，有 8.38%（16/191）的啮齿类动物为 Bartonella 阳性， gltA 和 rpoB 基因均为阳性。将啮齿类动物的巴尔通体序列进行系统发育分析分为五个进化枝，分别与 Tribocorum，B。rattimassiliensis，grahamii，B。fuyuanensis 和 B. Queenslandensis 密切相关。这项研究表明，在中国东部的啮齿

动物中，巴尔通体的生物分布广泛，基因型多种多样，在中国应监测这些巴尔通体对公共健康带来的威胁。

PO-0729

分泌蛋白 REG4 促进结肠癌细胞增殖的机制研究

倪东升
重庆市人民医院

结肠癌是消化道最常见的恶性肿瘤之一，结肠癌在我国的发病率呈逐年上升的趋势，发病年龄也有年轻化趋势。现有的粪便潜血试验、血液癌胚抗原等标志物检测等传统早期诊断方法对结肠癌灵敏度低，导致部分患者在首次确诊时已发生转移，降低了患者的生存期。因此，寻找结肠癌新的诊断标志物具有重要临床意义。近年来发现，再生基因（regenerating gene，Reg）家族与消化系肿瘤密切相关，且为分泌蛋白，其有望成为消化系肿瘤诊断和治疗的新分子，但其在肿瘤发生发展中参与的分子机制、调控机制以及受体及受体后途径还不确切，尚需进一步的研究。其中，Reg4 主要在胃、小肠、结肠及胰腺等消化系统中表达,正常组织表达水平相对较低。运用生物信息学分析，我们证实家族成员 Reg4 在结肠癌中表达量增高约 5.5 倍；利用无标记细胞分析仪和克隆形成实验证实，Reg4 具有促进结肠癌细胞增殖和非锚定生长的作用；免疫印迹实验显示在结肠癌细胞系 HTC116 中敲低 Reg4 抑制 STAT3 Y705 磷酸化，在结肠癌细胞系 HTC116 和 HT29 中过表达 Reg4 促进 STAT3 Y705 磷酸化，荧光定量 PCR 证实在结肠癌细胞系 HTC116 中过表达 Reg4 促进 STAT3 信号通路下游靶基因 SOCS3 和 c-FOS 转录；免疫印迹实验、无标记细胞分析显示和克隆形成实验分别证实在结肠癌细胞系 HTC116 中使用 STAT3 抑制剂 Stcttic 可回复过表达 Reg4 促进的 STAT3 Y705 磷酸化、肿瘤细胞增殖和非锚定生长。总之，我们的研究结果表分泌蛋白 Reg4 是决定结肠癌细胞增殖和生长的重要基因，有望成为结肠癌诊断的新标志物。

PO-0730

乳腺癌治疗过程中激素受体状态的改变

公娉
山东大学第二医院

研究目的 在中国，乳腺癌的发病率逐年上升，乳腺癌是女性常见的恶性肿瘤之一，也是女性常见的死亡原因。手术治疗是其主要的治疗方式，化疗、放疗、内分泌治疗、靶向治疗等个体化综合治疗策略的不断成熟使得乳腺癌获得了理想的疗效和预后，但仍有一部分患者出现复发和转移。乳腺癌激素受体状态的测定是内分泌治疗选择的基础，所以，乳腺癌原发肿瘤的激素受体状态已经成为常规的分子病理学检查。但是，乳腺癌患者的激素受体状态缺乏大数据的统计。乳腺癌患者激素受体状态在治疗前后是否出现改变，经过治疗之后的复发转移癌巢的激素受体状态与原发肿瘤是否存在差异尚知之甚少。本研究旨在大数据统计分析山东省乳腺癌患者激素受体状态，研究乳腺癌患者雌激素受体（estrogen receptor, ER）、孕激素受体（Progesterone receptor, PR）等生物标志物在乳腺癌原发肿瘤、新辅助化疗、复发转移过程中的变化，探讨生物学特性改变的临床意义以及对预后的影响。
研究方法 回顾性分析 2005 年-2016 年于山东大学齐鲁医院收治的乳腺癌患者 5305 例，其中有完整的病理信息的患者 4786 例。回顾性分析其临床病理资料，其中术前接受穿刺的患者 71 例，接受新辅助化疗的患者 301 例，原发肿瘤及转移部位均进行病理学检查的患者 39 例。应用内分泌治疗的患者 1839 例，用免疫组织化学的方法进行同时检测患者手术前后、新辅助化疗前后、复发转移灶以及原发灶的 ER、PR、HER-2、Ki-67 等生物标志物的变化以及其生存情况，做出生存曲线。计量资料比较采用 t 检验，计数资料比较采用卡方检验（Chi-square test，X2 检验），等级资料的

比较采用 wilcon 秩和检验。Kaplan-Meier 法计算生存率及绘制生存曲线。以 p＜0.05 视为异有统计学意义。
研究结论 中国的乳腺癌患者激素受体状态阳性占大多数，激素受体阳性患者预后较好。

PO-0731

Growth inhibition and induction of apoptosis of triple-negative breast cancer cell by valproic acid via down-regulation of EGFR

Shuiliang Wang[1,2]、Yunfeng Fu[1,2,3]、Zhuolin Li[1,2]、Yating Wu[1,2]、Ruxue Jia[1,2]、Shenghang Zhang[1,2]
1. 中国人民解放军联勤保障部队第 900 医院检验科
2. 厦门大学附属东方医院福建省适配体技术重点实验室
3. 中国人民解放军联勤保障部队第 900 医院基础医学实验室

Objective To explore the possible anti-tumor effect of valproic acid (VPA) against triple-negative breast cancer (TNBC) and its underlying molecular mechanism.
Methods MTS assay was carried out to evaluate the effect of VPA (0, 0.25, 0.5, 1, 2 or 4 mmol/L) on survival of TNBC cell MDA-MB-231. Crystal violet staining was used to detect the effect of VPA (0, 0.125, 0.25 or 0.5 mmol/L) on clone formation of MDA-MB-231. Induction of apoptosis of MDA-MB-231 treated with VPA (0.5 mmol/L) for either 24h or 48h was analyzed by detecting of cleavage of poly ADP-ribose polymerase (PARP) with Western blot as well as apoptotic-ELISA, and real-time quantitative reverse transcriptase PCR (qRT-PCR) was used to analyze the mRNA expression level of EGFR in MDA-MB-231. The effect of VPA (0.25, 0.5 or 1 mmol/L) on expression of EGFR and its downstream Akt signaling pathway in MDA-MB-231 was also detected by Western blot analysis. MiRNAs specific qRT-PCR was also carried out to analyze the effect of 0.5 mmol/L of VPA for either 24h or 48 h on expression of both miR-133a and miR-133b in MDA-MB-231. One-way ANOVA and dunnet-t test were used for statistical analysis. Results As compared with control (0 mmol/L of VPA), treatment with different doses of VPA (0.25, 0.5, 1, 2 or 4 mmol/L) significantly decreased the survival rate of MDA-MB-231 cultured in vitro in a dose-dependent manner (100％±0.46％ vs 86.97％±0.21％, 77.66％±0.17％, 66.81％±0.59％, 46.68％±0.45％, 15.89％±0.25％; P<0.0001). Meanwhile, treatment with different doses of VPA (0.125, 0.25 or 0.5 mmol/L) also significantly decreased the mean clone numbers of MDA-MB-231 (769.33±22.03 vs 599.33±39.00, 492.00±52.00, 263.33±14.74; P<0.05 ） as compared with control (0 mmol/L of VPA). While treatment with 0.5 mmol/L of VPA for 24h does not show any effect on apoptosis of MDA-MB-231 (apoptosis rate being 0.13±0.00 vs 0.14±0.00; P>0.05), long term treatment with 0.5 mmol/L of VPA (48h) did significantly induce apoptosis as compared with control (apoptosis rate being 0.13±0.00 vs 0.80±0.00; P<0.05). Although treatment with 0.5 mmol/L of VPA for 24h or 48h didn’t alter the mRNA expression of EGFR in MDA-MB-231, our Western blot analysis indicated that the protein expression of EGFR was significantly down-regulated, and the downstream Akt signaling pathway was inhibited accordingly in MDA-MB-231 treated with VPA (0.25, 0.5 or 1 mmol/L) for 24h. In addition, the expression of miR-133b targeting EGFR mRNA was significantly up-regulated in MDA-MB-231 treated with 0.5 mmol/L of VPA either for 24h or 48h as indicated by qRT-PCR analysis (1± 0 vs 6.21±0.89, 4.58±0.62; P<0.001) as compared with control (0 mmol/L of VPA).
Conclusions VPA exhibits favorable effect on inhibition of growth and induction of apoptosis of TNBC cell MDA-MB-231 in vitro. Our preliminary mechanism study suggested that treatment with VPA could down-regulate the expression of EGFR via up-regulation of EGFR mRNA-targeted miR-133b, which in turn inhibits the downstream Akt signaling pathway and induces growth inhibition and apoptosis of MDA-MB-231. VPA as a potential candidate of therapeutic drug for patient with TNBC is worthy of further investigation.

PO-0732

未接受核苷类似物治疗的慢性乙型肝炎患者潜在耐药相关变异流行特征

钱福初、邹伟华、金芳、李栋立、沈宇娟
湖州市中心医院

目的 乙型肝炎病毒（HBV）逆转录酶（RT）区域潜在的耐药（DR）相关变异可能与抗病毒药物的有效性和疾病进展有关。本研究调查未接受核苷类似物（NAs）治疗的中国慢性乙型肝炎患者潜在DR 相关变异的患病率和临床特征。
材料与方法 选择湖州市中心医院的 206 例未经治疗的慢性乙型肝炎患者作为研究对象。提取血清DNA，用巢式聚合酶链反应（nest-PCR）扩增 HBV-RT 区。通过直接测序分析了 42 个潜在的 DR 相关变异体。
结果 慢性乙型肝炎患者中，乙型肝炎病毒基因型 121 例（58.7%），丙型肝炎病毒基因型 85 例（41.3%）。在 42.7%（88/206）的患者中检测到潜在的 DR 相关变异。原发性和继发性 DR 变异检出率为 7.28%（15/206），包括 rtL80I/V、rtI169T、rtV173L、rtL180M、rtA181T/V、rtM204I/V 和 rtN236T。rt53、rt82、rt221、rt233、rt237 和 rt256 处的变异对基因型 B 具有特异性，而 rt38、rt84、rt126、rt139、rt153、rt191、rt214、rt238 和 rt242 处的变异对基因型 C 具有特异性。A-B 结构域间变异频率（3.96%）显著高于功能结构域（1.17%）和非 A-B 结构域（1.11%）。多因素 logistic 回归分析显示，在未经治疗的慢性乙型肝炎患者中，较低的 HBV-DNA 载量（$<10^6$ IU/ml）是与潜在 DR 相关变异相关的独立因素（$P<0.05$）。
结论 在未经治疗的中国慢性乙型肝炎患者中，潜在的 DR 相关变异是常见和复杂的。此外，这些变异可能导致血清 HBVDNA 降低。然而，潜在的 DR 相关变异对抗病毒治疗和肝病进展的影响还需要进一步研究。

PO-0733

血清 25-羟基维生素 D 水平与老年性高血压及其脑卒中的相关性研究

袁勇、孔凡斌、高辉
昆明市延安医院

目的 探讨血清 25-羟基维生素 D（25-(OH)D）的水平与原发性高血压发生发展的相关性。
方法 选择 2020 年 12 月-2021 年 5 月在昆明市延安医院老年病科住院的年龄≥60 岁高血压患者作为研究对象，共 152 例，按其是否合并有脑卒中，将病例分为单纯高血压组和高血压合并脑卒中组，选取同期健康体检者 66 例作为对照组，收集临床资料，同时用全自动生化分析仪检测 25-(OH)D 及其生化指标，采用统计学软件 SPSS 23.0 分析所收集资料和数据与高血压的关系。
结果 高血压 2 级和高血压 3 级患者血清 25-(OH)D 水平（15.68±5.74ng/mL、13.99±8.34ng/mL）显著低于正常对照组（21.75±6.40ng/mL），随着高血压分级的增加，血清 25-(OH)D 水平水平逐级降低；高血压合并脑卒中组血清 25-(OH)D 水平（16.20±7.99ng/mL）显著低于高血压组（16.61±7.23ng/mL）（p＜0.05）。高血压 2 级和高血压 3 级的 25-(OH)D、TC、HDL-C、LDL-C 的浓度水平均低于对照组，且高血压 3 级组的 HDL-C、血清 25-(OH)D 均低于高血压 2 级组，TC、LDL-C 均高于高血压 2 级组；高血压组及高血压合并脑卒中组 25-(OH)D、HDL-C、LDL-C、TC 的浓度水平均低于对照组，且高血压合并脑卒中组低于高血压组（P＜0.05）。线性回归分析结果显示，HDL-C、hs-CRP 是影响 25-(OH)D 的独立危险因素（p＜0.05）。
结论 低水平的 25-(OH)D 与老年高血压的发生、发展有相关性，且随高血压分级程度越高，25-(OH)D 水平越低。25-(OH)D 降低可能是高血压发生发展和导致心脑血管合并症的风险因子。

PO-0734

残余胆固醇和非高密度脂蛋白胆固醇与急性缺血性脑卒相关性的研究

袁婷、韦四喜、冯占辉、杨文秀、夏英、黄海
贵州医科大学附属医院

目的 将急性缺血性脑卒中（AIS）分为大动脉粥样硬化型（LAA）、小动脉闭塞型（SAO）和心源性栓塞型（CE）三个亚组，通过分析残余胆固醇（RC）和非高密度脂蛋白胆固醇（Non-HDL-C）在 AIS 及三个亚组患者中的变化，探讨 AIS 诊断与 RC 和 Non-HDL-C 等指标的相关性。
方法 收集 2019 年 1 月至 12 月在贵州医科大学附属医院确诊的急性缺血性脑卒中 151 例患者作为疾病组，同期体检健康人群 191 例作为对照组，首先分析两组血糖（Glu）、血脂相关指标和同型半胱氨酸（Hcy）等的水平差异及相关性；进一步亚组分析 LAA、SAO 和 CE 相关指标的水平差异。
结果 AIS 组 Glu、甘油三酯（TG）、RC 和 Hcy 水平高于对照组，高密度脂蛋白胆固醇（HDL-C）水平低于对照组，且男性患者 Non-HDL-C 水平高于对照组（P＜0.05）；Logistic 回归分析提示 RC 和 Non-HDL-C 水平升高是男性 AIS 发生的危险因素，而女性 AIS 发生的危险因素是 RC 水平升高；ROC 曲线和约登指数提示 RC 和 Non-HDL-C 水平预测男性 AIS 发生的临界值分别是 0.295 mmol/L 和 3.560 mmol/L，联合检测 ROC 曲线下面积（AUC）是 0.752；RC 水平预测女性 AIS 发生的临界值是 0.255 mmol/L。男性 LAA 组和 SAO 组 Glu、TG、TC、LDL-C、RC 和 Non-HDL-C 水平高于 CE 组，HDL-C 水平低于 CE 组，且 LAA 组 Hcy 水平也高于 CE 组（P＞0.05）。女性 LAA 组和 SAO 组 Glu、TG、TC、LDL-C 和 Non-HDL-C 水平高于 CE 组，HDL-C 和 Hcy 水平低于 CE 组，且 LAA 组 RC 水平也高于 CE 组，除 TG 差异有统计学意义外（P＜0.05），其余差异均无统计学意义（P＞0.05）。
结论 RC 和 Non-HDL-C 与 AIS 发生有关，且在 AIS 的发生中具有一定预测价值。

PO-0735

骨髓中破骨细胞数目增多与 KLF7 及 IL-6 蛋白表达水平的相关性研究

李伟
石河子大学医学院第一附属医院

目的 本研究在收集正常体重及肥胖受试个体一般资料、血清样本及骨髓标本的基础上，分析骨髓中 KLF7 及相关炎症因子表达水平与成骨细胞及破骨细胞数目的相关性，为骨髓相关疾病的临床治疗寻找分子靶标并提供新的理论依据。
方法 (1) 2019 年 9 月-2020 年 10 月，在石河子大学医学院第一附属医院收集正常体重个体(n = 24)及肥胖个体(n = 24)一般资料、血清样本及骨髓标本，检测血清中血糖、血脂及 IL-6、TNF-α 及 MCP-1 的含量。(2) 运用免疫组化染色比较正常及肥胖个体骨髓中成骨细胞与破骨细胞的占比分布。(3)运用免疫组化检测骨髓中 KLF7、IL-6、TNF-α 及 MCP-1 的表达水平。(4) 应用 SPSS 20.0 软件进行统计学数据分析。正态分布数据使用 t-检验分析、非正态分布数据使用非参数秩和检验分析。P<0.05 认为差异有统计学意义。
结果 1、肥胖受试个体血清中总 FFA 含量与 IL-6、TNF-α 及 MCP-1 水平显著高于正常体重个体。
2、肥胖受试个体骨髓中破骨细胞显著增多(P<0.05)。
3、肥胖受试个体骨髓中 KLF7、IL-6、TNF-α 及 MCP-1 水平显著高于正常体重个体。
4、骨髓中 KLF7 及 IL-6 表达水平与破骨细胞数量显著正相关。
结论 肥胖后，骨髓中破骨细胞数目增多可能与 KLF7 及 IL-6 蛋白表达水平增加相关。

PO-0736

Identification of A LncRNA Signature as Potential Prognostic Biomarker in Gastric Cancer

Shuang Shi、Chuan'xin Wang
The Second Hospital of Shandong University

Purpose Gastric cancer, with the high rate of metastasis and the low overall 5-year survival rate, is one of the most common malignancies and the major causes of cancer-related deaths worldwide. LncRNA shows potential in diagnosis and prognosis of cancers, so we study novel prognostic lncRNA candidates involved in gastric cancer.
Material and Methods Firstly, we analyze the dataset obtained from TCGA, and identify deregulated RNAs in gastric cancer. Then multiply Cox proportional model and Robust likelihood-based survival model were used to constructed a prognostic signature. CeRNA network and function enrichment analysis were used to investigate the potential mechanism and function of target lncRNAs. And the further experiment validate the function of LINC01929.
Results The results showed that 847 lncRNAs deregulated and 78 lncRANs associated with the overall survival in gastric cancer. 10 up-regulated lncRNAs were chose to construct a prognostic signature. CeRNA network and function enrichment showed several famous cancer-ralated pathway and GO terms were identified in our study. And LINC01929 up-regulated in 43 pairs of clinical gastric cancer tissues, and knockdown LINC01929 can suppress cell proliferation, invasion and migration of gastric cancer cells in vitro.
Conclusion Collectively, our findings indicated that the 10-lncRNA signature could be a prognostic indicator, and serve as a part of ceRNA network to regulate the cancer-related pathways in gastric cancer.

PO-0737

埃希菌属与 IFN-γ 相互作用调控 T2DM 发生的机制研究

吕美君、李莉莎
成都中医药大学附属医院

目的 通过分析 T2DM 患者差异性肠道菌群与细胞因子表达水平的相关性，探讨肠道菌群和细胞炎症因子相互作用网络诱发 T2DM 的作用机制。
方法 本研究进行了一项病例对照实验。招募初发 T2DM 患者和健康人各 30 例作为研究对象，并采集其空腹血浆和无菌粪便样本，检测空腹血糖、HbAlc、空腹胰岛素、TC、TG、HDL 和 LDL 等生化指标；采用流式细胞技术检测两组细胞因子表达水平的差异，并通过 16 SrRNA 三代全长测序技术分析两组肠道菌群的差异性；评估差异肠道菌群及细胞因子的相关性，揭示其可能的作用机制。
结果 与健康对照组相比，T2DM 患者空腹血糖(p<0.001)、HbA1c(p<0.001)、空腹胰岛素(p=0.03)等血糖指标均升高，BMI(p<0.001)、TG(p=0.035)和 LDL(p=0.026)等脂质指标也显著升高，且 TG 与血糖呈正相关关系；血清细胞因子 IL-2(p=0.0000006)、IL-6(p=0.000193)、TNF-α(p=0.016)、IFN-γ(p=0.000036) 和 IL-17(p=0.004) 表达水平显著上调；肠道中 Megamonas funiformis(p=0.0016)、Escherichia (p=0.049)丰度显著升高，而 Bacteroides stercoris (p=0.0068)，Bacteroides uniformis(p = 0.033)和 Phascolarctobacterium faecium(p = 0.033)丰富降低。通过 pearson 相关性分析发现，差异表达的 Escherichia 与 IFN-γ(r=0.73)具有显著的正相关关系。
结论 肠道细菌 Escherichia 与细胞因子 IFN-γ 间的相互作用网络可能具有驱动内脏脂肪组织巨噬细胞的激活而触发炎症的作用，由此抑制脂肪细胞中胰岛素信号传导，诱发胰岛素抵抗。

PO-0738

BubR1 基因表达对肝癌细胞对紫杉醇的敏感性的影响

刘斌
南华大学附属第二医院

目的 探讨 BubR1 基因在紫杉醇治疗肿瘤中的作用。
方法 构建针对 BUBR1 基因的特异性短发夹 RNA 载体，导入人肝癌细胞株 HepG-2，转染 48 h 后，运用实时荧光定量 PCR、Western 印迹法评价 RNA 干扰效果；BubR1 表达下调的肝癌细胞及对照组细胞用不同浓度(1、3、10、30、100、300、1000 和 3000 nmol/L)的紫杉醇处理，MTT 法检测细胞增殖情况。
结果 shRNA- BubR1 可有效抑制 BubR1 的 mRNA、蛋白水平以及内源性表达。MTT 结果显示，BubR1 表达下调的细胞在不同浓度紫杉醇作用下的增殖抑制率与对照组相比明显增加 ($P<0.05$)，并呈现剂量依赖性。
结论 下调 BubR1 的表达能增强肝癌细胞对紫杉醇的敏感性

PO-0739

儿童肺炎支原体流行及耐药情况调查研究

张辉
泰安市中心医院

目的 了解本地区儿童肺炎支原体的流行特征及耐药情况，探索相关耐药机制。
方法 对 3371 份儿童咽拭子标本进行 MP 快速分离培养及药敏实验，根据培养结果分析肺炎支原体流行特征，通过药物敏感实验测定肺炎支原体分离株对大环内酯类药物的耐药情况;选择耐药组及敏感组各 50 个样本进行核酸提取，使用巢式 PCR 扩增 23S 核蛋白体 RNA(23SrRNA)V 区基因,扩增产物进行全自动 DNA 测序,对测得序列进行耐药位点分析。
结果 3371 份临床送检咽拭子标本中分离 MP 1315 株,阳性率为 39.01%。不同年份儿童肺炎支原体阳性率存在差异，冬春季节阳性率明显高于夏秋季节，患儿<1 岁组阳性率为 15.56%，明显低于 3-5 岁组和 6-12 岁组，不同性别阳性率差异无统计学意义；大环内酯类药物敏感试验表明敏感株占 20.76%，其中罗红霉素，依托红霉素和克拉霉素敏感性大于 70%，乙酰螺旋霉素和交沙霉素敏感性较低； 耐药组 42 株样本的 23SrRNA V 区基因发生点突变,突变率 84%，其中 38 株突变位点在 23SrRNA V 区中心环的 2063 位,4 株突变位点在 2064 位，敏感组未发现 23SrRNA V 区基因发生 2063 位和 2064 位点突变。
结论 儿童肺炎支原体感染阳性率较高，且受不同年份季节气候、及不同年龄组社会活动特点等多种因素影响，肺炎支原体对大环内酯类抗生素耐药率高,不同药物耐药情况存在差异，耐药性的分子基础是 23SrRNA V 区基因的点突变,其中 2063 位点突变占主导地位，基因突变监测是肺炎支原体耐药监测的有效补充。各地应积极进行肺炎支原体流行特点、耐药情况监测，建立相应的防控及治疗措施。

PO-0740

没药倍半萜抗前列腺癌作用机制研究

王小玲
山东大学第二医院

本研究对从没药(myrrh)中分离得到的两个吉玛烷型倍半萜类化合物 1(10)E- 2-methoxy-8,12-epoxygermacra-1(10),7,11-trien-6-one (1)和 1(10)E-2-methoxy-5- acetoxy-furanogermacra-1(10)-en-6-one (2)进行了抗前列腺癌活性研究。结果显示，两个化合物在较高浓度时(80 μmol/L)对大肠癌 HT29 细胞增殖有显著的抑制作用，在浓度为 40 μmol/L 时对前列腺癌激素依赖性细胞 LNCaP、激素非依赖性细胞 PC3、PC3M、DU145 均具有明显的抑制活性。Western Blot 实验显示，化合物 1 和 2 均能在雄激素存在的情况下显著降低雄激素受体(AR)的表达、并减少 AR 向细胞核定位；荧光素酶活性分析表明，两个化合物能抑制 AR 启动子的表达活性；细胞免疫荧光结果也证实 ST 化合物对 AR 表达的抑制作用。进一步实验表明，这两个化合物能非常显著的抑制 PSA 启动子和 hk2-ARE 元件报告基因的表达活性，使 PSA 蛋白水平显著降低，表明化合物能显著抑制 AR 的转录激活功能。通过免疫共沉淀检测化合物对 AR 与 AR 辅助激活因子 SRC-1 和 ARA70 蛋白间相互作用的影响，结果显示，倍半萜化合物明显降低这种蛋白间的相互作用。

总之，本研究结果表明，从没药中得到的两个倍半萜单体化合物可以抑制前列腺癌细胞的增殖，其作用机制可能通过阻滞细胞周期、抑制 AR 的表达、抑制 AR 与辅助激活因子的相互作用，从而降低 AR 的功能，抑制细胞增殖。本项研究结果为没药抗肿瘤活性的研究提供了依据，也为前列腺癌的药物治疗提供了更为广阔的思路。

PO-0741

六西格玛理论在全血细胞计数质量控制中的应用

刘双、王悦、丛琳、周汉王、于梅
解放军总医院海南医院

目的 运用六西格玛理论（6σ）分析和评价我室全血细胞计数项目室内质量控制规则，了解我室血细胞分析仪检测系统的室内质量控制水平，选用适宜的室内质量控制规则，并指导其性能质量改进。
方法 统计 2019 年及 2020 年共 4 次国家卫生健康委临床检验中心全血细胞计数 8 个项目的室间质量评价结果，计算偏倚（|Bias%|）；收集 2020 年 4 月-2021 年 1 月本实验室近 10 个月所有的在控室内质控数据，计算高、中、低三个水平的合成变异系数（CV%）表示不精密度值；按照中华人民共和国卫生行业标准 WS/T406-2012 临床血液学检验常规项目分析质量要求的允许总误差（TEA%）作为质量规范。按公式计算各检测项目的 σ 值，并计算目标指数（QGI），选择是否优先改进其性能。
结果 本实验室使用高、中、低三个水平的质控品，高水平质控品（WBC、RBC、PLT、HCT、MCV、MCH、MCHC）、中水平质控品（WBC、RBC、PLT、MCHC）与低水平质控品（WBC、RBC、MCV）的 σ 值均大于 6，表现为世界一流水平，选用 13S 规则。中水平质控品（HGB、HCT、MCV、MCH）与低水平质控品（PLT、MCH）表现为良好(4≤σ<5)，选用 13S22sR4S41s 规则。低水平质控（HGB、HCT、MCHC）表现为优秀(5≤σ<6)，选用 13S22sR4S 规则。
结论 六西格玛应用于全血细胞计数检验项目，可有效评价其检测性能，并有助于提高全血细胞计数检验项目的质量水平。

PO-0742

A study on the optimal condition of rapamycin inhibiting the development of AS

Fei Yu 、Hongyun Jing、Ling Ding、Jiashan Li、Xiuru Guan*
The first Affiliated Hospital of Harbin Medical University

Background and purpose Rupture of atherosclerotic plaques and secondary thrombosis are the main causes of acute clinical cardiovascular events. It is important to inhibit the development of atherosclerosis.Rapamycin (RAPA), an mTOR inhibitor and autophagy inducer, which can stabilize atherosclerotic plaques. However, The optimal conditions for the inhibition of AS by rapamycin have not been determined. Here, the optimum concentrations and time of rapamycin exposure to induce autophagy in macrophages was investigated.
Methods Foam cell models were established through incubation of THP-1-derived macrophages with ox-LDL. Then we determined cell viability by using CCk-8 test. And we detected the process of foam cell formation by oil red O staining, and the protein expression levels of p62 and LC3 were detected by Western blot. Furthermore, the inflammatory factor IL-18 was determined by ELISA.
Results Rapamycin treatment at low dose and short time could inhibit the foaming of macrophages,inducing autophagy by decreasing p62 protein levels and enhancing LC3Ⅱ/Ⅰ expression. RAPA also weakened IL-18 content in the medium. The most obvious effects of rapamycin were treated with 100nmol/L for 24 hours in the study. However, the stress of excess rapamycin or Longer time may exacerbate the foaming of macrophages and cause autophagy blocking.
Conclusions Overall, for the first time our results show that rapamycin is a double-edged sword. Lower concentration and time could induce complete autophagy, but longer time and higher doses otherwise. It is expected that we should take full advantage of its merits for clinical treatment of AS.

PO-0743

褪黑素促进顺铂诱导的卵巢癌细胞凋亡及其机制研究

赵金金[1]、张海光[2]、莫清江[1]、鲁广建[1]、焦路阳[1]
1. 新乡医学院第一附属医院检验科
2. 新乡医学院第一附属医院妇产科

背景 卵巢癌严重威胁女性生命健康，顺铂作为治疗卵巢癌的常用药物发挥重要作用，然而卵巢癌细胞对顺铂的耐药通常导致治疗的失败。寻找新的方法增强卵巢癌对化疗药物的敏感性将极大提高卵巢癌的治疗效果。
目的 研究褪黑素是否能够提高卵巢对顺铂的敏感性并探讨其机制。
方法 以 PBS 作用于卵巢癌细胞（OVCAR3）作为对照组，以顺铂、褪黑素、顺铂+褪黑素作为实验组 1， 2， 3 ；分别作用 24， 48 ，72 小时后 MTT 检测细胞增殖情况，流式细胞术检测细胞凋亡情况；Western blot 检测凋亡相关蛋白及信号通路蛋白的表达。
结果 MTT 结果显示，顺铂和褪黑素作用 24，48， 72 小时均能抑制 OVCAR3 细胞增殖，同对照组相比具有统计学意义，顺铂和褪黑素组相比差异无统计学差异，顺铂+褪黑素组对卵巢癌细胞增殖的抑制更加明显，同对照组、顺铂组、褪黑素组相比差异均具有统计学意义；流式细胞术结果显示，顺铂和褪黑素作用于卵巢癌细胞 24， 48， 72 小时后都使细胞凋亡的比例增加，作用时间越长凋亡比例越高，顺铂和褪黑素作用效果同 PBS 组相比具有统计学意义，顺铂+褪黑素组不同时间点卵巢癌细胞的凋亡比例同其余三组相比均升高，差异具有统计学意义；western blot 检测凋亡相关蛋白显示，顺铂、褪黑素均能使促凋亡蛋白 BAX 表达升高，凋亡抑制蛋白 BCL-2 的表达降低，

顺铂+褪黑素组对 BAX 和 BCL-2 的影响更显著；检测信号通路蛋白发现，褪黑素组 p-ERK 的表达高于 PBS 组及顺铂组，差异具有统计学意义。
结论 褪黑素能够通过 ERK 通路调控凋亡相关蛋白 BAX 与 BCL-2 的比值增强卵巢癌细胞 OVCAR3 对顺铂的敏感性。

PO-0744

云南汉族人群 Tim-1 基因启动子区多态性与支气管哮喘的关联研究

彭传梅[1]、王杨[1]、董玉琳[1]、鲁祥辉[1]、狄勇[2]
1. 昆明市延安医院
2. 昆明医科大学

目的 探讨 Tim-1 基因启动子区多态性及其 mRNA 水平与云南汉族人群支气管哮喘易感性的关联。
方法 采用聚合酶链反应-限制性片段长度多态性（PCR-RFLP）方法，对 180 名云南汉族支气管哮喘病人和 180 名健康体检者 Tim-1 基因启动子区多态性位点-416G > C 和-1454G > A 的基因多态性进行检测，并对不同基因型进行测序验证，同时分别采用 qRT-PCR 法和散射比浊测定法检测疾病组和健康组 Tim-1 mRNA 的表达水平和血浆总免疫球蛋白 E（IgE） 的水平。
结果 Tim-1 启动子区多态性位点-146G > C 和-1454G > A 的基因型及等位基因频率差异在支气管哮喘组和健康体检组两组之间具有统计学意义（P<0.05）； 支气管哮喘组和健康体检组中 Tim-1 mRNA 的表达差异有统计学意义（ P<0.001）；支气管哮喘组和健康体检组中血浆 IgE 的水平差异有统计学意义（ P<0.001）；支气管哮喘组-146G > C 位点携带 CC 基因型的病人 Tim-1mRNA 水平高于携带 GG 型和 GC 型的病人，-1454G > A 位点携带 AA 基因型的病人 Tim-1mRNA 水平高于携带 GG 型和 GA 型的病人；携带-416CC 和-416GC 的支气管哮喘病人，其 IgE 水平明显高于携带-416GG 的病人，携带-1454GG 基因型的病人，其 IgE 水平明显高于携带-1454AA 基因型的病人。
结论 云南汉族人群 Tim-1 启动子区多态性位点-416G > C 和-1454G > A 的基因多态性与支气管哮喘遗传易感性相关；相比于健康体检者，支气管哮喘患者的 Tim-1mRNA 和 IgE 的表达明显升高；支气管哮喘组 Tim-1 两位点不同基因型与其 mRNA 水平和血浆 IgE 的表达高低密切相关。

PO-0745

PAICS is involved in the occurrence and development of gastric cancer, and participates in DNA damage response

Nan Huang、Fenyong Sun
Shanghai Tenth People`s Hospital of Tongji University

Objective PAICS, a key enzyme in the de novo purine synthesis, has been reported to be associated with the occurrence and development of many tumors, but not in gastric cancer. Purine nucleotides are important materials for DNA synthesis. Whether the enzymes related to purine synthesis pathway are involved in DNA damage response has not been clarified. This study aims to explore the biological function of PAICS in gastric cancer and whether it participates in DNA damage response process.
Methods Firstly, the expression and prognosis value of PAICS in gastric cancer was analysed using public data from the TCGA database with bioinformatics technology; then, the proliferation and apoptosis of gastric cancer cells after interfering PAICS was detected with CCK8, colony formation and flow cytometry in vitro. The tumorigenicity of gastric cancer cells after interfering PAICS was detected with subcutaneous tumorigenesis experiment in vivo. Finally, after the

interference of PAICS, the expression of γH2AX, a DNA damage repair marker, was measured along with immunofluorescence and comet assay, in order to verify whether PAICS was involved in DNA damage repair process.
Results Bioinformatics analysis showed the significantly high expression of PAICS in GC, and the relation with prognosis. CCK8, colony formation assay as well as apoptosis assay showed that the interference of PAICS inhibited GC cell proliferation and induced apoptosis. Tumor formation assay in nude mice verified that the interference of PAICS decreased the tumorigenicity of GC cells. Comet assay, γH2AX expression and immunofluorescence experiments demonstrated the occurrence of DNA damage after interfering PAICS. Co-immunoprecipitation demonstrated that PAICS interacted with histone deacetylase 1/2 (HDAC1/2), thus participating in DNA damage repair by influencing histone acetylations. In vivo and in vitro drug sensitivity experiments indicated that the sensitivity of GC cells to chemotherapy drugs could be enhanced via interfering PAICS.
Conclusion PAICS plays an oncogenic role in gastric cancer, which facilitates the occurrence and development of GC and is related to the prognosis of GC patients. Meanwhile, PAICS maintains genome stability through interaction with HDAC1/2. The interference of PAICS enhances the sensitivity of GC cells in response to chemotherapy drug, cisplatin.

PO-0746

新型冠状病毒疫苗接种的环境管理策略

宗玉龙、刘城、王瑾、赵书平
泰安市中心医院

目的 检测新型冠状病毒疫苗接种处的核酸，为环境管理提供依据。
方法 使用荧光定量 PCR 方法，对新冠疫苗接种处的环境样本以及全院重点部位环境样本进行核酸检测。
结果 通过对全院 56 处环境样本进行核酸检测，有 10 处核酸阳性，均为疫苗接种室样本。
结论 应加强新冠疫苗接种处的环境管理，避免因疫苗接种导致的其它部位核酸阳性。

PO-0747

Dual functions of p62 in the process of macrophage-derived foam cells formation and progress

Hongyun Jing、Wei Yang、Fei Yu、Ling Ding、Xiuru Guan*
The First Affiliated Hospital of Harbin Medical University

Background and aims Autophagy is one of the important defense mechanisms for cells to maintain inner environment stability. Recently, autophagy got more attention in atherosclerotic lesions because it played important roles in lipid metabolism. Our previous study showed that during macrophage-derived foam cells formation and progress the autophagy marker p62, a chaperone for selective autophagy of cargo, accumulated. However, details regarding to the autophagy and p62 effect on atherosclerosis has remained unknown. In this study, we monitored the p62 expression level, lipid droplet accumulation and light chain 3 I/II level suffering from three kinds of concentrations (overexpression, basic and knockdown) in p62 to investigate the role of p62 on the plaque stability under different states of autophagy induced by different concentration of oxidized low-density lipoprotein.
Results Under basic state of autophagy, p62-silencing resulted in autophagy dysfunction and the increase of the secretion of increased interleukin-1β; Overexpression of p62 induces autophagy and inhibits the secretion of IL-1β. When autophagy disordered, p62-silencing will ease the

autophagy disorder and reduce the secretion of IL-1β；Overexpression of p62 will aggravate autophagy disorder, which further aggravates the secretion of IL-1β leading to cell death and promoting AS. These results suggested that autophagy at different stages during the development of foam cells, via p62, has two distinct effects on plaque stability. Therefore, p62 will be an attractive target for the treatment of atherosclerosis.

PO-0748

Study on Inhibition of Chlamydia Trachomatis Activity by Single Drug of Huanglian Daochi Powder in Vitro

Bin Liu
Second affiliated hospital of south China universit

Objective To study the inhibitory effect of single drug of huanglian daochi powder on the activity of chlamydia trachomatis in vitro.
Method Huanglian daochi powder was prepared by water extraction method. Then, in vitro cytotoxicity test, MIC value determination, MBC value determination and combined drug sensitivity test were carried out on the standard Chlamydia trachomatis strain E. To study the inhibitory effect of single drug of huanglian daochi powder on the activity of chlamydia trachomatis in vitro.
Results Among the 14 traditional Chinese medicines, most of them had similar TD0 on McCoy cells, with the range of 6.12-12.50mg/ mL. Some traditional Chinese medicines, such as talc, were affected by the material texture, and TD0 value was higher. The MIC and MBC values of Rhubarb and Rhizoma Coptis were measured in the 14 tested Huanglian Daochi powder, suggesting that Rhubarb and Rhizoma Coptis had a strong inhibitory effect on Ct activity, and Rhubarb had a stronger inhibitory effect on Ct activity than Rhizoma Coptis. After iodine staining, it was observed under the microscope that with the increase of the concentration of the liquid, the volume of inclusion bodies decreased and the number of inclusion bodies gradually decreased until they disappeared. The diameters of inhibition ring of 14 traditional Chinese medicines to gonococcal drug resistant strains were Bamboo＞leaf Rush＞Rhizoma coptidis＞Rhubarb＞Gypsum＞Rehmanniae rehmanniae＞Polygonum quanum＞Radix Pallis＞Polygonum japonica＞Talc＞Licorice＞Gardenia＞Lotus seed heart＞Polygonum sinensis in order. Among 14 drugs, rhizoma coptidis combined with 13 others, the combined drug sensitivity test of the detected Rhubarb and Rhizoma coptidis with in vitro anti-CT activity was conducted according to the above method, and the FIC value was 1, indicating that the two drugs had no synergistic or antagonistic effect.
Conclusion Huanglian daochi powder had inhibitory effect on Chlamydia trachomatis activity in vitro, Licorice, Rhubarb, Gardenia, Polygonum japonica and so on had high inhibitory effect.

PO-0749

浙江地区汉族脑梗死患者氯吡格雷药物基因 CYP2C19 的基因多态性研究

林学飞
杭州迪安医学检验有限公司

目的 了解浙江地区汉族脑梗死患者吡格雷药物基因多态性分布情况。
方法 选取 2019 年 1 月至 2020 年 8 月应用氯吡格雷治疗的浙江地区汉族脑梗死患者 282 例为对象，其中男 200 例、女 82 例。收集外周静脉血,提取基因组 DNA,进行扩增及 CYP2C19 基因序列结果判断。分析其在浙江地区汉族脑梗死患者中的分布特点，以利于指导用药和疾病防治。

结果 共纳入脑梗死患者 282 例，基因扩增结果显示 CYP2C19 基因型分布为*1/*1 型 33.33%，*1/*2 型 40.42%、*1/*3 型 7.45%、*1/*17 型 3.19%，*2/*2 型 12.06%、*2/*3 型 3.19%、*3/*3 型 0.35%。超快代谢型、快代谢型、中间代谢型和慢代谢型患者所占比例分别为 3.19%（9 例)、33.33%(94 例)、47.87%(135 例)和 15.60%（10 例）。CYP2C19 基因代谢表型与珠中江地区、广东河源地区、厦门地区、遵义地区相比较，差异无统计学意义（P>0.05)；与豫北地区、云南楚雄地区相比较，差异有统计学意义（P<0.05)。
结论 浙江地区汉族脑梗死患者 CYP2C19 基因以*1/*2 型、*1/*1 型为主；基因代谢表型以中间代谢型和快代谢型为主。

PO-0750

Factors influencing the reference interval of thyroid-stimulating hormone in healthy adults: A systematic review and meta- analysis

Dongyang Xing、Delong Liu、Ri Li、Jiancheng Xu
Jilin University First Hospital

Background Many studies have reported that the thyroid- stimulating hormone (TSH) reference interval is susceptible to external factors, such as age, sex, race, region and iodine intake. However, no meta- analysis has comprehensively explored the effect of these factors on the TSH reference interval.
Methods Articles published from January 1960 to January 2020 were searched in PubMed, Embase, Cochrane, Scopus, Medline English databases and CNKI, WanFang and CQVIP Chinese databases. In total, 19 studies were ultimately included. All data were analysed using Review Manager 5.3, STATA 16.0 software, GraphPad Prism 8.0 and Microsoft Excel 2010 to draw the TSH concentration curve.
Results The TSH reference interval was significantly influenced by sex and age. The mean of TSH concentration in females was 0.27 mIU/L higher than that in males. Reference interval of TSH is divided into 20– 59 years old and >60 years old age groups in males, and 20– 39 years old and >40 years old age groups in females. Regardless of sex, TSH concentrations all increase with age. In iodine- deficient areas, TSH reference intervals were generally lower than those in iodine- sufficient or iodine- excessive
areas. The TSH reference interval in Asia and North American countries was generally higher than that in most European countries. In the subgroup analyses of sample size, region and assay methods and manufacturers, the between- group differences were significant.
Conclusion The TSH reference interval was significantly influenced by sex, age, iodine intake, sample size, region, and assay methods and manufacturers, but other factors should not be ignored. Therefore, it is necessary for each laboratory to validate an appropriate TSH reference interval based on local conditions.

PO-0751

高良姜素对人头颈部鳞癌细胞的生长抑制作用及其机理

朱丽萍
上海交通大学医学院附属第九人民医院

目的 探讨高良姜素在体内和体外实验中对人头颈部鳞癌细胞的抗肿瘤作用及其机制
方法 通过 MTT 法检测人头颈部鳞癌细胞 WSU-HN4、WSU-HN6 和 WSU-HN13 经不同浓度高良姜素处理后细胞增殖能力的变化；通过流式细胞术分析高良姜素对人头颈部鳞癌细胞周期和细胞凋

亡的影响；通过 Western Blot 方法检测高良姜素对人头颈部鳞癌细胞中 p21、cyclin D1、Bax 和 Bcl-2 等细胞周期、细胞凋亡相关蛋白的表达或磷酸化水平的影响；建立人头颈部鳞癌的裸鼠荷瘤模型，给荷瘤小鼠腹腔注射高良姜素，观察记录肿瘤的体积和体重，并监测小鼠的体重、生化指标和小鼠的生存情况，初步评价高良姜素的抗肿瘤作用和生物安全性。
结果 体外实验中高良姜素以时间和剂量依赖性方式抑制人头颈部鳞癌细胞的增殖，并通过影响 cyclinD1、CDK4、CDK6 和 p21 等细胞周期相关蛋白的表达诱导细胞周期阻滞在 G0/G1 期，通过上调促凋亡蛋白 Bax 和下调抗凋亡蛋白 Bcl-2、Bcl-xl 的表达诱导细胞凋亡。在体内实验中高良姜素能够抑制裸鼠荷瘤模型中肿瘤的生长，并能明显增加肿瘤组织中凋亡细胞的比例，下调 cyclinD1 蛋白的表达。
结论 本研究从细胞和动物实验入手，首次证实高良姜素对人头颈部鳞癌细胞的生长抑制作用，体外和体内实验结果表明，高良姜素通过诱导细胞凋亡和 G0/G1 期细胞周期阻滞的方式明显抑制人头颈部鳞癌细胞的增殖和生长。因此，高良姜素可作为一种新的人头颈部鳞癌辅助治疗药物，并具有广阔的临床应用前景。

PO-0752

基于数据库分析 TM4SF1 在卵巢癌中的表达和临床意义

李荣[1,2]、王芳[1]
1. 南京医科大学第一附属医院（江苏省人民医院检验医学部）
2. 南京医科大学附属妇产医院（南京市妇幼保健院）

目的 探究 TM4SF1 在卵巢癌中的表达情况及临床意义。
方法 收集 Oncomine、GEPIA 数据库中关于 TM4SF1 的数据信息，并对数据库中的资料进行二次分析；运用 Coexpedia、STRING 数据库分析 MECOM 在卵巢癌中共表达及互作蛋白情况；利用 Kaplan-Meier Plotter 分析卵巢癌患者中 TM4SF1 mRNA 的表达水平与患者预后的关系。
结果 Oncomine 数据库在不同类型肿瘤中有关 TM4SF1 基因的研究共 547 项，差异有统计学意义的有 138 项，其中在卵巢癌中有 10 项研究，均显示 TM4SF1 高表达；这一结果在 GEPIA 数据库中也得到证实；共表达分析发现了 504 个与其共表达的基因；蛋白互作分析发现 TM4SF1 蛋白可能与 RHBG、MYO10、C1D、CD63、CD37、TSPAN31、CD53、TSPAN1、DDR1、TSPAN4 蛋白有相互作用；TM4SF1mRNA 高表达组卵巢癌患者总体生存率低于低表达组（$P<0.05$）。
结论 TM4SF1 基因在卵巢癌中高表达，且其翻译的蛋白通过和多种蛋白相互作用发挥其生物学效应，其 mRNA 表达水平与卵巢癌患者生存预后相关，有望为卵巢分子靶向治疗提供新的思路。

Analysis of heart injury laboratory parameters in 273 COVID-19 patients

Huan Han[1]、linlin xie[2]、rui liu[1]、jie yang[1]、fang liu[3]、yong feng[2]、chengliang zhu[1]
1. Department of Clinical Laboratory, Renmin Hospital of Wuhan University
2. 武汉大学基础医学院
3. 武汉大学生命科学学院

Background Since December, 2019, an outbreak of pneumonia caused by a novel coronavirus (SARS-CoV-2) has raised intense attention in Wuhan, Hubei province, China. This disease, named COVID-19 by World Health Organization (WHO), spreads rapidly around the country and worldwide. SARS-CoV-2 infection caused mildly to seriously and fatally respiratory, enteric, cardiovascular, and neurological diseases.

Method We enrolled 273 COVID-19 patients who were admitted to Renmin Hospital(Wuhan, China). All patients were classified into moderate, severe and critical groups according to their symptoms. We detected and analyzed the main laboratory indicators related to heart injury, CK-MB, MYO, ultra-TnI and NT-proBNP, in COVID-19 patients and investigated the correlation between heart injury and severity of the disease.
Results The positive rate of CK-MB had no difference between the mild, severe and critical groups. While the positive rate of MYO, ultra-TnI and NT-proBNP is higher in severe cases and critical cases as compared to mild cases, the differences among the groups were statistically significant ($P<0.05$). After a pairwise comparison by Bonferroni correction, it was observed that the levels of NT-proBNP and MYO were significant increased in severe cases and critical cases compared to mild cases ($P<0.0167$), but no difference between severe cases and critical cases ($P>0.0167$). The increase of ultra-TnI only showed significantly difference between the mild cases and severe cases ($P<0.0167$), while there was no difference between mild cases and critical cases, severe cases and critical cases ($P>0.0167$).
Conclusion It was found that higher concentration in venous blood of CK-MB, MYO, ultra-TnI and NT-proBNP were associated with the severity and case-fatality rate of COVID-19. Careful monitoring of the myocardiac enzyme profiles is of great importance in reducing the complications and mortality in COVID-19 patients.

PO-0754

江苏地区产 OXA-232 肺炎克雷伯菌的流行病学特征

付宏煜、杜鸿
苏州大学附属第二医院

目的 产 OXA-48 样碳青霉烯酶肠杆菌科在不同生态系统中的快速传播给临床带来巨大挑战。近年来 OXA-232 样肠杆菌科在中国开始出现，以肺炎克雷伯菌最为常见。我国不同地区产 OXA-232 肺炎克雷伯菌 (OXA-232-producing K. pneumoniae，OXA-232Kp) 的分子流行病学特征与遗传环境所知甚少。描述临床 OXA-232Kp 的流行病学特征。
方法 收集 2018 年 9 月至 2019 年 9 月江苏 5 家医院临床分离的非重复碳青霉烯耐药肺炎克雷伯菌 (Carbapenem- resistant Klebsiella pneumoniae, CRKP)，采用微量肉汤稀释法和 Phoenix-M50 自动微生物系统进行药敏分析；PCR 结合测序检测 blaOXA-232 基因；脉冲场凝胶电泳（PFGE）分析菌株同源性；质粒测序分析携带 blaOXA-232 基因的质粒周围环境。
结果 1. 共收集 78 株 CRKP 菌株，其中 3 株菌株携带 blaOXA-232 基因，2 株 OXA-232Kp 菌株来自痰液 (66.7%)，1 株来自泌尿道 (33.3%)。
2. 所有 3 株 OXA-232Kp 对头孢菌素类、氨曲南、复方新诺明、喹诺酮类药物均耐药，2 名患者出院前经抗生素哌拉西林-他唑巴坦、阿米卡星、头孢他啶、庆大霉素等治疗后恢复。
3. MLST 分析均属于 ST15 型，基于 Gel J 分析≥85%的基因连锁率，分离菌株属于同一克隆。
4. 3 株菌株质粒均不能发生转移，提示该质粒为非接合质粒。该质粒与曾在中国东部报道的携带 blaOXA-232 的质粒 质粒周围环境相同。
结论 本文首次调查 OXA-232Kp ST15 在江苏地区的流行病学特征。携带 blaOXA-232 基因的质粒具有高度的同源性，表明该 6141 bp 的 ColE 型质粒对 blaOXA-232 基因在中国的流行具有重要作用。

PO-0755

Clinical Value of Serum Calcium in Elderly Patients with Sepsis

Huan Li
Renmin Hospital of Wuhan University

Purpose To explore the clinical value of serum calcium (Ca) in elderly patients with sepsis.
Materials and Methods The clinical data and laboratory data of elderly patients with sepsis (n = 165) and elderly population for physical examination (n = 67) in Renmin Hospital of Wuhan University from January 2020 to November 2020 were collected. We analyzed serum Ca levels in sepsis and septic shock firstly, and then continued to investigate them in the survival group and the death group. Meanwhile, we also assessed the correlation between serum Ca and PCT. Finally, ROC curves of serum Ca in sepsis were carried out to differentiate septic shock and judge the prognosis.
Results The serum Ca levels of the elderly patients with sepsis were lower than that of the control group (median 1.98 vs 2.31 mmol/L, $P < 0.001$), and the more severe the sepsis, the lower the serum Ca levels. Sepsis patients with decreased serum Ca had higher shock rate and mortality. There was a negative correlation between serum Ca and PCT ($r = -0.2957$, $P < 0.001$). And ROC curve analysis demonstrated that the areas under the curve (AUC) of serum Ca for differentiating sepsis from septic shock and the prognosis of elderly patients with sepsis were 0.770 and 0.802, respectively.
Conclusion Serum Ca has a certain value for the early recognition of elderly patients with sepsis and the judgment of the severity of the disease, as well as a potential evaluation value for differentiating sepsis from septic shock and prognosis.

PO-0756

Distinct Interactions of EBP1 Isoforms with FBXW7 Elicits Different Functions in Cancer

Yuli Wang [1]、Pengju Zhang[2]、Jianhua Mao[3]、Guangwei Wei[2]
1. The Second Hospital of Shandong University
2. 山东大学
3. Life Sciences Division, Lawrence Berkeley National Laboratory

Background The ErbB3-binding protein EBP1 is a member of the proliferation-associated 2G4 protein family and is ubiquitously expressed in all human tissues and is involved in the regulation of cell growth and differentiation. EBP1 encodes two different protein isoforms, the long form P48 and short form P42, due to alternative splicing of pre-mRNA, which are believed to have different cellular activities. The predominant P48 isoform can promote cell proliferation or survival including cancer cells and localizes to both cytoplasm and nucleus. Moreover, correlation of high expression level of P48 with poor clinical outcomes in patients suggests that P48 is closely related with cancer progression. In contrast, the P42 isoform, which lacks the N-terminal 54 amino acids, is considered to be a potent tumor suppressor because of its growth-inhibitory function. Although it is reported that P48 has an oncogenic activity and P42 plays a suppressive role in various cancer cells, the underlying mechanism regarding the distinctive functions of the 2 isoforms of EBP1 in cancer remains largely unclear.
FBXW7 (F-box and WD40 domain protein 7) functions as a substrate recognition subunit of the SCF (SKP1/CUL1/F-box protein) E3 ubiquitin ligase complex to regulate a network of proteins with central roles in cell division, growth, and differentiation. FBXW7 contains two important functional domains: the F-box domain, which interacts directly with SKP1 to recruit ubiquitin-conjugating enzymes, and the WD40 domain, which binds to a consensus phosphor-binding motif

called the CDC4 phosphodegron (CPD) in its substrates. FBXW7 has been characterized as a general tumor suppressor. FBXW7 mutation or deletion is often observed in multiple human cancers including colorectal cancer, and loss of FBXW7 function results in tumorigenesis. Accumulating data indicate that FBXW7 exerts its antitumor function mainly through targeting multiple oncoproteins for ubiquitination and proteasomal degradation, such as cyclin E, Notch, mTOR, Aurora A, and c-Myc. However, a detailed understanding of the full set of FBXW7 substrates and the mechanisms that link FBXW7 deficiency to tumorigenesis is still lacking.
In this study, we used proteomics approach to globally screen FBXW7-regulated proteins in colorectal cancer cells, and we first identified that EBP1 P48 expression was dramatically upregulated in FBXW7-deficient cells. However, the underlying mechanism of FBXW7 mediates EBP1 isoforms is still unclear.
Methods The aim of the present study was to detect whether EBP1 isoforms interact with the SCF-type ubiquitin ligase FBXW7 to exert different roles in tumorigenesis. The binding between FBXW7 and EBP1 isoforms, and the ubiquitin of EBP1 isoforms were detected by Co-immunoprecipitation. MTT, colony formation, transwell and matrigel assays were used to detect cell phenotypes which mediated by FBXW7 deficiency. Besides, nude mice were used to verify whether P48 mediates FBXW7 loss-induced metastasis in vivo. EBP1 isoforms regulated substrate degradation of FBXW7 were detected by qRT-PCR and western blot.
Results EBP1 isoforms interact with the SCF-type ubiquitin ligase FBXW7 in distinct ways to exert opposing roles in tumorigenesis. P48 bound to the WD domain of FBXW7 as an oncogenic substrate of FBXW7. P48 binding sequestered FBXW7α to the cytosol, modulating its role in protein degradation and attenuating its tumor suppressor function. In contrast, P42 bound to both the F-box domain of FBXW7 as well as FBXW7 substrates. This adapter function of P42 stabilized the interaction of FBXW7 with its substrates and promoted FBXW7-mediated degradation of oncogenic targets, enhancing its overall tumor-suppressing function.
Conclusion our study uncovers a physical and functional relationship among FBXW7 and EBP1 isoforms (P48 and P42). Two EBP1 isoforms distinctively modulate the role of FBXW7 by different and independent mechanisms. The knowledge of the role of FBXW7 and EBP1 isoforms in the molecular mechanisms governing tumorigenesis sheds new lights on improving current anticancer therapies.

PO-0757

环状 RNA 在原发性肝细胞癌中的研究进展

蔡馨
武汉大学人民医院

原发性肝细胞癌（HCC）是世界上常见的恶性肿瘤之一，研究调控 HCC 的侵袭迁移机制对于肝癌的临床诊断和治疗具有重要意义。环状 RNA（circRNA）作为非编码 RNA 家族的重要成员，因其环状结构高度稳定，在肝细胞中起微小 RNA（miRNA）海绵作用，以竞争内源性 RNA 机制调控 miRNA 或促进靶基因表达，在 HCC 进展中起重要作用。探讨 circRNA 在 HCC 发病中的作用机制，将有助于筛选 HCC 诊断标志物和研发治疗的有效靶点。

PO-0758

the role of ADAM17 in platelet production in pediatric ITP

Qi Wang、Xi Jia、Jia Wei
Children’s Hospital of Soochow University

Objectives To explore the role of ADAM17 in platelet production in pediatric ITP

Methods Patients Twenty preliminary diagnostic ITP children without any treatment hospitalised at the Department of Haematology of the Children's Hospital of Soochow University, from March 2019 to July 2020, were enrolled in this study. Twenty one healthy non-hematological and non-surgical children served as the control group. The study was approved by the Medical Ethics Committee of the Children's Hospital of Soochow University.

Next-generation RNA-Seq

Megakaryocytes from ITP or healthy donor children were purified by a single-step gradient solution (1.5%/3% bovine serum albumin) for RNA-Seq. In brief, RNA was prepared for sequencing according to Ribo-Zero™ rRNA removal Kit (illumina) for poly-A RNA. Sequencing was carried out using a 2x150bp paired-end (PE) configuration; image analysis and base calling were conducted by the HiSeq Control Software (HCS) + OLB + GAPipeline-1.6 (Illumina) on the HiSeq instrument. The sequences were processed and analyzed by GENEWIZ.

Giemsa staining of bone marrow smears

The bone marrow smears were fixed with icy methanol for 30 seconds, and then covered with 1×Giemsa working solution for 15 minutes at room temperature. Megakaryocytes were captured under 1000× magnification using an Olympus BX 40 microscope. For each slice, at least 5 random megakaryocytes were selected for examination. Fetal liver cell culture and megakaryocyte purification

The embryos of ADAM17Zn△/+ mice were isolated at the day 14.5 of pregnancy, a single-cell suspension through a 100 μm filter. Cells were cultured in Dulbecco's modified Eagle medium at 37oC and 5% CO2 for four days. On the fourth day, mouse fetal liver cells were allowed to sediment in a single-step gradient solution (1.5%/3% bovine serum albumin) to purify mature megakaryocytes.

Assays of proplatelet formation

Purified megakaryocytes were seeded at a density of 5 × 105 cells per well in 24-well plates. Quantification of PPF-MKs (proplatelet forming megakaryocytes) was determined by the number of megakaryocytes with more than two pseudopods per well examined under bright field microscopy.

Flow cytometry

For ploidy analysis, 75% cold ethanol pre-fixed megakaryocytes were treated with

0.02 mg/ml RNase A and then double-stained with 0.01 mg/ml propidium iodide and FITC-conjugated rat anti-mouse CD41 antibody for 30 minutes at room temperature.CD41 positive cells were selected to assess ploidy. To quantify ADAM17, platelets were labeled with FITC-conjugated mouse anti-human CD41 antibody and PE-conjugated mouse anti-human ADAM17 antibody. A FACS (BD FACS Canto II) flow cytometer was used for the flow cytometric analysis. CD41 positive platelets were selected to assess the expression of ADAM17. A cocktail of CD3-FITC/CD16+56-PE/CD45-Percp-Cy5.5/CD4-PC7/CD19-APC/CD8-APC-Cy7 monoclonal antibody.

Results Autoantibody-negative children with ITP had significantly lower CD4+ T cells (Ctrl 36.2±1.0; ITP 24.8±1.6) ($P<0.001$) and higher CD8+ T cells (Ctrl 23.7±0.6; ITP 33.6±2.0) ($P<0.001$)compared to control children. The bone marrow megakaryocytes from ITP children showed impaired proplatelet formation, which had more vacuoles instead of new-born platelets, but the size or maturation of nucleus was normal. The RNA-seq of bone marrow megakaryocytes from children with ITP shows decreased expression of ADAM17, Notch and cytoskeleton related genes (ARHGEF, MYO9B), while increased expression of ARHGAP, MYOM1, MYLK. The expression of platelet ADAM17 from ITP children (ITP 44.5±18.1) was also significantly decreased compared to the control group (Ctrl 248.1±18.3) ($P<0.0001$). Fetus of ADAM17 $^{Zn△/Zn△}$ mice exhibited severe thrombocytopenia with bleeding spots in head, neck and abdomen. The induced megakaryocytes from ADAM17 $^{Zn△/Zn△}$fetal liver suspension cells had normal ploidy distribution compared with ADAM17$^{+/+}$ megakaryocytes. The numbers of protruding barbell-like proplatelets in ADAM17 $^{Zn△/Zn△}$ megakaryocytes were significantly decreased. We found the expression of p-MLC was significantly higher in ADAM17 $^{Zn△/Zn△}$ megakaryocytes compared to ADAM17$^{+/+}$ megakaryocytes.

Discussion In this study, we found that the expression of ADAM17 was down-regulated in megakaryocytes/platelets from children with ITP. ADAM17 Zn△/ Zn△ megakaryocytes exhibit poor proplatelet formation and higher expression of p-MLC, a downstream of RhoA signaling pathway. ADAM17 is important in proplatelet formation for thrombopoiesis and lower expression of ADAM17 is possible an innate pathogenesis of pediatric ITP.
Autoantibodies against GPIb/GPIIb in ITP contribute to platelet consumption through over-activation of macrophagocytes and poor platelet production by interfering with megakaryopoiesis. Besides the production of autoantibody, dysregulation of immunity is also involved in ITP pathogenesis. Reduced regulatory T cells cause decreased immunosuppressive effect on B cells (plasma cells) and severe accumulation of CD8+ cytotoxic T cells in ITP which leads to direct platelet lysis. ITP children with negative autoantibody selected in our study, 16 out of 20 had lower CD4+ T cells and higher CD8+ T cells, ADAM17 can cleave L-selectin expressed on CD4+/CD8+ T controlled by myeloid-derived suppressor cells (MDSC) and regulate T cell proliferation or function through LAG-3, but the possible way of altered T cells in regulating the expression of megakaryocyte/platelet ADAM17 is not clear. Study of Bortezomib induced thrombocytopenia during relapsed multiple myeloma therapy shows accumulation of RhoA in megakaryocytes, which enhanced phosphorylation of myosin light chain inhibits proplatelet formation. Cytoskeleton arrangement is vital in proplatelet formation, RhoGTPase is a key switch. At the early stage of megakaryopoiesis, RhoA prevents actomyosin accumulation to facilitate megakaryocyte polyploidization, whereas it is downregulated gradually at the late stage of megakaryopoiesis, We also found increased expression of p-MLC in ADAM17 Zn△/ Zn△megakaryocytes, giving the clues of aberrant cytoskeleton arrangement in megakaryocytes without ADAM17. TNF-α, one substrate of ADAM17, can regulate RhoA by different mechanisms in tubular epithelial cells, further study of TNF-α and RhoA may help to understand the mechanism of ADAM17 in regulating megakaryocyte cytoskeleton arrangement.

PO-0759

四种国产尿液干化学分析仪一致性研究评价

诸佩超
上海市临床检验中心

目的 比较 UA-5800、URIT-1600、U120 Ultra、弘益尿干化学分析仪与 AX-4030 的一致性。
方法 UA-5800、URIT-1600、U120 Ultra、弘益分别与 AX-4030 比较，比较酸碱度（pH 值）、比重（SG）的均值差异百分率，比较尿胆原（URO），胆红素（BIL）、酮体（KET）、潜血（BLD）、蛋白质（PRO）、亚硝酸盐（NIT）、白细胞（LEU）、葡萄糖（GLU）的阳性率和符合率。
结果 UA-5800、URIT-1600、U120 Ultra、弘益与靶机 AX-4030 的 pH 均值差异百分率<10%，SG 均值差异百分率<1%；AX-4030 与 U120Ultra 的 BLD(P<0.01)、PRO（P<0.05）阳性率差异有统计学意义，其它阳性率比较结果无显著差异；非 pH、SG，UA-5800 与 AX-4030 一般符合率 92.2%-99.2%，Kappa 值 0.64-0.92，URIT-1600 与 AX-4030 一般符合率 96.6%-99.1%，Kappa 值 0.75-0.98，U120 Ultra 与 AX-4030 一般符合率 90.4%-97.7%，Kappa 值 0.67-0.88，弘益与 AX-4030 一般符合率 98.5%-100%，Kappa 值 0.94-1。
结论 UA-5800、URIT-1600、U120 Ultra、弘益部分项目由于敏感度不同存在差异，但其所达到的效果基本一致，能够满足基本的临床需要。尿液干化学分析属于一种初筛手段，国产尿机检测速度快，其中 URIT-1600 测试速度 480 个/小时，弘益测试速度 500 个/小时，能满足大样本医院的测试需求；同时这四种国产性能比较高，能满足市场需求。

PO-0760

利用六西格玛方法优化生化免疫自动审核系统

孟国艳
昆明市第一人民医院

目的 探索利用六西格玛精益管理方法改进并优化已实施的生化免疫自动审核系统的效率。
方法 六西格玛是一套系统的、集成的业务改进方法体系，通过 DMAIC 流程，在已经实施的生化免疫自动审核系统中相关项目的通过率等有关数据作为现状调查数据，查找原因并确定主要原因，优化自动审核的流程，消除自动审核过程中的缺陷和无价值作业。比较利用六西格玛精益管理方法改进优化前后自动审核系统的通过率、真阳性率、真阴性率和假阳性率的变化，并制定下一步改进计划。
结果 生化免疫项目自动审核通过率由 63.61%提升至 83.22%，检测项目的样本周转时间（TAT）由 2.3 小时缩短至 1.5 小时。
结论 使用六西格玛精益管理的方法可以有效推进自动审核系统效率提升，保证自动审核系统高效运行，该方法亦可用于实验室其他项目自动审核系统的改进。

PO-0761

亚抑菌浓度苯唑西林诱导金黄色葡萄球菌临床株 Lpl 脂蛋白表达的作用

蒋苳芳
贵州航天医院

目的 探讨亚抑菌浓度 β-内酰胺类抗菌药物对金黄色葡萄球菌临床株脂蛋白 Lpl 的诱导作用。
方法 遴选我国主要流行克隆群 CC239(ST239)中的菌株作为实验对象，在检测菌株抗生素敏感性的基础上，采用亚抑菌浓度苯唑西林（OXA）进行处理，SDS-PAGE 分析菌体蛋白；制备重组 Lpl-His 蛋白及其多克隆血清，采用 Western blot 对诱导蛋白进行鉴定。
结果 遴选的 6 株 ST239 型临床分离的 MRSA 菌，抗菌药物敏感性检测显示 t030 和 t037 菌株对利福平和复方新诺明的敏感性呈相反趋势，但都能在亚抑菌浓度 OXA 诱导下产生一约 30 kDa 的蛋白质，经制备脂蛋白 Lpl 抗体，Western blot 鉴定该受 OXA 诱导表达的蛋白质为金葡菌 Lpl，其诱导作用具有剂量依赖效应。
结论 亚抑菌浓度苯唑西林可诱导金葡菌 MRSA 临床分离株产生脂蛋白 Lpl，该诱导蛋白在金葡菌致病性中的作用值得深入研究。

PO-0762

Analysis of PLXNA1, NRP1 and NRP2 variants in a cohort of patients with isolated hypogonadotropic hypogonadism

Wenting Dai[1]、meichao Men[2]、Dan-na Chen[3]、Jia-da Li[4]、Xinying Wang[4]、Wang Zeng[4]、Fang Jiang[4]、Ruizhi Zheng[5]
1. Zhuzhou Central Hospital
2. 湘雅医院
3. 长沙医学院
4. 中南大学生命科学院
5. 河南省人民医院

Backgroud Isolated hypogonadotropic hypogonadism (IHH) is a clinical syndrome described by failure of gonadal function secondary to defects on the synthesis, secretion or action of the gonadotropin-releasing hormone (GnRH). The secreted glycoprotein SEMA3A binds its receptors NRP1 or NRP2 to located correct GnRH neuron migration, with an additional role of the NRP co-receptor PLXNA1. Therefore, variants in NRP1, NRP2 and PLXNA1 have been related to defective GnRH neuron development in mice and inherited GnRH deficiency in humans.
Method Whole-exome sequencing and pedigree analysis were performed to examine the genotypic and phenotypic spectra of these genes in a large cohort of IHH probands from China.
Results We identified ten heterozygous missense variants in PLXNA1, five heterozygous missense variants in NRP1, and two heterozygous missense variants in NRP2. NRP1 variants were found only in KS individuals and were strongly linked to hearing loss (25%, 2/8). 85.00% (17/20) of patients also harbored variants in other IHH-associated genes.
Conclusion Our study greatly enriched the genotypic and phenotypic spectra of PLXNA1, NRP1 and NRP2 in IHH. Our results may conducive to the genetic counseling, diagnosis, and treatment of IHH with mutations in PLXNA1, NRP1and NRP2 gene. Furthermore, Our results indicated that NRP1 were strongly linked to hearing loss (2/8 individuals). Moreover, whether the SEMA3A-NRP1 pathway interact with PROK2-PROKR2 pathway in the development of GnRH neurons is worth further study.

PO-0763

The AST/ALT Ratio (De Ritis) represents an unfavorable prognosis in patients with SFTS in early-stage based on exploration of clinical characteristic: An observation cohort study

Lianzi wang、yuanhong Xu
Department of Clinical Laboratory, the First Affiliated Hospital of Anhui Medical University, No. 218 Jixi Road, Hefei, Anhui, 230032, China

Background Severe fever with thrombocytopenia syndrome (SFTS), a wide distribution infectious disease caused by SFTSV with a high mortality which became a threat to public health, in this research, we aimed to investigate the epidemiological and clinical characteristics of patients infected with SFTS, further looking for prognostic risk factors for SFTS.
Methods In this retrospective and cross-sectional study, we enrolled patients from the First Affiliated Hospital of Anhui Medical University confirmed SFTS from September 1, 2019 to December 12, 2020. Cases were analyzed for epidemiological, demographic, clinical, and laboratory data. Logistic regression models were used to assess the association between predictors and outcome variables. A generalized additive mixed model (GAMM) was conducted to

analyze the change trend of AST/ALT in SFTS patients received ribavirin. P values ≤ 0.05 were considered statistically significant.
Results Clinical and laboratory results of 107 hospitalized patients with SFTSV infection were retrospectively described. Mean age at the onset of the disease was 60.38±11.29 years old and the ratio between male and female was 1:1.2. Fever and thrombocytopenia were the most typically feature of SFTS, furthermore, many patients accompanied by neurological complications, gastrointestinal symptom, muscle symptoms and other nonspecific characteristic, and the data of laboratory results showed an abnormal in markers of blood routine, coagulation function and biochemical.
107 patients were grouped into two group according to the status of patients in the end,
survivors had a higher level of PLT counts, TP and eGFR, meanwhile, level of APTT, TT, D-D, FDP, ALT, AST, AST/ALT-ratio, Creatinine, CK, LDH and PCT was higher in non-survivors, results from univariate cox regression revealed that elevated level of FDP, TT, AST/ALT-ratio and PCT as well as decreased level of eGFR and patients with central nervous system symptoms were significant predictors for prognostic of SFTS, results from multivariate logistic regression analysis in three adjusted models showed AST/ALT-ratio was an independent risk factor for prognosis of SFTS patients, Kaplan–Meier survival analysis showed that SFTS patients with AST/ALT-ratio >2.683 was associated with a shorter futime therefore indicated an unfavorable prognosis in all three adjusted models. Treatment of ribavirin may increase platelet counts meanwhile decrease AST/ALT-ratio of SFTS patients.
Conclusion SFTS is an emerging infectious disease, could lead to a multiple organ injury, AST/ALT-ratio was an independent risk factor for prognosis of SFTS patients,
further investigation should be done in order to better understand this disease and guide the clinical treatment.

PO-0764

AKT 抑制剂 Perifosine 对非酒精性脂肪性肝病（NAFLD）进展的促进作用

荆振唐
山东大学第二医院

目的 明确 AKT 抑制剂 Perifosine 是否促进 NAFLD 进展。
方法 通过高脂饲料喂养建立小鼠（C57BL/6、BALB/c）非酒精性脂肪性肝病模型，在给予高脂饲料喂养第 5 周后，将小鼠随机分组并对小鼠进行 DMSO 或 Perifosine 每日腹腔注射。通过各种生化、病理及分子生物学技术研究手段，研究 Perifosine 在体内外通过对 AKT 的抑制影响 FLIP，进而对 NAFLD 进展产生影响。
结果 通过高脂饲料的喂养，成功建立 C57BL/6 和 BALB/c 脂肪肝模型，Perifosine 组小鼠整体体重水平高于 DMSO 组。同时采血检测显示，Perifosine 组小鼠血脂、转氨酶水平高于 DMSO 组，肝脏 HE 染色、油红 O 染色显示 Perifosine 组病理学损伤程度较重。进一步研究表明，Perifosine 通过抑制 AKT，使 AKT 磷酸化水平降低，从而下调 FLIP 的表达，FLIP 是脂肪性肝炎及其代谢异常的关键抑制剂，从而导致实验小鼠 NAFLD 的进展加快，促进发展。
结论 Perifosine 通过抑制 AKT 活化，下调 FLIP 表达，增加小鼠脂肪性肝炎及其代谢异常的发生率，使得 NAFLD 进展加快。提示 AKT 抑制剂类药物的使用可能会加速 NAFLD 的进展。

PO-0765

HBV 编码的 miRNA 通过激活机体先天免疫来抑制 HBV 复制

赵晓晴
山东大学第二医院

我们之前的研究发现乙型肝炎病毒 (HBV) 可以编码一种 microRNA (HBV-miR-3)，它可以通过靶向 HBV 转录本来抑制 HBV 的复制。然而，HBV-miR-3 是否通过影响宿主先天免疫来调节 HBV 的复制尚不清楚。在这里，我们探究了 HBV-miR-3 在 HBV 感染后先天免疫反应中的重要功能。我们发现在 HBV 感染的 HepG2-NTCP 细胞中 HBV-miR-3 的表达以剂量和时间依赖性方式逐渐增加。HBV-miR-3 通过激活 JAK/STAT 信号通路下调肝细胞中的 SOCS5 的表达来增强干扰素诱导的抗病毒作用。此外，HBV-miR-3 可以通过外泌体转运作用于巨噬细胞从而促进了其向 M1 的转化。另外，含有 HBV-miR-3 的外泌体通过抑制 SOCS5 介导的 EGFR 泛素化来促进 IL-6 的分泌。简而言之，这些结果表明 HBV-miR-3 可以激活先天免疫反应，通过多种途径抑制 HBV 复制，从而抑制 HBV 诱导的急性肝细胞损伤并影响持续性 HBV 感染的进展。

PO-0766

溶酶体功能在自噬介导卵巢癌顺铂耐药的机制研究

马丽伟
郑州大学第一附属医院

目的 探讨溶酶体参与了自噬介导卵巢癌顺铂耐药性机制研究。
方法 MTT 法检测细胞生存率; 免疫荧光检测自噬相关蛋白 p62 和 LC3 变化，再通 LysoTracker 染色观察溶酶体变化; cathepsin D 试剂盒检测酶活性改变; 流式细胞术检测细胞凋亡; Western blot 检测凋亡相关蛋白表达。
结果 对于不同浓度的顺铂，SKOV3 /DDP 细胞比 SKOV3 细胞的生存率高; 6 mg /L 的顺铂作用下，与 SKOV3 细胞相比，在 6 h、12 h 和 24 h，SKOV3 /DDP 细胞 LC3 的表达增高，p62 逐渐下降，LysoTrakcer 着色增强， cathepsin D 活性增高; 与自噬抑制剂 3-MA 相比，CQ 更加明显地增加顺铂诱导 SKOV3 /DDP 细胞的凋亡率($P < 0.05$) ，LysoTracker 着色明显减弱， cathepsin D 活性降低，细胞色素 C、cleaved caspase-3 和 Bax 表达增加，Bcl-2 表达降低($P < 0.05$) 。
结论 卵巢癌耐药细胞自噬水平增加、利用氯喹等抑制细胞溶酶体从而抑制细胞自噬能够增加化疗药物的敏感性，因此，我们推测溶酶体或许是介导肿瘤化疗药物耐受的重要决定因素，这可能主要是通过溶酶体内 ATP 维护溶酶体功能和稳态，维持自噬的流量，从而介导癌症细胞对化疗药物的耐药。本研究以人卵巢癌细胞 SKOV3 细胞和 SKOV3/DDP 细胞为研究对象，基于 ATP 影响溶酶体功能调控自噬通量，探讨溶酶体参与卵巢癌顺铂耐药性的作用机制，为肿瘤化疗药物耐受的治疗提供新的策略。

PO-0767

胎肾组织微环境对 hiPSCs 定向分化的诱导作用研究

李开霖、孙超、刘晓立、赵升田
山东大学第二医院

终末期肾病是指各种慢性肾脏疾病的终末阶段，具有高发病率和高致死率的特点，是世界范围内危害人类健康的公共卫生问题。目前临床上针对终末期肾病较为理想的治疗方式是肾移植，移植后，生存期较长，患者可以保证基本生活质量。但是肾移植面临的最大问题是肾源缺乏，大多数终

末期肾病患者只能通过透析来维持生命，在等待中经受痛苦甚至死亡。利用再生医学技术构建结构成熟、功能良好、可移植的新肾脏，既可以解决肾源短缺问题，也可以作为慢性肾病的模型探究其发病机制，因此，肾脏再生研究具有重要的研究意义和临床价值。

根据对哺乳动物肾脏器官发生的现有认识，现在有许多关于通过定向分化人类诱导多能干细胞（hiPSCs）生成人肾脏类器官的报道。肾脏类器官在人类肾脏发育、疾病模拟和肾脏再生等方面都有广阔的应用前景。然而，这种类器官模型的实用性最终将取决于它们的发育准确性。通过文献检索和本团队的前期研究，我们发现肾脏类器官研究存在两个急需解决的关键问题：一、传统方法使用生长因子和化合物诱导 hiPSCs 定向分化存在诱导效率低、肾单位成片段状的问题，大量非肾细胞的存在导致肾脏类器官的结构和功能成熟度较低；二、大量诱变剂的使用导致体内研究存在生物安全性问题。为解决上述问题，我们研究团队根据胚胎肾脏早期的发育特征，设计了一种新颖的生物诱导方法，利用胎肾发育微环境诱导 hiPSCs 定向分化。采取的研究方案如下：将大鼠胚胎肾制成单细胞悬液，与 hiPSCs 共培养至 3D 结构，结果显示胎肾组织微环境对 hiPSCs 定向分化的诱导作用显著，诱导效率和结构成熟度相比传统方法更高，该过程的关键分子机制本课题组正在研究中。本课题的研究成果为解决当前肾脏类器官研究面临的瓶颈问题提供了新思路。与传统的化学方法相比较，该技术更符合肾脏发育的一般规律，也具有更高的生物安全性。

PO-0768

云南地区 816 例新生儿细胞遗传学检测结果分析

冷玉春
昆明金域医学检验所有限公司

目的 对云南地区 816 例新生儿的细胞遗传学结果进行分析，为倡导本地区产前筛查和产前诊断的重要性提供科学依据。
方法 对 2019 年至 2020 年送至我公司的 816 例新生儿的外周血样本分别抽取 0.1ml、0.2ml、0.3ml、0.4ml 梯度接种至外周血淋巴细胞培养基进行培养，制备 G 显带标本，进行核型分析，按照《ISCN》（2016）描述核型。
结果 816 例新生儿中检出染色体异常 162 例，涉及异常核型 42 种（不包括染色体多态性），染色体异常检出率 19.85%（162/816），其中常染色体异常 153 例，性染色体异常 9 例。常染色体异常中 21-三体 133 例，占染色体异常结果的 82.10%（133/162），包括标准型 121 例、易位型 7 例以及嵌合型 5 例。检出 18-三体 5 例，占染色体异常结果的 3.09%（5/162）。
结论 云南地区新生儿染色体异常检出率较高，其中大多数为三体患儿，建议进一步加强本地区一、二级预防措施的实施，减少缺陷患儿的出生。

PO-0769

偏离度分析模型在体外诊断试剂成本管控中的应用

田丽、夏洪韬、赵明才、胡娟、杨国庆
遂宁市中心医院

目的 分析试剂成本率偏离原因，为优化资源使用效率和科学决策提供参考。
方法 以四川省某三甲公立医院开展的 112 个检验项目为研究对象，利用回顾性分析建立标准值，运用偏离度分析模型对数据进行研究。
结果 （1）2018-2020 年试剂成本和试剂成本率逐年上升，与检验总人次和检验收入变化趋势不一致；（2）试剂成本率标准值 33.26%，试剂单位成本标准值 4.89 元/人份，利用效率标准值 77.50%；（3）2020 年试剂成本率偏离度 4.87%；（4）利用效率、试剂单位成本、检验人次对该

院 2020 年试剂成本率偏离度的影响分别为 4.14%、0.46%和 0.27%；（5）试剂成本率正偏离的检验项目有 90 个，负偏离有 22 个；（6）前十项检验项目导致试剂成本率偏离 2.60%。
结论 （1）树立精细化管理意识，应用科学监督工具，实时评估分析试剂成本管控情况，找出运营存在问题，有针对性地采取措施，以达到试剂成本的合理管控；（2）建立标准值和偏离度分析模型能有效填补监管漏洞，实时、真实地呈现各个因素间和各检验项目间的关系和影响，有利于厘清责任科室和具体因素，提高医院科学管理水平；（3）医院应自上而下重视试剂成本的精细化管理。医院决策层应重点关注影响大的检验项目，从医院整体层面分析评估和制定措施；科室管理层应动态监测试剂单位成本或利用效率偏离度高的检验项目，及时挖掘深层次原因，采取适宜管控措施，避免潜在风险。

PO-0770

Improving equivalence in fibrinogen evaluation between the prothrombin time-derived fibrinogen assay and Clauss method using a pooled plasma calibrator

Sheng Wang、Xiaoyong Duan、Yan Zhang、Liuchun Wu、Xingtai Liu
Sinopharm Gezhouba Central Hospital

Aims Both the Clauss and Prothrombin Time-derived fibrinogen (PT-Fib) methods have widely been used in fibrinogen (Fib) evaluation. We aimed to improve the interchangeability between these two methods.
Methods Thirty fresh plasmas of low, normal, and high Fib concentration were mixed to prepare the pooled human plasma. The Fib concentration was assessed by the Clauss method. The PT-Fib values were further recalibrated by the assigned plasma pools and the precision, linearity and reference intervals were verified according to the guidelines of American Society for Clinical and Laboratory Standards (CLSI) EP15-A and EP6-A documents. Finally, the recalibrated PT-Fib method was compared with Clauss method by the simultaneous Fib test of total 5268 coagulation samples.
Results The results indicated that the recalibrated PT-Fib method can detect the Fib concentration with clinically acceptable third-order linearity in the range of 1.27-8.00 g/L. Only one result out of 39 healthy people tested using the recalibrated PT-Fib method did not fall within the reference range defined by the manufacturer. We also found more than 99% of results between these two methods were interchangeable in the range of 1.51 to 8.00 g/L. The disagreement between these two methods was found only in patients with certain underlying conditions.
Conclusions After recalibrattion, the consistency between the PT-Fib and Clauss methods was enhanced and the interchangeability was improved. The application of the recalibrated PT-Fib method provided accurate and reliable results with the manufacture provided reagents and improved detection speed and cost-effectiveness.

PO-0771

运用 6sigma 管理方法缩短门诊凝血实验室内周转时间的研究

郑欣、胡骏、张雪清、张俊、姚冬婷、胡晓波
上海中医药大学附属龙华医院

目的 探讨运用 6sigma 管理方法缩短门诊凝血实验室内周转时间 (TAT) 的效果。
方法 通过界定、测量、分析、改进、控制五大步骤，对门诊凝血实验室内 TAT 较长的主要原因进行调查分析，找出其中的关键因素，并针对性地制定改进方案和控制计划。

结果 经过七个月的持续质量改进后，门诊凝血实验室内 TAT 显著缩短，中位数 M 由 127.5 min 缩短到 66 min,达标率由 47.0 %提高到 93.9 %，百万机会缺陷数 (DPMO) 由 530 035 ppm 降低到 61 002 ppm。分别采用 Mood 中位数检验和双比率检验对改进前后的数据进行统计，结果显示改进前后 TAT 和 TAT 达标率的差异均具有统计学意义 (P＜0.05)。
结论 本研究采用 6sigma 管理方法，通过基线数据分析和头脑风暴，找出了影响门诊凝血实验室内 TAT 的关键未落实原因，并针对性地进行改进，最终取得了明显成效。将 6sigma 管理理念引入检验科的质量管理体系，有利于深挖潜在的、隐藏的问题，进而解决问题，持续改进，不断促进检验的发展与进步，在实验室管理方面具有推广价值。

PO-0772

衍生化及非衍生化串联质谱法在遗传代谢疾病筛查诊断中的应用及比较

张瑞、周磊、杨柳、刘家云
空军军医大学西京医院

目的 考查并比较了衍生化和非衍生化串联质谱（MS/MS）法在测定 11 种氨基酸和 22 种酰基肉碱中的应用及意义，为其有效防治遗传代谢病的精准诊疗提供更为科学依据。
方法 利用衍生化 MS/MS 法和非衍生化 MS/MS 法分别分析比较了 1060 例出生 3 天至 1 岁儿童的干血滤纸片。采足后跟血于空白采血滤纸上，完全渗透。衍生化法：用已知浓度的同位素内标萃取液萃取干血滤纸片中的 33 种待测物质, 经过 20 分钟衍生化反应后, 用串联质谱仪分析血片中 33 种待测物质的质谱谱图并计算其浓度；非衍生化法：用已知浓度的同位素内标萃取液萃取干血滤纸片中的 33 种待测物质, 加热震荡 45 分钟后, 用串联质谱仪分析血片中 33 种待测物质的质谱谱图并计算其浓度。
结果 非衍生化串联质谱法的批内 CV 为 2.06-7.39%，批间 CV 为 3.64-10.97%；衍生化串联质谱法的批内 CV 为 4.14-10.95%，批间 CV 为 6.14-12.91%。经统计学分析男、女之间氨基酸和酰基肉碱含量无显著性差异(P>0.5)。
结论 衍生化法与非衍生化串联质谱法进行血滤纸片氨基酸和酰基肉碱分析, 均有较高的回收率, 能够达到较高的精确性和准确性,其中非衍生化法简便易行，样本处理步骤少时间短，但是衍生化法灵敏度更高检出限更低，两种方法均能灵敏，特异地测定血中氨基酸和酰基肉碱浓度，满足临床对遗传代谢疾病筛查及诊断的需要。

PO-0773

信息管理系统改进在凝血功能常规检验分析前阶段中的应用及效果评价

马跃飞、欧启水
福建医科大学附属第一医院

目的 评价信息管理系统改进在凝血功能常规检验分析前阶段中的应用效果。
方法 完善信息管理系统,改进相关功能。对比信息管理系统改进前（2012 年 10 月至 2014 年 6 月）和改进后（2014 年 7 月至 2016 年 3 月）相同时间段内凝血功能常规检验的分析前错误数量和比例、TAT 的变化。观察"不规范报告数"、"临床投诉量"和"满意率"等指标是否优化以评价信息管理系统改进后的效果。

结果 改进了信息管理系统的监控和提醒功能,包括实现对标本全过程各节点的实时监控功能、增加患者采集信息的条目、增加采集和送检提醒功能和信息反馈功能、报警功能等。信息管理系统改进后分析前错误数量和比例下降（采集量不符合要求 0.61%vs 0.20%,标本凝固 0.41%vs 0.26%,溶血或脂血 0.067%vs 0.038%,TAT 超时 0.23%vs 0.098%,患者基本资料不全 0.16%vs 0.038%）。标本运送反应时间（TAT1）、送检时间（TAT2）、实验室报告时间（TAT3）的中位数值和 TAT1+TAT2、TAT3 的离群值占比均下降。标本在检验科之外的流转时间减少了 10.5 min。评价指标上,由分析前错误导致的"不规范报告数"由 7 份减少到 3 份,"临床投诉量"由 5 次降为 2 次,临床对凝血功能常规检验流程和结果的总体满意率由 89.7%上升为 96.0%。
结论 改进信息管理系统能有效监控凝血功能常规检验分析前影响因素,减少实验室不易觉察的分析前错误,是保证检验质量的重要举措。

PO-0774

M2 巨噬细胞与非小细胞肺癌不良预后的相关性

王云杰
西安医学院第一附属医院

巨噬细胞是肿瘤微环境中重要的免疫细胞，在肿瘤的发生与进展中扮演着重要的角色。在肿瘤微环境中，肿瘤细胞将巨噬细胞等募集至周围，微环境发生改变，巨噬细胞的表型随之而改变，可极化为促肿瘤的 M2 型，以及抑制肿瘤的 M1 型。M2 型巨噬细胞能够促进肿瘤微环境血管的生成，帮助肿瘤细胞逃避机体免疫监视，促进其生长。肺癌目前仍是全世界癌症的主要死亡原因，而非小细胞肺癌（non-small cell lung cancer，NSCLC）占原发性肺癌的 85%以上，其中 70%NSCLC 为鳞癌(squamous cell carcinoma) 或者腺癌(adenocarcinoma)。在中国，肺癌是发病率和死亡率最高的恶性肿瘤，且晚期肺癌患者 5 年生存率仍低于 15%众多研究表明，巨噬细胞与肿瘤的预后具有具有一定的相关性。此篇文章，将对巨噬细胞在非小细胞肺癌中的分布以及巨噬细胞表型与人类非小细胞肺癌预后的关系进行讨论。

PO-0775

WTAP facilitates progression of endometrial cancer via CAV-1/NF-κB axis

Qin Li
Yantai Yuhuangding Hospital

The N6-methyladenosine (m6A) modification is one of the most prevalent methylations in eukaryotic mRNA and it is essential for the development of many important biological processes as multiple types of tumors. One of the most important enzymes catalyzing generation of m6A on mRNA is Wilms' tumor 1-associating protein (WTAP), however, the potential role of WTAP in endometrial cancer (EC) still remains unknown. Here, we investigated WTAP expression level in cancer tissue and paracancerous tissue from EC patient. Subsequently, WTAP was knocked down by siRNA in endometrial cancer cell line of Ishikawa and HEC-1A respectively. Cell proliferation, migration and invasion were studied. The expression of Caveolin-1 (CAV-1) was detected by qPCR. The enrichments of m6A and METTL3 on CAV-1 were detected using RIP-qPCR. The activity of NF-κB was studied using Western Blot. We observed that WTAP was dramatically up-regulated in cancer tissue, and enhanced cell proliferation, migration and invasion and decreased apoptotic in EC in vivo and in vitro, which indicated higher tumor malignancy and worse survival outcome. After WTAP was knocked down in EC cells, CAV-1 was significantly upregulated, and the enrichments of m6A and METTL3 at 3'UTR region of CAV-1 were decreased. Moreover, the activity of NF-κB signaling pathway was inhibited by its regulator CAV-

1. Taken together, we concluded that WTAP could methylate 3'UTR of CAV-1 and downregulate CAV-1 expression to activate NF-κB signaling pathway in EC, which promoted endometrial cancer progression.

PO-0776

Exosomal miR-451a in serum correlates with clinical stage in pancreatic cancer patients

Jia Chen、Weiqin Chen、Zhen Li、Xiaobo Hu
Department of Laboratory Medicine, Longhua Hospital, Shanghai University of Traditional Chinese Medicine

Objectives The aim of this study was to explore the diagnostic efficiency of serum exosomal miR-451a as a novel biomarker for pancreatic cancer (PC).
Methods Serum samples were collected prior to treatment. Firstly, we analyzed miRNA profiles in serum exosomes from 8 PC patients and 8 healthy volunteers. We then validated the usefulness of selected miRNAs as biomarkers using the other 138 PC patients and 49 healthy controls.
Results miR-451a is significantly upregulated in serum-derived exosomes from PC patients compared to expression in those from healthy individuals. Serum exosomal miR-451a had better diagnostic power than CA19-9 in identifying PC patients. In addition, exosomal miR-451a showed a significant association with clinical stage in PC and had better diagnostic performance on late-stage patients. And it was a frequent event that miR-451a was upregulated in pancreatic cancer tissues.
Conclusions Serum exosomal miR-451a might serve as a new diagnostic marker for PC diagnosis and malignancy assessment.

PO-0777

糖尿病小鼠模型中 FGF15 对肝糖代谢的影响

陈茜
山东大学第二医院

背景 成纤维细胞生长因子 15（FGF15）是由远端回肠表达和分泌的细胞因子，它可以通过内分泌方式调节肝糖代谢。减肥手术后，BAs 和 FGF15 均升高。
实验方法 通过高脂饮食和链脲佐菌素诱导肥胖的糖尿病大鼠模型，并分为 SHAM 组和 SG 组。 在手术后第 12 周评估 SG 的减肥和抗糖尿病作用。 然后，我们在手术后第 12 周检测了血清和门静脉中的 TBA 以及 FXR 激动型胆汁酸亚型的水平。然后我们通过 PAS 染色试剂盒和糖原测定试剂盒对肝糖原含量进行了染色和检测，并通过 RT-PCR 检查了肝糖异生的关键酶的表达水平。最后，检测回肠 FXR，FGF15 和肝 FGFR4 的组织表达及其与葡萄糖代谢有关的信号通路。
研究结果 SG 手术组大鼠肝脏中糖原含量和 PAS 阳性细胞百分比明显高于 SHAM 组。 此外，SG 组 G6Pase 和 PEPCK 的 mRNA 水平显著下降。 另外，SG 组的血清和门静脉的 TBA 水平显着高于 SHAM 组。 根据 RT-PCT 和免疫组织化学结果，SG 组回肠 FGF15 和肝 FGFR4 的 mRNA 和蛋白表达水平均显着升高。此外，与 SHAM 组相比，SG 手术大鼠的 FXR mRNA 水平也显着升高。免疫印迹结果表明，在 SG 操作的大鼠中 ERK1 / 2 的磷酸化增加，而 GS 的磷酸化被抑制。另外，SG 组 CREB 的磷酸化程度下降和 PGC-1α 的表达下降说明 CREB-PGC-1α 途径的抑制。
结论 SG 术后升高的胆汁酸通过激活受体 FXR 诱导回肠远端 FGF15 表达。而且，活化的 FGF15 对肝糖原合成和糖异生的作用有助于进一步 SG 的抗糖尿病作用。

PO-0778

82 例常德市新型冠状病毒肺炎患者的实验室指标分析

仇玄、张瑶、林立中、王丽志、和珂莉、吴建华
常德市第一人民医院

目的 回顾性分析新型冠状病毒肺炎患者首次入院的临床特征和相关实验室检测结果。
方法 收集 2020 年 1 月 24 日到 3 月 9 日期间常德地区 82 例 COVID-19 患者首次入院时一般临床资料、患者入院后首次实验室检查结果。将入组患者分为非重症组和重症组，比较两组之间实验室检查的差异，寻找新冠肺炎重症患者的危险因素。
结果 82 例 COVID-19 患者中非重症患者 60 例、重症患者 22 例。首诊症状主要为发热（52 例）、咳嗽（48 例）、咳痰（12 例）等。与非重症组相比，重症组血常规中的淋巴细胞计数显著降低，中性粒细胞与淋巴细胞比值、超敏 C 反应蛋白（CRP）、血沉（ESR）显著增加，差异均有统计学意义（P<0.05）；重症组白蛋白显著减少，天冬氨酸转氨酶、肌酸激酶同工酶、D-二聚体显著增加，差异均有统计学意义（P<0.05）。NLR 为分析新型冠状病毒肺炎重症的显著影响因素，即 NLR 每增加 1 个单位，患重症新型冠状病毒肺炎概率增加 1.212（1.003, 1.465）倍。NLR、ESR、降钙素原（PCT）为联合预测重症新冠肺炎的最优模型，其 AUC 为 0.767，灵敏度为 66.7%，特异度为 87.3%。
结论 COVID-19 患者首次入院部分实验室指标出现特征性改变，且重症患者实验室指标改变也具有特异性，NLR、ESR、PCT 可作为联合预测重症新冠肺炎的模型。本结果为新冠肺炎重症患者的早期识别和治疗方案的制定提供实验室参考依据。

PO-0779

持续性高危型 HPV 感染女性的男性配偶中 HPV 的感染率及其与女性感染的基因型一致性分析

王丽娜
山东大学第二医院

目的 HPV 感染是最常见的性传播感染之一。持续性高危型 HPV（hrHPV）感染是导致宫颈癌发病的主要原因之一，然而 hrHPV 感染阳性女性的性伴侣 HPV 患病率和基因型分布了解甚少。本项研究旨在研究 hrHPV 阳性女性的男性性伴侣的 HPV 患病率和基因型分布，评估 hrHPV 感染和伴侣之间的类型特异性和一致性。
方法 2019 年 1 月至 2020 年 6 月在山东大学第二医院进行子宫颈癌筛查妇女性，选择 208 例 hrHPV 阳性且持续一年以上的女性与其稳定的男性伴侣同时入组。 所有受试者均通过 cobas 4800 HPV DNA 检测对 HPV 基因分型试验进行了测试，女性患者同时进行薄层液基细胞学检查。
结果 208 例 hrHPV 阳性女性中，HPV16/18 感染阳性患者 46 例，其余 162 例为其他 12 种 hrHPV 阳性。其 208 例男性配偶中，138 例 hrHPV 阳性，HPV16/18 感染阳性者 26 例，其余 102 例为其他 12 种 hrHPV 阳性；且 HPV16/18 感染女性与配偶 HPV 感染一致性为 26/46（56.5%），其他 12 种 hrHPV 感染女性与配偶 HPV 感染一致性为 70/162（43.2%）。
结论 我们证明了 HPV 男性感染的高流行以及感染分型与性伴侣之间的相关性。

PO-0780

Progranulin 在 FSGS 中的作用及机制研究

李荃新
山东大学第二医院

目的 局灶性节段性肾小球硬化（FSGS）病理生理机制尚不明晰，但肾小球足细胞损伤是促进其发生发展的重要始动因素。最新研究表明，Progranulin 参与肾脏疾病的发生。表观遗传调节因子 Progranulin 是 DNA 甲基化和组蛋白泛素化的调控因子，在胚胎的发育及肿瘤的发生中扮演重要角色，但在肾脏疾病中的作用知之甚少。我们前期工作证实，Progranulin 在 FSGS 足细胞中表达显著降低并加重足细胞损伤，过表达 Progranulin 明显减少足细胞凋亡并抑制 Notch1 的表达。本课题探究 Progranulin 在 FSGS 中的作用及调控机制。
方法 本课题运用 cre-loxp 技术构建足细胞 Progranulin 敲除小鼠等手段深入研究 Progranulin 在 FSGS 足细胞损伤中的作用及探讨自噬信号通路在足细胞中的分子调控机制；并进一步以腺相关病毒为载体过表达 Progranulin 作为 FSGS 治疗手段的初步探究。
结果 Progranulin 在 FSGS 肾脏组织中表达降低，敲除 Progranulin 可以进一步加重阿霉素诱导的肾脏损伤，过表达 Progranulin 可以减轻在 FSGS 足细胞损伤，Progranulin 可以通过调控足细胞的自噬水平调控足细胞损伤。
结论 在 FSGS 中，Progranulin 的缺失通过调控足细胞自噬加重足细胞损伤，Progranulin 可能作为 FSGS 治疗的潜在靶点。

PO-0781

Polybrominated diphenyl ethers and decabromodiphenyl ethane in paired hair/serum and nail/serum from corresponding chemical manufacturing workers and their correlations to thyroid hormones, liver and kidney injury markers

Dong Yu
Shandong Academy of Occupational Health and Occupational Medicine,Shandong First Medical University & Shandong Academy of Medical Sciences

We detected the polybrominated diphenyl ethers (PBDEs) or decabromodiphenyl ethane (DBDPE) in paired hair-serum and nail-serum samples collected from the corresponding chemical manufacturing workers. The levels of decabrominated diphenyl ether (BDE-209) or DBDPE in the serum, hair and nail samples were all signif- icantly higher than those reported in other studies, and the “work place” (pretreatment or posttreatment work- shop) was the primary influencing factor that affected the levels of specific BFRs in vivo. For BDE-209 workers, the BDE-209 in both the hair and nail samples were significantly and positively related to the BDE-209 in the serum, indicating that both hair and nails can be used as noninvasive biomatrices to reflect internal exposure to BDE-209. In DBDPE workers, hair rather than nails was more suitable for use as a noninvasive biomatrix to infer the DBDPE exposure level. A series of serum biomarkers reflecting thyroid hormones and liver and kidney injuries were tested to calculate the correlations between hair or nail BFR levels and the levels of the biomatrices. The BDE- 209 in the hair samples was significantly and positively correlated with the total protein (TP), and the nail BDE-209 level was significantly and positively related to the total bilirubin (TBIL), indirect bilirubin (IDBIL)

PO-0782

铜绿假单胞菌 crpP 基因和携带 crpP 的整合性接合元件研究

朱志宸[1]、杨慧盈[2]、杜鸿[1]、周冬生[2]
1. 苏州大学附属第二医院
2. 北京微生物学与流行病研究所

目的 crpP 是一种新型的氟喹诺酮类药物耐药基因，主要位于铜绿假单胞菌携带的整合性接合元件（integrative and conjugative element，ICE）上。crpP 基因和携带 crpP 的 ICE 的多样性和流行性仍待阐明。本研究旨在为 crpP 基因和携带 crpP 的 ICE 提供深入的生物信息学和流行病学见解，为后续相关研究提供理论依据。
方法 使用二代或三代测序技术获得菌株全基因组序列，通过生物信息学分析鉴定 crpP 基因及携带 crpP 的 ICE 并统计它们的流行率及分布状况；通过系统发育分析制定 crpP 基因亚型和携带 crpP 的 ICE 的分型/命名方案；通过克隆和药物敏感性实验评估 CrpP 酶对喹诺酮类药物敏感性的影响；通过精细注释和比较基因组学分析确定携带 crpP 的 ICE 的遗传学特征。
结果 1. 37 种 crpP 基因亚型可被划分至 6 个初级分组（crpP-1 至 crpP-6），crpP-1 分组的基因主要分布在铜绿假单胞菌中。
2. 6 种 CrpP-1 分组的 CrpP 酶被证实能介导菌株对氟喹诺酮类药物敏感性下降。
3.携带 crpP 的 ICE 因具有高度保守的 45 bp 序列左端和右端附着位点，并显示出相似的骨架基因排列构成，而定义为一个新的 Tn6786 家族。这些 ICE 可被划分成 4 组（A 组至 D 组），且详细的遗传解剖分析显示 22 个代表性的携带 crpP 的 Tn6786 类 ICE 在核苷酸序列和模块结构上都表现出高度的多样性。
4.crpP 基因在我国临床分离的铜绿假单胞菌中的阳性率为 53.5%（107/200），且都位于染色体携带的涵盖了上述四个分组的 Tn6786 类 ICE 中。
结论 crpP 基因在我国临床分离的铜绿假单胞菌中普遍存在，且都位于染色体携带的 Tn6786 类 ICE 中。这类 ICE 正处于进化的活跃阶段，并很有可能成为除了 crpP 外其余细菌有益基因传播的重要载体。

PO-0783

Identification of key genes and pathways in discoid lupus skin via bioinformatics analysis

Qian Dong、Kang Chen、Jinye Xie、Weijia Wang
中山市人民医院

Discoid lupus erythematosus (DLE) is the AQ4 most common skin manifestation of lupus; however, the molecular mechanisms underlying DLE remain unknown. Therefore, we aimed to identify key differentially expressed genes (DEGs) in discoid lupus skin and investigate their potential pathways.To identify candidate genes involved in the occurrence and development of the disease, we downloaded the microarray datasets GSE52471 and GSE72535 from the Gene Expression Database (GEO). DEGs between discoid lupus skin and normal controls were selected using the GEO2R tool and Venn diagram software. The Database for Annotation, Visualization, and Integrated Discovery (DAVID), Enrichr, and Cytoscape ClueGo were used to analyze the Kyoto Encyclopedia of Gene and Genome pathways and gene ontology. Protein-protein interactions (PPIs) of these DEGs were further assessed using the Search Tool for the Retrieval Interacting Genes version 10.0.Seventy three DEGs were co-expressed in both datasets. DEGs were predominantly upregulated in receptor signaling pathways of the immune response. In the PPI network, 69 upregulated genes were selected. Furthermore, 4 genes (CXCL10, ISG15, IFIH1, and IRF7) were found to be significantly upregulated in the RIG-I-like receptor signaling pathway, from analysis of Enrichr and Cytoscape ClueGo.The results of this

study may provide new insights into the potential molecular mechanisms of DLE. However, further experimentation is required to confirm these findings.

PO-0784

妊娠期妇女血脂水平参考区间的建立与探讨

舒静[1]、罗晓婷[2]
1. 西南医科大学附属医院
2. 西南医科大学

目的 通过回顾性分析建立妊娠期妇女特异性血脂水平参考区间，为临床妊娠期妇女血脂水平判断提供参考和依据。
方法 收集 2019 年 1 月至 2020 年 1 月在西南医科大学附属医院建档的 1193 例健康妊娠期女性血脂检测指标。按孕周将正常孕妇分为早期妊娠 P1 组（<14 周）、中期妊娠 P2 组（14~27 周）、晚期妊娠 P3 组（>27 周）。分析不同孕期孕妇血脂代谢水平，采用非参数法分别建立血脂参考区间，并对其进行验证，评估其临床适用性。
结果 (1)除 HDL-C 外，TG、TC、LDL-C、ApoA1、ApoB 从 P1 到 P3 组呈现逐渐上升的趋势；HDL-C 从 P1 组开始上升，P2 组达峰值，P3 组较 P2 组有所下降；ApoA1 在 P3 组达峰值，但较 P2 组上升程度并不显著。（2）P1 组 TG、TC、HDL-C、LDL-C、ApoA1、ApoB 分别是 2.89~5.65mmol/L、0.31~2.41mmol/L、1.13~2.48mmol/L、1.06~3.22mmol/L、1.32~2.29g/L、0.44~1.32g/L；P2 组分别是 3.41~7.37mmol/L、0.69~3.73mmol/L、1.28~2.82mmol/L、1.34~4.25mmol/L、1.56~2.59g/L、0.61~1.75g/L；P3 组分别是 4.02~7.87mmol/L、1.23~4.50mmol/L、1.28~2.69mmol/L、1.77~4.67mmol/L、1.58~2.61g/L、0.80~1.91g/L。（3）除早期妊娠 LDL-C 外，其他妊娠期血脂各项指标 RIs 与目前使用的 RIs 结果判断差异均具有统计学意义（P<0.05）。
结论 通过回顾性分析建立的孕妇血脂参考区间符合妊娠期妇女血脂水平的生理变化，为临床动态监测妊娠期妇女的血脂水平变化，评估孕妇健康状况，以及妊娠期相关疾病的预防、诊断和疗效监测等提供了科学的依据。

PO-0785

Matrix Metalloproteinase 3 as a Valuable Marker for Patients with COVID-19

Shengjie Shi、Xiaobing Xie
First Hospital of Hunan University of Chinese Medicine

Background The situation of the coronavirus disease 2019(COVID-19) continues to evolve, our study explored the significance of serum levels of Matrix Metalloproteinase 3 (MMP3) as a marker for patients with COVID-19.
Methods Sixty-two COVID-19 patients in the First Hospital of Hunan University of Chinese Medicine and Loudi Center for Diseases Prevention and Control, from January to March 2020, were sampled as the novel coronavirus pneumonia infected group. One hundred and thirty-one cases from the First Hospital of Hunan University of Chinese Medicine, including 67 healthy individuals and 64 non- COVID-19 inpatients, served as the non-infected group. Approximately every 5 d, sera from 20 cases were collected and analyzed thrice, using an automatic biochemical analyzer, to detect serum MMP3 concentrations. The correlation was analyzed between MMP3 and other pro-inflammatory cytokines. Following normality tests, differences in serum MMP3 levels between the infected and non-infected group were analyzed via SPSS (version 25.0) software, using the Wilcoxon rank-sum test.

Results The MMP3 concentration was 44.44（23.46~72.12）ng/ml in the infected group and 32.42 (28.16~41.21）ng/ml in the non-infected group. The difference between the two groups was statistically significant (Z=-2.799, P=0.005<0.05). A positive correlation was found between MMP3 and IL-1β(r=0.681, P=0.000<0.05), and IL-6(r=0.529, P=0.002<0.05).Serum MMP3 concentration, measured over three separate time points, were 55.98 (30.80~75.97) ng/ml, 34.84 (0.00~51.84) ng/ml, and 5.71 (0.00~40.46) ng/ml, respectively.
Conclusion Detection of serum MMP3 levels may play an important role in the development of therapeutic approaches for COVID-19 and may indicate the severity of the disease.

PO-0786

表皮葡萄球菌 psm-mec 过表达菌株的构建

杨永长
电子科技大学附属医院·四川省人民医院

目的 构建表皮葡萄球菌 psm-mec 过表达菌株，探讨 psm-mec 的功能。
方法 PCR 扩增含启动子的 psm-mec 基因片段 p221，利用穿梭质粒 pLI50 构建 psm-mec 过表达质粒 p221, 采用电转化技术将重组质粒导入金黄色葡萄球菌 RN4220 进行修饰。提取质粒后电转化表皮葡萄球菌 ATCC1222，筛选阳性克隆。菌落 PCR，real time RT-PCR 和 DNA 序列分析进行验证。半定量生物被膜分析法检测 p221 菌株生物被膜。
结果 PCR 扩增出含启动子的 psm-mec 序列的 p221 片段，酶切鉴定结果显示 psm-mec 过表达质粒 p221 构建正确，菌落 PCR，real time RT-PCR 和 DNA 序列分析结果表明表皮葡萄球菌 psm-mec 过表达菌株 p221 构建成功。与 ATCC12228 相比，psm-mec 过表达菌株 p221 生物被膜形成量明显增加，提示 psm-mec 影响表皮葡萄球菌生物被膜形成。
结论 成功构建了表皮葡萄球菌 psm-mec 过表达菌株，psm-mec 增加表皮葡萄球菌生物被膜形成。

PO-0787

白细胞假性减少一例

钱香
江苏省人民医院（南京医科大学第一附属医院）

目的 老年女性帕金森病患者，住院期间其中一次血常规结果为：WBC 0.11×109/L，WNR 散点图上也显示 WBC 数量减少。依据复片规则推片镜检后发现：WBC 总数应在正常范围内。查看仪器原始数据我们发现：WBC 计数在 WNR 通道为 0.11×109/L，在 WDF 通道为 9.70×109/L。本文旨在探讨导致 WBC 计数在 WNR 通道假性减少的原因。
方法 将患者血浆置换成生理盐水后再测；在体外模拟全血在 WBC 通道的状态，即在患者全血中按比例加入溶血剂；在本例患者血浆和血细胞层中分别加入 WNR 溶血剂。
结果 血浆置换后，WBC 计数在 WNR 通道为 9.41×109/L，在 WDF 通道为 8.93×109/L，说明影响来自于血浆。在体外模拟全血在 WBC 通道的状态，即按比例加入溶血剂，结果显示：本例患者 WNR 管出现凝块，而对照管未出现凝块，说明是因为强酸性溶血剂使得血浆发生了凝固。又在本例患者血浆中加入 WNR 溶血剂，也形成凝块，而血细胞层则无，进一步证实干扰来源于血浆。将凝块进行涂片，可见纤维状凝固物内包裹 WBC。
结论 该患者当天下午重新抽血再测时已经无此现象；查阅患者的病例资料，发现其前一日输注了大剂量的白蛋白，当日早上五点半采血时无输液。分析为输注的白蛋白，在 WNR 强酸环境下发生了凝固，网络了 WBC，导致其假性减低，影响 WNR 通道结果，而不影响 WDF 通道结果。

PO-0788

急性胰腺炎患者的血清 HCY 水平与其发生 SIRS 的相关性研究

王宏波[1]、王宇鹏[1]、石婷[1]、彭剑桥[1]、谭超超[1]、叶湘漓[2]
1. 湖南省人民医院
2. 湖南师范大学医学院

目的 寻找急性胰腺炎（AP）患者血清 HCY 水平与其发生 SIRS 之间的关系，探讨高 HCY 血症是否是 AP 患者发生 SIRS 的独立风险因子。
方法 收集 AP 患者入院后 48 h 内的 HCY 数据，依据其血清水平分为<15 μmoL/L 组、15~20 μmoL/L 组和>20 μmoL/L 组，比较在不同血清 HCY 水平下 AP 患者 SIRS 的发生率和平均持续时间的差异；接着收集 HCY、APACHE Ⅱ评分、CTSI、C 反应蛋白和白细胞计数等数据进行 ROC 曲线分析，探讨 HCY 能否作为 SIRS 的预测因子；再将发生 SIRS 的 AP 患者的血清 HCY 水平分别与 APACHE Ⅱ评分和 CTSI 进行分析，探讨高 HCY 血症是否影响发生 SIRS 的 AP 患者的预后；最后对各变量进行单因素和多因素 Logistic 回归分析，探讨高 HCY 血症是否是 AP 患者发生 SIRS 的独立风险因子。
结果 与<15 μmoL/L 组相比，15~20 μmoL/L 组和>20 μ moL/L 组的 SIRS 发生率和平均持续时间均显著增加，且差异有统计学意义（p <0.001）；ROC 曲线分析显示，高 HCY 水平对于 AP 患者发生 SIRS 有一定的预测作用（AUC=0.643）；Pearson 相关分析显示，发生 SIRS 的 AP 患者，其 HCY 水平与 CTSI 之间存在明显的相关性（r=0.313，p <0.001）；同时，发生 SIRS 的 AP 患者的 APACHE Ⅱ评分越高，其 HCY 水平也越高（p <0.001）；单变量和多变量 Logistic 回归分析表明，高 HCY 血症是 AP 患者发生 SIRS 的独立风险因子（HR：1.010；95% CI：0.997-1.018；p =0.039）。
结论 血清 HCY 水平与 AP 患者发生 SIRS 密切相关，高 HCY 血症可能是 AP 患者发生 SIRS 的独立风险因子。

PO-0789

应用 ROC 曲线确定孕妇 IgG-抗 A、抗 B 抗体效价在 ABO 新生儿溶血病的最佳临界值

张强[1]、张敏[2]
1. 东南大学附属中大医院
2. 东南大学

目的 应用 ROC 曲线评价孕妇抗体（IgG 抗-A、抗-B）效价在预测 ABO 新生儿溶血病中的诊断价值，分别确定其最佳诊断临界值。
方法 选择本院 440 例母胎血型不合的 O 型孕妇，应用微柱凝胶法检测 IgG-抗 A 抗体 259 人次（病例组 22 例，对照组 234 例），IgG-抗 B 抗体 254 人次（病例组 16 例，对照组 238 例），进行非匹配病例对照研究和绘制 ROC 曲线，利用 Youden 指数确定最佳临界值，检测新生儿溶血指标（溶血三项）。
结果 IgG 抗 A、抗 B 抗体效价在病例组均显著高于对照组（p<0.05），ABO-HDN 发病率在 IgG-抗 A 检测组和 IgG-抗 B 检测组分别为 8.60%、6.30%。孕妇 IgG-抗 A、抗 B 抗体的 ROC 曲线下面积分别为 0.947、0.959，均具有显著统计学意义（p<0.05），最佳临界值均为 1:256。
结论 ABO 新生儿溶血病时孕妇 IgG-抗 A、抗 B 抗体效价显著升高，产前筛查 O 型孕妇的抗体（IgG-抗 A、抗 B）效价对于 ABO 新生儿溶血病的发生具有极佳的早期预测价值。ROC 曲线简单有效，可直观确定诊断试验的最佳临界值。

PO-0790

NLRP3 炎症小体对脑血管周细胞生长和功能的影响

权文强、李冬
上海市同济医院(同济大学附属同济医院)

目的 探究 NLRP3 炎症小体对脑血管周细胞生长和功能的影响及作用机制。收集 9 月龄正常（NLRP3+/+）及敲除（NLRP3-/-）的转基因小鼠大脑，左侧大脑经 PFA 固定后切片，免疫荧光染色分析大脑血管总长、血管周细胞数量变化；右侧大脑组织匀浆后分离血管，采用 Western blot 法检测血管匀浆中周细胞标志物 PDGFRβ 和 CD13 的蛋白水平；利用不同浓度 NLRP3 抑制剂 MCC950 处理脑周细胞株 HBPC/ci37,MTT 法检测周细胞增殖情况，Western blot 检测 PCNA、Ki67、PDGFRβ、CD13 等蛋白变化；利用不同浓度重组的 IL-1β 蛋白刺激 HBPC/ci37 细胞，Western blot 检测 AKT、ERK、NFκB 等增殖相关信号通路激活情况。
结果 免疫荧光染色显示 NLRP3-/-转基因小鼠的脑血管总长与 NLRP3+/+小鼠相比明显缩短（P<0.01），血管周细胞明显减少（P<0.05）；血管匀浆的 Western blot 结果显示周细胞标志物 PDGFRβ 和 CD13 的蛋白水平明显下降（P<0.01）。体外实验结果显示不同浓度的 MCC950 均能够抑制周细胞 HBPC/ci37 增殖，且抑制作用呈浓度依赖性（P<0.01）；MCC950 同时也抑制了周细胞 HBPC/ci37 的 p-AKT（P<0.01），p-ERK（P<0.05）蛋白水平，作用呈浓度依赖性；而加入 IL-1β 蛋白刺激周细胞 HBPC/ci37 可激活 p-AKT 蛋白表达水平（P<0.01），PDGFRβ、CD13 的表达水平升高（P<0.01）；加入 AKT 抑制剂后 p-GSK3β 水平明显下降（P<0.001），同时 PDGFRβ、CD13 的表达水平明显下降（P<0.05）。
结论 NLRP3 炎症小体参与脑血管周细胞的生长和增殖，其通过激活 AKT 信号通路来维持大脑中周细胞的正常功能水平。

PO-0791

武汉地区孕妇地中海贫血基因突变类型与频率分析

里进[1]、杨媛媛[2]、叶光明[1]、李一荣[1]
1. 武汉大学中南医院
2. 湖北中医药大学

目的 对湖北武汉孕妇地中海贫血携带率、基因突变类型、基因频率情况等进行分析，了解本地区地中海贫血基因分布和基因突变类型，为预防、控制武汉重型及中间型地中海贫血患儿的出生和地中海贫血孕妇临床治疗提供数据支撑。
方法 通过收集从 2018 年 1 月至 2021 年 3 月对 2452 例婚前、孕前、产前、体检及新生儿等在武汉中南医院进行基因筛查的人员进行调查（除重复基因筛查人员和不合格筛查人员外），记录地中海贫血携带率，基因突变类型和基因突变频率。
结果 在 2452 例地中海贫血基因分析中，地贫基因携带者 301 例，携带率为 12.28%。α－地中海贫血 158 例，携带率为 6.44%，其中 α－地贫孕妇人 78；β－地中海贫血 141 例，携带率为 5.75%，其中 β－地贫孕妇 47 人；复合型地贫 2 例（α3.7 杂合和 IVS-2-654 杂合）其中孕妇一人，携带率为 0.082%。缺失型 α－地贫（SEA 杂合，α3.7 杂合，α4.2 杂合，α4.2 纯合 SEA 和 α3.7 双重缺失）孕妇分别为 21 例，46 例，6 例，1 例，1 例；突变型 α－地贫（CS142 杂合，QS125 杂合）孕妇分别为 1 例，2 例；突变型 β－地贫（-28 杂合，-29 杂合，Cap 杂合，CD17 杂合，CD26 杂合，CD41-42 杂合，CD71-72 杂合，IVS-2-654 杂合）孕妇分别为 1 例，1 例，2 例，8 例，1 例，14 例，2 例，18 例。
结论 从本研究结果推断武汉地区地贫分布特点：α－地中海贫血前三位主要为 SEA 杂合基因型（占比为 41.77%），α3.7 杂合基因型（占比 39.24%），α4.2 杂合基因型（占比 7.59%）；β－

地中海贫血前三位主要为 IVS-2-654 杂合基因型（占比 41.84%），CD41-42 杂合（占比 26.95%），CD17 杂合（占比 22.7%）。

PO-0792

Development and implementation of a LIS-based validation system for autoverification toward zero defects in the automated reporting of laboratory test results

Di Jin[1]、Qing Wang[1]、Dezhi Peng[1]、Jiajia Wang[1]、Bijuan Li[2]、Yating Cheng[2,3]、Nanxun Mo[2,3]、Xiaoyan Deng[2]、Ran Tao[2,3]
1. Jinan Kingmed Center for Clinical Laboratory
2. 广州医科大学
3. 广州金域医学检验中心有限公司

Background Validation of the autoverification function is one of the critical steps to confirm its effectiveness before use. It is crucial to verify whether the programmed algorithm follows the expected logic and produces the expected results. This process has always relied on the assessment of human-machine consistency and is mostly a manually recorded and time-consuming activity with inherent subjectivity and arbitrariness that cannot guarantee a comprehensive, timely and continuous effectiveness evaluation of the autoverification function. To overcome these inherent limitations, we independently developed and implemented a laboratory information system (LIS)-based validation system for autoverification.
Methods We developed a correctness verification and integrity validation method (hereinafter referred to as the "new method") in the form of a human-machine dialog. The system records personnel review steps and determines whether the human-machine review results are consistent. Laboratory personnel then analyze the reasons for any inconsistency according to system prompts, add to or modify rules, reverify, and finally improve the accuracy of autoverification.
Results The validation system was successfully established and implemented. For a dataset consisting of 833 rules for 30 assays, 782 rules (93.87%) were successfully verified in the correctness verification phase, and 51 rules were deleted due to execution errors. In the integrity validation phase, 24 projects were easily verified, while the other 6 projects still required the additional rules or changes to the rule settings. Taking the Hepatitis B virus (HBV) test as an example, from the setting of 65 rules to the automated releasing of 3000 reports, the validation time was reduced from 452 hours (manual verification) to 275 hours (new method) , a reduction in validation time of 177 hours. Furthermore, 94.6% (168/182) of laboratory users believed the new method greatly reduced the workload, effectively controlled the report risk and felt satisfied. Since 2019, over 3.5 million reports have been automatically reviewed and issued without a single clinical complaint.
Conclusion To the best of our knowledge, this is the first report to realize autoverification validation as a human-machine interaction. The new method effectively controls the risks of autoverification, shortens time consumption, and improves the efficiency of laboratory verification.

PO-0793

Systematic Approach of Reference Genes for Pan-Cancer in Platelets Based on RNA-Sequence Data

guishu yang、huaichao luo
Sichuan Cancer Hospital & Institute, Sichuan Cancer Center, School of Medicine, University of Electronic Science and Technology of China

Background In recent years, there are many studies have shown that some messenger RNA (mRNA) in platelets were potential biomarkers for the diagnosis of early-stage pan-cancer, and RT-qPCR allows presence of these mRNA transcripts to be quantified. Therefore, studies about more accurate normalization of transcript level were required, which were performed by using the most stable reference genes.
Methods The candidate reference genes were screened out from the dataset of the platelets' transcriptome of the pan-cancer and the stability of the gene expression was verified in systematic approaches. Here screening of reference genes in platelet for pan-cancer has been done and evaluation of the stability gene expression was performed in systematic approaches. Bioinformatics and functional analysis were performed from RNA-seq of tumor-educated platelets dataset followed by gene expression analysis and validation of candidate genes.
Results 285 candidate genes were obtained from the dataset GSE68086, and seven reference genes (YWHAZ, GNAS, GAPDH, OAZ1, PTMA, B2M and ACTB) were generated from 95 candidate genes after optimizing the mean > 1 and coefficient of variation (CV) < 1 from the 285 of our pre-evaluation reference genes and 73 known reference genes. Finally, three highly stable expression candidates: GAPDH, B2M and ACTB were selected and validated in 50 subjects.
Conclusions We identified seven reference genes, three of which: GAPDH, B2M and ACTB were found to be highly stable reference genes which are sorted orderly through the different algorithm. Finally, GAPDH is recommended as the most suitable reference gene for platelet transcript analysis.

PO-0794

长沙地区 HbA1c 参考区间的建立

向哲邑、叶思霈
湖南省人民医院

目的 通过统计分析建立适用于长沙地区临床实验室糖化血红蛋白的一致性参考区间，并验证其适用性。
方法 选取 2020 年 7 月到 2021 年 1 月期间若干例体检的健康志愿者，统一于每天的 8：00-10：00 采集体检人员的静脉血液，进行 HbA1c 检测。按参考人群的纳入及排除标准（即无慢性疾病、未接受药物或饮食治疗等）选择 200 例参考人群，分为男、女两组，每组按年龄分别分为≤45 岁（青年组），45～60 岁（中年组），≥60 岁（老年组）。其中青年组 78 例，中年组 54 例，老年组 69 例，记录其相关的基本资料，收集其 HbA1c 的数值，对其进行统计学分析，建立适用于长沙地区健康人群 HbA1c 的一致性参考区间。
结果 长沙地区健康成人 HbA1c 总体水平 95%的参考区间为 5.1%~6.3%，女性 HbA1c 水平 95%的参考区间为 5.1%~6.3%，男性 HbA1c 水平 95%的参考区间为 5.2%~6.4%。由于对男、女总体水平的分析发现性别间 HbA1c 水平的差异无统计学意义，故参考区间并未分性别建立。由于各年龄组 HbA1c 水平的分布均服从正态分布，且中年组和老年组之间的两两比较差异性不显著，故合并成中老年组，得出 HbA1c 水平的参考区间为：青年组 5.13%~6.13%，中老年 5.29%~6.58%。

结论 综上所述，长沙地区健康成人 HbA1c 总体水平为 5.1%~6.3%，性别间 HbA1c 水平的差异无统计学意义。按年龄组建立本地区 HbA1c 水平的参考区间为：青年组 5.13%~6.13%，中老年 5.29%~6.58%。HbA1c 水平随着年龄的增长有明显上升的趋势。

PO-0795

建立儿童及青少年骨源性碱性磷酸的参考区间

陈灿星[1]、胡志峰[1,2]、姚少濠[1,2]、张玲[1,2]、刘勇[1,2]、褚冬霞[1]、宗智慧[1]、陶然[1,2]
1. 广州金域医学检验中心有限公司
2. 广州医科大学金域检验学院

目的 通过回顾 23959 名健康体检者（年龄区间 0-18 岁）的骨源性碱性磷酸酶（Bone Alkaline Phosphatase）定量检测结果，建立不同年龄段，不同性别的骨源性碱性磷酸酶的参考区间。
方法 回顾分析 2020 年 7 月至 2020 年 12 月送检本中心实验室的健康体检人群（儿童和青少年），用贝克曼库尔特 ACCESS2 免疫分析仪定量检测骨源性碱性磷酸酶的结果，按年龄、性别分组，采用双侧限值 P2.5～P97.5，建立儿童及青少年（0-18 岁）正常的参考区间，并观察骨源性碱性磷酸酶在儿童及青少年的分布特征。
结果 1 岁以下骨源性碱性磷酸酶参考区间为（44.28-121.91）μg/L，1-3 岁参考区间为（38.29-120.07）μg/L，4-6 岁参考区间为（42.27-117.35）μg/L，7-9 岁参考区间为（38.07-118.69）μg/L，且 9 岁以下，男孩和女孩间骨源性碱性磷酸酶的结果差异无统计学意义（P＞0.05）。10-18 岁男性参考区间为（20.58-126.88）μg/L，10-18 岁女性参考区间为（11.68-121.58）μg/L，且男女间骨源性碱性磷酸酶的结果差异有统计学意义（P＜0.05）。
结论 实验室应根据本地区检测人群、实验室仪器和检测试剂建立骨源性碱性磷酸酶定量分析的参考区间。儿童及青少年，骨源性碱性磷酸酶浓度明显比成人高，且 1 岁以下及青春期间浓度最高。建立儿童及青少年骨源性碱性磷酸的不同年龄和性别的参考区间，有助于辅助筛查维生素 D 缺乏性、佝偻病等疾病。

PO-0796

药食同源小分子化合物对成骨细胞分化和骨形成的调控作用

印崇[1,2,3,4]、卫萍[5]、于阳[6]、梁欢[3]、田野[3]、邓旭东[3]、骞爱荣[3]、郭晓兰[1,4]
1. 川北医学院附属医院检验科
2. 川北医学院附属医院院士专家工作站&表观遗传与 RNA 药物研究室
3. 西北工业大学生命学院
4. 川北医学院检验系&转化医学研究中心
5. 广西农业科学院
6. 天津医科大学药学院

目的 小分子化合物研究一直是现代医学领域的热点，而中药和食物中的小分子活性化合物成分研究在近年来引起了愈来愈多的关注。新近研究发现，一些小分子化合物可以通过调控成骨细胞中关键调控因子的功能，对成骨细胞的功能起调控作用，该方向目前在骨骼系统疾病研究领域受到了广泛的关注。作者前期文献调查发现，食品用火麻中的多肽类成分对于脊椎动物的钙沉积和 wnt 信号通路有显著的促进作用，因此推测火麻多肽可能是一种潜在的药食同源小分子化合物，为了深入研究火麻多肽的功能，开展了如下研究。
方法 通过碱提法提取了食用火麻蛋白，并使用胰蛋白酶对火麻蛋白进行酶解消化，经超滤、透析后合成火麻多肽。验证火麻蛋白和火麻多肽的细胞学和动物学毒性后，在安全浓度下用火麻蛋白和火麻多肽处理前成骨细胞 MC3T3-E1 和人骨髓间充质干细胞，并用火麻多肽对去卵巢骨质疏松小鼠进行灌胃，检测处理后细胞的成骨分化水平，以及小鼠的骨形成水平。

结果 结果表明，火麻蛋白和火麻多肽不具备任何细胞学和动物学毒性，细胞学实验结果表明，火麻蛋白和火麻多肽处理，可以显著提高前成骨细胞 MC3T3-E1 和人骨髓间充质干细胞的碱性磷酸酶活性和成骨标志基因表达水平，此外对于 Bmp2 和 wnt 信号通路的下游基因表达均有显著的促进效果；体内实验表明，火麻多肽可以对去卵巢骨质疏松小鼠的骨质疏松起显著的治疗作用。
结论 本研究证明了火麻蛋白和火麻多肽对于成骨细胞分化和骨形成的促进作用，说明了火麻中有效成分可以起到促进骨形成，抑制骨质疏松的效果。研究结果对于推进火麻这一特色作物的药食同源和转化医学研究有积极的促进作用。

PO-0797

LncRNA LOC100912373 modulates PDK1 expression by sponging miR-17-5p to promote the proliferation of fibroblast-like synoviocytes in rheumatoid arthritis

Chang Fan、xiaoya cui、sen chen、shaopeng huang、kaiquan huang、hui jiang
The First Affiliated Hospital of Anhui University of Chinese Medicine

Rheumatoid arthritis (RA) is a common autoimmune disease and characterized by chronic inflammation, abnormal synovial cell proliferation, and joint swelling and tenderness, and it causes patients substantial pain. To date, the pathogenesis of RA remains unclear, and specific treatment is still lacking in the clinic. Evidence from previous research indicated that the long noncoding RNA (lncRNA) LOC100912373 is a key lncRNA and involved in RA. However, our understanding of the specific mechanism of lncRNA LOC100912373 in RA development and progression is still in its infancy. In this study, fibroblast-like synoviocytes (FLSs) were cultured by enzyme-dispersed and substrate-attached explant methods. The MTT method, flow cytometry and transmission electron microscopy were used to determine the effect of lncRNA LOC100912373 on FLSs. The expression of key genes such as lncRNA LOC100912373, miR-17-5p, PDK1 and AKT in FLSs was detected by RT-qPCR, immunofluorescence and Western blot. The localization of lncRNA LOC100912373 was determined by fluorescence in situ hybridization. The specific targeting relationship between lncRNA LOC100912373 and miR-17-5p/PDK1 was verified by RNA immunoprecipitation and luciferase reporter gene analysis. The results showed that lncRNA LOC100912373 localized in the cytoplasm and was highly expressed in the synovial tissues and FLSs of AA rats. LncRNA LOC100912373 overexpression promoted the proliferation of FLSs. In addition, lncRNA LOC100912373 could bind to miR-17-5p, and the expression of lncRNA LOC100912373 was negatively correlated with miR-17-5p and positively correlated with PDK1/AKT. In conclusion, lncRNA LOC100912373 may upregulate the expression of PDK1 by sponging miR-17-5p, accelerating the phosphorylation of AKT and inducing the proliferation of FLSs, thus promoting the occurrence and development of RA.

PO-0798

Transcriptome-wide high-throughput m6A sequencing of differential m6A methylation patterns in the human rheumatoid arthritis fibroblast-like synoviocytes cell line MH7A

Hui Jiang [1]、kefeng cao[2]、chang fan[1]、xiaoya cui[1]、yanzhen ma[1]、kaiquan huang[1]
1. 安徽中医药大学第一附属医院(安徽省中医院)
2. 太和县中医院

Introduction N6-methyladenosine (m6A) is the most frequent internal modification in eukaryotic mRNAs and is closely related to the occurrence and development of many diseases, especially tumors. However, the relationship between m6A methylation and rheumatoid arthritis (RA) is still a mystery.
Methods Two high-throughput sequencing methods, namely, m6A modified RNA immunoprecipitation sequence (m6A-seq) and RNA sequence (RNA-seq) were performed to identify the differentially expressed m6A methylation in human rheumatoid arthritis fibroblast-like synoviocytes cell line MH7A after stimulation with TNF-α. Gene Ontology (GO) analysis and Kyoto Encyclopedia of Genes and Genomes (KEGG) analyses were used to obtain enriched GO terms and significant KEGG pathways. Then, four candidate genes, Wilmstumor 1-associating protein (WTAP), receptor-interacting serine/threonine protein kinase 2 (RIPK2), Janus kinase 3 (JAK3) and tumor necrosis factor receptor SF10A (TNFRSF10A) were selected to further validate the m6A methylation, mRNA and protein expression levels in MH7A cells and synovial tissues of adjuvant arthritis (AA) rats by RT-qPCR and western blot.
Results Using m6A-seq, we identified a total of 206 genes with differentially expressed m6A methylation, of which 118 were significantly upregulated and 88 genes were significantly downregulated. Likewise, 1207 differentially mRNA expressed mRNAs were obtained by RNA-seq, of which 793 were upregulated and 414 downregulated. Further joint analysis showed that the m6A methylation and mRNA expression levels of 88 genes changed significantly, of which 30 genes displayed increased m6A methylation and decreased mRNA expression, 57 genes displayed decreased m6A methylation and increased mRNA expression increased, and 1 gene displayed increased m6A methylation and increased mRNA expression. GO and KEGG analyses indicated that these unique genes were mainly enriched in inflammation-related pathways, cell proliferation and apoptosis. In addition, the validations of WTAP, RIPK2, JAK3 and TNFRSF10A were in accordance with the m6A and RNA sequencing results.
Conclusion This study established the transcriptional map of m6A in MH7A cells and revealed the potential relationship between RNA methylation modification and RA related genes. The results suggested that m6A modification was associated with the occurrence and course of RA to some extent.

PO-0799

A novel pooling strategy with sample concentration for screening of SARS-CoV-2

Xueliang Wang 、Zhongqiang Huang、Jian Song、Ran Zhao、Yanqun Xiao、Hualiang Wang
Shanghai Centre for Clinical Laboratory

Purpose The COVID-19 pandemic caused by SARS-CoV-2 has resulted in significant shortages of RT-PCR testing supplies. Sample pooling has the potential to improve available RT-PCR testing capacity. However, compromised sensitivity caused by the sample dilution in the traditional sample pooling (TSP) can lead to higher rates of false-negative results in low-viral-load

specimens. We aim to overcome the challenge by a novel strategy, namely sample pooling concentration (SPC).
Methods Three or eight individual nasopharyngeal samples previously tested for SARS-CoV-2 were pooled into a single sample. Automated RNA extraction were processed individually and in pools (TSP strategy and the SPC strategy) and subsequently tested by RT-PCR.
Results Our results show that the sample dilution from traditional pooling (TSP strategy) led to a mild, but expected, loss in Ct value. This drop in sensitivity was responsible for all of the false-negative results in samples with low viral loads. However, use of the SPC strategy yielded 100% accuracy with no loss of sensitivity.
Conclusion We conclude that the SPC method as a resource-efficient strategy may facilitate early detection and elimination of COVID-19 community transmission.

PO-0800

Recent Progress of Nanozymes in the Detection of Pathogenic Microorganisms

Fengfeng Zhao
Department of Clinical Laboratory of Zhongda Hospital, Southeast University

Infectious diseases are among the world's principal health problems. It is crucial to develop rapid, accurate and cost-effective methods for the detection of pathogenic microorganisms. Natural enzymes are generally proteins but also include catalytic RNA produced by living cells. Recently, considerable progress has been achieved in the field of inorganic enzyme mimics (nanozymes). Compared with natural enzymes, nanozymes have higher stability and lower cost. More interestingly, their properties can be designed for various demands. Herein, we introduce the latest research progress on the detection of pathogenic microorganisms by using various nanozymes. We also discuss the current challenges of nanozymes in biosensing and provide some strategies to overcome these barriers.

6. Department of Surgery, Affiliated Tumor Hospital of Nantong University, Nantong, China

The widespread prevalence of coronavirus disease-2019 (COVID-19) which is caused by severe respiratory syndrome coronavirus 2 (SARS-CoV-2) infection, has resulted in a severe global public health emergency. However, there are no sensitive biomarkers to predict the disease prognosis of COVID-19 patients. Here, we have identified interleukin-8 (IL-8) as a biomarker candidate to predict different disease severity and prognosis of COVID-19 patients. While serum IL-6 become obviously elevated in severe COVID-19 patients, serum IL-8 was easily

detectible in COVID-19 patients with mild syndromes. Furthermore, IL-8 levels correlated better than IL-6 levels with the overall clinical disease scores at different stages of the same COVID-19 patients. Thus, our studies suggest that IL-6 and IL-8 can be respectively used as biomarkers for severe COVID-19 patients and for COVID-19 disease prognosis.

CD4+，CD8+T 淋巴细胞计数和重症新型冠状病毒肺炎相关性的 meta 分析

张海鹏[1]、吴婕[2]
1. 天津医科大学第二医院
2. 天津医科大学总医院

Purpose We investigate the relationship between CD4+T counts, CD8+T counts, CD4/CD8 ratio and the severity of COVID-19 patients.
Methods We searched PubMed, EMBASE and Web of Sciences without date (until Jun 2, 2020) or language restrictions.
Results 13 studies included a total number of 1647 patients were considered. Both CD4+T and CD8+T counts significantly reduced in severe COVID-19 group compared with non-severe group [CD4+T (MD: -0.22×10^9/L, 95%CI: -0.27 to -0.17×10^9/L, I^2=89%); CD8+T (MD: -0.14×10^9/L, 95%CI: -0.18 to -0.11×10^9/L, I^2=88%)]. And there was no significant difference in CD4/CD8 ratio (MD: 0.17, 95%CI: -0.12 to 0.46, I^2=91%).The details are presented in Fig 1.
Conclusions Both CD4+T and CD8+T counts may serve as biomarkers for predicting severity of COVID-19.

PO-0803

硫化氢代谢异常影响胚胎转运

宁楠楠
山东大学齐鲁医院

目的 异位妊娠严重影响育龄期女性健康，其中输卵管妊娠所占比例较高。硫化氢是一种气体信号分子，该信号系统参与体内的多种生理和病理过程。胱硫醚-γ-裂解酶和胱硫醚-β-合成酶是硫化氢代谢的两种关键酶。
方法和结果 通过免疫印迹和免疫荧光，发现胱硫醚-γ-裂解酶和胱硫醚-β-合酶存在于人输卵管上皮细胞，硫化氢信号传导抑制输卵管的自发收缩。借助 GYY4137、NaHS 和胱硫醚-β-合成酶敲基因小鼠，发现硫化氢信号传导的异常导致小鼠胚胎滞留在输卵管并且发育滞后。
结论 研究结果揭示了输卵管胚胎运输的新调节机制，为异位妊娠预防和治疗研究提供帮助。

PO-0804

Diagnostic Value of Hemoglobin and Prognostic Nutritional Index for Colorectal Cancer in Familial Adenomatous Polyposis Patients

Xueliang Ding、Shaobo Tian、Yanan Chu、Jia Hu、Guobin Wang、Lin Wang、Zheng Wang
Wuhan Union hospital

Colorectal cancer (CRC) is a major cause of mortality in familial adenomatous polyposis (FAP) patients. We aimed to analyze the value of hemoglobin (Hb) and prognostic nutritional index (PNI) for CRC diagnosis in FAP patients. A total of 43 patients were considered with FAP from January 2005 to June 2020 in Wuhan Union Hospital, 19 of them were confirmed as CRC patients. The differences of Hb and PNI levels between FAP patients with CRC and without CRC were detected by Non-parametric test or Student's t-test. Logistic regression analysis was performed to analyze the factors affecting Hb and PNI levels. The diagnostic efficacy of Hb and PNI for CRC in FAP patients was evaluated by receiver operating characteristic (ROC) curve analysis. We found that Hb and PNI levels were lower in FAP patients with CRC compared with patients without CRC. In CRC patients, lower Hb levels were associated with advanced lymph node metastasis and stage; lower PNI levels were related to larger tumor size. CRC was the main factor leading to the low levels of Hb (OR=0.179, 95%CI: 0.047-0.674) and PNI (OR=0.231, 95%CI: 0.057-0.932) in FAP patients. The area under the ROC of Hb and PNI for CRC diagnosis in FAP patients were 0.703 (95%CI: 0.545-0.861) and 0.765 (95%CI: 0.622-0.909), respectively. The value of Hb and PNI are closely associated with CRC, and can be used for CRC diagnosis in FAP patients.

PO-0805

双氢青蒿素下调食管癌细胞 hTERT 的分子机制

李青容
川北医学院

目的 探讨双氢青蒿素（DHA）下调人食管癌细胞端粒酶逆转录酶（hTERT）的分子机制。
方法 采用 CCK8 和平板克隆形成实验检测 DHA 对食管癌细胞株 Eca109、KYSE150 及 TE1 细胞增殖的影响；采用 Transwell 实验和划痕实验检测 DHA 对食管癌细胞迁移的影响；采用荧光显微镜和流式细胞术检测 DHA 处理后的食管癌细胞内活性氧（ROS）的含量；采用 qPCR 和蛋白免疫印迹检测相关 mRNA 和蛋白的表达水平。通过裸鼠皮下注射 Eca109 细胞建立食管癌裸鼠移植瘤，监测给药后肿瘤体积的变化，WB 和 IHC 检测处理组 hTERT 蛋白表达变化。
结果 DHA 能在体外显著抑制食管癌细胞株 Eca109、KYSE150 和 TE1 细胞增殖和迁移，并能显著下调 hTERTmRNA 和蛋白表达，且呈时间和剂量依赖性。进一步的分子机制研究显示， DHA 显著上调食管癌细胞内活性氧（ROS）产生，并下调 hTERT 启动子结合的转录因子 SP1 表达。采用抗氧化剂（NAC）抑制 DHA 诱导的食管癌 ROS 产生后，SP1 和 hTERT 下调程度降低。此外，在上述细胞株中过表达 SP1 后，hTERT 蛋白表达水平显著增强，且食管癌 Eca109、KYSE150 和 TE1 细胞的增殖和迁移能力显著增加。在裸鼠体内，DHA 可显著抑制食管癌裸鼠移植瘤的生长，肿瘤体积显著小于对照组，差异有统计学意义（$P<0.05$）；且与对照组相比处理组 hTERT 蛋白表达显著降低。
结论 DHA 通过 ROS/SP1/hTERT 信号轴抑制食管癌细胞增殖和转移，有望成为一种新的抗食管癌药物。

滤泡调节性 T 细胞与滤泡辅助性 T 细胞在 ANCA 相关性小血管炎中的临床意义研究

龙彦[1]、冯景泓[1]、马寅婷[1]、孙媛媛[1]、徐丽娟[2]、宋英[1]、刘忱[1]
1. 北京大学人民医院
2. 北京大学医学部免疫学研究室

目的 探讨滤泡调节性 T 细胞与滤泡辅助性 T 细胞在 ANCA 相关性小血管炎患者血清自身抗体产生中的潜在作用；
方法 本研究共入选 26 例活动期 ANCA 相关性小血管炎（AAV）患者和 22 例年龄及性别匹配的对照组患者，利用流式细胞术对循环 TFR 及其亚群、TFH 及其亚群进行全面系统地分析，采用 ELISA 法检测血清 IL-4、IL-10、IL-12、IL-17A、IL-21 及 TGF-β 等细胞因子，同时收集患者血清 MPO-ANCAs、PR3-ANCAs 及血肌酐等临床资料。
结果 本研究结果显示活动期 AAV 患者循环 TFR 水平和 TFR/ TFH 比值明显降低，且循环 TFR 中转录因子 Helios，FoxP3 及 Ki-67 表达水平显著降低，同时 TFR 功能分子 TIGIT 明显降低而拮抗分子 CD226 表达显著升高，提示 AAV 患者循环 TFR 的功能和增殖能力可能受损。而 TFH 表面功能分子 ICOS 及 PD-1、转录因子 Ki-67 表达水平明显上调，结果提示活动期 AAV 患者中 TFH 的功能增强。此外，AAV 患者中循环记忆 B 细胞和浆细胞水平显著升高，并与 TFR 水平和 TFR/TFH 比值呈明显负相关。另外，TFR、TFR/TFH 比值与血清 MPO-ANCA 水平呈负相关而 TFH 与血清 MPO-ANCA 水平呈正相关。TFR 和 TFR/TFH 比值与肾功能损伤指标血清 SCr，BUN 呈显著负相关，血清 IL-4 和 IL-21 升高与 TFR 和 TFR/TFH 比值减低密切相关。
结论 本研究结果提示 AAV 患者 TFR 降低及 TFR/TFH 失衡与自身抗体水平升高有关，并可能与肾功能损伤密切相关，而血清 IL-4 和 IL-21 升高可能是导致 TFR 变化及其与 TFH 失衡的潜在原因。

医院临床实验室 HIV 感染的筛查、确认及报告

王娟[1]、华文浩[2]、刘芳遥[3]、崔丽艳[4]
1. 北京肿瘤医院
2. 北京大学人民医院
3. 北京市海淀区疾病预防控制中心
4. 北京大学第三医院

艾滋病又称获得性免疫缺陷综合征（Acquired Immune Deficiency Syndrome，AIDS），是由机体感染人类免疫缺陷病毒（human immune deficiency virus，HIV）而引发的全身疾病，疾病后期可继发各种机会性感染、恶性肿瘤和中枢神经系统病变最终导致死亡。感染 HIV 者包括 HIV 感染者和艾滋病患者均为传染源。艾滋病在我国的传播呈现快速增长的趋势，已成为严重威胁我国人民健康的公共社会问题。近几年来中国疾病预防与控制中心对于 HIV 感染筛查策略有所变化，中美间筛查策略也有细微差别。本文简要介绍了 HIV 感染者筛查的血清学生物标志物及中美筛查和确认策略，并对医疗机构 HIV 筛查报告发放模式提出建设性的意见。

PO-0808

Circulating serum exosomal long non-coding RNAs FOXD2-AS1, NRIR, and XLOC_009459 as diagnostic biomarkers for colorectal cancer

Miao Yu [2]、Li Xie[1]、Xingguo Song[1]、YaJing Zhao[1]
1. Department of Clinical Laboratory, Shandong Cancer Hospital and Institute, Shandong First Medical University and Shandong Academy of Medical Sciences
2. Shandong Provincial Third Hospital, Cheeloo College of Medicine, Shandong University

Exosomes derived from cancer cells encapsulate various kinds of tumor-specific molecules, thus can interact with adjacent or distant cells to mediate information exchange. Long non-coding RNAs (lncRNAs) in exosomes have the potential as diagnostic and prognostic biomarkers in different types of cancers. The current study was aimed to identify circulating exosomal lncRNAs for the diagnosis of colorectal cancer (CRC).
Methods Exosomes were isolated from the serum by ultracentrifugation and verified by transmission electron microscope (TEM), qNano and immunoblotting. Exosomal lncRNAs FOXD2-AS1, NRIR, and XLOC_009459 were selected by lncRNA microarray and validated by qPCR in 203 CRC patients and 201 healthy donors. The receiver operating characteristic curve (ROC) was used to assess the diagnostic efficiency of serum exosomal lncRNAs.
Results Exosomal FOXD2-AS1, NRIR, and XLOC_009459 (TCONS_00020073) levels were significantly upregulated in 203 CRC patients and 80 early-stage CRC patients compared to 201 healthy donors, possessing the area under the curve (AUC) of 0.728, 0.660 and 0.682 for CRC, as well as 0.743, 0.660 and 0.689 with 73.1% for early-stage CRC, respectively. Notably, their combination demonstrated the markedly elevated AUC of 0.736 for CRC and 0.758 for early-stage CRC, indicating their potential as diagnostic biomarkers for CRC.
Conclusions Our data suggested that exosomal lncRNAs FOXD2-AS1, NRIR and XLOC_009459 act as the promising biomarkers for the diagnostics of CRC and early-stage CRC.

PO-0809

The significant of blood index and biochemistry index in patients with rheumatoid arthritis

Wei Zhou、Xi Li、Yanting Jiang、Sihui Li、Min Jin、Jingzhe Sui、Jian Wang
First Affiliated Hospital of Guangxi Medical University

Background The aim of this study is to demonstrate the clinical significance of the platelet-to-lymphocyte ratio (PLR) and the ratio of aspartate aminotransferase (AST) to alanine aminotransferase (ALT) in patients with rheumatoid arthritis (RA).
Methods A total of 215 patients with RA, 115 patients with osteoarthritis (OA), and 303 healthy controls (HCs) were included in this study. Data on the AST and ALT levels were collected from liver function test reports, and data on the number of platelets and lymphocytes were obtained from a routine blood analysis. Moreover, all the laboratory parameters of patients with RA, patients with OA, and HCs were retrospectively analyzed.
Results The results obtained in this study showed that patients with RA had the highest PLR and AST/ALT ratio, whereas HCs had the lowest ratios ($p < 0.05$). Receiver operating characteristic (ROC) analysis showed that PLR+AST/ALT can produce highly sensitive and moderate specificity, distinguishing patients with RA from HCs, with a sensitivity of 91.1%, specificity of 75.3%, and area under the ROC curve (AUC) of 0.907. Spearman's analysis showed the PLR is negatively correlated with the erythrocyte sedimentation rate and C-reactive protein levels ($p < 0.005$).

Conclusions Combined detection of PLR and AST/ALT is better than each indicator individually and can improve the diagnostic efficiency of RA.

PO-0810

乳腺癌来源外泌体微小 RNAs 和长链非编码 RNAs 的研究进展

叶婷、万雪、刘靳波
西南医科大学附属医院

外泌体是一种直径为 30-150nm 的微囊泡，其内部包含蛋白质、脂质、代谢产物、微小 RNAs（miRNAs）和长链非编码 RNAs（LncRNAs）等活性物质，它通过介导细胞间信息交流、调节肿瘤微环境促进肿瘤发生发展。miRNAs 和 LncRNAs 是非编码 RNAs 中重要的组成部分，通过外泌体介导在乳腺癌的发生发展中起重要作用。本文主要总结乳腺癌细胞来源外泌体 miRNAs 和 LncRNAs 在乳腺癌进展、微环境和耐药等方面的作用，乳腺癌微环境来源外泌体 miRNAs 和 LncRNAs 对乳腺癌发生发展的影响，以及外泌体 miRNAs 和 LncRNAs 作为乳腺癌的生物标志物的临床潜力。

PO-0811

PD-1 等免疫负调控分子在早期宫颈鳞癌患者手术治疗前后外周血中的表达情况分析

林雨虹
福州市第一医院

目的 探讨 PD-1 及相关细胞因子在宫颈鳞癌(Cervical squamous cell carcinomas, CSCC)外周血中表达的特点及临床意义。
方法 选择 2018 年 1 月到 2020 年 12 月福州市第一医院手术治疗的 50 例 CSCC 患者作为研究对象，通过 ELISA 法和流式细胞术检测外周血中 PD-1、PD-L1、叉头样转录因子 p3（Foxp3）和调节性 T 淋巴细胞(Regulatory T lymphocytes, Tregs)的表达水平，并术后随访 6 个月。
结果 CSCC 组外周血中 PD-1 蛋白(ELISA)是正常对照组的约 59.5 倍(72.64/1.22)，PD-L1 约 10 倍(2.99/0.30)，Foxp3 约 17 倍(38.92/2.23)，且在患者手术后随访中观察到下降趋势；同时 CD4+占淋巴细胞比例是正常对照的约 1.7 倍(0.59/0.34)，Tregs 约 1.7 倍(0.12/0.07)，以及 PD-1+的 Tregs 约 1.8 倍(0.75/0.41)。
结论 PD-1、PD-L1、Foxp3 以及 Tregs 是促进 CSCC 发展的重要因素，可作为预判 CSCC 临床手术疗效的潜在的生物靶标。

PO-0812

妊娠晚期血脂与妊娠期并发症及妊娠结局的关系

李偌铱、李新月
空军特色医学中心

目的 近年来随着我国居民生活方式的改变，人群血脂异常总体患病率明显升高，且肥胖及高龄产妇逐渐增多，妊娠期血脂水平会进一步升高，可造成病理性高脂状态。妊娠晚期脂质代谢异常可能导致患者产后发生脂代谢异常的风险增加，且新生儿发生早产、巨大儿、胎儿生长受限及将来患心血管疾病的概率增加，且妊娠期间脂质代谢异常与子痫前期、妊娠期糖尿病、肝内胆汁淤积及自发

性早产发病明显相关，严重影响母儿预后。本文旨在探索妊娠晚期血脂水平与妊娠期并发症及围产期结局的关系，并综合分析孕晚期血脂水平对妊娠结局的影响。
方法 回顾性选取我院 2018 年 3 月至 2019 年 2 月定期产前检查并分娩的孕晚期孕妇，分为血脂正常组和血脂异常组，并收集所有孕妇产检资料及妊娠结局资料，比较不同孕期并发症孕妇的血脂水平，并比较血脂正常组和异常组不良妊娠结局的发生情况。
结果 血脂异常组孕妇年龄、孕前 BMI 及孕晚期 BMI 均明显高于血脂正常组，差异有统计学意义(P<0.05)；血脂异常组 GDM（妊娠期糖尿病）、HDCP（妊娠期高血压）发病率均高于血脂正常组，但无统计学差异(P>0.05)；孕晚期高 TC 及 LDL-C 降低是妊娠期糖尿病的危险因素(P<0.05)；孕晚期血脂指标与 HDCP 发生风险没有相关性(P>0.05)；妊娠期高血压疾病组 TG 明显高于正常妊娠组，差异有统计学意义(P<0.05)；但血脂正常组与血脂异常组的围产期结局包括剖宫产、早产、巨大儿、胎膜早破、胎儿窘迫及产后出血，均没有发现统计学差异(P>0.05)。
结论 妊娠期脂代谢异常与妊娠期并发症关系密切，因此监测孕期血脂水平并及时控制，有利于改善母婴妊娠结局。

PO-0813

Analysis of association between thyroid-associated hormones and cardiovascular risk factors in older people by mining real-world data

Chaochao Ma、Xinqi Cheng、Ling Qiu
Department of Clinical Laboratory, Peking Union Medical College Hospital, Peking Union Medical College & Chinese Academy of Medical Science

Background The association between thyroid-related hormones and cardiovascular disease risk factors(CRFs) in older people is unclear. The study aims to analyze the association between thyroid-related hormones and CRFs and their clustering in the elderly.
Methods 3213 older people were included in our study. Thyroid-related hormones and other medical information were downloaded from electronic health records. Binary logistic regression models were established to calculate the odds ratios (ORs) for single CRFs according to the thyroid associated hormones quartile. Disordered multiclass logistic regression was performed to analyze the association between clustering of CRFs and level of thyroid hormones.
Results The influence of TSH of higher level within the reference interval on dyslipidemia was statistically significant. (Q4: OR=1.396, 95% CI :1.104-1.765, P=0.005). The higher level of FT3 level within the reference interval had a association with dyslipidemia (Q4:OR=0.587,95% CI :0.467-0.738,P<0.001) and overweight (Q3:OR=1.433, 95% CI:1.131-1.81; Q4:OR=1.388, 95% CI:1.087-1.771). High level of FT4 within the reference interval is statistically related to diabetes(Q4:OR=1.685, 95%CI 1.050-2.704) and overweight (Q4:OR=0.697, 95% CI:0.554-0.875). Compared with Q1 level, Q2 (OR=0.772, 95% CI: 0.609-0.978, P=0.032), Q3 (OR=0.767,95% CI:0.600-0.979, P=0.033) and Q4 (OR=0.645,95% CI:0.498-0.836, P=0.0001) levels of TT4 had a statistically significant impact on overweight. Individuals with high level of TSH and TT3 within RI were more likely to have clustered CRFs (³3 risk factors) than those with low level, while TT4 was the opposite.
Conclusion The association between thyroid associated hormones and CRFs in elderly were analyzed and it provided reference for thyroid hormone management in patients.

PO-0814

血吸虫病 Sj26GST-mRNA 疫苗的免疫原性研究

廖琳
郴州市第一人民医院

目的 体外合成血吸虫病 Sj26GST-mRNA 候选疫苗并评价其免疫原性。
方法 利用信息学软件分析 Sj26GST 基因序列的密码子偏好性、GC 含量和 mRNA 二级结构，优化 Sj26GST 编码区序列，并将 β 球蛋白 3'和 5'UTR 序列插入优化序列的两端；将上述序列连接到 pcDNA3.1（+）上，体外转录，琼脂糖凝胶电泳鉴定序列的准确性；利用脂质体（Lip2000）将 Sj26GST-mRNA 转染到 HeLa 细胞中，Western blot 鉴定其在真核细胞内的表达；Sj26GST-mRNA 与鱼精蛋白 1:1 混合于 Balb/c 小鼠左后腿股四头肌肌肉注射免疫 3 次（每间隔两周免疫一次），分别在 2、4、6、8 周小鼠尾部收集免疫后的血清，ELISA 法检测各组小鼠血清中 Sj26GST 特异性 IgG 水平；无菌分离各组小鼠脾淋巴细胞，ELISA 法检测脾淋巴细胞上清中 TNF-α、INF-γ、IL-4、IL-6 的含量其增值水平；流式细胞术分析了 Sj26GST-mRNA 免疫 Balb/c 小鼠脾细胞内 T 淋巴细胞表型。
结果 生物信息学软件分析显示优化后的 Sj26GST 基因序列具有更高的稳定性，体外转录后琼脂糖凝胶电泳显示 PCR 扩增到与预期大小（5000bp）一致的特异性条带；Western blot 检测 Sj26GST-mRNA 成功在 HeLa 细胞中表达；Sj26GST-mRNA 免疫 Balb/c 小鼠后第 2 周即产生 Sj26GST 蛋白特异性抗体，第 8 周达到最大；末次免疫 14 d 后，Sj26GST-mRNA 免疫的 Balb/c 小鼠脾淋巴细胞增殖指数明显高于对照组；Sj26GST-mRNA 免疫的 Balb/c 小鼠脾淋巴细胞上清中 TNF-α、IFN-γ、IL-6 含量显著增加，IL-4 的含量没有统计学差异。
结论 成功构建稳定表达的 Sj26GST-mRNA 候选疫苗可诱导高水平的特异性 Sj26GST 蛋白抗体和 Th1 型细胞免疫应答。

PO-0815

关于中国计量学院研制的新型冠状病毒核酸标准物质 GBW(E)091089 和 GBW(E)091090 适用性讨论

吴俊华
杭州迪安医学检验中心有限公司

目的 验证中国计量学院新型冠状病毒核酸标准物质 GBW(E)091089、GBW(E)091090 的 1ab(ORF1ab)基因片段是否在中山大学达安基因股份有限公司、圣湘生物科技股份有限公司、上海复星长征医学科学有限公司、上海伯杰医疗科技有限公司研制的新型冠状病毒核酸检测试剂盒（RT-PCR 法）1ab(ORF1ab)基因检测片段范围内。
方法 将中国计量学院新型冠状病毒核酸标准物质 GBW(E)091089 稀释，按照各试剂盒要求反应体系加入反应液，重复 20 孔，上扩增仪进行扩增，分析 1ab(ORF1ab)基因检出情况。
结果 上海伯杰医疗科技有限公司研制的新型冠状病毒核酸检测试剂盒（RT-PCR 法）能够检测出 1ab(ORF1ab)基因，中山大学达安基因股份有限公司、圣湘生物科技股份有限公司、上海复星长征医学科学有限公司研制的新型冠状病毒核酸检测试剂盒（RT-PCR 法）不能检出 1ab(ORF1ab)基因。
结论 中国计量大学新型冠状病毒核酸标准物质 GBW(E)091089、GBW(E)091090 的 1ab(ORF1ab)基因片段在上海伯杰医疗科技有限公司研制的新型冠状病毒核酸检测试剂盒（RT-PCR 法）1ab(ORF1ab)基因检测片段范围内，不在中山大学达安基因股份有限公司、圣湘生物科技股份有限公司、上海复星长征医学科学有限公司研制的新型冠状病毒核酸检测试剂盒（RT-PCR 法）1ab(ORF1ab)基因检测片段范围内。若要对达安、圣湘、复星新型冠状病毒核酸检测试剂盒（RT-

PCR 法）1ab(ORF1ab)基因检测结果进行验证或评价则需选择开放阅读框 1ab(ORF1ab)基因全基因片段的标准物质。

PO-0816

锌指蛋白 ZNF692 在乳腺癌细胞中高表达可促进乳腺癌的发生发展

张文武、肖斌、李林海
广州医科大学附属第六医院 清远市人民医院检验医学部

目的 探究 ZNF692 在乳腺癌细胞中的表达水平及其对乳腺癌细胞增殖、侵袭和迁移的影响以及对其分子机制初步探索。
方法 利用 TCGA 数据库挖掘 ZNF692 在乳腺癌组织及癌旁组织中的差异表达，分析 ZNF692 的表达与分子分型、TNM 分级和临床分期等临床病理特征的相关性；通过慢病毒系统构建稳定表达 ZNF692 的乳腺癌细胞株；通过 CCK8 实验和克隆形成实验分析过表达 ZNF692 对乳腺癌细胞增殖及集落形成能力的影响；通过伤口愈合实验、Transwell 细胞迁移、侵袭实验阐明过表达 ZNF692 对乳腺癌细胞体外迁移和侵袭的影响；采用免疫荧光实验明确 ZNF692 的亚细胞定位；利用 RNA-seq 联合 CUT&TAG 实验对 ZNF692 的下游靶基因进行筛选并通过 RT-qPCR 验证。
结果 ZNF692 在乳腺癌组织中表达显著上调（$P<0.001$）；对于不同的乳腺癌分子分型，ZNF692 在 TNBC 型、HER2+型、Luminal A 型、Luminal B 型均表达升高；过表达 ZNF692 促进乳腺癌细胞增殖、侵袭和迁移；ZNF692 定位于细胞核；ZNF692 能够影响 JAK1、SOCS3 等基因的表达。
结论 ZNF692 在乳腺癌细胞中高表达，可能通过 JAK-STAT 通路促进乳腺癌发生发展，有望作为乳腺癌诊断、治疗的潜在分子靶标。

PO-0817

陕西省 1 万例女性叶酸代谢能力分析

梁建萍、文少佳、张强、朱亚荣
西安金域医学检验所有限公司

目的 分析陕西省女性叶酸代谢能力水平，为指导女性个体化合理补充叶酸以及预防新生儿出生缺陷等疾病提供指导意义。研究将女性孕期缺乏叶酸的风险，分为四个等级，即“未见风险”“低度风险”“中度风险”“高度风险”，从而根据风险程度合理用药。
方法 本研究收集了 1 万例女性外周血标本并提取基因组 DNA，之后采用实时荧光定量 PCR 的方法进行叶酸代谢基因检测，分别对亚甲基四氢叶酸还原酶（MTHFR）基因的 C677T、A1298C 位点以及甲硫氨酸合成酶还原酶（MTRR）基因 A66G 位点进行基因检测，最后根据基因型结果并结合现有文献的数据所总结的公式评估叶酸代谢能力水平从而判断其风险等级。
结果 所检测的陕西省 1 万例女性样本中，对于 MTHFR 基因 C677T、A1298C 位点而言 A1298C 位点突变频率小于 C677T 位点的突变频率。同时综合 MTRR 基因 A66G 位点基因型， 统计得出“未见风险”“低度风险”“中度风险”“高度风险”四个风险等级的人群占比分别为 22%、39%、27%、12%。“高度风险”人群明显少于其他三个风险等级人群。
结论 陕西省女性 MTHFR 基因和 MTRR 基因基因型存在差异，叶酸代谢能力不同，存在不同程度的叶酸缺乏。叶酸代谢基因因此需要进行叶酸代谢基因检测，根据分型结果给予个体化补服合适剂量的叶酸，以预防出生缺陷。

PO-0818

Long non-coding RNA LINC00641 promotes the growth and invasiveness of hepatocellular carcinoma by sponging miR-501-3p

hai tao xie
Department of Clinical Laboratory, The First Affiliated Hospital, University of South China

Long non-coding RNA LINC00641 has been reported to regulate tumor progression in several cancers. However, the expression and function of LINC00641 in hepatocellular carcinoma (HCC) is still unclear. In this study, we measured the expression of LINC00641 in 79 pairs of HCC and adjacent normal liver tissues. The clinical significance of LINC00641 in HCC was explored. We also investigated the function of LINC00641 in HCC proliferation and invasion. We observed that LINC00641 expression was significantly increased in HCC relative to normal tissues ($P < 0.0001$). High expression of LINC00641 was significantly associated with vascular invasion, advanced TNM stage, and reduced overall survival in HCC patients. Knockdown of LINC00641 inhibited the proliferation, colony formation, and invasion of HCC cells. In contrast, overexpression of LINC00641 promoted HCC cell growth and invasiveness. In vivo studies confirmed that knockdown of LINC00641 restrained tumorigenesis of HCC cells. Mechanistic studies revealed that LINC00641 inhibited the expression of miR-501-3p, which has been previously reported to act as a tumor suppressor in HCC. Furthermore, luciferase reporter assays validated that LINC00641 harbored a target site for miR-501-3p. Rescue experiments demonstrated that LINC00641-induced proliferation and invasion of HCC cells was reversed by co-expression of miR-501-3p. Taken together, LINC00641 contributes to aggressive phenotype of HCC cells by sponging miR-501-3p and represents a promising therapeutic target for this disease.

PO-0819

长链非编码 RNA OIP5-AS1 在鼻咽癌细胞株 5-8F 和 CNE-1 中的生物学功能研究

谢海涛
南华大学附属第一医院

目的 探讨长链非编码 RNA OIP5-AS1 对鼻咽癌细胞株 5-8F 和 CNE-1 生物学功能的影响。
方法 构建 OIP5-AS1 慢病毒干扰载体，转染鼻咽癌细胞株 5-8F 和 CNE-1，运用流式细胞术、CCK8 实验、划痕试验等检测沉默 OIP5-AS1 对鼻咽癌细胞生物学功能的影响。
结果 敲除 OIP5-AS1 基因后，细胞 G1 期百分比增高、细胞增殖速度变慢和划痕中心区细胞数减少。
结论 长链非编码 RNA OIP5-AS1 能促进鼻咽癌细胞 5-8F 和 CNE-1 的增殖、侵袭和转移能力。

PO-0820

Assessment of patient-based real-time quality control algorithm performance on different types of analytical error

Xincen Duan[1]、Beili Wang[1]、Jing Zhu[1]、Wenqi Shao[1]、Hao Wang[1]、Junfei Shen[1]、Wenhao Wu[1]、Wenhai Jiang[1]、Kwok Leung Yiu[2]、Baishen Pan[1]、Wei Guo[1]
1. Department of Laboratory Medicine, Zhongshan Hospital, Fudan University
2. Roche Diagnostics

Background Patient-based real-time quality control (PBRTQC) has gained attention because of its potential to detect analytical errors in situations wherein internal quality control is less effective. Multiple PBRTQC algorithms have been proposed. However, there is a lack of comprehensive comparison of the performance of PBRTQC algorithms on different types of analytical errors. Thus, a comparative study was conducted.
Methods The performance of six different PBRTQC algorithms was evaluated on three types of analytical errors using 906,552 test results for outpatient serum sodium, chloride, alanine aminotransferase, and creatinine at the Department of Laboratory Medicine at Zhongshan Hospital, Fudan University in 2019. The performance results were compared and assessed.
Results The moving average, moving median, exponentially weighted moving average, and moving quartiles performed similarly for effectively detecting constant errors (CE) and proportional errors (PE) but not random errors (RE). The moving sum of positive patients and moving standard deviation could detect RE for serum sodium and chlorides but performed poorly on detecting the CE and PE.
Conclusions This study demonstrated the importance of assessing the potential source of error of a particular analyte and the corresponding type of analytical error before choosing a quality control algorithm for implementation.

PO-0821

POCT 项目的院内质量管理体会

孙瑞营、续薇
吉林大学第一医院

目的 为了面对当前 POCT 操作人员结构复杂、设备类型多样、质量保证与信息化建设急待提高的现状，提出 POCT 质量要求及院内管理方案。
方法 查阅近年来 ISO/TS、CLSI、GB/T、POCT 中国专家共识、CAP、JCI 医院评审标准、三级综合医院评审标准实施细则等文件的要求，综述对 POCT 质量管理的要求；总结近三年来我院临床 检验（质控）中心共五次对全院 57 个科室送检的 5418 份标本进行 POCT（血糖、血气、HCG）项目比对的数据，提出 POCT 管理质量管理中对人员资质、设备管理、室内质量控制、设备比对、项目比对的要求。
结果 ①建立院内 POCT 统一的组织管理模式；②发布院内 POCT 质量管理体系文件 24 份并有效实施；③院内培训 POCT 操作人员 2874 人，考核合格后给予院内授权 2844 人，占院内护士总人数的 90%；④POCT 科室开展室内质控占 100%；⑤开展全院 POCT 检验的项目比对，比对结果符合率>80%为合格；血糖项目参加比对仪器共 908 台次，一次性符合率 100%为 241 台次（26.54%），一次性符合率 80%为 142 台次（15.64%），校准后一次性符合率 100%为 136 台次（14.98%），校准后一次性符合率 80%为 124 台次（13.66%）；血气分析项目参加比对仪器共 83 台次，均合格；HCG 项目参加比对仪器共 1 台，均合格；⑥全部科室应用 POCT 信息化操作软件，基本实现院内 POCT 管理。

结论 对照国内外 POCT 质量管理要求，分享院内 POCT 管理做法，相信能够加强院内 POCT 质量管理的同质化与一致性，保证 POCT 检验在临床诊疗中发挥作用。

PO-0822

大数据回顾性分析策略优化临床常规生化报告 TAT

朱晶、邵文琦、王蓓丽、潘柏申、郭玮
复旦大学附属中山医院

目的 探讨通过大数据回顾性分析策略优化常规生化报告 TAT。
方法 回顾性分析 2020 年 4 月至 12 月常规生化门诊标本每个工作日各时间段平均、最大和最小测试数，以及同时段全自动生化分析仪平均、最大和最小负荷量，优化门诊标本和病房标本上样方式和仪器负荷分配方式。统计优化前后的常规生化门诊和病房报告 TAT 各时间点：门诊标本和病房标本的接收时间、上前处理仪器时间、上全自动生化分析仪时间、出结果时间和报告确认时间。计算 TAT 各时间段的中位数时间，90%百分位数时间和极值时间。
结果 TAT 大数据回顾性分析策略能更科学有效地根据实时标本量和测试数指导工作人员进行门诊和病房标本间的上样和仪器负荷分配。经本研究策略优化后的门诊常规生化标本从上前处理仪器至上全自动生化分析仪的中位数时间从 23.6 分钟降至 18.3 分钟（下降 22.5%）；从上全自动生化分析仪至出结果的中位数时间从 38.7 分钟降至 26.9 分钟（下降 30.5%）。同期病房标本 TAT 并无明显变化。
结论 通过以 TAT 大数据回顾分析为策略，指导门诊和病房标本上样和仪器负荷分配方式，可有效提升工作效率，降低标本接收至出结果的时间。在不影响病房标本 TAT 的前提下，提高门诊标本检测速度，缩短门诊标本 TAT。

PO-0823

活动性肺结核患者多功能 T 细胞的免疫应答

秦爽、陈瑞麒、蒋雨洁、朱恒悦、陈栎江、陈彦凡、沈默、林向阳
温州医科大学附属第一医院

目的 结核病仍然是全世界传染病致死的主要原因。本项研究中，我们旨在评估肺结核患者外周血 T 细胞的免疫状态，并进一步探索多功能 T 细胞的作用。
方法 本研究招募了 30 例活动性肺结核（APTB）患者，30 例潜伏性结核感染（LTBI）患者，25 例治愈性肺结核（CPTB）患者和 25 例健康对照（HCs）。 通过流式细胞仪检测外周血 T 细胞的表型和功能。用结核分枝杆菌（Mtb）特异性抗原 ESAT-6-CFP10 短期刺激各组患者的外周血单个核细胞（PBMCs）和 APTB 患者的胸水细胞（PFCs）后，检测 Mtb 特异性 $CD4^+$ T 细胞和 Mtb 特异性 $CD8^+$ T 细胞的频率、分化程度和细胞因子的表达，并进一步检测其多功能 T 细胞的频率和迁移能力。
结果 与 HCs 和 LTBI 患者相比，APTB 患者的 $CD4^+$ T 和 $CD8^+$ T 细胞较少，但 $CD8^+$ T 细胞上颗粒酶 A，颗粒酶 B 和穿孔素的表达增加。 与 LTBI 和 CPTB 患者相比，APTB 患者的结核分枝杆菌特异性 $CD8^+$ T 细胞表现为具有更高分化程度的 $CD45RA^-CCR7^-$ 细胞，并且其具有更高频率的多功能 $CD4^+$ T 和 $CD8^+$ T 细胞。 重要的是，APTB 患者胸水中多功能 $CD4^+$ T 细胞的频率高于外周血，并且其外周血中表达迁移受体 CXCR3 的多功能 $CD4^+$ T 细胞的比例降低，而其 CXCR3 对应的配体，即趋化因子 MIG，IP-10 和 I-TAC，在血浆和胸水中的浓度显著升高，且胸水中的浓度显著高于外周血由此形成浓度梯度。
结论 APTB 患者的 T 淋巴细胞减少可能导致 $CD8^+$ T 细胞的代偿性激活，其外周血中的多功能 $CD4^+$ T 细胞可以在 CXCR3 和相关的趋化因子的作用下迁移到肺部感染部位。 多功能 $CD4^+$ T 细

胞和多功能 $CD8^+$ T 细胞频率升高可作为活动性肺结核的标志，并在监测疾病治疗疗效中具有重要意义。

PO-0824

The study on the impact of COVID-19 on common respiratory viruses infections in Southwest China

Yanjun Si、minjin wang、tangyuheng liu、huiyu zhong、xingbo song、binwu ying
West China Hospital，Sichuan University

Objectives This study aims to investigate the impact of COVID-19 on common respiratory viruses infections. Knowing the epidemiological patterns of common respiratory viruses may be valuable to improve the diagnostic and therapeutic efficacy of patients during the coronavirus disease-19 pandemic.
Method we analyzed common 12 respiratory tract pathogens in clinical specimens collected from 1206 patients in in Southwest China with fever and respiratory symptoms during Nov 16, 2019 through January 15, 2020 (pre-pandemic period), and from 2343 patients during January 16, 2020 through Mar 16, 2020. All data were analyzed to unravel the epidemiological patterns.
Results The detection rates of the human rhinovirus (15.01% VS 8.02%), influenza A H3N2 (9.78% VS 2.90%) and bocavirus (4.81% VS 1.75%) were appreciably reduced but the influenza B virus (0.33% VS 3.88%), mycoplasma pneumoniae (, 1.16% VS 2.52%) and human metapneumovirus (2.99% VS 3.37%) were appreciably increased among the patients during the COVID-19 pandemic. Moreover, the co-infection was observed in 212 specimens. Notably, bocavirus was the most common virus tending to occur in co-infection with other respiratory pathogens in this study.
Conclusion Interventions for mitigating spread of SARS-CoV-2 likely also reduced transmission of other pathogens. However, the increased positive rates of influenza B virus, mycoplasma pneumoniae and human metapneumovirus also suggested an risk of infection during the pandemic period. The findings highlight the importance of understanding the transmission patterns of the common respiratory virus in COVID-19 regions, which can provide information support for the development of appropriate treatment plans and health policies, while eliminating unnecessary fear and tension.

PO-0825

长链非编码 RNA RP11-490M8.1 抑制脂多糖诱导的人脐静脉内皮细胞炎症

刘雪辉[1]、伍绍国[1]、胡炎伟[2]
1. 广州市第十二人民医院广州市职业病医院
2. 广州市妇女儿童医疗中心

目的 探讨 LncRNA RP11-490M8.1 在内皮细胞中对炎症因子调控作用的初步研究。
方法 我们收集三对 AS 斑块组织和动脉内膜正常组织进行基因芯片分析，挖掘表达显著异常的基因；用脂多糖处理内皮细胞、构建慢病毒载体过表达 LncRNA RP11-490M8.1，以实时荧光定量 PCR（qRT-PCR）检测 LncRNA RP11-490M8.1 和细胞炎症因子如 TNF-α、IL-6，NF-κB 的 RNA 水平，以免疫印迹（western blot）检测细胞炎症因子（IL-6,TNF-α，NF-κB）的蛋白表达水平；将内皮细胞接种于 6 孔细胞培养板中，分为 4 组进行干预：①慢病毒空载体对照组（对照组）；②慢病毒空

载体加 LPS（LV-MOCK +LPS）；③慢病毒过表达组（LV- LncRNA RP11-490M8.1）；④ LncRNA RP11-490M8.1 过表达加 LPS（LV-LncRNA RP11-490M8.1 +LPS）。
结果 基因芯片分析发现 LncRNA RP11-490M8.1 在 AS 斑块中表达下调，qRT-PCR 和 western blot 结果显示 LPS 上调炎症因子（IL-6,TNF-α，NF-κB）的表达；慢病毒过表达 LncRNA RP11-490M8.1 后炎症因子表达下调，表明 LncRNA RP11-490M8.1 负向调控炎症因子的表达；分组干预实验结果显示 LncRNA RP11-490M8.1 能减弱 LPS 对炎症因子的诱导作用。
结论 在内皮细胞中 LncRNA RP11-490M8.1 抑制 LPS 诱导的炎症因子（IL-6,TNF-α，NF-κB）表达，LncRNA RP11-490M8.1 很可能是阿托伐他汀钙发挥抗炎作用的靶向分子，为动脉粥样硬化的发展提供新的方向。

PO-0826

Bioinformatics analysis of differentially expressed genes in bladder cancer

Tingting Long、Shanying Deng、Yuemei Chen、Chunying Zhang、Hong Jiang
West China Hospital of Sichuan University

Objective To identify the key candidate genes in bladder cancer using bioinformatics analysis.
Methods The gene expression profiles of GSE40355, GSE37815 and GSE13507 were downloaded from the Gene Expression Omnibus (GEO) database. The differentially expressed genes (DEGs) between bladder cancer and normal samples were extracted with GEO2R online tool. The gene ontology (GO) functional and Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment analyses of DEGs were performed by DAVID. A protein-protein interaction (PPI) network was constructed using STRING and visualized in Cytoscape software. MCODE was used for module analysis of the PPI network. For the analysis of overall survival among the key identified genes, Kaplan-Meier method was implemented. At last, GEPIA and UALCAN were applied to determine the expression of the core genes in bladder cancer.
Results The 215 DEGs were identified including 31 upregulated and 184 downregulated genes, and enriched in cellular component (CC), biological processes (BP) as while as molecular function (MF). As for the KEGG-pathway, the DEGs were mainly associated with staphylococcus aureus infection, systemic lupus erythematosus, complement and coagulation cascades. The PPI network contained 170 nodes and 532 edges, and AURKB, CCNB2, DCN, PLEK, C1QB, CXCL12 and CSF1R were screened as hub genes. Beside the three most significant sub-modules of DEGs were extracted. Two of the 7 genes, including DCN and CXCL12 were associated with the overall survival of patients with bladder cancer. Both GEPIA and UALCAN databases indicated that expression of DCN and CXCL12 were down-regulated in bladder cancer model.
Conclusion The identified DEGs, especially the core genes may provide potential targets for the diagnosis and treatment of bladder cancer.

PO-0827

Bioinspired Soft Robot with Incorporated Microelectrodes

Ting Wang
the First Affiliated Hospital of Nanjing Medical University,

Bioinspired soft robotic systems that mimic living organisms using engineered muscle tissue and biomaterials are revolutionizing the current biorobotics paradigm, especially in biomedical research. Recreating artificial life-like actuation dynamics is crucial for a soft-robotic system.

However, the precise control and tuning of actuation behavior still represents one of the main challenges of modern soft robotic systems.

This method describes a low-cost, highly scalable, and easy-to-use procedure to fabricate an electrically controllable soft robot with life-like movements that is activated and controlled by the contraction of cardiac muscle tissue on a micropatterned sting ray-like hydrogel scaffold.

The use of soft photolithography methods makes it possible to successfully integrate multiple components in the soft robotic system, including micropatterned hydrogel-based scaffolds with carbon nanotubes (CNTs) embedded gelatin methacryloyl (CNT-GelMA), poly(ethylene glycol)diacrylate (PEGDA), flexible gold (Au) microelectrodes, and cardiac muscle tissue. In particular, the hydrogels alignment and micropattern are designed to mimic the muscle and cartilage structure of the sting ray. The electrically conductive CNT-GelMA hydrogel acts as a cell scaffold that improves the maturation and contraction behavior of cardiomyocytes, while the mechanically robust PEGDA hydrogel provides structural cartilage-like support to the whole soft robot. To overcome the hard and brittle nature of metal-based microelectrodes, we designed a serpentine pattern that has high flexibility and can avoid hampering the beating dynamics of cardiomyocytes. The incorporated flexible Au microelectrodes provide electrical stimulation across the soft robot, making it easier to control the contraction behavior of cardiac tissue.

PO-0828

2013-2020 年寄生虫室间质评结果回顾性分析及总结

邓山鹰
四川大学华西医院

目的 通过对寄生虫形态学的室间质评结果进行回顾分析及总结，进一步提高临床检验人员发现和识别寄生虫的能力。

方法 回顾分析 2013~2020 年我室参加寄生虫形态学检验室间质评的 200 份样本回报结果，其中 80 份来自美国病理家协会，120 份来自卫生部临检中心，统计回报结果正确率，分析寄生虫（卵）辨认错误的原因，并总结少见及相似寄生虫的形态特征和鉴别要点。

结果 200 份样本中 195 份识别结果正确，正确率为 97.5%；80 份美国病理家协会样本中 77 份识别正确，3 份识别错误，12 份未评分，正确率为 96.3%；120 份卫生部临检中心样本中 118 份识别正确，2 份识别错误，正确率为 98.3%。美国病理家协会与卫生部临检中心样本共涉及 30 种寄生虫 47 种不同生活史形态。相似寄生虫卵鉴别包括：阔节裂头绦虫卵、肺吸虫卵、肝片形吸虫卵和姜片虫卵，脱蛋白质膜受精蛔虫卵与退变钩虫卵，钩虫卵与东方毛圆线虫卵，马来微丝蚴与班氏微丝蚴；少见寄生虫卵鉴别包括：微小膜壳绦虫卵与缩小膜壳绦虫卵；大便中食物残渣与寄生虫卵的鉴别及各种包囊的鉴别。

结论 通过阶段性收集整理寄生虫室间质评资料进行回顾分析，并定期进行混合虫卵样本的镜下复习、寄生虫图谱复习以及少见与相似寄生虫（卵）的形态复习，可提高寄生虫检验质量，提升检验人员的能力。

PO-0829

GRK3 在口腔鳞癌细胞增殖、迁移及侵袭中的作用

张晗、罗清琼、朱丽萍、陈福祥
上海交通大学医学院附属第九人民医院

目的 探讨沉默 G 蛋白偶联受体激酶 3（GRK3）对口腔鳞癌（OSCC）细胞增殖、迁移和侵袭的影响及其可能机制。

方法 利用 Oncomine 数据库分析 GRK3 在正常口腔组织及 OSCC 组织中的表达水平。用 RNA 干扰技术下调 OSCC 细胞 WSU-HN6 和 CAL27 的 GRK3 表达水平，用 qPCR 法验证干扰效率。用 CCK-8 法和流式细胞术分别检测 OSCC 细胞的增殖能力和凋亡水平，用 Transwell 小室法检测 OSCC 细胞的迁移和侵袭能力，用 qPCR 法检测细胞周期、上皮-间质转化（EMT）和基质金属蛋白酶（MMPs）相关分子的表达水平。
结果 GRK3 在 OSCC 组织中的表达水平显著高于正常口腔组织（P<0.001）。转染 si-GRK3 后，OSCC 细胞的 GRK3 表达水平均下调 70%以上。沉默 GRK3 可显著抑制 OSCC 细胞的增殖、迁移和侵袭能力（均 P<0.001），对细胞凋亡无显著影响（P＞0.05）。下调 GRK3 后，OSCC 细胞的细胞周期蛋白 D1（Cyclin D1）、Cyclin D3、周期蛋白依赖性激酶 2(CDK2)和 CDK4 表达降低（均 P<0.05）；EMT 相关分子波形蛋白（Vimentin）、Zeb1 和 Slug 表达降低，E-钙黏蛋白（E-Cadherin）表达升高（均 P<0.05）；MMP3 和 MMP9 表达降低（均 P<0.05），MMP2 和 MMP7 无明显变化（均 P＞0.05）。
结论 GRK3 可通过调节细胞周期相关分子促进 OSCC 细胞的增殖能力，并通过调控 EMT 和 MMPs 促进其迁移和侵袭能力。

PO-0830

无创性 IgA 肾病病理分级诊断模型建立

刘记宏、刘子杰
昆明医科大学第一附属医院

目的 分析 IgA 肾病 Lee 病理分级与高血压病程及临床常规实验室指标之间的相关关系，通过不同病理分级研究对象的实验室指标组间差异，建立无创性病理分级诊断模型。
方法 采集昆明医科大学第一附属医院肾内科经肾穿刺活检确诊的 112 例原发性 IgA 肾病患者，收集患者的病历资料及实验室常规监测指标，通过回顾性分析，采用单因素和多因素回归分析逐步筛选变量，最终通过有序 Logistic 回归构建 IgA 肾病的无创性病理分级诊断模型。
结果 高血压病程与 IgA 肾病 Lee 病理分级之间显著相关(r=0．246，p=0．009)；同时，血肌酐（OR=1.31，p=0.000）、尿酸（OR=1.58，p=0.045）、尿总蛋白（OR=1.26，p=0.039）、无抽烟史（OR=0.27，p =0.025）、血红蛋白（OR=0.97，p =0.028）与 IgA 肾病 Lee 氏分级有相关性。通过患者的血红蛋白、白蛋白、血肌酐、尿酸、血清 C3、尿总蛋白数据，建立了 IgA 肾病 Lee 病理分级诊断模型，该模型准确性高达 74%（c2 =62.248，p=0.000），可为临床诊疗提供有力依据。
结论 我们最终通过有序 logistic 回归建立了无创性 IgA 肾病 Lee 病理分级诊断模型。

PO-0831

The functional characteristics and clinical value of peripheral NK and NKT cells in patients with chronic hepatitis B cirrhosis

Xin Wei[1]、Weifeng Yao[2]、He Chen[1]、Zhongxin Wang[1]
1. The First Affiliated Hospital of Anhui Medical University
2. 浙江省立同德医院

Objective To explore the functional characteristics of peripheral NK and NKT cells in patients with chronic hepatitis B cirrhosis (HBV-LC) and their correlation with the disease.
Methods Collected 25 compensated HBV-LC patients (HBV-CLC), 25 decompensated HBV-LC patients (HBV-DLC) and 25 health individuals (HC) at the same period. Detected changes in the frequency and absolute number of peripheral NK and NKT cells. Expression of activation markers,

activating- and inhibitory receptors, and cytotoxic molecules on peripheral NK and NKT cells were detected, and analyzed the correlation between NK/NKT and HBV-LC.
Results Compared with HC, the frequency and absolute number of peripheral NK and NKT cells in HBV-LC patients were significantly reduced (P<0.05), but HBV-DLC patients had significantly higher expression of activation markers (P<0.05); although there was no significant difference in the expression of activating- and inhibitory receptors (P>0.05), peripheral NKT cells in HBV-LC patients significantly expressed cytotoxic molecules, while the cytotoxic ability of peripheral NK cells in HBV-DLC patients was significantly impaired (P>0.05). Besides, NK/NKT also has a certain diagnostic value for HBV-DLC.
Conclusion The functional characteristics of peripheral NK and NKT cells in HBV-LC patients, especially in HBV-DLC patients, has undergone significant changes, which have certain diagnostic value for HBV-DLC. These findings may provide a new perspective and theoretical basis for the immune prevention and treatment of HBV-LC patients.

PO-0832

改良胶体金试剂盒检测广州地区人群弓形虫感染现状

杨兆收[1,2]、官煜彬[2]、杨小蓉[2]、陈少莲[2]
1. 广东药科大学
2. 广东药科大学附属第一医院

目的 前期我们改造了检测弓形虫感染的胶体金试剂盒，检测人体内抗弓形虫抗原的 IgG 和 IgM 抗体，诊断弓形虫感染与否。其特异性和灵敏性明显提高。本研究旨在此试剂盒检测广州地区人群的感染现状。
方法 收集 2020 年 05 月-2020 年 07 月广东药科大学附属第一医院住院病人和体检健康人的新鲜分离的血清。其中住院病人血清 637 个，体检健康人血清 202 个。根据公司提供的操作说明书，定性检测血清中的人抗弓形虫 IgG 抗体和 IgM 抗体。检测结果用阴性或阳性表示。通过卡方检验分析住院病人和健康人的弓形虫感染差异性，以及不同性别、年龄段、不同病种人群之间的感染差异性。
结果 胶体金检测结果显示，广州地区人群弓形虫感染阳性率为 6.55%。IgG 单阳性率 4.65%，IgM 单阳性率 2.03%，双阳性率 0.24%。其中年轻组的 IgM 阳性率高于老年组（Old 0.93%，Young 2.73%，P=0.072）。住院病人 IgG 阳性率大于健康人（Inpatients 5.45%，Health 2.48%，P=0.079）。此外男性感染阳性率高于女性（Female 5.13%，Male 7.91%，P=0.106）。特别是肿瘤患者中男性阳性率显著大于女性（Female 1.49%，Male 9.00%，P=0.045）。
结论 胶体金试剂盒可以快速检测患者体内抗弓形虫抗体，可及时为诊断弓形虫感染及治疗提供依据。广州地区的男女弓形虫感染率差异明显。肿瘤患者的男女感染率差异尤为显著。性别差异对开辟预防和治疗弓形虫感染的方法提供科学依据。

PO-0833

Research and development of blood transfusion management system based on Bayesian network

Keyu He、Qiang Zhang、Min Zhang
Zhongda Hospital, Southeast University

Aim This study processed the historical blood use data through Bayesian network machine learning, and develops an artificial intelligence blood transfusion management system to optimize patient blood management and blood resource allocation.

Method The database included clinical cases that used red blood cells transfusion to treat anemia in February, May, August, and November 2019, and excluded cases of surgical operations, active bleeding (trauma, gastrointestinal bleeding, etc.), hematological tumors and patients under 10 years old. Set the patient's gender, age, blood type, hemoglobin concentration, application, blood transfusion, and physician as the weight parameters; also set the blood transfusion department's inbound volume, outbound volume, applied volume, resource tension, and difference between application and actual delivery as weight parameters, and establish the original model. Taking 80% of the cases in the database (340 cases) as the training sample, the patient-related information is set as a Bayesian network model with 9 nodes and 17 directed edges. Based on the Bayesian network, the structure learning and parameter learning of the database are carried out, and the red blood cell transfusion management system is finally constructed.
Result The Weka model found that the classification accuracy of the Bayesian network model was 92.9%, and the other 20% of the cases in the database (85 cases) were used as test samples, and the test set prediction accuracy was 92.9%, indicating that the external consistency of the model was good, and the red blood cell transfusion management system was successfully constructed. This study also found that when blood resources become scarcer, some departments/physicians are more inclined to aggressive blood transfusion strategies, to achieve priority to blood resources.
Conclusion This research has successfully constructed a clinical red blood cell transfusion management system, which can help the blood transfusion department identify unqualified red blood cell applications and assist in evaluating physicians/departments. The degree of blood resource tension is an important parameter for unqualified applications.

PO-0834

区域性即时检测管理体系建立的初探

杨翌翔、韦薇、侯彦强
上海市松江区中心医院

目的 区域医学检验中心的出现实现了区域内大部分检验结果的同质化，但保留在基层单位的即时检测项目难以保证检验质量，试图建立区域性即时检测管理体系以提升即时检测项目的管理水平，进而促进区域内即时检测质量的提升。
方法 在区域卫生主管部门的主导下，组织区域医学检验中心，卫健委检验专业质量控制管理小组，和区域内其他医疗卫生机构的相关负责人，成立卫健委区域即时检测管理办公室。分析区域内即时检测管理工作的现状，针对监督管理不到位、人员资质不统一、培训考核不完善以及比对工作不规范四大方面因素，卫健委区域即时检测管理办公室建立起区域性即时检测管理体系，依托区域医学检验中心的多方面优势，采取相关措施，集中力量解决问题。
结果 通过建立区域性即时检测管理体系，实现了卫健委检验专业质量控制管理小组对各医疗机构即时检测工作的有效监管，区域医学检验中心对人员资质、培训考核和比对工作的统一实施，使得区域性即时检测管理工作能够落到实处。
结论 在充分发挥区域医学检验中心专业技术、人才和硬件等方面优势的基础上，初步建立覆盖辖区内医疗机构的区域性即时检测管理体系，能够解决区域内即时检测管理工作中的弱点和难点，提高整个区域即时检测管理体系的管理效率，还能促进各机构医疗质量管理水平的进一步提升。

PO-0835

Amphiphilic peptide-operated nanovalves for targeted drug delivery and control release on mesoporous silica nanoparticles

Fengfeng Zhao
Department of Clinical Laboratory of Zhongda Hospital, Southeast University

Objective A simple but smart pH-responsive end-capped mesoporous silica nanoparticle (MSN)-based drug delivery system (DDS) was demonstrated.
Methods The nanovalve systems were constructed by the self-assembly behavior of peptide-based amphiphile (P45) in the presence of Doxorubicin hydrochloride (Dox). A series of characterizations confirmed that the DDSs had been successfully fabricated.
Results Dox molecules are entrapped by nanovalves in the pores of MSNs, and an in vitro release experiment demonstrated that the P45/Dox@MSNs exhibited “zero premature release” in the physical environment. However, a rapid accelerated release was triggered by an acidic atmosphere in cellular cytosol. Moreover, detailed investigations confirmed that the enhanced cellular uptake of P45/Dox@MSNs due to the RGD motif of the nanovalves, exhibiting an obvious toxicity to cancer cells.
Conclusion Therefore, the multifunctional DDSs constructed here can serve as a promising platform to realize targeted drug delivery and controlled drug release by using diversified bioactive native amphiphilic peptide.

PO-0836

12 例凝血因子 X 缺陷症患者的出血倾向和凝血功能状态的相关分析

汪建茹[2]、白欢[1]、唐宁-通讯作者[1]
1. 华中科技大学同济医学院附属同济医院检验科
2. 湖北医药学院附属襄阳市第一人民医院检验科

目的 分析 12 例凝血因子 X 缺陷症患者出血倾向和凝血功能状态，以提高对该病的认识。
方法 对纳入研究的 12 例患者进行止凝血筛查，检测 APTT 和 PT，利用凝固法检测患者血浆 FX:C，同时对 FX 基因采用 DNA 直接测序法进行基因诊断，并分析 12 例患者出血倾向。
结果 12 例凝血因子 X 缺陷症患者中 10 例为遗传性、2 例为获得性：10 例遗传性凝血因子 X 缺陷症患者中 4 例患者无出血倾向，APTT 和 PT 基本正常，FX:C 为 40%-50%，F X 基因突变都为 c.746A>C 杂合突变；另 5 例患者表现为月经过多、外伤性出血难止等轻微出血倾向，APTT 和 PT 轻度或明显延长，FX:C 为 30%-50%，FX 基因突变分别为 c.871C>T、c.871C>T、c.1252G>A、c.452G>A、c.1252G>A，都为杂合突变；另 1 例患者表现为血便、血尿、下肢淤青等较严重出血倾向，APTT 和 PT 显著延长，FX:C 为<1.0%，FX 基因突变为 c.746A>C 纯合突变，为国际首次报道。2 例获得性凝血因子 X 缺陷症患者中 1 例表现为月经过多，外伤性出血不易止等轻微出血倾向，APTT 和 PT 轻微或明显延长，FX:C 9%；另一例表现为下肢血肿的中度出血倾向，考虑由浆细胞病诱发所致，其 APTT 和 PT 均显著延长，FX:C 为 3%。
结论 除凝血因子 X 重度缺乏者外，凝血因子 X 缺陷症患者通常临床出血症状较轻或无临床出血表现。

PO-0837

预警新兴的医院内感染致病菌：洋葱伯克霍尔德菌复合群

刘玥[1,2]、崔琳[3]、胡屹[2,4]、武洁[5]、许学斌[1]
1. 上海市疾病预防控制中心
2. 复旦大学公共卫生学院
3. 上海市临床检验中心
4. 复旦大学公共卫生安全教育部重点实验室
5. 上海市第一妇幼保健院医院

洋葱伯克霍尔德氏菌复合群(Burkholderia cepacia complex, Bcc)是一组革兰阴性非发酵菌，具有种群生物多样性，其特殊能量新陈代谢路径可作为植物病防治的生物调节剂；Bcc 亦可导致人体不同部位的感染，最常定植于囊性纤维化和慢性肉芽肿患者肺部，也可通过导管等开放性通道感染人体其他器官，易感者有特定人种和年龄组；各类非无菌药剂、医用消毒剂的内源性污染和医疗设备表面污染是导致健康看护机构感染暴发的主要源头；阻断传播链中危害控制的关键点在于增补制药企业基于 Bcc 高敏感性检测方法的标准化法典制定、各类医疗机构潜在院内感染及针对潜在医院感染风险加强 Bcc 基线监测。

PO-0838

基于 TCGA 数据库筛选微小 RNA（miRNA）用于原发性乳腺癌诊断的生物信息

何谦、尹阳
西安交通大学第二附属医院

目的 基于肿瘤基因图谱（the cancer genome atlas，TCGA）数据库筛选微小 RNA（miRNA）用于原发性乳腺癌的早期诊断。
方法 从 TCGA 上下载原发性乳腺癌 miRNA 表达数据，应用多种工具将癌症组与正常组比较获得差异表达 miRNA。分析差异 miRNA 作用的靶基因与乳腺癌高频突变基因之间的关系，得到备选 miRNA，将备选 miRNA 与乳腺癌前 20 名差异表达的 miRNA 求交集，得到目标 miRNA，将目标 miRNA 做 ROC 曲线分析。
结果 TCGA 数据包含原发性乳腺癌组织 1075 例，正常对照乳腺组织 95 例，共有 1870 条 miRNA 的表达数据。其中乳腺癌组织中表达升高至 3 倍以上的 miRNA 90 个，下调至 1/3 的 miRNA 39 个，共得到差异表达显著 miRNA129 个， 利用 miRwalk 软件预测到相对应 18413 个靶基因。我们在 c-Bioportal 数据库中筛选出原发性乳腺癌突变发生率大于 5%的基因 12 个。18413 个靶基因中包含这 12 个高频基因，此 12 个基因为差异 miRNA 的靶基因同时也是高频基因，故将此 12 个基因对应 63 个 miRNA 作为备选 miRNA。将备选 miRNA 与乳腺癌前 20 名差异表达的 miRNA 求交集得到目标 miRNA 6 个：hsa-mir-4732，hsa-mir-486，hsa-mir-592，hsa-mir-449，hsa-mir-187，hsa-mir-196a，将这 6 个 miRNA 进行 ROC 曲线分析，预测其作为肿瘤标志物的诊断能力。
结论 基于 TCGA 数据库的生物信息学方法可简便而可靠地筛选目标 miRNA 进行后续研究，有较高的参考价值。

PO-0839

双氢青蒿素通过 TGFβ-Smads 信号通路抑制三阴性乳腺癌细胞增殖和转移

何谦
西安交通大学第二附属医院

目的 拟证实青蒿素通过抑制 TGF-β 信号通路从而调节核基质蛋白 CIZ1 表达，抑制乳腺癌增殖和转移的作用。
方法 体外培养人乳腺癌 MDA-MB-231 细胞，采用 CCK-8 法检测青蒿素及其衍生物双氢青蒿素 DHA 对细胞增殖的抑制作用；划痕实验检测药物对乳腺癌细胞迁移能力的影响；RT-qPCR 和 Western blot 分别检测其对 CIZ1、Snail 及 TGF-β1 的 mRNA 及蛋白表达水平的影响;通过划痕实验、Transwell 体外侵袭实验和 Western blot 技术进一步探究外源施加 TGF-β1 或 TGF-β1 通路抑制剂 SD-208，激活/抑制 TGFβ1-smads 通路对药物抗转移作用及其分子机制的影响。
结果 1. 青蒿素及 DHA 对人乳腺癌 MDA-MB-231 细胞系的增殖有显著抑制作用，呈浓度-时间依赖性 。2. DHA 以浓度依赖性明显抑制乳腺癌细胞系的迁移能力，抑制 CIZ1、Snail、TGF-β1 的 mRNA 及蛋白表达水平。3. TGFβ1 处理可增强乳腺癌细胞的转移能力，TGFβ1 处理增强 MDA-MB-231 细胞 CIZ1、snail 蛋白表达及 smad2/3 蛋白磷酸化水平；DHA 可以逆转 TGFβ1 诱导的以上效应，且随着药物浓度提高，DHA 对以上效应的抑制能力进一步增强；施加 TGF-β1 通路抑制剂 SD-208，DHA 的抗肿瘤转移活性也能得到增强。DHA、SD-208、DHA+SD-208 的联合处理组均能显著抑制了 CIZ1、snail 和磷酸化 smad2/3 蛋白表达。
结论 DHA 通过抑制 TGFβ1/Smads 通路和 CIZ1 蛋白显著抑制乳腺癌 MDA-MB-231 细胞增殖和迁移，并可有效逆转 TGF-β1 诱导的乳腺癌细胞转移增强效应，并发挥抗乳腺癌转移作用。本研究初步证实了 TGF-β1/Smad 信号通路与 CIZ1 蛋白及其级联调控关系可能成为调控乳腺癌进展和转移过程的新作用机制。

PO-0840

COVID-19 流行后武汉市 3100 例儿童呼吸道病原体感染情况分析

马俊娥、崔湘铧、刘芮、韩欢、祝成亮
武汉大学人民医院

目的 分析 COVID-19 流行后儿童呼吸道病原体的感染情况，并且与 COVID-19 流行前的感染情况做对比，观察在采取一系列防控措施后，病原体感染率是否存在变化。
方法 收集 COVID-19 流行前后武汉大学人民医院儿科住院患儿的咽拭子和血清，采用直接免疫荧光法检测腺病毒（ADV）、流感病毒 A、B(IFA、IFB)、副流感病毒 1、2、3（PIV1、PIV2、PIV3）及呼吸道合胞病毒（RSV）7 种呼吸道常见病毒抗原，采用间接免疫荧光法检测 2 种呼吸道非典型病原体 IgM 抗体，即肺炎支原体(MP)和肺炎衣原体(CP)。检验结果进行统计学分析。
结果 COVID-19 流行后，3100 例呼吸道感染患儿中，共有 1112 例患儿检出病原体，检出率为 35.87%，九种呼吸道病原体中 MP 的检出率最高（28.19%）,其次为 PIV1 （4.00%）、RSV（3.35%）、PIV3 （1.94%）、CP（0.77%）、ADV（0.32%）、PIV2（0.03%），未检出 IFA、IFB；存在病原体混合感染，混合感染率为 2.71%；男女患儿 PIV1、PIV3 以及 MP 的感染具有统计学差异（P<0.05），其中女性患儿 PIV1 和 MP 感染率较高，男性患儿 PIV3 感染率较高，其他病原体感染并无统计学差异；PIV1、PIV3、RSV 和 MP 的感染率在各年龄组间具有统计学差异（P<0.05），各病原体感染分别集中在 0～6 岁、0～3 岁、0～3 岁、1～6 岁；此外，与 COVID-

19 流行前的 7818 例患儿相比，COVID-19 流行后患儿总体的病原体感染阳性率明显下降，差异具有统计学意义（P<0.05）。

结论 MP 是本院儿科患儿呼吸道感染的主要病原体，女性患儿较男性患儿感染率高，1～6 岁感染率最高，针对 COVID-19 的一系列防护措施可有效减少儿童呼吸道病原体的感染。

PO-0841

A machine learning approach to personalized dose adjustment of lamotrigine using noninvasive clinical parameters

Xiuqing Zhu[1]、wencan Huang[2]、haoyang Lu[1]、zhanzhang Wang[1]、xiaojia Ni[1]、Jinqing Hu[1]、Shuhua Deng[1]、Yaqian Tan[1]、Lu Li[1]、Ming Zhang[1]、Chang Qiu[1]、Yayan Luo[1]、Hongzhen Chen[1]、Shanqing Huang[1]、Tao Xiao[1]、Dewei Shang[1]、Yuguan Wen[1]

1. Department of Pharmacy, The Affiliated Brain Hospital of Guangzhou Medical University (Guangzhou Huiai Hospital)

2. 广州市民政局精神病医院

The pharmacokinetic variability of lamotrigine (LTG) plays a significant role in its dosing requirements. Our goal here was to use noninvasive clinical parameters to predict the dose-adjusted concentrations (C/D ratio) of LTG based on machine learning (ML) algorithms. A total of 1141 therapeutic drug monitoring measurements were used, 80% of which were randomly selected as the "derivation cohort" to develop the prediction algorithm, and the remaining 20% constituted the "validation cohort" to test the finally selected model. Fifteen ML models were optimized and evaluated by tenfold cross-validation on the "derivation cohort," and were filtered by the mean absolute error (MAE). On the whole, the nonlinear models outperformed the linear models. The extra-trees' regression algorithm delivered good performance, and was chosen to establish the predictive model. The important features were then analyzed and parameters of the model adjusted to develop the best prediction model, which accurately described the C/D ratio of LTG, especially in the intermediate-to-high range (≥ 22.1 μg $mL^{-1}g^{-1}$day), as illustrated by a minimal bias (mean relative error (%) = + 3%), good precision (MAE = 8.7 μg $mL^{-1}g^{-1}$day), and a high percentage of predictions within ±20% of the empirical values (60.47%). This is the first study, to the best of our knowledge, to use ML algorithms to predict the C/D ratio of LTG. The results here can help clinicians adjust doses of LTG administered to patients to minimize adverse reactions.

PO-0842

新型冠状病毒肺炎患者血浆 CRP，PCT，IL-6 水平检测的临床诊断价值

马俊娥[1]、崔湘铧[1]、刘芮[1]、韩欢[1]、邬开朗[2]、刘芳[2]、祝成亮[1]

1. 武汉大学人民医院

2. 武汉大学病毒学国家重点实验室

目的 评估单独及联合检测新型冠状病毒肺炎(Coronavirus Disease-2019，COVID-19)患者血浆 c 反应蛋白（C reactive protein,CRP）、降钙素原（procalcitonin,PCT）、和白介素-6(Interleukin-6,IL-6)水平的临床诊断价值。

方法 选取 2020 年 1 月 1 日至 2020 年 2 月 2 日期间武汉大学人民医院 COVID-19 确诊患者 96 例，其中普通型 41 例，重型 45 例和危重型 10 例，另选 40 例健康者作为对照组，收集 96 位患者的 CRP，PCT 和 IL-6 以及 40 位健康者的 CRP，PCT 检测结果并绘制 ROC 曲线；

结果 与对照组相比，COVID-19 组患者的 CRP 和 PCT 水平显著增高,（CRP 分别为 0.4，60.35mg/L，PCT 分别为 0.053，0.087ng/ml ）；在 COVID-19 患者中，普通型患者的 CRP，PCT 水平明显低于重型、危重型患者，(CRP 分别为 36.8，84.9，94.1 mg/L，PCT 分别为 0.060，0.118，0.224 ng/ml)；普通型患者的 IL-6 水平低于危重型，（分别为 8.42，73.65pg/ml）；差异均具有统计学意义 (P<0.05)；ROC 曲线显示 PCT 和 CRP 诊断 COVID-19 价值较高，评估重型和危重型 COVID-19 患者，CRP 的价值最高，且三个指标联合检测可以提高评估效能；评估危重型 COVID-19 患者，IL-6 有较高的预测价值。
结论 血浆 CRP，PCT 和 IL-6 水平可能是诊断 COVID-19 的潜在生物标志物，并且其血浆水平可以评估 COVID-19 的严重程度，三指标联合检测可以提高评估效能，对 COVID-19 的临床诊断和治疗具有重要的参考价值。

PO-0843

Analysis of adjunctive serological detection to nucleic acid test for severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection diagnosis

Rui Liu
Renmin Hospital of Wuhan University

Background The severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) caused coronavirus disease 2019 (COVID-19) epidemic in China, December 2019. The clinical features and treatment of COVID-19 patients remain largely elusive. However, accurate detection is required for SARS-CoV-2 infection diagnosis. We aimed to evaluate the antibodies-based test and nucleic acid-based test for SARS-CoV-2-infected patients.
Methods We retrospectively studied 133 patients diagnosed with SARS-CoV-2 and admitted to Renmin Hospital of Wuhan University, China, from January 23 to March 1, 2020. Demographic data, clinical records, laboratory tests, and outcomes were collected. Data were accessed by SARS-CoV-2 IgM-IgG antibody test and real-time reverse transcriptase PCR (RT-PCR) detection for SARS-CoV-2 nucleic acid in COVID-19 patients.
Results Of 133 COVID-19 patients, there were 44 moderate cases, 52 severe cases, and 37 critical cases with no differences in gender and age among three subgroups. In RT-PCR detection, the positive rate was 65.9%, 71.2%, and 67.6% in moderate, severe, and critical cases, respectively. Whereas the positive rate of IgM/IgG antibody detection in patients was 79.5%/93.2%, 82.7%/100%, and 73.0%/97.3% in moderate, severe, and critical cases, respectively. Moreover, the IgM and IgG antibodies concentrations were also examined with no differences among three subgroups.
Conclusion The IgM-IgG antibody test exhibited a useful adjunct to RT-PCR detection, and improved the accuracy in COVID-19 diagnosis regardless of the severity of illness, which provides an effective complement to the false-negative results from a nucleic acid test for SARS-CoV-2 infection diagnosis after onsets.

PO-0844

Clinical characteristics of COVID-19 patients with hepatitis B virus infection — a retrospective study

Rui Liu
Renmin Hospital of Wuhan University

Background & Aims The outbreak of coronavirus disease 2019 (COVID-19) has been declared a pandemic. Although COVID-19 is caused by infection in the respiratory tract, extrapulmonary manifestations including dysregulation of the immune system
and hepatic injury have been observed. Given the high prevalence of hepatitis B virus
(HBV) infection in China, we sought to study the impact of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) and HBV coinfection in patients.
Methods Blood samples of 50 SARS-CoV-2 and HBV coinfected patients, 56 SARSCoV-2 mono-infected patients, 57 HBeAg-negative chronic HBV patient controls and 57 healthy controls admitted to Renmin Hospital of Wuhan University were collected
in this study. Complete blood count and serum biochemistry panels including markers indicative of liver functions were performed. Cytokines including IFN-γ, TNF-α, IL-2, IL-4, IL-6 and IL-10 were evaluated. T cell, B cell and NK cell counts were measured using flow cytometry.
Results SARS-CoV-2 and HBV coinfection did not significantly affect the outcome of the COVID-19. However, at the onset of COVID-19, SARS-CoV-2 and HBV coinfected patients showed more severe monocytopenia and thrombocytopenia as well as more
disturbed hepatic function in albumin production and lipid metabolism. Most of the disarrangement could be reversed after recovery from COVID-19.
Conclusions While chronic HBV infection did not predispose COVID-19 patients to more severe outcomes, our data suggest SARS-CoV-2 and HBV coinfection poses a higher extent of dysregulation of host functions at the onset of COVID-19. Thus,
caution needs to be taken with the management of SARS-CoV-2 and HBV coinfected patients.

PO-0845

Analysis of Nucleic Acid and Antibody Detection Results for SARS-CoV-2 Infection

Juanjuan Chen
Renmin Hospital of Wuhan University

Background RT-PCR of virus nucleic acid test (NAT) has become the standard method to diagnose SARS-CoV-2 infection. However, there are still many limitations, especially the problem of the high false negative rate. Therefore, the aim of this study was to investigate the positive rate of SARS-CoV-2 NAT and evaluate the diagnostic performance of SARS-CoV-2 IgM and IgG antibody detection in novel coronavirus infection.
Methods A total of 10,309 suspected or high-risk cases of infection with SARS-CoV-2 in Wuhan Hubei, China, were tested for virus NAT by RT-PCR. Among those cases, 762 COVID-19 patients and 143 patients with non-COVID-19 who were tested for SARS-CoV-2 IgM and IgG during the NAT period were screened. The difference between the two test methods was analyzed using the chi-square test.
Results The positive rate of 10309 cases was about 36% (95%CI: 95%CI: 33.39%–-39.67%). SARS-CoV-2 was present in various types of specimens, and alveolar lavage fluid had the highest positive rate ([52.38% (95%CI: 31.02–-73.74)).)].The clinical sensitivity of serum SARS-CoV-2 IgM and IgG was 77.17% (588/762) and 94.88% (723/762), respectively, and the clinical specificity was 93.71% (134/143) and 90.21% (129/143). The AUC of SARS-CoV-2 IgG and combination of IgG with IgM were equally larger than IgM (0.973 (95%CI: 0.964-0.983) vs 0.930

(95%CI: 0.910–-0.949)). IgG antibody had the highest specificity ([100.0% (95%CI: 100.00%–-100.00%))%)]and sensitivity ([94.0% (95%CI: 92.45%-95.55%))%)]when detected alone or in combination with IgM antibody. The total coincidence rate of SARS-CoV-2 antibodies detection and SARS-CoV-2 NAT for the diagnosis of SARS-CoV-2 infection was 92.04% (833/905). Among the 34 SARS-CoV-2 NAT-negative patients with clinical symptoms and CT imaging features, 29 (85.29%) patients were positive for SARS-CoV-2 IgM, and 31 (91.76%) were positive for IgG.
Conclusions SARS-CoV-2 NAT should be considered for many types of specimens, and the combined test of SARS-CoV-2 IgM and IgG can make up for the problem of missed NAT in COVID-19 patients.

PO-0846

Incidence, clinical risk and prognostic factors for liver metastasis in patients with cervical cancer: A Population-Based Retrospective Study

Hang Liu[2]、Xiangsen Ye[3]、Di Li[1]、Qian Yao[1]、Yan Li[1]
1. Department of Clinical Laboratory, Renmin Hospital of Wuhan University
2. Department of Clinical Laboratory, Renmin Hospital of Wuhan University
3. Department of Clinical Laboratory, The Central Hospital of Wuhan, Tongji Medical College

Background Cervical cancer is one of the most frequent malignancies in women, particularly metastasis resulting in a poor prognosis. However, the clinical characteristics of cervical cancer patients with advanced liver metastasis have not been well investigated. We aimed to evaluate the incidence, clinical risk and prognostic factors for hepatic metastasis in cervical cancer patients.
Materials and Methods The clinical features of patients diagnosed with cervical cancer were collected from the Surveillance, Epidemiology and End Result (SEER) public cancer database between 2010 and 2015. Multivariate logistic and Cox regression models were performed to identify potential risk and prognostic factors for liver metastasis in patients with cervical cancer.
Results A total of 431 patients (2.32%) developed liver metastasis in our analysis. The following characteristics were significantly associated with the development of liver metastasis: black ethnicity, uninsured status, higher tumor stage, poorer differentiated grade, non-squamous histology, non-surgery of primary site, patients with any additional lung, bone, and brain metastasis. Multivariate Cox regression showed that patients with additional lung metastasis, without radiotherapy, and without chemotherapy were negatively correlated with overall survival. Concurrent chemotherapy and radiotherapy was a favorable prognostic factor to improve overall survival, and chemotherapy showed to increase cause-specific survival. Additional lung metastasis was an independent characteristic for both risk and prognostic factors for hepatic metastasis in patients with cervical cancer.
Conclusion Our results found several potential clinical features that may be used to assess the risk and prognosis of liver metastasis in patients with cervical cancer. These associated factors may provide clinical indications for the early identification and treatment of cervical cancer patients with hepatic metastasis.

PO-0847

FAM122A 通过下调 GATA1 转录活性抑制红细胞分化

陈婧
上海交通大学医学院附属第九人民医院

目的 FAM122A 是进化上高度保守但功能未知的蛋白。我们发现 FAM122A 在 $CD71^{+}$的早期阶段红细胞中高表达，提示 FAM122A 可能在红系分化中具有潜在作用。
方法 1. 检测 FAM122A 在红系分化过程中的表达：采用 hemin 诱导的 K562 细胞以及 EPO 诱导的 $CD34^{+}$细胞体外诱导模型。
2. 探讨 FAM122A 是否参与红系分化。将 $CD34^{+}$细胞进行 FAM122A 基因的敲低或过表达，发现 FAM122A 不影响红系早期 BFU-E、CFU-E 的生成，但明显抑制终末红系分化。
3. 研究 FAM122A 抑制红系分化的作用机制。利用质谱以及 RNA-seq 分析，发现红系特异转录因子 GATA1 是潜在的介导 FAM122A 调控红系分化的关键分子。FAM122A 不影响 GATA1 的表达，两者存在直接相互作用。EMSA 实验发现 FAM122A 阻碍 GATA1 与其 DNA 靶序列的结合，ChIP 实验及双荧光素酶报告系统证实 FAM122A 抑制 GATA1 与其靶基因启动子区 DNA 的结合，抑制 GATA1 转录活性。
4. GEO 数据分析，发现 FAM122A 在 β-地中海贫血病人细胞中异常高表达，提示 FAM122A 可能参与红系分化异常相关疾病的发生。
结果 本项研究发现 FAM122A 在红系终末分化阶段表达下调，且过表达 FAM122A 显著抑制红细胞的终末分化。FAM122A 与 GATA1 相互作用，抑制 GATA1 与其靶基因的结合及其转录活性，抑制红细胞分化。GEO 数据分析，发现 FAM122A 在 β-地中海贫血病人中显著高表达。
结论 本课题的研究揭示了 FAM122A 参与调控红系分化的新功能，这不仅对于全面认识红系分化信号调控网络具有重要的理论和实践指导意义，而且为体外有效扩增红细胞提供新的思路。

PO-0848

川东北地区 MM 患者骨髓瘤细胞免疫表型特征及其临床意义

祝静、龙思琪、蒋瑶、刘文
川北医学院附属医院

目的 明确我国川东北地区多发性骨髓（MM）患者骨髓瘤细胞免疫表型的特征及其临床意义。
方法 流式细胞术检测川北医学院附属医院 2018 年 1 月至 2020 年 1 月期间血液科住院的 MM 患者骨髓瘤细胞的免疫表型，分析 CD38、CD138、CD19、CD56、CD20、CD117、CD27、CD28、CD33、cKappa、cLambda 在不同临床分期之间表达率的差异以及其与病情评估指标 LDH、白蛋白、β2-MG、血红蛋白的关系。
结果 川东北地区 MM 患者骨髓瘤细胞 CD 分子的阳性表达率从高到低依次为 CD38（100%）、CD138（100%）、CD56（77.9%）、CD19（55.8%）、cLambda（55.8%）、CD28（54.8%）、CD117（48.1%）、CD27（44.2%）、cKappa（44.2%）、CD33（26.9%）、CD20（21.2%）。ISS 不同分期 CD27 的阳性表达率比较，差异有统计学意义（$P<0.05$）；CD56+组 LDH、白蛋白低于 D56-组，CD117+组白蛋白水平高于 CD117-组，CD27+组 β2-MG 低于 CD27-组，CD28+组的血红蛋白高于 CD28-组（$P<0.05$）；CD19+组与 CD19-组相比、CD20+组与 CD20-组相比以及 CD33+组与 CD33-组相比，血清 LDH、β2-MG、白蛋白及血红蛋白均无显著差异（$P>0.05$）。
结论 川东北地区 MM 患者 CD27 的阳性率越低，ISS 分期越晚，可能病情更重；CD27+组、CD56+组、CD117+组以及 CD28+组的疾病活动度、肿瘤负荷、肿瘤消耗及瘤细胞可能对骨髓的浸润及抑制程度均分别的低于相应的阴性组。

PO-0849

Luteolin transforms the polarity of bone marrow-derived macrophages to regulate the cytokine storm

Shuxia Wang、Xiaoming Yao
Affiliated Hospital of Integrated Traditional Chinese and Western Medicine, Nanjing University of Chinese Medicine; Jiangsu Province Academy of Traditional Chinese Medicine

Background and objective Macrophages are indispensable regulators of inflammatory responses. Macrophage polarisation and their secreted inflammatory factors have an association with the outcome of inflammation. Luteolin, a flavonoid abundant in plants, has anti-inflammatory activity, but whether luteolin can manipulate M1/M2 polarization of bone marrow-derived macrophages (BMDMs) to suppress inflammation is still unclear. This study aimed to observe the effects of luteolin on the polarity of BMDMs derived from C57BL/6 mice and the expression of inflammatory factors, to explore the mechanism by which luteolin regulates the BMDM polarity.

Methods M1-polarized BMDMs were induced by lipopolysaccharide (LPS) + interferon (IFN)-g and M2-polarization were stimulated with interleukin (IL)-4. BMDM morphology and phagocytosis were observed by laser confocal microscopy; levels of BMDM differentiation and cluster of differentiation (CD)11c or CD206 on the membrane surface were assessed by flow cytometry (FCM); mRNA and protein levels of M1/M2-type inflammatory factors were performed by qPCR and ELISA, respectively; and the expression of p-STAT1 and p-STAT6 protein pathways was detected by Western-blotting.

Results The isolated mouse bone marrow cells were successfully differentiated into BMDMs, LPS+IFN-g induced BMDM M1-phenotype polarization, and IL-4 induced M2-phenotype polarisation. After M1-polarised BMDMs were treated with luteolin, the phagocytosis of M1-polarized BMDMs was reduced, and the M1-type pro-inflammatory factors including IL-6, tumour necrosis factor (TNF)-a, inducible nitric oxide synthase (iNOS), and CD86 were downregulated while the M2-type anti-inflammatory factors including IL-10, IL-13, found in inflammatory zone (FIZZ)1, Arginase (Arg)1 and CD206 were upregulated. Additionally, the expression of M1-type surface marker CD11c decreased. Nevertheless, the M2-type marker CD206 increased; and the levels of inflammatory signalling proteins phosphorylated signal transducer and activator of transcription (p-STAT)1 and p-STAT6 were attenuated and enhanced, respectively.

Fig. 1 The differentiation proportion of BMDM.

Fig. 2 Effect of luteolin on the phagocytic activity in polarised BMDMs. The BMDMs that have phagocytosed Gram-positive bacilli (a) or Candida albicans (b) are stained with Wright-Giemsa Stain to visualize in the field.

Fig. 3 Effect of luteolin on the expression of BMDM surface markers CD11c and CD206.

Fig. 4 Effects of luteolin on the protein levels of p-STAT1/6 in polarized BMDMs.

Conclusions Our study suggests that luteolin may transform the BMDM polarity from a pro-inflammatory M1-phenotype to an anti-inflammatory M2-phenotype through p-STAT1/6. Simultaneously, inflammatory factors are analogously altered from pro-inflammatory to anti-inflammatory type. In light of these findings, our research provides a novel insight into the role of naturally occurring luteolin holds promise as an anti-inflammatory and immunomodulatory agent.

PO-0850

The value of serum amyloid A levels for predicting disase severity in COVID-19 patients: A systematic review and meta-analysis

Wenjie Huang、Lihong Wu、Yangyang Liu、Lin Sun、Fangrong Gan、Jianlin Chen、Yifan Sun
Affiliated Liutie Central Hospital of Guangxi Medical University

Backgroud An abundance of clinical reports focused on the serum amyloid A (SAA) have been report on severe coronavirus disease 19 (COVID-19), but a systematic analysis synthesizing these findings has not been performed.
Methods A comprehensive literature search was conducted in PubMed, Embase databases and Web of Science from their outbreak to February 1, 2021. Two investigators independently reviewed suitable studies. Pooled standardized mean difference (SMD), 95% confidence intervals (CI), and correlation coefficient (r) were computed using random-effect model.
Results We included 19 of 317 titles identified by our search, involving a total of 1806 mild cases and 1529 severe cases. Compared with the mild group, the severe group had markedly higher SAA levels (SMD=1.155, 95% CI 0.89, 1.42). Subgroup analysis manifested that SAA level difference between severe group and mild group were associated with age, sample size and detection method. Sensitivity analyses showed the credibility and robustness of our results. In addition, In six studies in 1144 severe COVID-19 patients and critical COVID-19 patients, SAA was significantly higher in critical patients (SMD=0.476, 95% CI 0.13, 0.82).
Conclusion High circulating SAA levels were markedly associated with COVID-19 severity, especially for participants subject age less than 60 when compared to mild COIVD-19 patients, and the concentrations of SAA were also significantly higher in critical COVID-19 when compared to severe COVID-19 patients. Further studies, in larger cohorts, are needed to confirm whether the SAA is a useful tool in discriminating between COVID-19 patients with stable disease, those with acute exacerbations, and subjects without disease.

PO-0851

Human decidual stromal cells in early pregnancy induce functional re-programming of monocyte-derived dendritic cells via crosstalk between G-CSF and IL-1β

Huayang Wang
Qilu Hospital of Shandong Universtiy

Objective To explore the effect of early pregnancy decidual stromal cells (DSCs) on monocyte-derived DCs and the relevant mechanisms.
Methods DSCs in early pregnancy were isolated and co-cultured with monocyte-derived dendritic cells in vitro. The functions and phenotypes of dendritic cells were analyzed. The secretion profile of DSCs were analyzed and the role of DSC-derived G-CSF on modification of dendritic cells was further investigated by neutralizing antibody. Last, the G-CSF secretion from DSCs in healthy pregnancy and spontaneous abortion (SA) patients was analyzed.
Results DSC-conditioned DCs showed altered phenotypes, secretion profiles and Th2 priming potential. G-CSF concentration was significantly up-regulated in the co-culture supernatant between DSCs and DCs. Supplementation of G-CSF neutralizing antibody partly reversed the reprogramming of DCs mediated by DSCs. Furthermore, G-CSF production was promoted by IL-1β, which was mainly produced by DCs and significantly up-regulated after their cultivation with DSCs. Interestingly, the effects of DSC on IL-1β production of DCs occurred in their immature stage but not their mature stage. Lastly, no significant difference of G-CSF was found in DSCs

from healthy early pregnancy women and spontaneous abortions (SA) patients. However, DSCs from SA patients secreted less G-CSF in response to exogenous rhIL-1β or DC cultivation.
Conclusion Our study bolster the understanding of the decidual immunomodulatory microenvironment during early pregnancy, and brings new insight into the potential clinical value of G-CSF in pregnancy disorders.

PO-0852

RDW 在医院获得性肺炎实验室诊断中的价值评估

王书侠[1]、姚孝明[2]、王志国[2]
1. 南京中医药大学附属中西医结合医院 江苏省中医药研究院
2. 南京中医药大学附属中西医结合医院

背景和目的 医院获得性肺炎（HAP）是住院患者最常见的并发症，常见的病原体主要为细菌、真菌等。红细胞分布宽度（RDW）是血球分析仪快速、自动计算出的一种红细胞指数。RDW 越高，表明红细胞的离散程度越大。RDW 过去一直用于贫血的诊断或鉴别诊断，近来有研究发现，其与自身免疫性疾病、心血管病、消化系统疾病、感染性疾病等均有密切关系。本文探讨 RDW 在 HAP 实验室诊断及其感染菌群中的价值评估。
方法 回顾性分析住院患者的痰培养结果及其相应的血常规衍生参数 RDW，痰培养结果分为痰培养阳性组（HAP）和痰培养阴性组（疑似 HAP），随机抽取同期健康体检者作为对照组；并采用受试者工作特征曲线（ROC）及曲线下面积（AUC）分析 RDW 对 HAP 及感染菌群的诊断价值。
结果 相对于对照组[12.85（12.27~13.3）]和痰培养阴性组[13.15（12.57~14.2）]，住院患者痰培养阳性组的 RDW 水平[15.4（14.2~14.6）]显著升高，RDW 的异常（升高）率（58.9 %）也显著升高；痰培养阳性组的菌群以革兰氏阴性杆菌为主（68.49 %），其次为革兰氏阳性球菌（16.43 %）和真菌（15.07 %）；阴性杆菌组的 RDW 水平[15.9（14.35~17.4）]相对于阳性球菌组[14.8（14.17~15.3）]和真菌组[14.9（14.05~16.17）]有显著性差异。ROC 曲线分析显示，RDW 诊断 HAP 感染的 AUC 为 0.81；区分革兰氏阴性菌与革兰氏阳性菌及真菌的 AUC 分别为 0.75 和 0.72。
结论 RDW 不仅可作为怀疑 HAP 感染和非感染的初步评估，还可以作为 HAP 感染菌群尤其革兰氏阴性菌感染的初判，以辅助抗生素的治疗。怀疑 HAP 患者同时观察 RDW 的水平，必要时动态监测 RDW 的变化，可以给我们在 HAP 的实验室诊断上得到不少启示。RDW 将是一项很有前景的炎性生物标志物。

PO-0853

医学检验领域能力验证数据防串通措施的探讨

郭晓俊、蒋玲丽、王青
上海市临床检验中心

目的 为保证能力验证结果评价科学、客观、公正和有效,对能力验证计划防止数据串通的措施进行了探讨。
方法 从样品设计、发样方式、检测周期和统计设计 4 个方面介绍了防止数据串通的措施, 以 2018 年-2020 年上海市临床检验中心实施的血凝检测和内分泌检测能力验证计划为例，对实施前后的数据比较来分析，探讨能力验证防止数据串通措施的具体实施方法。
结果 在样品的设计时分别取不同浓度水平样品，分割水平设计（采用合理的样品近似浓度水平，但样品不同），同时增加编制序号的数量，使参加者无法从编号上辨别样品的区别；采用盲样随机化处理发放样品；检测周期的设计应缩短结果上报周期，将样品邮寄时间及大概到达时间提前告知参加者，让参加者提前准备实验条件，以最快的速度、最短的时间完成检测并上报结果；在统计方

法的设计时通过采用标准化四分位间距的统计方法计算分割水平样本，同时能统计系统误差和随机误差。
结论 设计分割水平样品、盲样随机化处理发放样品、缩短能力验证结果上报周期和采用标准化四分位间距的统计方法等几种措施可以有效地防止能力验证数据的串通，从而保证医学实验室能够出具更加准确地检测报告以服务于临床，最终保障患者的治疗和健康。

PO-0854

Psychological Effects of COVID-19 on Mental Health of Parents of Children with Hematopathy

Xu Chen[1]、Yuanyuan Gao[2]
1. First Affiliated Hospital of Soochow University
2. 苏州大学附属儿童医院

Background We explored whether parents of children with hematopathy had more psychosocial problems than parents of healthy children during the COVID-19 outbreak.
Methods An online survey was used in this study, a total of 1116 parents participated, mental health variables were assessed via the Simplified Coping Style Questionnaire (SCSQ) and the Symptom Check List-revised (SCL-90-R).
Results Compared with parents of healthy children (n=731), parents of children with hematopathy (n=385) have a higher possibility (70.9% vs. 33.2%, P<0.01) of negative coping style. Parents of children with hematopathy are more concerned to the media reports related to the epidemic (46.9% vs. 10.4%). In SCL-90-R somatization, obsessive-compulsive, and anxiety scale, parents of children with hematopathy have higher scores than parents of healthy children (12.50±1.69 vs.12.23±1.37, p<0.01; 13.42±6.69 vs. 10.47±2.25, p<0.01; 15.21±5.53 vs. 10.52±2.34, p<0.01, respectively). History of visiting Wuhan, and history of epidemics occurring in the community are the independent risk factors of two groups' parental obsessive-compulsive and anxiety symptoms (P<0.01).
Conclusions Parents of children with hematopathy have obvious serious symptoms of obsessive-compulsive and anxiety during the outbreak of COVID-19. Providing psychological interventions to parents of children with hematopathy needs to be realized.

PO-0855

自发性狼疮肾炎模型小鼠肾小球系膜细胞分离、原代培养及鉴定

陈鹤鸣、林婷、宋艳芳、林青
福建中医药大学附属人民医院

目的 原代培养及鉴定自发性狼疮肾炎模型小鼠肾小球系膜细胞，探索分离、培养的最佳条件。
方法 对照组 ICR 小鼠和模型组 MRL/lpr 小鼠各 9 只，在 12、14 和 18 周龄时检测小鼠的自身抗体以及尿蛋白；通过肾脏组织病理切片，观察小鼠狼疮肾炎发病情况。采用细胞筛网分离出肾小球，结合优生选择法原代培养肾小球系膜细胞。通过细胞形态学、免疫细胞化学技术鉴定 MRL/lpr 小鼠肾小球系膜细胞。
结果 模型组小鼠，ANA 和抗 ds-DNA 抗体明显增高（P<0.05），尿蛋白在 14 和 18 周龄明显增高（P<0.05），肾脏组织染色显示，MRL/lpr 小鼠从 12 周开始即表现出狼疮肾炎相关的病理改变。种植 25d 后，MRL/lpr 小鼠肾小球系膜细胞逐渐铺满培养瓶底，相差显微镜下呈星形、梭形。免疫细胞化学显示抗 α 平滑肌肌动蛋白（α-SMA）阳性、抗足细胞裂孔膜蛋白（nephrin）阴性，排除其他肾小球固有细胞。

结论 改良后的自发性狼疮肾炎小鼠肾小球系膜细胞的原代培养操作简单，在保证动物模型发病的同时，获得稳定、活性强、纯度高的细胞。

PO-0856

医院水环境中碳青霉烯类耐药细菌多样性及耐药基因研究

史庆丰
复旦大学附属中山医院

目的 调查医院内不同水环境中碳青霉烯类耐药细菌的分布及其耐药基因污染现状。
方法 使用 mSuper CARBA 显色平板（含美罗培南 4μg/mL）对医院门诊区域、普通病房、行政楼和重症监护室的洗手池、拖把清洗和废液倾倒处水槽孔进行采样，培养 48 小时后使用 MALDI-TOF 质谱仪对细菌进行鉴定。同时使用数字 PCR 微滴法对样本进行碳青霉烯耐药基因 blaKPC、blaNDM、blaOXA-23、blaOXA-48 鉴定。
结果 共采集 71 个水环境样本，49 个（69.01%）样本培养出碳青霉烯类耐药细菌，以嗜麦芽窄食单胞菌的检出率最高（43.66%），其次为鲍曼不动杆菌（15.49%）；39 份水环境样本可鉴定出至少 1 种耐药基因，其中 blaNDM 检出率显著高于其它三个耐药基因（$\chi 2=48.086$，$P=0.001$），9 份细菌培养阴性样本可鉴定出 blaKPC 或 blaNDM 耐药基因。
结论 医院水环境中广泛定植碳青霉烯类耐药细菌，ICU 和普遍病房水环境 blaNDM 耐药基因污染严重，可能成为医院感染多重耐药菌来源，今后应加强对此类环境的消毒管理。

PO-0857

医学实验室质量体系内部审核技巧和方法分享

陈振朋、张维
西安金域医学检验所有限公司

目的 内部审核，也称为第一方审核，用于内部目的，由组织自己或以组织的名义进行，可作为组织自我合格声明的基础。掌握合适有效的内部审核技巧，是内审成功与否的关键。
方法 医学实验室质量体系内部审核是审核实验室质量体系是否符合所依据的标准以及是否有效的运行。内审员的选择及内审技巧和方法的掌握是内审成败的关键所在。
结果 1. 审核员的要求和基本能力：审核员要求对所要审核的体系和内容有较为清晰的认识和理解，同时审核员不能审核自己科室体系；
2. 审核员所需具备的基本素质和能力：有道德、思想开明、善于交谈、善于观察、自立、有丰富的质量管理经验、掌握一定的内审技巧。
3. 审核技巧：首先在面谈时，需要选择正确的面谈对象，提问应单刀直入，直截了当的明确问题，掌握正确的提问技巧，如 5W1H 法：WHAT、WHEN、WHERE、WHO、WHY、HOW 。提问时应注意开放式提问与封闭式提问相结合，以开放式提问为主。在听受审者谈话时，审核者应真诚、耐心、专心聆听，并多给予反馈和鼓励。审核员在现场要带着问题去观察，寻找客观事实。查阅文件和记录时，应细心核对，确认是否按体系去做，受控的记录和文件可以作为客观证据。要善于联想和追溯，质量体系各要素之间是有逻辑上的关联性。
4. 审核中需注意：控制审核进度；控制审核氛围和现场纪律；抽样有代表性；从表面显现寻找问题实质；与被审方负责人确认不符合事实。
5. 审核方法自下而上和自上而下审核；正向和逆向审核；按部门或按要素审核。
结论 在质量体系审核中，选择合适的审核员，并掌握相应的审核技巧和方法，关系到本次审核的质量和成败。

PO-0858

一例发生于年轻患者的母细胞性浆细胞样树突状细胞肿瘤实验室检查及临床病理特点总结并文献复习

黄林林[1]、唐梅[1]、周宇[1]、许玉玲[2]、敬敏[1]、左梅琳[1]、杨友谊[1]、陈虹[1]、罗军[2]
1. 四川金域医学检验中心
2. 广西医科大学第一附属医院

目的 探讨发生于年轻患者的母细胞性浆细胞样树突状细胞肿瘤（BPDCN）实验室多平台检查诊断、临床病理特点总结及文献复习。
方法 回顾研究广西医科大学第一附属医院血液内科的一例 21 岁患者，腹股沟皮下包块，大小约 2cm，手术切除送实验室检查，并做骨髓细胞及流式细胞分析，通过细胞形态、免疫表型、流式细胞及分子等多平台检测进行综合诊断、临床病理特点总结并复习文献。
结果 中等大小母细胞样肿瘤细胞弥漫浸润，核分裂易见，免疫表型 CD2、CD7、CD123、CD4、CD56 均为强阳性,Ki-67 高表达，CD3、CD20、CD34、MPO、S-100、MUM-1、CD10 均为阴性，CD99、TDT 部分阳性，骨髓流式细胞可见一群异常幼稚细胞，CD123 强阳性，CD33、CD7、CD2、CD4、CD56 和 CD304 阳性，TDT 弱阳性，考虑不典型 BPDCN。骨髓细胞呈急性白血病骨髓象，但细胞形态不典型，需鉴别 AML-M5 及 BPDCN。白血病融合基因检测：阴性。染色体核型：46，XY。血液肿瘤全外显子 NGS 检测：IKZF1、JAK1、VAV1 基因突变阳性。综合诊断为：符合母细胞性浆细胞样树突状细胞肿瘤。该患者先后用 VDCLP、Hyper-CVAD 方案化疗 4 个疗程，过程顺利，随访 10 个月，现在患者一般情况良好，等待移植治疗。
结论 母细胞性浆细胞样树突状细胞肿瘤是一种非常罕见的临床进展呈高度侵袭性的淋巴造血系统肿瘤，临床表现复杂，容易误诊，常见皮肤损害、骨髓受累，少数以淋巴结肿大、脾大、发热起病，中老年发病，年轻患者罕见，典型标志 CD4、CD123、CD56、CD304、CD303、TCL1 阳性表达。BPDCN 必须结合组织形态、免疫表型、骨髓细胞、分子检测等多平台检查综合诊断，其预后极差，复发率高，中位生存期不足 2 年，缺乏标准的治疗方案,目前多采用化疗联合造血干细胞移植综合治疗，年轻患者预后好于老年人。

PO-0859

血清淀粉样蛋白 A 在眼科疾病应用的研究进展

刘晓娜
济南市明水眼科医院

血清淀粉样蛋白 A（SAA）是一种非特异性急性时相反应蛋白，其作为炎症标志物的临床价值近年来得到广泛关注。SAA 水平变化对于感染性疾病的早期诊断、危险评估、疗效观察及预后评价都具有重要临床价值。SAA 能与血浆中的高密度脂蛋白结合，是载脂蛋白家族中的异质类蛋白质，作为淀粉样沉积的前体物质，是在研究淀粉样变性的过程中被发现的。在健康人体血液中微量存在，当机体发生炎症反应时，SAA 由单核巨噬细胞产生的 IL－1、IL－6 和 TNF－α 等炎症相关因子刺激肝细胞分泌，在病毒或细菌感染 3～6h 内明显升高，且半衰期短，仅 50 分钟。在机体急性炎症时期其血浆浓度可升高 1000 多倍，并在疾病的恢复期快速下降并恢复至正常水平，因此成为目前反映炎症感染最为敏感的实验室标志。SAA 在全身炎症性疾病中的临床应用较广泛，但在局部炎症性疾病中的临床应用报道比较少见。本文就 SAA 在眼科的临床应用进行综述。

PO-0860

Serum vitamin D and vitamin-D-binding protein levels in children with chronic hepatitis B

Caizhi Huang[1]、Jie Zhang[1]、Lin Zhang[1]、Cuihua Yu[2]、Yi Mo[1]、Liya Mo[1]
1. Hunan Children's Hospital
2. 长沙市第一医院

AIM To explore vitamin D and VDBP serum levels in children with CHB and the association of vitamin D and VDBP with HBV replication and hepatic fibrosis.
METHODS We enrolled 204 children with CHB admitted to Hunan Children' Hospital in summer and autumn between 2018 and 2019 and 170 healthy controls. CHB patients included: 164 hepatitis B e antigen (HBeAg) positive and 40 HBeAg negative; 193 hepatitis B surface antigen (HBsAg) positive and 11 HBsAg negative; 164 with detectable HBV deoxyribonucleic acid (DNA) and 40 with undetectable HBV DNA; 131 with HBV genotype B and 23 with HBV genotype C; and 27 without hepatic fibrosis and 97 with hepatic fibrosis. Serum levels of 25(OH)D, VDBP, liver function markers, and other clinical parameters were collected to analyze their association with vitamin D and VDBP. Mann-Whitney U test, Kruskal-Wallis H test, or t test was used to analyze serum 25(OH)D and VDBP levels in different groups. Spearman rank correlation test was utilized to analyze the correlation of 25(OH)D and VDBP with other markers. Statistically significant factors determined by univariate analysis were further analyzed by binary multivariate logistic regression analysis. $P < 0.05$ was considered statistically significant.
RESULTS Children with CHB had lower serum 25(OH)D (56.64 ± 17.89 nmoL/L) and VDBP [122.40 (70.74-262.84 μg/L)] levels than healthy controls had ($P < 0.001$). Serum 25(OH)D and VDBP levels were significantly different among the different grades of hepatic fibrosis ($P < 0.05$). VDBP levels in children with HBV genotype C, HBsAg, HBeAg, and detectable HBV DNA were significantly lower than those in children with HBV genotype B, no HBsAg, no HBeAg, and undetectable HBV DNA ($P < 0.05$). Serum 25(OH)D level was negatively correlated with age and serum total bilirubin level ($r = -0.396$ and -0.280, respectively, $P < 0.001$). Serum VDBP level was negatively correlated with HBV DNA (log10 IU/mL) ($r = -0.272$, $P < 0.001$). Serum 25(OH)D level was not correlated with VDBP level ($P > 0.05$). Univariate ($P < 0.05$) and multivariate logistic regression analysis showed that low level of 25(OH)D (odds ratio = 0.951, 95% confidence interval: 0.918-0.985) and high level of HBV DNA (odds ratio = 1.445, 95% confidence interval: 1.163-1.794) were independently correlated with hepatic fibrosis ($P < 0.01$).
CONCLUSION Serum levels of 25(OH)D and VDBP are decreased in children with CHB. Serum VDBP level is negatively correlated with HBV replication. Low level of 25(OH)D is independently associated with hepatic fibrosis in children with CHB. There is no significant association between serum levels of 25(OH)D and VDBP.

PO-0861

Study of decreased serum levels of retinol binding protein 4 in majordepressive disorder

Qian Yao、Li Yan
Renmin Hospital of Wuhan University

Background Studies in western populations find that obesity and depression are positively correlated. Adipokines secreted by adipose tissue may serve as the crosstalk link between peripheral tissue and central nervous system,which mediates the relationship between obesity and depression.

Objective This study aimed to investigate serum retinol-binding protein 4 (RBP4) concentration inpatients with major depressive depression (MDD) and clarify its possible association with depression.
Methods Major depressive disorder patients (n = 237), healthy controls (n = 48) were collected from June 2017 to October 2019.The measurement of RBP4 levels was performed by Advia 2400 automatic biochemistry analyzer. Depressive symptoms of patients were assessed using the 24-item Hamilton Depression Scale (HAMD24).
Results (1) Serum RBP4 levels of MDD patients were significantly lower than that of the control group [(34.25 ± 8.82)mg/L vs(37.56 ± 8.83)mg/L](P < 0.05)which was independent from obesity;(2)The level of RBP4 [(31.13 ± 9.16) mg/L] in suicide attempt (SA) group was significantly lower than that in the control group andnon-suicide attempt (non-SA) group [(35.55 ± 8.37)mg/L](P < 0.05); (3) There was no significant correlation between serum RBP4 concentration and HAMD-24score (P > 0.05); serum RBP4 concentrations were positively associated with age,age of onset and duration of disease (r=0.325,0.298,0.135; P < 0.001, P < 0.001, P = 0.038) in depressive patients. (4) The level of serum RBP4 was positively correlated with TC,TG,and LDL-C(r=0.350,0.207,0.268;P < 0.001,P=0.001,P < 0.001),but not with other blood lipid indexes. ROC curve of RBP4 for MDD revealed an area under the curve of 0.603 and a sensitivity of 81.3%,specificity of 80%.
Conclusion The level of RBP4 in patients with MDD was lower than that in the normal control group, which might be related to the prognosis of patients with depression.

PO-0862

Autoimmune Epilepsy in Western China: Disease Characteristics and Prevalence

Shuo Guo[1]、Minjin Wang[2]、Yanbing Zhou[1]、Zirui Meng[1]、Yu Zhang[2]、Mingxue Zheng[2]、Xingbo Song[2]、Binwu Ying[2]
1. West China Hospital, Sichuan University
2. 四川大学华西医院

OBJECTIVE In western China, autoimmune epilepsy is an uncommon but important disease, and its true incidence is unknown. Delineating the characteristics and actual prevalence of autoimmune origin epilepsy in western China is critical to help patients receive immunotherapy, which is more effective than traditional antiepileptic therapy.
The aim of this study was to illustrate the characteristics and prevalence of autoantibodies in patients in western China with epilepsy of unknown etiology.
METHODS From January 2017 to June 2019, 639 patients with unexplained epilepsy were assessed retrospectively. Neuronal autoantibodies were assessed in 471 individuals with an APE2 score higher than 4, including 12 common neural-specific autoantibodies, antibodies against four common pathogens associated with central nervous system infections, or neurophagocytosis, and two thyroid-related autoantibodies.
RESULTS According to the APE2 score, suspected autoimmune epilepsy accounted for 44.37% of the cases of epilepsy with unknown etiology (209/471 patients). Sixty-nine patients were positive for neural-specific autoantibodies in CSF or serum that indicated that 33.02% (69/209 patients) exhibited suspected autoimmune epilepsy. 14.65% (69/471 patients) of the patients exhibited epilepsy of unknown etiology. Among the patients, 32 (46.38%) expressed NMDAR-Ab, 14 (20.29%) expressed GABABR-Ab, 10 (14.49%) expressed LGI1-Ab, 7 (10.14%) expressed GFAP-Ab, 3 (4.34%) expressed Yo-Ab, 2 (2.90%) expressed CASP2-Ab, and 1 (1.45%) expressed Hu-Ab. Compared to patients with non-autoimmune epilepsy, the positive rates of thyroid-related antibody expression and the neurophagocytosis pathogen levels of HSV-IgG and T. gondii-IgG were significantly different in patients with autoimmune epilepsy.

CONCLUSION This study elucidated the disease characteristics and prevalence of autoimmune epilepsy in western China, allowing for better identification and diagnosis of autoimmune epilepsy in the future.

PO-0863

Bacillus subtilis spores expressing Clonorchis Sinensis paramyosin (CsPmy) can positively regulate the intestinal microbiota of Ctenopharyngodon idellus.

Hengchang Sun[1]、Mei Shang[1]、Jiao Gong[1]、Wenying Zhou[1]、yan Huang[2]、Xinbing Yu[2]、Bo Hu[1]
1. The Third Affiliated Hospital, Sun Yat-sen University, Guangzhou, China
2. 中山大学中山医学院

Background Clonorchis sinensis is a pandemic zoonosis in China. For *Ctenopharyngodon idellus* (grass carp), *Bacillus subtilis* spores expressing paramyosin of *Clonorchis sinensis* has been proved to be a potent oral vaccine against *Clonorchis sinensis* cercaria infection. However，how the *Bacillus subtilis* spores affect the intestinal microbiota in grass carp deserves further study.
Method Bacillus subtilis spores were prepared in our previous study and were mixed with the pellet feed of grass carp. Grass carp, weigh 120-150 g, were divided into Bs-CotC-CsPmy，Bs-CotC and NC group in aquariums and were fed with *Bacillus subtilis* spores expressing with or without CsPmy for 8 weeks, respectively. Pellets Feed without spores were used as control. Then, fishes were sampled and the intestine tissues were used for whole-genome DNA extraction. The genomic DNA was extracted using OMEGA D3350 Bacterial DNA Kit (Omega, USA). The V3-V4 regions of 16S ribosomal DNA of bacteria were amplified, purified, and pooled in equimolar and paired-end sequenced (2 × 250 bp) on an Illumina MiSeq platform. The microbial community and diversity were evaluated. And changes in the microbiota were also analyzed.
Results Microbial community richness and diversity were significantly elevated in the Bs-CoC-CsPmy spore treated group. And 45 unique OTUs were found in the Bs-CoC-CsPmy group. The number of sequences related to Pseudomonas in the Bs-CoC-CsPmy group decreased compared with that in the NC group. Candidate probiotics including *Lactobacillus*, *Streptococcus*, and *Micrococcus* were also detected and analyzed. Higher- abundance Lactobacillus and Streptococcus genus were found in the Bs-CoC-CsPmy group. Additionally, bacteria associated with digestion were also investigated. The abundance of *Rikenellaceae*, *Ruminococcaceae*, and *Lachnospiraceae* (at the family level) varied in different groups, but they were dramatically increased in the BH group compared with other groups. Moreover, the abundances of *Odoribacter, Desulfovibrio*, and *Alistipes* were higher in the Bs-CoC-CsPmy group than those in the NC group.
Conclusion Oral administration of *Bacillus subtilis* spores expressing *Clonorchis sinensis* paramyosin reduced the abundance of potentially pathogenic bacteria (e.g., *Flavobacterium*) and enhance the abundance of probiotics (e.g. *Streptococcus*, *Lactobacillus*) or bacteria associated with digestion in grass carp.

PO-0864

First Case of Infective Endocarditis Caused by Methylobacterium radiotolerans

Ruifei Chen[1,2]、Xinkun Qi[1,2]、Bing Ma[2]、Poshi Xu[1,2]、Youhua Yuan[2]
1. Department of Clinical Laboratory of Central China Fuwai Hospital
2. 河南省人民医院

Methylobacterium radiotolerans is mainly present in the environment and has rarely been isolated from clinical samples. Here, we report for the first time a clinical case of severe infective endocarditis (IE) caused by M. radiotolerans. Several methods, including 16S rRNA amplification and sequencing, and matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF MS) were used to identify the bacterial sample isolated from the patient's cardiac vegetation. Drug sensitivity test was conducted by disk diffusion on blood Mueller-Hinton agar. This isolate was identified as M. radiotolerans. Drug susceptibility tests revealed that this isolate was susceptible to aminoglycosides and ciprofloxacin and was resistant to aztreonam. This is the first report of M. radiotolerans detection in the heart. This finding broadens the spectrum of pathogens that cause IE and serves as an encouragement to clinical personnel to pay attention to the diagnosis and treatment of severe IE caused by this rare pathogen.

PO-0865

嗜酸性粒细胞性肠炎一例

孙改河
郑州大学第一附属医院

一般资料
主诉: 女性患者，44 岁，因"腹痛 15 天，发现白细胞升高，CA125 升高 2 天"。实验室检查：大便常规：外观粘液样稀便，潜血阳性，镜检可见白细胞++++/Hp，涂片瑞氏染色为大量嗜酸性粒细胞。目前诊断：1.嗜酸性粒细胞性胃肠炎；2.低蛋白血症。
患者 2016 年 7 月 7 日加用激素治疗，口服醋酸泼尼松片治疗，密切观察患者病情变化。腹泻次数逐渐减少，自 10 余次减少至 1 次，临床症状逐步改善，于 2016 年 7 月 19 日出院，7 月 26 来院复查血液分析结果显示正常。
讨论 1. 嗜酸性粒细胞性胃肠炎(eosinophilic gastroenteritis,EG)是一组原因不明，以原发性胃肠道组织中嗜酸性粒细胞异常浸润为特征，伴有外周血嗜酸性粒细胞升高以及胃肠道症状表现的少见胃肠道疾病。病变可累及从食管到直肠的全胃肠道壁各层。1937 年 kaijser 最早描述了本病，可能与食物、药物等引起的 I 型变态反应有关，发病率约为 1-20/10 万。临床表现无特异性，容易误诊误治。按照病变部位分为局限性和弥漫性，按照浸润程度分为黏膜型、肌层型、浆膜层。诊断主要根据患者临床表现、血象、放射学和内镜病理检查结果进行诊断。
2. 实验室要注重细节，大便常规镜检发现有不明细胞成分时，可以涂片进行瑞氏染色。常见的细胞，不同寻常的比例，同样有玄机，值得深究和探讨。
3. 嗜酸性粒细胞比例增高伴 CA125 增高，不一定就是肿瘤、寄生虫，还需要考虑过敏性疾病，需要多结合病史分析。
4. 实验室检查结果要综合分析，长期腹部不适伴血液嗜酸性粒细胞增高应排除 EG。

PO-0866

Immune-associated molecule CTNNB1 for predicting the survival and tumor immunotherapy in hepatocellular carcinoma

Mei Shang、Minqi Luo、Wenying Zhou、Huimin Dong、Hengchang Sun、Sheng Liu、Jiao Gong、Bo Hu
The third Affiliated Hospital of Sun Yat-sen University

Objective Emerging study has inferred that immune checkpoint genes and the gene CTNNB1 encoding β-catenin act as the vital role in the pathogenesis and growth of liver cancer. Nevertheless, the differentially expression and its value to evaluate the prognosis of immune checkpoint genes in hepatocellular carcinoma (HCC) with or without different CTNNB1 status are still in blank.
Methods We comprehensively collected and analyzed gene expression data from HCC tissues and normal tissues in The Cancer Genome Atlas (TCGA) database. Differentially expressed genes analysis was applied to investigate the potential immune checkpoint genes that affecting the process of HCC, including the patient survival. Moreover, correlation analysis, gene-gene co-expression and survival analysis helped identify key immune checkpoint biomarkers associated with CTNNB1 mutations.
Results It was shown that five immune checkpoint genes (CD274, PDCD1, CTLA4, LAG3, and HAVCR2) were lowly expression in HCC tumors, and some of them might be highly related to the pathogenesis of HCC. The comparisons of CTNNB1 wild-type and mutant patients revealed that elevated expressions of PDCD1, CD274, CTLA4, and HAVCR2 were found in CTNNB1 wild-type group. Infiltration and survival analysis confirmed that CTNNB1-wildtype expression level was raised significantly than CTNNB1-mutation in CD8+ T cell, CD4+T cell, macrophage, neutrophil cell and dendritic cell (besides B cell). Also, HCC patients in CTNNB1 mutation group with high expression of CD274 ($p<0.001$), PDCD1 ($p=0.012$) had a better survival.
Conclusions Totally, our research screened potential differentially expression of immune checkpoint genes in different stages of HCC, and provided comprehensive and new immune checkpoint genes connected with CTNNB1 mutations, availing a theoretical insight for immunotherapy, especially the individualized management.

PO-0867

基层社区医疗机构检验科质量体系建立初探

张崇唯[1]、唐小兵[2]、应斌武[1]
1. 四川大学华西医院
2. 成都市成华区第七人民医院

目的 提升基层社区医院及卫生服务中心检验部门质量，保障结果准确度，建立检验科整体质量保障体系，剖析 5 年“医联体”模式下社区检验科的经验与收获。
方法 通过“华西-成华社区联盟”架构下，华西医院实验医学科派出专人及对应专家对基层社区 3 家社区公立医院及 8 家社区卫生服务中心检验科人员进行培训，并督导其工作人员建立质量管理文件体系，对常用检测仪器配置、调试，分享社区医院检验科存在诸多问题的解决思路，并针对社区医疗机构检验科在人员、仪器、管理上存在的困难探讨出可行的改进措施。
结果 检验人员专业素质通过“医联体”模式管理整体得到显著提升，中级检验职称从“0”到现在的 6 人，学术论文也从“0”到 5 篇，其中核心期刊 1 篇。日常检测中的准确率明显提高，各社区对检验科仪器的校准率达 90%，设备的在用状态监控及维护率达到 95%，检验效能得到显著提升。90%社区检验科建立了质量管理制度流程，使其检验全过程均有制度监管，且有两家社区医院顺利通过国家评审从无等级医院升级为“二乙综合医院”。 “联盟检验”模式从 11 家社区医院受益发展到全区域

20 家社区检验能力和报告质量得到显著提升，大部分检验项目达到同质化标准，促进作用十分明显。

结论 社区医院直接影响我国广大基层医疗水平和在传染病防控中的首诊作用。检验科以“请进来走出去”方式，结合技、管、扶的创新“医联体”模式，改进影响检验质量体系的各种因素。把从单纯依靠三级医院“输血”转变为社区检验科自身能“造血”，探索出一条适合广大社区医院检验科高质量可持续发展的途径。

PO-0868

MARCO 基因多态性与肝细胞癌发生风险的关联研究

苏真珍、蔡蓓
四川大学华西医院

目的 胶原样结构巨噬细胞受体（macrophage receptor with collagenous structure，MARCO）组成性表达于巨噬细胞表面。既往已有研究证实巨噬细胞在肝细胞癌（hepatocellular carcinoma，HCC）中具有重要的肿瘤抑制作用，而 MARCO 的低表达与 HCC 发生发展密切相关。鉴于 MARCO 表达受抑可能与其基因突变相关，本研究拟探讨 MARCO 基因多态性与 HCC 发生风险之间的关系。

方法 本研究共纳入 420 例 HCC 患者及 519 例良性肝脏疾病患者。以基质辅助激光解吸电离飞行时间质谱法对 MARCO 基因中的两个单核苷酸多态性（single nucleotide polymorphisms，SNP）位点（rs17009726 and rs6761637）进行分型检测。

结果 HCC 及对照组间各 SNP 基因型及等位基因型的分布差异无统计学意义。但 rs17009726 AG 基因型更多见于 HCC 组[HCC 者中为 106（25.2%），良性肝病对照组中为 105（20.2%），显性模型中，p=0.074，校正比值比（AOR）为 1.383，其 95%置信区间（CI）为 0.969~1.974]。与此同时，rs6761637 TC 基因型也更常见于 HCC 患者[HCC 者中为 105（25.0%），良性肝病对照者中为 105（20.2%），显性模型中，p=0.081，AOR=1.374，95% CI=0.962~1.961]。

结论 我们的初步研究结果提示携带特异性 MARCO 基因型的个体可能更易发生 HCC，但需要继续扩大研究样本量以证实相关研究结论。

PO-0869

The promoting effects of n-butanol extracted fraction of Tetrastigma hemsleyanum (TH-b) on the maturation and function of human dendritic cells

yuchong zhu、Jun-quan Liu
Hangzhou Golden Domain Medical Laboratory Co., Ltd., Hangzhou 310053, China

Objective Different extracts of Tetrastigma hemsleyanum (T. hemsleyanum) were compared in our study to find the active ingredient and its optimal concentration, which might be beneficial to the maturation and function of human dendritic cells (DCs).

Methods Isolated mononuclear cells from the peripheral blood of healthy donors were induced via GM-CSF, IL-4, and IFN-γ and LPS to be maturation DCs.DCs were incubated with different fractions of T. hemsleyanum extracts in concentration gradient. Phagocytosis and killing of Candida spores test was employed to evaluate different functional fractions for immune responses. The expression of co-stimulatory molecules CD80, CD86 and MHC II (HLA-DR) and IL-12 secretion were tested by flow cytometry and ELISA respectively to estimate the maturation states and immunoregulation ability. In the following study, DCs induced with various extracts in

different dosages were co-cultured with PBMCs in order to observe potential immunoreaction for proliferation of lymphocytes.
Results The expression of CD195 on DCs cultured for 8 days was significantly increased compare to the base line (85.3% vs. 2.4%, P<0.05). TH-b was found to increase DCs' phagocytosis function, and 0.62μg/ml was the optimal concentration. The expression of CD80, CD83, CD86, and HLA-DR on the surface of DCs increased after induction by TH-b. After 48 hours cultured with TH-b, IL-12 secreted by DCs increased significantly. And when treated with 0.62μg/ml TH-b, DCs secreted the highest level of IL-12(526.3pg/ml), which was significantly higher than that of the control group (260.1pg/ml) (P<0.05). The cell proliferation rates were significantly higher when the ratios of DCs after TH-b induction to lymphocytes were 1:1 and 1:10 than that of control group(P<0.05).
Conclusion N-butanol extracted fraction of T. hemsleyanum (abbreviated as TH-b) showed promoting effects on the maturation and phagocytosis function of human dendritic cells, and could enhance the expression of co-stimulatory molecules CD80, CD86 and IL-12 secretion at a low concentration. The optimal dosage for clinical application might be 0.62μg/ml.

PO-0870

降钙素原、C 反应蛋白及血清淀粉样蛋白 A 联合检测在感染性疾病中的诊断价值

戚佩谊
南方医科大学珠江医院

感染性疾病是一类高发性疾病，多数感染性疾病患者早期症状缺乏特异性，对其准确、有效的诊断一直是临床医生面临的重大问题。虽然其检测方法很多，如白细胞计数、C-反应蛋白(C-reactive protein，CRP) 、红细胞沉降率及体温等，但这些方法的特异性和灵敏度都不够高，不利于临床的诊断。因此对感染性疾病行早期诊断存在尤为重大的意义，在感染性疾病诊断中常采用血清降钙素原(Procalcitonin， PCT) 、C 反应蛋白(C－reactive protein， CRP) 、血清淀粉样蛋白 A(Serum amyloid A， SAA) 等检测方法。PCT 属于常见炎性因子。大量研究调查发现 PCT 检测在细菌感染早期诊断中临床应用价值较高。CRP、 SAA 是常用的感染疾病诊断炎症反应标志物，但临床上就其应用价值存在较大争议，吴金霞、罗菊梅［13］的研究表明 PCT 联合 CRP 在诊断脓毒血症的过程中，其准确性、特异性以及敏感性分别为 97.11%、75.00%、 98.00%，显著高于单独检测 PCT 或者 CRP 的诊断方式。这与王碧玉［14］、柴 林，肖敏，杨贤义等［15］研究学者的研究成果一致。管建［16］的研究结果显示，细菌感染组患儿的 PCT、CRP 水平高于病毒感染组及健康组，病毒感染组及健康组 PCT、CRP 水平差异无统计学意义。同时，细菌感染组 PCT、CRP 单独检测阳性率均高于其他两组，提示 PCT、CR 是诊断细菌性感染的敏感指标，但对于诊断病毒性感染缺乏特异性，另外细菌感染组及病毒感染组患儿 SAA 水平及阳性率差异无统计学意义，但均高于健康新生儿组，提示 SAA 在诊断新生儿感染性发热方面具有重要意义，弥补了 PCT、CRP 的不足。
综上所述，PCT、CRP、SAA 三者联合检测对感染性疾病的诊断价值更高，值得推广应用。

PO-0871

脱发人群肠道菌群变化特点

强永杰
南方医科大学珠江医院

目的 研究通过分析脱发人群与正常人群肠道菌优势菌群变化与菌属组成结构变化，为未来脱发治疗方法提供一定的思路。
方法 实验组通过采集 10 例脱发人群（30-40 岁）大便样本，进行细菌、真菌涂片染色，细菌真菌培养（稀释后培养）鉴定，找到优势菌群；通过二代测序方法分析肠道菌群组成种类对照 10 例，为健康未脱发人群（30-40 岁）。提取粪便样本总 DNA;根据细菌 16SrDNA V3~V5 区设计引物进行扩增,利用 Illumina Miseq 平台进行高通量测序;测序结果经过 Reads 拼接,OTUs(operational taxonomic units)聚类,物种注释,α 多样分析,主成分分析,最终得到样品物种信息。
结果 涂片：实验组大便涂片革兰氏染色球/杆菌比例明显高于对照组；细菌、真菌培养：实验组双歧杆菌、消化链球菌、乳杆菌、产气荚膜梭菌、肠杆菌检出比例低于对照组；二代测序：实验组其中拟杆菌门(Bacteroidetes)占比 46.94%，厚壁菌门(Firmicutes)占比 30.58%，对照组实验组其中拟杆菌门占比 60.96%，厚壁菌门占比 41.51%包含幽门螺杆菌的螺杆菌属检出比例升高，实验组平均占比比对照组高 0.03%。
结论 表明实验组（脱发组）和对照组（未脱发组）菌群结构存在显著差异。这些结果表明,脱发人群与未脱发人群在肠道菌群多样性方面没有明显差异,但在菌群结构上存在较大差异;同时脱发人群肠道菌群致病菌数量多于健康人群,而拟杆菌类有益菌低于健康人群。由于有研究表明，脱发与生物素合成相关，未来可进一步细菌对生物素合成情况进行研究。

PO-0872

西南地区 398 例克氏综合征患者临床特征分析

王念、周汶静、林立、周易、宋兴勃、巫丽娟、钟慧钰、叶远馨
四川大学华西医院

目的 分析西南地区克氏综合征患者临床特征，探讨染色体核型、临床症状、血清性激素水平在克氏综合征患者诊断中的临床应用价值及诊断意义。
方法 回顾性分析我院 398 例克氏综合征患者的主要临床症状、外周血染色体核型以及其中 206 例具有血清性激素结果的纯合型（47，XXY）克氏综合征患者和随机收集的同期的 180 例染色体核型正常的男性对照的血清性激素水平，进行比较分析。
结果 398 例 KS 患者中，其年龄范围主要集中在 11-30 岁，以 21-30 岁年龄段所占比例最高，占比 61.05%。同时，该类患者的临床来源以泌尿外科为主共 306 例占比 76.89%。对 334 例具有明确的临床症状信息的 KS 患者进行分组分析，其中以睾丸发育不良综合征（TDS）所占比例较高为 55.99%。在 398 例克氏综合征患者的染色体核型分析中纯合型 （47，XXY）381 例，占比 95.75%，嵌合型（47，XXY/46,XY）3 例/（47，XXY/46,XX）2 例共占比 1.25%和变异型 12 例，占比 3.0%。在 206 例非嵌合型克氏综合征患者血清素卵泡生成素（FSH）、黄体生成素（LH）、PRL（泌乳素）及睾酮（T）水平分析中，KS 组血清 LH 和 FSH 均明显高于正常对照组（P<0.05），血清 PRL 在两组间无显著性差异（P>0.05），而血清 T 水平明显低于对照组（P<0.05）。
结论 西南地区克氏综合征患者以 TDS 为主要临床表现，以 FSH 、LH 及 T 激素的改变最为明显。综合分析临床主要症状、染色体核型、血清性激素水平有助于提高克氏患者的临床诊断效率。

PO-0873

流式细胞仪在对血液系统肿瘤免疫表型分析中最低检测限的稀释性验证

金咏梅、赵玮晨、蒋能刚、廖红艳、粟军
四川大学华西医院

目的 对流式细胞仪在诊断血液系统肿瘤方面的最低检测限进行稀释性验证。
方法 选取 4 例不同血液系统肿瘤患者骨髓，包括髓系肿瘤、B 淋巴系肿瘤、T 淋巴系肿瘤及浆细胞系肿瘤，对标本中白血病细胞用正常人骨髓白细胞进行稀释，浓度包括 1%、0.1%、0.01%，按不同疾病个体化抗体组合方案，加入相应抗体对目的细胞进行标记，上机实验观察结果。以 CD45/SSC 双参数散点图设门进行分析，各浓度梯度标本收集到 20 个及以上白血病细胞时视为阳性，同一样本重复 10 次，有 9 次及以上为阳性时判断为最低检测限达到或低于该浓度。
结果 BD FACSCantoⅡ流式细胞仪在诊断血液系统肿瘤方面的最低检测限为 0.01%。
结论 BD FACSCantoⅡ流式细胞仪在诊断血液系统肿瘤方面的最低检测限为 0.01%，能够很好地满足临床的需求。

PO-0874

评估血清 Hcy 及 Betaine 水平在妊娠合并糖尿病病人中的诊断价值

王雅茹、张诗田、刘蕊、屈恩帅、牛文彦
天津医科大学朱宪彝纪念医院

目的 目前有关血清 homocysteine（Hcy）、叶酸、vitamin B12（VitB12）水平与血糖浓度以及妊娠期糖尿病（GDM）风险的研究结果尚不确定。 Hcy 水平在 GDM 中的研究相对较少，且结果之间不一致，甜菜碱（betaine）和 vitamin B12 之间的关系也没有得到很好的研究，特别是在怀孕期间。而 betaine 和甜菜碱-同型半胱氨酸甲基转移酶（BHMT）在 Hcy 转化成蛋氨酸途径中起着重要作用。本实验旨在分析 Hcy、betaine 在妊娠合并糖尿病病人中的表达水平，以及与叶酸、VitB12、生化指标等数据之间的相关性，评估 Hcy 作为风险因子在妊娠合并糖尿病病人中的诊断价值，并进一步探究 BHMT 和 betaine 水平对 Hcy 水平的影响，为临床预防和治疗妊娠合并糖尿病病人提供理论依据。
方法 入院就诊的怀孕妇女，按照 ADA 诊断标准，将人群分为对照组和妊娠合并糖尿病组（包含 2 型糖尿病伴妊娠和 GDM 人群）。ELISA 法检测血清 Hcy、VitB12、叶酸以及 BHMT 水平。甜菜碱含量检测试剂盒检测 betaine 水平。全自动生化分析仪及糖化血红蛋白分析仪检测血脂及 HbA1c 水平。血糖分析仪检测空腹静脉血糖（FPG）水平。SPSS 分析 Hcy、betaine 与多指标之间的相关性，ROC 曲线评估 Hcy、betaine 对妊娠合并糖尿病的诊断价值。
结果 血清 Hcy 水平在妊娠合并糖尿病患者中明显增高，而 betaine、VitB12 水平明显减低，叶酸和 BHMT 水平无统计学意义。Hcy 与 betaine 呈负相关，与 FPG、HbA1c 呈正相关。Betaine 与 VitB12 呈正相关。Hcy 在妊娠合并糖尿病患者中的诊断价值为 0.7145，而 betaine 对其诊断无意义，两者联合检测也未增加其诊断价值。妊娠合并糖尿病患者中，GDM 患者占 67%，Hcy 水平低于 T2DM 伴妊娠患者，但两者之间无统计学意义，betaine 水平在两组中同样无统计学意义，Hcy 水平在这两组中的诊断价值分别为 0.7261、 0.7087。
结论 Hcy 可作为风险因子，对妊娠合并糖尿病患者有一定的诊断价值，同时提示妊娠期间，除了补充叶酸、VitB12 外，betaine 的补充也是非常有必要的。

PO-0875

基于甘特图提高科研课题进度及科研人员管理能力*

雷明德
重庆市东南医院

目的 探索建立基于甘特图管理模式的科研人才培养评估体系并应用于人才评价。
方法 根据近三年的参与科研申请并通过的立项课题，多角度对比上述科研共同参与人员 A、人员 D 两人的科研学习参与度及课题贡献量，对比分析科室层面及医院层面对科研课题的各项参数。
结果 人员 A 在课题排名与工作量均无变化，故课题贡献量无变化。人员 D 在课题排名与工作量均在不同程度的发生变化，根据科研量化考核数据分析，人员 D 在 2018 年科研量化比为 2%，2019 年科研量化比为 8.5%，具有统计学差异（u=2.06,P<0.05）。科研课题的性质也由多科室合作发展到区域内多中心合作模式，到 2020 年科研发展为跨区域多中心合作。课题级别分别为区卫健委项目、区卫健委与区科技局联合项目、区科技局项目。
结论 基于甘特图管理模式,提高科研人员积极性及工作能力，为科研管理者及实验室管理者提供参考依据,为医院科研发展提供保障。

PO-0876

血清低密度脂蛋白胆固醇直接测定法与不同公式法间对比

陈波
广州医科大学附属第二医院

目的 探讨低密度脂蛋白胆固醇(LDL-C)直接测定法与多种公式计算法、及其校正公式计算法和自推导公式结果的可比性。
方法 随机抽取 2014 年 6 月至 2014 年 12 月本院患 1654 例，其中男 899 例，女 755 例,年龄范围 58.57±17.86 岁，早晨空腹采静脉血，离心取血清进行总胆固醇（TC）、三酰甘油(TG)、高密度脂蛋白胆固醇(HDL-C)、载脂蛋白 B（ApoB）和 LDL-C 项目测试。并与计算 F 公式、P 公式、D 公式、F’公式、P’公式、D’公式和 C 公式（自推导公式）LDL-C =0.88TC-0.79HDL-C-0.20TG （r=0.985，P<0.01）的相关性，按 TG 浓度分成 3 组分别为 0.33～1.70 mmol／L、1.70～4.52mmol／L 和 4.52～11.65mmol/L 进行公式法与直接测定法结果比较。
结果 根据直接 LDL-C 浓度范围将其分为 10 组进行观察数据基本为正态分布，其浓度主要集中在 1.20～4.80mmol/L 之间，3.00～3.60mmol/L 为构成比最高。将 TG 浓度范围从直方图显示出数据基本为偏态分布，浓度主要集中在 0.90～3.60mmol/L 之间，1.80～2.70mmol/L 为构成比最高，TG 浓度<4.52mmol/L 时，其累计百分数达 98.67%。直接测定法和公式法血清 LDL-C 含量的相关性最高为 C 公式，其次为 D 公式，最低为 P 公式。均数比较 F’公式与直接测定法最近，其次为 F 公式，最远为 P’公式。离散度最小 P 公式，其次为 D’公式，最大为 P’公式。符合率（|差值|<=10%）从大到小分别为 C 公式>F’公式>D’公式>D 公式>F 公式>P 公式>P’公式。TG 在 0.33～1.70 mmol／L 组符合率从高到低分别为 C 公式>D’公式>F’公式 > F 公式>D 公式>P 公式> P’公式,最高是 C 公式（95.89%），最低是 P’公式（47.75%）。TG 在 1.70～4.52mmol／L 组符合率从高到低分别为 C 公式> D 公式> P’公式 > F’公式>F 公式> D’公式>P 公式,最高是 C 公式（93.85%），最低是 P’公式（27.95%）。TG 在 4.52～11.65mmol/L 组符合率从高到低分别为 D 公式>C 公式>F 公式=F’公式= P’公式>D’公式> P 公式,最高是 D 公式（54.55%），最低是 P’公式（4.55%）。
结论 实验结果表明，7 种公式法中 C 公式法具有与直接法良好相关性和一致性（r=0.985，符合率=94.68%），其次 D 公式（r=0.981，符合率=82.10%)与 F’公式（r=0.970，符合率=85.01%)均较好。在 TG 在 0.33～4.52 mmol／L 范围内 C 公式、D 公式、F’公式、F 公式和 D’公式均有较好符合率，在 TG>4.52 mmol／L 范围 7 种公式法符合率均不理想。TG 浓度<4.52mmol/L 时的累计百分数可达 98.67%，也考虑到经济的因素，LDL-C 直接法费用比 TC、TG、 和 HDL-C 贵，而公式计算则

不需要附加费用，因此通常可以采用公式法测定 LDL-C。当 TG 浓度>4.52mmol/L 或监测 LDL-C 时，应采用直接法为佳，这样取得更经济、实惠、相对准确的 LDL-C 结果。

PO-0877

一例多种羧化酶缺乏症的质谱及基因突变分析

谢汛杰
南方医科大学珠江医院

目的 对一例以肺炎、皮疹及严重代谢性酸中毒为先发症状的多种羧化酶缺乏症进行临床观察、质谱及基因分析。
方法 通过临床观察分析症状，同时分别用、串联质谱、气相色谱及高通量测序检测患儿血氨基酸和酰基肉碱谱、尿有机酸谱以及患儿及其父母 BT 及 HLCS 基因突变情况。
结果 患儿临床表现主要为皮肤溃疡、蜕皮，精神反应差，重症肺炎等，串联质谱分析提示支链氨基酸、丙酰肉碱、甲基丙二酰肉碱和 3-羟基异戊酰肉碱明显升高，气相色谱分析提示 3-羟基丙酸、3-甲基巴豆酰甘氨酸、甲基枸橼酸、3-羟基异戊酸明显升高，基因突变分析提示为复合杂合突变，其中 HLCS_ex9 c.1522C>T 源于父亲，HLCS_ex10 c.1711G>A 源于母亲。
结论 本研究的对象是一例症状及质谱结果均符合的多种羧化酶缺乏症，基因分析为复合杂合突变，生物素治疗有明显效果，预后良好，但需要定期监测 3-羟基异戊酰肉碱水平。早期做串联质谱筛查能有效减少遗传代谢病的致残风险。

PO-0878

Emergence of Ceftazidime-Avibactam Resistance Due to A Novel blaKPC-2 Mutation during Treatment of Carbapenem-Resistant Klebsiella pneumoniae Infections

Quanfeng Liao
Department of Laboratory Medicine, West China Hospital of Sichuan University

Objective Klebsiella pneumoniae carbapenemase (KPC)-producing K.pneumoniae have represented a serious health problem in worldwide. The resistance to ceftazidime-avibactam (CAZ-AVI) began to emerge since its approval in 2015. We aim to explore the resistance mechanism of CAZ-AVI.
Methods Phenotypic test and whole-genome sequencing (WGS) analysis were performed in carbapenemase-resistant Klebsiella pneumoniae (CRKP) of HX0917 and HX1016 isolates, collected from the same patient following treatment with CAZ-AVI.
Results We report a case of emergence of CAZ-AVI resistance in ST 11 KPC-2-producing K. pneumoniae (HX1016) during 14 days of exposure with CZA-AVI. Molecular analysis highlighted the A533C mutation in the blaKPC-2 gene, resulting a D178A substitution in protein sequence, which restored the hydrolysis ability of imipenem and meropenem, but not for ertapenem, and the result of phenotypic test was negative. However, the CRKP (HX0917) isolate produced serine-carbapenemase by phenotypic detection and lost its capacity of hydrolyzing carbapenems.
Conclusion The emergence of CAZ-AVI resistance should arouse our attention, the susceptibility testing should be followed by a combination of phenotypic and molecular methods, to make sure that no potential carbapenemase-producing bacteria are missed.

PO-0879

广州郊区某农村井水铊等重金属的健康风险评估

潘心红、李美霞
广州市疾病预防控制中心

目的 通过对广州郊区某农村井水中铊等重金属进行监测，对重金属致癌和非致癌的健康风险进行评估，为饮用井水与水源的安全管理提供了科学依据。
方法 于 2020 年 10 月采集广州郊区农村的 14 口水井的 34 宗井水，对照水源分别为山泉水、末梢水、沟塘水共 12 宗，用电感耦合等离子体质谱仪法（ICP-MS）进行检测，采用国家标准（GB5749 －2006）国家标准和美国环保署 （US EPA） 推荐的健康风险评价模型，对其进行健康风险评估。
结果 农村井水中 Tl 的含量严重超标，超标率高达 70%以上，Pb、Fe、 Mn、PH 值和浑浊度含量也不同程度超标，Tl 超标的平均浓度顺位为井水>末梢水>沟塘水>山泉水；井水中致癌风险 As > Cd，分别为 2.57×10-6 和 3.01×10-8；Tl、Pb、Fe、Mn 等非致癌性健康风险在 65.1×10-8 ～ 0.79×10-8，均低于国际放射防护委员会（ICRP）的推荐值 （5.0×10-5）。
结论 调查表明：广州郊区某农村的井水 Tl 严重超标，Pb、Fe、Mn、PH 值和浑浊度等项目的含量也超标，非致癌物的个人健康风险值依次为 Pb > Mn > Tl > Fe，虽然对暴露人群的健康危险影响较小，但井水中重金属 Tl 污染特别严重，因此广州郊区某农村井水不能饮用，希望有关部门需要定期加强监测与风险评估，防止重大公共卫生事件的发生。

PO-0880

2015-2019 年腹腔积液标本的病原菌分布及耐药性分析

郭媛媛
云南省第二人民医院

目的 分析腹腔积液的病原菌构成和药敏情况，为临床合理用药提供依据。
方法 回顾性分析云南大学附属医院 2015 年 1 月-2019 年 12 月收集的腹腔积液标本分离的病原菌培养及体外药敏试验。
结果 1254 份腹腔积液标本共分离出非重复病原菌 687 株，总检出率为 54.78%，687 株病原菌中主要是革兰阴性菌（60.84%），主要是大肠埃希菌和肺炎克雷伯菌，其次是革兰阳性菌（28.97%），主要是屎肠球菌和表皮葡萄球菌；真菌占 10.19%。革兰阴性菌检出率由 2016 年的 79.82%下降至 2019 年的 53.21%，下降约 1.5 倍，革兰阳性菌检出率由 2016 年的 20.18%上升至 2019 年的 46.79%，上升约 2.5 倍。腹腔感染的主要科室来源是普通外科占 61.3%，其次是 ICU 占 23.8%。产 ESBLs 大肠埃希菌和肺炎克雷伯菌的检出率分别为 64.09%、43.48%，产 ESBLs 的肺炎克雷伯菌对哌拉西林＞90%，对头孢菌素类均＞60%，对喹诺酮类及加酶抑制剂复合制剂耐药率在 40%左右，对阿米卡星耐药率为 10%。产 ESBLs 的大肠埃希菌对青霉素类、第一代和第三代头孢菌素均＞90%，对喹诺酮类耐药率均＞60%，对加酶抑制剂复合制剂耐药率＜20%。产 ESBLs 的肺炎克雷伯菌对碳青霉烯类抗生素敏感性为 100%，不产 ESBLs 的肺炎克雷伯菌对碳青霉烯类抗生素的耐药率接近 20%。
结论 云南大学附属医院腹腔积液分离病原菌中革兰阴性菌检出率逐渐下降，而革兰阳性菌检出率呈上升趋势，产 ESBLs 的检出率较其他医院偏高，对常见抗菌药物耐药率偏高，由于产 RSBLs 会同时存在产碳青霉烯酶，容易被产碳青霉烯酶的机制覆盖，因此产 ESBLs 会出现假阴性，建议临床医生应严格按照药敏试验结果合理使用抗菌药物，同时加强医护人员的无菌意识，加强感染的预防与控制。

PO-0881

High prevalence and fitness of IncFrepB carrying qnrS1 in hypervirulent Klebsiella pneumoniae isolates

Yang Liu 、si chen、wan lagen
First Affiliated Hospital of Nanchang University

Objective The objective of this study was to reveal theprevalence and fitness of plasmids carrying qnrS1 in hypervirulent Klebsiella pneumoniae (hvKP) isolates.
Method Weidentified bacterial virus genes, cps genotypes, and resistance genes by polymerase chain reaction. Plasmid typing wasdetermined byPCR-based replicon typing.Pulsed-field gel electrophoresis andmultilocus sequence typing were conducted to analyze the genetic relatedness.The transferability of qnrS1-carrying plasmidswas analyzed by conjugation experiments and Southern blotting. The fitness of the qnrS1-plasmid carriagewas assessedin vitro competition assays.
Result A total of 299 hvKP isolates carrying qnrS1 resistance gene collected from a Chinese teaching hospitals from 2018 to 2020 were investigated for theprevalence and fitness of plasmids carrying qnrS1. The most frequently capsular serotypes were K64 (85.3%, 245/299). Multilocus sequence typing analysisrevealed K64 capsular serotypes were all ST11, and non-K64 were mainly ST23 type (7/44, 15.9%), andnext by ST11 type (3/44,6.8%).IncFrepB-type replicon was found in90.0% (n =272) of299 isolates with plasmid typing, whereas IncN-type replicon was detected in12.0% (n =36), IncFIB-type replicon in4.3% (n =13) and IncFIIAs-type replicon in1.7% (n =5) of the isolates. Outcomes of the conjugation experiments showed that the qnrS1 gene was carried to the receiver cell on FrepB plasmids.The analysis of the transconjugants showed decreased susceptibility to quinolones and revealed a cotransfer of blaTEM-1 or blaSHV-1 with the qnrS1 alleles. The capsule serotype of 9 donors indicated that non-K64 strains (n=6) formed easier conjugates thanthe K64 strains (n=3) ($p<0.05$). S1 nuclease-PFGE and Southern blotting showedtheqnrS1 genewas located on different size plasmids. However, thefitness of plasmids were differed as only plasmidsof~70 kb cotransfer of blaTEM-1 with the qnrS1 alleles could be stablysub-cultured. The transconjugants with stable plasmid (J53::pK3-qnrS and J53::pK6-qnrS) showedcompetition index valuesof 0.59 and0.61, respectively.
Conclusion IncFrepB-type replicon was found to be the most prevalent type of plasmid carring qnrS1 in hvKP in our hospital. IncFrepB showed diversity, mainly reflected in the size of the plasmid and the carrying status of ESBL-related genes. These plasmid has showed different fitness costs in transconjugants. FrepB plasmidsof ~70 kb carrying TEM-1 genes could be stably disseminated. Therefore,these plasmids mayrepresent the mainqnrS1 genes of thehvKPepidemic in Jiangxi, China,and requiresheightened attention.

PO-0882

改良微量血清杀菌活性测定法与经典血清杀菌活性测定法的比较

徐灵、董成林、吴成志、邵燕、李仁杰、崔邦铨
上海中冶医院

目的 比较改良微量血清杀菌活性（SBA）测定法与经典血清杀菌活性测定法的检测结果。
方法 选择接受头孢唑肟钠静脉滴注治疗的患者 35 例，采集用药后 30 min 的血液标本，同时采用改良微量血清杀菌活性测定法（改良法）与经典血清杀菌活性测定法（经典法）检测血清对标准质控菌株铜绿假单胞菌（ATCC 27853）的 SBA 效价，比较 2 组检测结果。

结果 接受头孢唑肟钠静脉滴注治疗的 35 例患者中，改良法测得的 SBA 效价为 1:4 ~ 1:64（中位数为 1:16），经典法测得的 SBA 效价为 1:4 ~ 1:32（中位数为 1:16），2 组检测结果差异无统计学意义（P >0.05）。
结论 改良 SBA 法与经典 SBA 法检测结果相一致，可替代经典法应用于临床和研究，且其操作更简便，易于推广应用。

PO-0883

基于 VITEK MS 快速检测产碳青霉烯酶肺炎克雷伯菌的方法研究

胡珍、林豪芸、吴文苑
深圳市人民医院

目的 本研究通过对基于 VITEK MS 快速检测产碳青霉烯酶肺炎克雷伯菌（*Carbapenemase-producing Klebsiella pneumoniae*，CPKP）的方法研究，建立用于临床微生物实验室的基于 VITEK MS 快速检测 CPKP 方法。
方法 首先，应用产碳青霉烯酶标准阳性质控菌优化美罗培南水解试验的实验条件和 VITEK MS 仪器参数，建立基于 VITEK MS 快速检测 CPKP 方法。其次，收集 2020 年 3 月至 2021 年 2 月深圳市人民医院检验科微生物实验室临床分离的非重复碳青霉烯耐药肺炎克雷伯菌（*Carbapenem-resistant Klebsiella pneumoniae*，CRKP），按 1:1 比例收集同期的非重复碳青霉烯敏感肺炎克雷伯菌（*Carbapenem-susceptibal Klebsiella pneumoniae*，CSKP），采用聚合酶链式反应（polymerase chain reaction，PCR）检测 CRKP 和 CSKP 的碳青霉烯酶耐药基因，检出 CPKP 和非产碳青霉烯酶肺炎克雷伯菌；用基于 VITEK MS 快速检测 CPKP 的方法分别检测 CRKP 和 CSKP，检出 CPKP 和非产碳青霉烯酶肺炎克雷伯菌。以 PCR 结果评估基于 VITEK MS 快速检测 CPKP 方法的灵敏度和特异度。最后，收集 2016 年 1 月至 2017 年 12 月深圳市人民医院检验科微生物实验室临床分离的经全基因组测序确定的非重复 CPKP，以此菌株为对象，评估基于 VITEK MS 快速检测 CPKP 方法检测 CPKP 的检出率。
结果 本研究通过对美罗培南水解试验中的实验条件和 VITEK MS 仪器参数的激光强度等进行优化，建立了基于 VITEK MS 快速检测 CPKP 方法。共收集非重复 CRKP15 株和 CSKP15 株。PCR 检测 15 株 CRKP 均为 CPKP、15 株 CSKP 均非产碳青霉烯酶肺炎克雷伯菌。应用本研究建立的基于 VITEK MS 快速检测 CPKP 方法，分别检测 15 株 CRKP 均判断为 CPKP，15 株 CSKP 均判定为非产碳青霉烯酶肺炎克雷伯菌。以 PCR 结果，本研究所建立的基于 VITEK MS 快速检测 CPKP 方法的灵敏度和特异度均为 100%。经全基因组测序确定的非重复 CPKP 共 80 株，基于 VITEK MS 快速检测 CPKP 方法检测 78 株为 CPKP，2 株为非产碳青霉烯酶肺炎克雷伯菌。基于 VITEK MS 快速检测 CPKP 方法检测 CPKP 的检出率为 97.5%。
结论 本研究建立的基于 VITEK MS 快速检测 CPKP 方法对 CPKP 检出的灵敏度和特异度高，具有良好的临床应用前景。

PO-0884

脓毒症背景下嗜麦芽窄食单胞菌及其他常见致病菌对适应性免疫的影响研究

阴晟、王敏、麦伟华
中南大学湘雅二医院

研究嗜麦芽窄食单胞菌（StenotroPhomonas maltoPhilia，SMA）血流感染中患者免疫血象表征。通过与其他致病菌的免疫细胞分布模式对比，揭示 SMA 与不同致病菌流感染下免疫情况是否具有差异及分析该现象的内在机制，并证实 SMA 感染对于免疫系统的抑制效应。

方法 回顾性统计分析 2018—2021 年中南大学湘雅二医院单中心临床确诊 SMA 血流感染患者及其他病原菌的免疫细胞及炎症因子，并通过数据结果得出临床细胞免疫调节规律和临床诊断意义。
结果 淋巴细胞百分比和中性粒细胞百分比的中位数能较合理的反映数据的平均水平，PCT 的总体分布受极值影响更大。SMA 与肺炎克雷伯菌在淋巴细胞百分比（P=0.001）和中性粒细胞百分比（P=0.006）临床血流感染总体分布上有统计学意义；与白色念珠菌在中性粒细胞百分比（P=0.022）上有统计学意义。
结论 SMA 血流感染能抑制淋巴细胞的增殖，从而导致适应性免疫应答反应下降。临床需要进一步关注 SMA 的合并感染及及慢性感染，降低因耐药耐药及继发性免疫抑制相关脓毒症的病死率。

PO-0885

鹑鸡肠球菌对万古霉素耐药性监测及耐药基因研究

谢晖
南京大学医学院附属鼓楼医院

目的 调查临床分离鹑鸡肠球菌对万古霉素的耐药情况及耐药机制。
方法 采用 VITEK 2 系统 GP67 卡对 2019 年 1-12 月南京鼓楼医院临床分离 15 株鹑鸡肠球菌进行药敏试验，采用 E-test 法复核菌株对万古霉素最低抑菌浓度（MIC）；采用 PCR 及测序技术分析万古霉素耐药决定基因 vanA、vanB、vanC1 及 vanC2/3；采用 Illumina HiSeq 2000 测序技术对菌株基因组 DNA 进行 Paired-end（PE）测序，利用生物信息学对菌株全基因组序列分析及耐药基因、毒力基因分析。
结果 15 株鹑鸡肠球菌对万古霉素的 MIC 值集中在 4 mg/L 和 6 mg/L，所占比例分别为 40%和 33.3%，检出 1 株（6%）万古霉素高水平耐药株 EG17906（MIC 为 256 mg/L），该菌株对除万古霉素和替考拉宁耐药外，对其余常用抗生素均敏感；15 株菌株均检出 vanC2/3 基因， EG17906 菌株同时检出 vanA 基因；EG17906 菌株经全基因组测序分析 ，基因组大小为 3 765 197 bp ，GC 含量为 40.4% ，总基因数为 3 754，基因组含有 3 592 个编码序列，60 个 tRNA 编码基因以及 10 个完整的 rRNA 基因编码操纵子。耐药基因预测分析该菌株携带 VanC1XY、VanHAX、erm(A)、erm(A) 、 tet(O) 、 cat(pC221) 。 全 基 因 序 列 提 交 至 NCBI 数 据 库 ， GeneBank 号 为 JABMDB000000000。
结论 鹑鸡肠球菌携带 vanC2/3 对万古霉素呈低水平耐药，而同时携带 vanA 基因可造成菌株高水平耐药，需引起重视。

PO-0886

多重耐药鲍曼不动杆菌耐药特征及同源性分析研究

王佳
昆明市延安医院

目的 收集昆明市两家三甲医院多重耐药鲍曼不动杆菌耐药数据，描述相关耐药基因携带情况，并通过分子流行病学调查明确菌株间亲缘关系，从而提供可靠和及时的流行病学资料，指导临床制定合理有效的用药策略。
方法 收集 2018 年 1 月至 2020 年 12 月两家三甲医院临床分离的非重复鲍曼不动杆菌菌株共 92 株，采用 MIC 法和 K-B 法检测鲍曼不动杆菌对临床常用抗菌药物的敏感性，应用 PCR 扩增 7 种 β-内酰胺酶耐药基因（SHV、TEM、IMP、VIM、ADC、OXA-23、OXA-58），同时采用多位点序列分型方法对 92 株多重耐药鲍曼不动杆菌进行分子分型，分析菌株同源性关系。
结果 92 株 MDRAB 对所检测抗生素耐药程度均较高，对青霉素类、单环 β-内酰胺类、头孢菌素类和碳青霉烯类抗菌药物的耐药率高达 100%；在 β-内酰胺酶抑制剂中，耐药率均达到为 90%以上；

对妥布霉素、复方新诺明、阿米卡星、庆大霉素、左氧氟沙星的耐药率两家医院差别较为明显，医院甲对上述药物耐药率高达 80%以上，而医院乙耐药率仅为 65%左右；米诺环素尤为显著，医院甲耐药率达 62%，医院乙耐药率仅为 7.1%；医院甲 MDRAB 对替加环素未出现耐药，医院乙耐药率达到 14.3%。92 株 MDRAB 中，两家医院检出率较高的耐药基因是：OXA-23、TEM、ADC 基因；其中医院甲 47 株分别携带 OXA-23、TEM 基因，占 94%；医院乙却有 41 株携带 OXA-23 基因，占比高达 97.6%；未检出 SHV、IMP、VIM、OXA-58 基因。92 株中 55 株同时携带 TEM+ADC+OXA-23 基因，68 株携带 TEM+OXA-23 基因，携带 TEM+ADC 基因 56 株，携带 ADC+OXA-23 基因 75 株。将 92 株 MDRAB 测序结果提交到 Pubmlst 数据库进行比对，结果共分为 12 个序列型，其中医院甲主要以 ST208 型（58%）为优势型别，其次为 ST1145 型，占 24%；医院乙主要以 ST368 型（30.9%）为主）。

结论 临床分离鲍曼不动杆菌耐药现象严重，对各种类型抗生素普遍耐药，少数菌株对头孢哌酮/舒巴坦和米诺环素具有敏感性，全部菌株对替加环素敏感性较好，提示临床可以使用替加环素作为 MDRAB 感染的治疗。目前，鲍曼不动杆菌耐药日益严重可能由于携带多种耐药基因所导致，携带多种耐药基因是本地区鲍曼不动杆菌多重耐药的重要机制之一。通过我们对两家医院耐药基因检测发现，两家医院耐药基因携带情况不尽相同，这可能与两家医院临床抗生素使用情况和医院管控政策相关。两家医院分别存在不同型别的耐药菌株克隆传播，医院间尚未存在克隆菌株的流行播散。

PO-0887

Co-occurrence of rapid gene gain and loss in an interhospital outbreak of carbapenem-resistant hypervirulent ST11-K64 Klebsiella pneumoniae

Xiaotuan Zhang、Zhuo-ran Liu、luo-gen Liu
The Second Affiliated Hospital, University of South China

We report an outbreak of carbapenemase-producing, hypervirulent Klebsiella pneumoniae in two hospitals that undergo frequent patient transfers. Analysis of 11 complete assembled genomes showed that the bacteria were ST11-K64 strains. Moreover, 12 single nucleotide polymorphisms (SNPs) identified the strains as having originated from the same cluster, and were also indicative of interhospital transmission of infection. Five plasmids were assembled in each of the strains. One plasmid carried several virulence genes, including the capsular polysaccharide regulators rmpA and rmpA2. Two others carried antimicrobial-resistance genes, including one for carbapenem resistance, blaKPC-2. Comparative genomic analysis indicated the occurrence of frequent and rapid gain and loss of genomic content along transmissions and the co-existence of progeny strains in the same ward. A 10-kbp fragment harboring antimicrobial resistance-conferring genes flanked by insert sequences was missing in a plasmid from strain KP20194c in patient 3, and this strain also likely subsequently infected patient 4. However, strains containing the 10-kbp fragment were also isolated from the ward environment at approximately the same time, and harbored different chromosome indels. Tn1721 and multiple additional insert sequence-mediated transpositions were also seen. These results indicated that there is a rapid reshaping and diversification of the genomic pool of K. pneumoniae facilitated by mobile genetic elements, even a short time after outbreak onset. ST11-K64 CR-hvKP strains have the potential to become new significant superbugs and a threat to public health.

PO-0888

Mst2 促进单增李斯特菌感染过程中 JNK/NLRP3 信号通路的活化

高爱娇、申艳娜、刘瑞卿、王琳、唐慧欣、刘亚珊
天津医科大学

目的 单核细胞增生李斯特菌（简称单增李斯特菌）是一种人畜共患的革兰阳性胞内寄生菌，感染后可引起脑膜炎、败血症等致死性疾病，死亡率高达 30%。有研究报道 NLRP3 炎症小体参与宿主防御以抵抗病原体感染，然而单增李斯特菌感染过程中 NLRP3 炎症小体激活的具体潜在机制尚未完全阐明。近年来，研究表明 Mst1/2 在固有免疫中发挥着重要作用。在结核分枝杆菌感染过程中 Mst2 促进趋化因子 CXCL1/2 的表达进而调控免疫反应。在乳腺癌细胞以及高脂、高糖或脂多糖刺激的神经细胞中 Mst1 均可通过介导 JNK 的活化促进细胞凋亡。而 Mst2 是否参与单增李斯特菌感染诱导的炎症反应尚未见报道。因此，我们探究 Mst2 在单增李斯特菌感染过程中活化 NLRP3 信号通路的作用机制。
方法 Western blot 方法检测单增李斯特菌感染的小鼠原代腹腔巨噬细胞中 Mst2 的蛋白水平。比较 Mst2 siRNA 预处理前后的小鼠原代腹腔巨噬细胞经单增李斯特菌感染后，细胞裂解物中 p-JNK、Nek7 蛋白水平、NLRP3 及其下游分子 p20(活化的 caspase-1)、mIL-1β 表达水平。免疫共沉淀方法检测 Mst2 抑制剂预处理前后的小鼠原代腹腔巨噬细胞经单增李斯特菌感染后，胞内 Nek7 与 NLRP3 的结合水平。
结果 在单增李斯特菌感染过程中，Mst2 蛋白水平在感染 60 min 明显升高。与未处理组相比，Mst2 siRNA 处理组 p-JNK 在 2 h 明显降低，Nek7、NLRP3、p20、mIL-1β 蛋白水平在 4 h 明显降低。Mst2 抑制剂处理组 Nek7 与 NLRP3 结合水平在 2 h 显著降低。
结论 单增李斯特菌感染过程中，Mst2 通过促进 Nek7 与 NLRP3 的结合激活 JNK/NLRP3 信号通路。

PO-0889

临床厌氧菌感染的分布特征以药敏分析

张桂华
中国医科大学附属第一医院鞍山医院

目的 分析厌氧菌标本来源、科室、年龄分布特征及药敏试验结果，为临床经验性治疗和合理使用抗菌药物提供依据。
方法 收集 2018 年 5 月—2020 年 1 月医院住院患者所有合格标本中分离到的 45 株厌氧菌，经厌氧菌检测试剂盒鉴定和药敏试验结果分析。
结果 检测出的厌氧菌主要是厌氧消化链球菌 14 株、脆弱拟杆菌 9 株、艰难梭菌 7 株和产气荚膜梭菌 3 株等，还有些厌氧菌受限于检测能力的不足无法确定。对厌氧消化链球菌、脆弱拟杆菌和艰难梭菌的药敏结果分析，它们对阿莫西林/克拉维酸、替卡西林/克拉维酸敏感率都为 100%，此外，甲硝唑对厌氧消化链球菌、脆弱拟杆菌和艰难梭菌均保持很高的敏感性。
结论 厌氧菌引起的临床感染常见，然而厌氧菌感染死亡率高，，临床医生可根据菌株的分布特征及药敏结果对厌氧菌感染进行积极有效的治疗。

PO-0890

2020 年四川省细菌耐药监测网老年人细菌耐药数据分析

张欣、喻华、黄湘宁
电子科技大学附属医院•四川省人民医院

目的 对四川省细菌耐药监测网成员单位 2020 年度老年人细菌分布及耐药情况进行统计分析，为本省临床合理应用抗菌药物提供依据。
方法 各成员单位临床分离菌，采用标准纸片扩散法或自动化仪器检测法，按照统一技术方案测定监测药物对细菌的敏感性，依据 CLSI 指南 2019 年折点标准，用 WHONET 5.6 软件进行数据分析老年（≥65 岁）患者病原菌数据。
结果 共有 103 家医院参加了 2020 年度细菌耐药监测工作，其中数据基本合格纳入分析的共 94 家。按患者首次分离菌株进行统计分析，共收集细菌 89214 株，其中革兰阴性菌 69768 株(78.2%)，革兰阳性菌 19446 株(21.8%)。耐甲氧西林金黄色葡萄球菌(MRSA)和耐甲氧西林凝固酶阴性葡萄球菌(MRCNS)的检出率分别为 30.3%和 81.0%，MRSA 检出率低于全国检出水平，未发现万古霉素及替考拉宁耐药菌株，凝固酶阴性葡萄球菌对利奈唑胺的耐药率为 0.1%。万古霉素耐药粪肠球菌和屎肠球菌分别占 0.4%和 0.8%，自 2014 年起呈明显下降趋势，利奈唑胺耐药粪肠球菌和屎肠球菌分别占 2.1%和 0.5%。按非颅内感染的折点判断，青霉素耐药的肺炎链球菌比例为 0.6%，对头孢噻肟耐药率为 5.8%，略低于全国水平。化脓性链球菌主要对大环内酯类、克林霉素耐药，耐药率均超过 55.0%。革兰阴性菌中分离率前 4 位细菌分别为大肠埃希菌、肺炎克雷伯菌、铜绿假单胞菌和鲍曼不动杆菌，分别为 20749 株(29.7%)、14694 株(21.1%)、9471 株(13.6%)和 6638 株(9.5%)。肠杆菌目细菌对碳青霉烯类抗菌药物总耐药率虽低于 10.0%，但耐药率自 2011 年起有逐渐上升趋势。大肠埃希菌对头孢噻肟和头孢曲松的耐药率均在 54%以上，与全国水平持平，对碳青霉烯类耐药率在 1.5%左右。肺炎克雷伯菌对亚胺培南和美罗培南耐药率分别为 6.1%和 6.5%，呈持续上升趋势。碳青霉烯类耐药铜绿假单胞菌的检出率为 10.9%，显著低于全国平均水平，铜绿假单胞菌对亚胺培南、美罗培南、头孢他啶、头孢哌酮/舒巴坦、阿米卡星和环丙沙星的耐药率分别为 10.5%、8.7%、13.0%、8.4%、1.5%和 14.0%。鲍曼不动杆菌对包括碳青霉烯类在内的大多数监测药物耐药率超过 40%，对亚胺培南和美罗培南的耐药率略低于之前水平。流感嗜血杆菌对氨苄西林耐药率持续升高，耐药率达 70.7%。
结论 我省老年患者细菌耐药仍呈增长趋势，多重耐药和广泛耐药菌株检出率仍保持较高水平甚至呈增长趋势，对临床治疗造成严重威胁，应充分利用本地细菌耐药监测结果进行感控管理，促进抗菌药物合理应用。

PO-0891

Clinical characteristics, resistance mechanisms, and molecular epidemiology of chlorhexidine-resistant Pseudomonas aeruginosa isolated from a teaching hospital in China

Xiangkuo Zheng[3]、Xiaoya Zhang[4]、Beibei Zhou[1]、Shixing Liu[1]、Liqiong Chen[1]、Ying Zhang[2]、Wenli Liao[1]、Weiliang Zeng[2]、Qing Wu[1]、Chunquan Xu[1]、Tieli Zhou[1]

1. Department of Clinical Laboratory, the First Affiliated Hospital of Wenzhou Medical University, Wenzhou, Zhejiang Province, China
2. School of Laboratory Medicine and Life Science, Wenzhou Medical University, Wenzhou, Zhejiang Province, China
3. Department of Clinical Laboratory, the First Affiliated Hospital of Wenzhou Medical University, Wenzhou, Zhejiang Province, China
4. Department of Andrology, Linyi People's Hospital, Linyi, Shandong Province, China

Background Chlorhexidine is applied widely to prevent the spread of bacteria in the hospital environment, however, it can also cause the resistance of bacteria to chlorhexidine. The aim of our present study was to investigate clinical characteristics, resistance mechanisms and epidemiological characteristics of chlorhexidine resistance in *Pseudomonas aeruginosa* clinical isolates.

Methods A collection of 294 *P. aeruginosa* clinical isolates were collected from the First Affiliated Hospital of Wenzhou Medical University from 2018. Sensitivity to antibiotics was determined using the agar dilution method. Relevant clinical data collection considered to be potentially relevant to chlorhexidine-resistance were from the patient medical records. Resistance mechanisms of *P. aeruginosa* to chlorhexidine were analysed by PCR, efflux pump inhibition test and real-time quantitative PCR (qRT-PCR). P. aeruginosa were typed by pulsed-field gel electrophoresis (PFGE) and multilocus sequence typing (MLST).

Results A total of 32 chlorhexidine-resistant *P. aeruginosa* isolates were identified. Our results indicated that minimum inhibitory concentrations (MICs) of chlorhexidine to chlorhexidine-resistant strains were ≥64 μg/ml. Relevant clinical data collection showed that chlorhexidine resistance is related to some of the following factors: duration of hospitalization, length of staying in intensive care unit (ICU), duration of mechanical ventilation, chlorhexidine usage and the occurrence of nosocomial pneumonia. Expression of mexA, mexC, mexE, mexX, and oprD genes was upregulated about 6.5-12.8 fold in chlorhexidine-resistant strains than those susceptible strains, suggesting that genes hyperexpression were probably the main mechanism of resistance to chlorhexidine. MLST and PFGE analysis demonstrated that 32 chlorhexidine-resistant strains belong to different sequence types (STs) and electrophoresis pulse types.

Conclusion Overexpression of efflux pump genes was the principal resistance mechanism of chlorhexidine-resistant *P. aeruginosa*. In addition, molecular epidemiological analysis showed that the homology of chlorhexidine-resistant strains was low and there was no obvious clonal transmission.

PO-0892

沙眼衣原体 T3SS 效应蛋白 CT622 的原核表达、纯化、多克隆抗体制备及对 HeLa 细胞增殖的影响

彭彬峰[1]、陈诗诗[2]、舒明艺[3]、陈恩[1]、雷文波[1,3]、刘双全[1]
1. 南华大学附属第一医院检验医学中心
2. 衡阳市中医医院肿瘤内科
3. 南华大学衡阳医学院原生物学研究所，湖南省特殊病原体防控重点实验室

目的 原核表达、纯化沙眼衣原体（Chlamydia trachomatis，Ct）CT622 蛋白，将纯化后的 CT622 蛋白免疫新西兰兔，制备 CT622 多克隆抗体，并初步探讨 CT622 蛋白对 HeLa 细胞增殖的影响，为进一步阐明 CT622 蛋白在沙眼衣原体致病中的作用提供实验依据。
方法 以 Ct D 型基因组为模板，CT622 特异性引物 PCR 扩增 ct622 基因，构建原核表达重组载体 pGEX-6p-1/CT_622。将重组载体经 0.8 mM 的 IPTG 大量诱导表达，采用 Glutathione Sepharose 4B beads 纯化 GST-CT622 融合蛋白，融合蛋白经 PreScission Protease 酶切除 GST 标签离心后取上清获得纯化的 CT622 蛋白。生物信息学分析 CT622 蛋白免疫原性，将纯化的 CT622 蛋白进行去内毒素处理后，与弗氏完全佐剂超声乳化，皮下免疫新西兰兔。将 CT622 蛋白与琼脂糖介质偶联制备成抗原亲和纯化层析柱进行抗体纯化。BCA 测定抗体浓度，SDS-page 鉴定纯化后的 CT622 蛋白多克隆抗体纯度，ELISA 检测抗体效价。用不同浓度的 CT622 蛋白处理 HeLa 细胞 24 h 后，CCK-8 细胞活性检测试剂盒检测细胞存活率（Cell viability%）。
结果 成功表达并纯化了 CT622 蛋白，生信分析表明该蛋白免疫原性良好，经纯化后 CT622 抗体浓度为 0.75 mg/mL，纯度在 85%以上，其效价在 1：512, 000 左右。CCK-8 结果表明，不同浓度 CT622 蛋白处理 HeLa 细胞后，其细胞存活率高于 PBS 对照组，并在 CT622 浓度为 10 μg/mL 时细胞存活率最高。
结论 成功表达并纯化了沙眼衣原体 CT622 蛋白，制备了高效价兔源性抗 CT622 抗体，CT622 蛋白可促进 HeLa 细胞增殖。

PO-0893

神经外科重症患者 CRE 感染发生危险因素及 NLR、PCT、MCP-1 对感染的鉴别诊断价值

张林
郴州市第一人民医院

目的 探讨神经外科重症患者 CRE 感染发生危险因素及中性粒细胞/淋巴细胞比值（NLR）、降钙素原（PCT）、单核细胞趋化蛋白-1（MCP-1）对感染的鉴别诊断价值。
方法 选取 2017 年 2 月～2019 年 3 月我院神经外科重症感染患者 122 例作为研究对象，包括 61 例耐碳青霉烯肠杆菌科细菌（CRE）感染、61 例碳青霉烯敏感肠杆菌科细菌（CSE）感染，比较两组临床资料、NLR、PCT、MCP-1，Logistic 分析 CRE 感染发生危险因素，Pearson 分析 NLR、PCT、MCP-1 与急性生理与慢性健康评分（APACHEⅡ评分）相关性，ROC 分析 NLR、PCT、MCP-1 对神经外科重症患者 CRE 感染的鉴别诊断价值，KM 曲线分析 NLR、PCT、MCP-1 高水平组、低水平组生存率。
结果 两组抗生素药物应用、抗生素药物使用时间、碳青霉烯类使用、APACHEⅡ评分、NLR、PCT、MCP-1 水平相比，差异有统计学意义（P＜0.05）；抗生素药物应用≥2 联、抗生素药物使用时间＞10 d、碳青霉烯类使用、APACHEⅡ评分≥20 分、NLR、PCT、MCP-1 高水平表达均为神经外科重症患者 CRE 感染危险因素（P＜0.05）；神经外科重症 CRE 感染患者 NLR、PCT、

MCP-1 与 APACHEⅡ评分呈正相关关系（P＜0.05）；联合诊断 CRE 感染 AUC 值大于单一诊断（P＜0.05）；CRE 感染患者 NLR、PCT、MCP-1 高水平组病死率高于低水平组（P＜0.05）。
结论 神经外科重症患者 CRE 感染受多种因素影响，其中 NLR、PCT、MCP-1 与病情程度密切相关，有助于 CRE 感染的鉴别诊断，临床可据此采取针对性干预措施，预防 CRE 感染的发生。

PO-0894

质谱分析仪用于耐甲氧西林金黄色葡萄球菌分子分型的研究

张婷婷
宜宾市第一人民医院

目的 评价基质辅助激光解析电离飞行时间质谱技术(MALDI-TOF MS)对耐甲氧西林金黄色葡萄球菌(MRSA)分子分型的应用价值。
方法 收集 2009.1 到 2012.3 来自全国 6 个城市共 270 株 MRSA 菌株，经多位点序列分析（MLST）表型主要为 St239、St5、St59、St45 4 个基因型，使用 ClinProTools 软件建立模型，并用剩余菌株验证得出模型的敏感性和特异性；随机选取试验组 35 株 St239，对照组 43 株包括 20 株 St5、15 株 St59、8 株 St45 构建模型 St239; 随机选取试验组 8 株 St45，对照组 35 株包括 11 株 St5、8 株 St59、16 株 St239 构建模型 St45。
结果 154 株 St239、72 株 St5、30 株 St59、14 株 St45 经检测显示，模型 St239、St45、St5 的交叉效度和可接受度均为 100%，仅模型 St59 的交叉效度为 90.45%，其可接受度也为 100%；模型 St45 能正确区分出 St45 的敏感性和特异性均为 100%，模型 St239 能正确区分出 St239 的敏感性是 95.8%以及特异性是 93.2%，模型 St59 能正确区分出 St59 的敏感性是 86.7%以及特异性是 91.7%，模型 St5 能正确区分出 St5 的敏感性是 50%以及特异性是 95.8%。
结论 MALDI-TOF MS 分型与多位点序列分析（MLST）具有较好的一致性，且具有操作简便、快速、低成本、重复性好、稳定性高的优点。

PO-0895

Activation of mTOR in Th1/Th2 cells in Kelbsiella pneumoniae-caused liver abscess patients

Jie Zhang
Sichuan Academy of Medical Sciences & Sichuan Provincial People’s Hospital

Liver abscesses are space-occupying lesions, which has become a public health problem and the mechanism is still unclear. Klebsiella pneumoniae is a well-known human nosocomial pathogen. Hypervirulent variant of Klebsiella pneumonia (hvKP) isolates can cause serious, life-threatening community-acquired infections in healthy hosts, including liver abscess. Cytokines produced by T helper (Th) cells are of critical importance for the outcome of many infectious diseases. Cytokines produced by T helper (Th) cells are importance for defending infection. In this report, we demonstrated that the balance of Th1/Th2 response was shifted in peripheral blood from Klebsiella pneumoniae-caused liver absecess patients. We again observed that Klebsiella pneumoniae could directly cause increased IFN-γ and IL-4 production in PBMC from healthy people. We demonstrated further that Klebsiella pneumoniae-caused liver absecess partially induces mTOR activation in Th1 and Th2 cells in vivo and in vitro. Collectively, these results suggest that the possibility of targeting mTOR as a strategy to modulate Th1 and Th2 response of host defense to prevent Klebsiella pneumoniae-caused liver absecess.

PO-0896

38 例侵袭性赛多孢霉属感染的临床特征及药敏结果分析

郑燕青[1,2]、鹿秀海[3]、蔡洁[4]、马晓波[1,2]、徐和平[1,2]、洪国斐[1,2]
1. 厦门大学附属第一医院检验科
2. 厦门市基因检测重点实验室
3. 山东眼科医院检验科
4. 厦门大学附属眼科中心检验科

目的 分析了解侵袭性赛多孢霉属感染的临床表现和药敏结果，为赛多孢霉属感染的诊断与治疗提供参考。
方法 收集 2017 年 1 月至 2020 年 12 月收治的 38 例侵袭性赛多孢霉属感染患者的临床资料和分离的病原菌株，对赛多孢霉属感染相关病例的临床表现与治疗效果和药敏结果进行回顾性分析。
结果 38 例侵袭性赛多孢霉属患者中检出尖端赛多孢霉 17 株，波氏赛多孢霉 22 株，桔黄赛多孢霉 1 株。眼外伤、溺水和免疫力降低是赛多孢霉属感染的常见的诱因，临床最常见的赛多孢霉属侵袭性感染主要有角膜炎、肺部感染、糖尿病足、外伤伤口感染，体外药敏结果显示赛多孢霉属对伏立康唑的药敏范围为 0.12-0.5ug/ml，其他抗真菌药物普遍耐药。
结论 侵袭性赛多孢霉属感染主要以外伤为主，预后与患者的自身免疫状态、及时的诊断，和正确使用伏立康唑治疗明显相关。

PO-0897

PTX3 基因多态性与中国非 HIV 相关隐球菌病具有相关性

张为利、廖全凤、刘雅、吴思颖、邓劲、肖玉玲、马莹、谢轶、康梅
四川大学华西医院

Objectives We aimed to conduct an association analysis between the SNPs of pattern recognition receptors (PRR) genes and the susceptibility to cryptococcosis in HIV-uninfected Chinese patients.
Methods Using the SNaPshot SNP typing technique, eight SNPs of PRR genes were typed on 97 HIV-uninfected cryptococcosis patients and 120 healthy controls who admitted to West China Hospital, Sichuan University, China, from 1 March 2018 to 30 December 2018.
Results It was found that that PTX3 rs2305619 polymorphism was associated with cryptococcosis in HIV-uninfected patients. Compared with the GG genotype, AA genotype increased the risk of cryptococcosis in HIV-uninfected patients ($p = .015$, OR, 2.579; 95% CI, 1.202-5.535). In the immunocompetent patients, the AA genotype had a higher risk ($p = .002$, OR, 4.399; 95% CI, 1.745-11.088). Further verification found that the plasma PTX3 level of the AA genotype was significantly higher than the GA or GG genotype (60.28 ± 16.12 vs 7.32 ± 0.79, $p < .001$).

PO-0898

宏基因测序在血流感染临床诊疗中的应用价值分析

胡雪姣、邓倩昀、顾兵
广东省人民医院

目的 探讨病原宏基因组检测（mNGS）对于疑似血流感染患者的早期临床诊疗的价值，以规范和优化 mNGS 的临床使用场景。

方法 纳入 2017-2020 年广东省人民医院疑似血流感染且同时行血培养和 mNGS 检测的患者 290 例，收集其外周血样本，进行常规病原检测和 mNGS 检测以确定病原体。收集患者的所有临床诊疗信息。比较 mNGS 和血培养对血流感染的诊断效能，研究 mNGS 对于疑似血流感染患者的诊断病原或排除感染的临床价值，以及 mNGS 是否能指导调整临床抗生素方案。
结果 290 患者包括 118 例血流感染和 172 例非血流感染患者。118 例血流感染患者中，通过血培养仅检测到 46 例（38.98％），mNGS 检测 105 例（88.98％）；血培养和 mNGS 的灵敏度分别是 38.98%、88.98%，特异度分别是 95.93%、63.37%。mNGS 对血流感染具有 89.34%的阴性预测价值。血培养和 mNGS 的 Kappa 值为 0.142（＜0.2）。约 33%的 mNGS 检测对临床抗生素使用具有有效影响，超过 70%的 mNGS 检测结果对临床诊断或治疗的决策有一定的积极影响。
结论 对于血流感染，mNGS 的敏感性较培养高，但特异性亟待提升。mNGS 对于培养困难的病原体，尤其对立克次体、病毒等感染、混合感染的诊断上优势明显。mNGS 与传统微生物检测互补不替代，mNGS 与血培养联合使用有利于对患者的病因诊断和抗菌治疗，但仍需大样本的前瞻性研究证实。

PO-0899

去铁铵干预下鲍曼不动杆菌耐药性状变化转录组差异分析

高玉红、郑瑞、朱磊、李艺坤
云南省第一人民医院

目的 研究铁离子螯合剂去铁铵作用下，鲍曼不动杆菌转录组基因表达与抗菌药物耐药性变化的关系。
方法 以一株脑脊液中分离得到的耐碳青霉烯鲍曼不动杆菌 PG15 作为模式菌株，肉汤稀释法测定去铁胺对 PG15 的最低抑菌浓度为 32mmol/L，加入去铁胺后测定抗菌药物的最低抑菌浓度变化，并对添加去铁胺前后的鲍曼不动杆菌 PG15（三个重复）进行转录组测序，分析基因表达差异。
结果 添加去铁铵后数种抗菌药物的最低抑菌浓度均降低一倍：亚胺培南、头孢吡肟、左氧氟沙星、四环素、哌拉西林/他唑巴坦对 PG15 的最低抑菌浓度分别由 16μg/mL、32μg/mL、16μg/mL、16μg/mL、128/4μg/mL 降为 8μg/mL、16μg/mL、8μg/mL、8μg/mL、64/2μg/mL。转录组数据显示：添加 32mmol/L 去铁铵后，测试菌株有 1206 个基因表达上调，302 个基因下调，非显著性差异表达基因 1557 个。差异表达基因上调大于 3 倍的 32 个基因中，鲍曼不动杆菌铁载体-鲍曼不动杆菌素的生物合成相关基因占了 18 个；铁结合及转运蛋白基因 4 个；AdeABC 外排泵基因 2 个；其它基因 8 个。上调幅度大于 3 倍的基因主要涉及鲍曼不动杆菌素生物合成基因，分析该现象可能是由于铁螯合剂去铁铵介入后，菌株应对低铁胁迫环境所采取的一种主动适应方式，菌株试图通过提高不动杆菌素的合成量来保证菌体对环境铁元素的摄取优势。其它上调基因还包括 I 型菌毛装配相关基因 csuABCDE（与生物被膜的形成密切相关）有小幅度上调。下调基因有 302 个：其中下调超过 6 倍的基因有 41 个，很多基因功能未明，其余基因多与代谢相关，包括膜双组分运输系统，嘌呤代谢，氨基酸代谢、苯酸盐代谢、丙酮酸代谢基因均下调表达，其它下调的重要基因还包括多药转运体，海藻糖 6-磷酸酶（生物膜形成相关蛋白），6-磷酸葡萄糖酸脱氢酶。
结论 去铁铵增强了鲍曼不动杆菌对部分抗菌药物的敏感性，这与鲍曼不动杆菌在低铁环境下铁载体生物合成基因及外排泵基因表达上调有关。

PO-0900

高毒力高侵袭的甲氧西林敏感金黄色葡萄球菌临床分离株的分析

孙艳
东南大学附属中大医院

目的 金黄色葡萄球菌是院内感染和社区感染常见的致病菌，以往的研究大多关注耐甲氧西林金黄色葡萄球菌（MRSA)，而关于甲氧西林敏感金黄色葡萄球菌（MSSA)的研究较少。从某医院的 ICU 菌血症患者身上分离到一株 MSSA，该患者病情重、治疗药效差，探索该株 MSSA 的致病机制。
方法 对此患者的导管血、上肢血、下肢血、痰标本来源的 MSSA 菌株和金葡菌标准菌株 ATCC29213 进行多位点序列分型，予裸鼠皮下注射浓度为 1*10^8 的 MSSA 和金葡菌标株菌液 100uL，监测裸鼠是否形成皮下脓肿。
结果 此患者多个样本来源的 MSSA 菌株均为 ST188 型，金葡菌标株为 ST5 型，注射 MSSA 菌株裸鼠的皮下脓肿生成速度较注射金葡菌标株的快，皮下脓肿面积更大，皮下组织的血平板涂片见细菌生长，经鉴定为金葡菌。
结论 ST188 型 MSSA 的毒力较 ST5 型金葡菌标株大，侵袭性较金葡菌标株强。

PO-0901

耐碳青霉烯高毒力肺炎克雷伯菌临床及分子流行病学特征

张露丹[1]、曹慧军[1]、周丹[2]、刘宝[1]、费樱[1,2]
1. 贵州医科大学附属医院
2. 贵州医科大学

目的 研究耐碳青霉烯高毒力肺炎克雷伯菌(carbapenem-resistant hypervirulent Klebsiella pneumoniae, CR-hvKP)菌株感染的临床特征、耐药情况、多重耐药的机制和高毒力机制，为临床及时识别该菌提供临床和实验室依据，从而采取行之有效的抗感染治疗措施。
方法 收集 2020 年 1 月 1 日—2020 年 12 月 31 日贵州某三甲医院临床分离拉丝试验阳性且任一碳青霉烯类药物耐药的肺炎克雷伯菌，初步鉴定为 CR-hvKP 菌株。收集感染患者的临床资料和药敏试验结果进行分析，同时采用 PCR 扩增上述菌株的常见碳青霉烯酶基因和毒力基因，并对其进行荚膜血清型和多位点序列分型，采用 ERIC-PCR 进行同源性分析。
结果 本研究中自 10 位发生多部位感染的患者分离 CR-hvKP 共 38 株，均为多重耐药菌，对三、四代头孢菌素、氟喹诺酮类、氨基糖苷类抗生素均 100%耐药，对替加环素、多黏菌素 B 耐药率为 23.7%，未检出对头孢他啶/阿维巴坦耐药菌株。10 位患者有基础疾病、经历过手术或侵入性操作、β-内酰胺类抗生素暴露史、住院天数长、预后不良的临床特征。38 株 CR-hvKP 菌株均检出 blaKPC 基因，而未检出其他常见碳青霉烯酶基因 blaNDM、blaVIM、blaIMP、blaOXA-48；均检出毒力基因 mrkD、rmpA、entB、ybtS、fimH、aerobactin，毒力基因 KfuBC 检出率为 86.85%，未检出 allS、wcaG 两种毒力基因。38 株 CR-hvKP 荚膜血清型均为 K64，多位点序列分型均为 ST11，ERIC-PCR 同源性分析示具有完全相同的 DNA 图谱，提示具有同源性。
结论 本研究中 CR-hvKP 感染的临床特征与 CRKP 感染相似，均是 ST11 型产 KPC 酶的 CRKP 菌株；CR-hvKP 耐药形势严峻，已经检出同时对多黏菌素和替加环素耐药的泛耐药 CR-hvKP 菌株；本研究中检出的 CR-hvkP 菌株，多位点序列分型均为 ST11，荚膜血清型均为 K64，ERIC-PCR 具有完全相同的 DNA 图谱，提示存在爆发流行可能。

PO-0902

Molecular types, virulence and drug resistance features of bacterial strains in simultaneous outbreaks of paratyphoid A and B fever

Xuewei Tong
Hospital of Xinjiang Production and Construction Corps

OBJECTIVE This study investigated the molecular types, virulence, and drug resistance features of the bacterial strains in simultaneous outbreaks of paratyphoid A and B fever, which could provide evidence for preventing the simultaneous transmission of different types of paratyphoid fever.
METHODS The data of the confirmed and suspected paratyphoid fever patients were analyzed in this retrospective study. All the patients were students from a high school in China. The strains were isolated for serological typing and drug sensitivity test. Multiplex polymerase chain reactions (M-PCR), pulsed-field gel electrophoresis (PFGE), and multilocus sequence typing (MLST) were used for molecular typing. Additionally, the virulence genes and drug resistance genes were evaluated.
RESULTS In total, 31 confirmed patients and 35 suspected patients were included in this study. Thirty-two strains of Salmonella Paratyphi were isolated from the 31 confirmed patients; the serotypes were A and B in 19 and 13 patients, respectively, while the intermediate rate of strains against ciprofloxacin was 100%. The molecular types of 11 representative strains by M-PCR were in agreement with the serotypes, while PFGE and MLST suggested the transmissions of Salmonella Paratyphi clones of two origins. The representative strains carried the virulence gene of SPI1-5 and regulatory gene, while Salmonella Paratyphi A also carried the CDT gene. The detection rate of ciprofloxacin-resistant genes was 89.39% in the representative strains.
CONCLUSIONS The simultaneous transmission of Salmonella Paratyphi A and B is characterized by high pathogenicity and poor sensitivity to ciprofloxacin, which should be investigated further in the laboratory and clinical practice.

PO-0903

评估黏菌素肉汤纸片洗脱法和全自动药敏系统检测肠杆菌目和铜绿假单胞菌对黏菌素耐药性的价值

黄嘉仪
复旦大学附属中山医院
上海交通大学医学院附属瑞金医院
上海交通大学医学院检验系

目的 黏菌素是临床用以治疗多重耐药革兰阴性杆菌感染的最后一线抗菌药物。但是，目前开展黏菌素药敏试验对临床实验室来说存在一定困难。为此，实验室标准协会(Clinical and Laboratory Standards Institute, CLSI)开发了一种更容易在临床实验室内开展的新方法，即黏菌素肉汤纸片洗脱法（Colistin Broth Disk Elution, CBDE）。本研究的目的是评估 CBDE 法和 BD PhoenixTM 药敏分析系统对肠杆菌目和铜绿假单胞菌的黏菌素药敏检测性能。
方法 收集 2018-2021 年从临床分离的 179 株细菌包括肠杆菌目细菌和铜绿假单胞菌，同时使用 CBDE、BD PhoenixTM 药敏分析系统和微量肉汤稀释法（reference Broth MicroDilution, rBMD）测定菌株最低抑菌浓度（Minimum Inhibitory Concentration, MIC）值。以 rBMD 作为参考方法，分析这两种方法的性能评价指标。
结果 CBDE 法和 BD PhoenixTM 药敏分析系统的分类一致性（Categories Agreement, CA）分别为 99.44%和 92.73%、基本一致性（Essential Agreement, EA）分别为 97.77%和 92.18%、非常

重大错误（Very Major Error, VME）分别为 0 和 21.67%、重大错误（Major Error, ME）分别为 0.84%和 0、灵敏性分别为 100%和 78.33%，以及特异性分别为 100%和 99.16%。
结论 CBDE 法用于肠杆菌目及铜绿假单胞菌黏菌素药敏检测结果稳定可靠。该方法性能指标在本实验室均达到了行业标准 WS/T639—2018《抗菌药物敏感性试验的技术要求》和 CLSI 规定的标准。而 BD PhoenixTM 药敏分析系统易出现假敏感（VME）情况，超出可接受标准。使用该系统作为黏菌素药敏试验的检测性能存在缺陷。本研究通过使用临床菌株进行性能验证，证明了 CBDE 法以其经济、易操作且准确性高的优点，可以作为 rBMD 的替代方法在本实验室内作为黏菌素药敏试验的常规项目开展使用。

PO-0904

山西省耐甲氧西林金黄色葡萄球菌表型分析及基因研究

侯亚彬[1]、王海如[1]、任洁[1]、张宇[1]、郝崇华[2]
1. 山西医科大学附属人民医院
2. 山西省人民医院

目的 分析耐甲氧西林金黄色葡萄球菌（MRSA）的表型和基因型，研究 MRSA 的多重耐药机制，探寻抗菌药物作用新型靶点，为预防和治疗 MRSA 感染及临床有效合理使用抗菌药物提供帮助。
方法 收集 2019 年 6 月-2020 年 12 月山西省 13 家三甲医院临床分离的连续和非重复的 MRSA 菌株 236 株，采用 K-B 纸片扩散法和药敏分析系统对菌株进行耐药表型确证和药物敏感试验，采用多重聚合酶链反应检测 mecA 基因、毒力基因和耐药基因岛（SCCmec）进行分析。
结果 共收集到 236 株 MRSA 菌株。药敏试验显示，未分离到对万古霉素、利奈唑啉和替考拉宁耐药的 MRSA，但所有菌株均对青霉素、苯唑西林、氨苄西林和头孢唑啉耐药。236 株 MRSA 均携带 mecA 基因。最常见的肠毒素基因是 see（77.5%），其次是 sed（53.9%）和 sec（5.3%）。脱落毒素基因（etb）和中毒性休克综合征毒素（tst）阳性率分别为 49.1%和 8.1%。在 MRSA 分离株中，SCCmecⅡ型、Ⅲ型和Ⅳ型分别占 53.4%、38.2%和 8.4%。
结论 本研究揭示了山西省 MRSA 分离株的耐药性、毒力基因谱和 SCCmec 类型。耐药表型检测显示本地区 MRSA 呈现多重耐药、高度耐药的特点，基因分析表明耐药程度严重，耐药模式复杂。

Chlamydia trachomatis T3SS effector CT622 induces proinflammatory cytokines via TLR2/TLR4-mediated MAPKs/NF-κB pathway in THP-1 cells

Wenbo Lei[1,2]、Binfeng Peng[2]、Mingyi Shu[1]、En Chen[2]、Shuangquan Liu[2]、Zhongyu Li[1]
1. 南华大学衡阳医学院原生物学研究所
2. 南华大学附属第一医院检验医学中心

Chlamydia trachomatis, an obligate intracellular pathogen, which infections leading cause of sexually transmitted diseases and blinding blindness. The pathogenic mechanism of C. trachomatis may be associated with the induction of host inflammatory response. However, yet little is known about the molecular mechanisms for C. trachomatis leading to inductions of proinflammatory cytokines. As a T3SS effector protein, CT622 plays a crucial role in the process of growth and development of C. trachomatis. To date, relatively little is understood about whether CT622 can induce host inflammatory response. In the present study, we investigated the roles and mechanisms of CT622 protein in regulating the inflammatory response in THP-1 cells. Stimulation with CT622 can promotes the expression levels of interleukin-6 (IL-6) and interleukin-8 (IL-8). Our results further indicated that MAPKs and NF-κB signaling pathways are involved in

CT622 induced proinflammatory cytokines. Moreover, the levels of IL-6 and IL-8 were declined after treatment of the cells with MAPKs and NF-κB inhibitors. Similarly, we further investigated the role of TLRs signaling pathways in CT622 induction of proinflammatory cytokines and activation of MAPKs/ NF-κB， our results show that the expression levels of IL-6 and IL-8 were reduced, the phosphorylation of ERK, p38, JNK, and IκBα were attenuated after silencing the Toll-like receptor 4 (TLR4) expression by using siRNA. We also found that after disturbing the expression of TLR2, CT622 induced IL-8 production and activated ERK were also be abrogated, whereas the expression level of IL-6 and the phosphorylation of p38, JNK, and IκBα were not affected. Taken together, these observations illustrated that CT622 contributes to the inflammatory response via TLR2/TLR4-mediated MAPKs/NF-κB pathway in THP-1 cells, which should further promote our understanding of Chlamydial pathogenic mechanisms.

PO-0906

Application of Fibrous Materials in the Diagnosis of Tuberculous Meningitis

Yan Zhang
Department of Clinical Laboratory, the Affiliated Drum Tower Hospital of Nanjing University Medical School, Nanjing 210008, China

Tuberculous meningitis (TBM) is a non-suppurative inflammatory disease of meninges and meninges caused by Mycobacterium tuberculosis (MTB), with high mortality. Traditional methods for laboratory detection of MTB are less sensitive and time-consuming. Some fibrous materials like silica fiber in GeneXpert MTB/RIF kit and paper fiber in acid-fast staining were used for clinical diagnosis of TBM. These detection methods were compared and analyzed. The results showed that the sensitivities of the 3 detection methods were 28.81%, 16.95% and 37.29%, respectively, and the specificity were all 100%, based on clinical diagnosis. The diagnostic efficiency of GeneXpert MTB/RIF technique was significantly better than that of culture method (2=6.174, P=0.013). Although there was no statistically significant difference when compared with acid-fast staining (2=0.957, P=0.328), the GeneXpert MTB/RIF technique has the advantage of accurately distinguishing MTB from non-MTB. The above results indicate that GeneXpert MTB/RIF technique has advantage of high sensitivity, high specificity, accuracy and simple operation. The detection time is short to 2 h, which is greatly shortened compared with 4-8 weeks for Rochelle solid culture method. The fibrous materials have high application value for the diagnosis of TBM.

PO-0907

In vitro bacteriostasis of Coptis chinensis on Staphylococcus aureus and its mechanism

Lingqing Xu、jinyan Li、qianjun He、weihong Wen、 yingxian Tang、zhongwen zhang
The Sixth Affiliated Hospital of Guangzhou Medical University

objective This study aimed to investigate the inhibitory effect of Coptis chinensis on Staphylococcus aureus (S. aureus) in vitro and its mechanism.
Methods 1.A total of 80 strains of S. aureus, half of which were methicillin-resistant S. aureus (MRSA) and the other half of which were methicillin-susceptible S. aureus (MSSA), were collected.
2.Drug sensitivity test was carried out using a VITEK 2 Compact automatic microbial analyzer.
3.The minimal inhibitory concentration (MIC) of Coptis chinensis against the 80 strains of S. aureus was determined using the doubling dilution method; 4.S. aureus was treated with Coptis

chinensis, the optic density value was measured every two hours, the growth curve was drawn, and the exosmosis levels of deoxyribonucleic acid (DNA), ribonucleic acid (RNA), and other macromolecular substances were detected.
Results 1.Of the 80 strains of S. aureus, 34 strains (42.5%) were isolated from secretion samples, 11 strains (13.75%) from pus/puncture fluid samples, 17 strains (21.25%) from sputum/throat swab samples, and 18 strains (22.5%) from blood samples.
2. The MIC of Coptis chinensis against the 80 strains of S. aureus ranged from 16 mg/ml to 128 mg/ml, but the difference in the in vitro inhibitory effect against MRSA and MSSA was not statistically significant.
3.There was no significant difference in the in vitro antibacterial effect of Coptis chinensis on S. aureus from the different samples.
4.After treatment with Coptis chinensis, the growth of S. aureus was significantly inhibited, and the exosmosis levels of DNA, RNA, and other macromolecular substances increased significantly
Conclusion Coptis chinensis has a good inhibitory effect on clinically separated S. aureus, and it could play an important role in managing S. aureus infection, especially in the treatment of MRSA.

PO-0908

Predicting Risk Factors and Outcomes of malignant patients with Gram-negative bacteremia using real-world data

SUJIAO NI、Ruiling ZU、Kaijiong Zhang、pingyao Xu
Sichuan cancer hospital

Background Gram-negative bacteremia(GNB) is a frequently complicated cause of cancer patients morbidity and mortality. The incidence, risk factors and outcomes for GNB remained poorly characterised.
Methods This study retrospectively analyzed the risk factors and outcomes of GNB in malignant patients. The univariable and multivariable logistic regression were used to identify baseline risk factors for GNB and mortality. Then we developed a nomogram to predict 30-day mortality in patients with GNB .
Results The final cohort comprised 1004 malignant patients with Bloodstream infection(BSI)，65.7%(N=660) accquired GNB. In univariate analysis, GNB patients showed association with Gynecologic cancer, Hepatobiliary cancer, Hematologic cancer, Genitourinary cancer , Upper gastrointestinal cancer , Head and neck cancer , Lung and bronchus cancer ,admission to ICU before infection, chronic obstructive pulmonary disease， pulmonary infection, urinary tract infection, soft tissue infection, biliary tract infection, and antibiotic expose were independent factor for GNB infection. Laboratory indicators shows that procalcitonin(PCT) is higher in GNB patients and LYMPH is lower.Multivariate analysis showed Gynecologic cancer, Hepatobiliary cancer, Hematologic cancer, Genitourinary cancer,urinary tract infection, biliary tract infection,surgery and PCT were independent risk factors for GNB. In univariate analysis, Non-survivor groups showed association with: male patients, cardiacdysfunction, renal dysfunction, shock, admission to ICU before infection, stay in ICU after infection, pulmonary infection, surgery, chemotherapy, catheterization, nasogastic tube, mechanical ventilation, fungal drug expose, lower platelet counts (PLT), higher CRP and PCT . Multivariate analysis shows that shock,admission to ICU before infection, pulmonary infection, nasogastic tube,and lower PLT were independent risk factors for death from GNB . We developed a nomogram to predict 30-day mortality in patients with GNB, The C-index of this predictive model was 0.804，which suggested a good prediction capability of this model to predict 30-day mortality in cancer patients with GNB.
Conclusion This large analysis of malignant patients with GNB provided significant risk factors in the infection and mortality. And based on the large cohort, a nomogram was constructed which could reduce the risk of mortality.

PO-0909

肺炎克雷伯菌整合子携带情况及与耐药性和毒力基因的相关性研究

宋国滨[1,2]、王刚[2]、黄颖[2]、徐元宏[2]
1. 同济大学附属东方医院检验科
2. 安徽医科大学第一附属医院检验科

目的 分析肺炎克雷伯菌中整合子携带情况，并对其与耐药性和毒力基因的相关性进行分析，为进一步研究整合子在耐药性与毒力基因中的作用提供数据依据。
方法 运用纸片扩散法和 vitec compact2 仪器进行药敏试验，聚合酶链式反应（PCR）技术检测三种整合酶基因、七种常见毒力基因，并运用 SPSS 软件分析整合子与耐药性和毒力基因携带的相关性，P＜0.05 为具有统计学意义。
结果 我院共收集 133 株肺炎克雷伯菌，其中 I 型整合子检出 58 株，未检出 II 型、 III 型整合子，耐药性检测分析显示菌株对氨苄西林天然耐药以及对米诺还素、多粘菌素 B、替加环素的耐药率分别为 8.27%、2.26%、0%外，对 β 内酰胺类、喹诺酮类、氨基糖苷类、磺胺类抗生素耐药率普遍大于 30%，整合子阳性的菌株耐药率比整合子阴性菌株高，其差异具有统计学意义，但整合子阳性菌株毒力基因携带率低于整合子阴性菌株，其差异具有统计学意义。
结论 我院整合子类型主要以 I 型为主，携带 I 型整合子菌株比整合子阴性菌株普遍耐药，但其毒力基因正好相反，其具体机制应进一步研究，加强抗生素的合理应用，防控多重耐药菌的快速传播。

PO-0910

COVID-19 患者尸检组织单细胞转录组图谱的建立与分析

夏欣一
中国人民解放军东部战区总医院

目的 随着 COVID-19 继续在全球传播，迫切需要更好地了解 COVID-19 的病理特征。已有的大规模尸检发现 SARS-CoV-2 感染会导致多器官和组织损伤，主要是肺部、消化道和免疫系统，进一步了解患者不同器官中各种重要免疫细胞的比例和分子变化为理解 COVID-19 的病理机制具有重要意义。
方法 收集 2 名死于 COVID-19 患者的 2 份骨髓、2 份 PBMC、2 份肺组织和 1 份结肠组织以及外周血 PBMC 作为患者组。正常组单细胞测序结果来源于公共数据库。单细胞转录组测序分析所有两组各类型组织的差异表达基因、细胞类型聚类和鉴定。根据典型标记对细胞类型进行注释，对组织特异性簇进行评分，最终结果用 UMAP 进行可视化处理，用来评估患者组和正常组之间的细胞类型组成是否有显著差异。
结果 共获得 150966 个单细胞转录组数据。其中，21773 个骨髓单个细胞（患者组 17396 个，对照组 4377 个），41571 个 PBMC（患者组 21244 个，对照组 20327 个），47397 个肺单个细胞（患者组 4241 个，对照组 43156 个）,和 40225 个结肠细胞（患者组 1050 个，对照组 39175 个）。首先，绘制了新冠肺炎患者组和对照组不同组织的单细胞图谱。发现在感染后，各组织多种细胞类型的比例发生变化，最明显的是中心粒细胞、T 细胞、AT2、AT1 细胞等。其次，SARS-CoV-2 感染后细胞间的信号转导存在显著差异，且存在组织特异性，主要涉及抗病毒反应，免疫激活，细胞因子和炎症反应等。最后，来自不同组织的中性粒细胞、单核细胞、T 细胞和巨噬细胞在应对病毒感染时具有不同的转录因子调控模式，可有助于提示 COVID-19 的治疗靶点。
结论 本研究通过 2 例 COVID-19 患者死亡病例建立骨髓、血液、肺实质和结肠的单细胞转录组数据图谱，解析不同器官之间的重要免疫细胞细胞比例和较深入的分子层面变化，有助于理解

SARS-CoV-2 是如何影响不同器官而引起系统性免疫反应。为理解病毒感染后不同组织后细胞比例和细胞通讯的改变、感染后不同组织淋巴细胞减少等关键科学问题提供依据。

PO-0911

基于 CRISPR 和侧流层析的 HPV 多重检测和分型的新方法研究

贺云萱、夏欣一
中国人民解放军东部战区总医院

目的 目前 HPV 检测技术众多，但尚存在实验周期长、操作复杂、灵敏度低、特异性差以及大多仅能进行单一型别的分析等局限。为了解决此问题，本研究开创了新型简便、快速检测且同时多重检测 HPV 型别的新技术。
方法 首先利用有特殊标记的特异性引物标记检测靶标 PCR 产物的两端，通过侧流层析试纸进行直接检测；再采用 MY09/11 通用引物对待检测靶标序列进行扩增，通过特异性 crRNA 引导 Cas12a 切割并激活切割单链报告子，以侧流层析试纸显示检测结果；接着使用 Cas/sgRNA 复合物切割多种靶向 DNA，通过 PCR 扩增后，以琼脂糖凝胶电泳图显示结果；最后，通过盲检 30 例临床样本，并将结果与 23 型检测试剂盒的结果对比。
结果 本研究构建了三种不同的检测方法，首先通过 10 种高危型 HPV 质粒分别验证了三种方法的稳定性、特异性和灵敏性，均表现良好，灵敏度最高可达 10-4ng/μl。其次，盲检结果为：基于侧流层析技术的双标记扩增 HPV 分子检测系统检测出 30 例临床样本中阳性符合率为 100%。基于 CRISPR 的侧流层析技术检测 HPV 系统检测阳性符合率为 96.7%。基于 CRISPR 的多重检测技术检测不同的 30 例临床样本中，阳性符合率 92%，综上，这三种方法检测效果均表现良好。
结论 本研究开发了三种新方法，相较于传统的 HPV 检测方法，均表现出操作简单、灵敏度高、准确度高等优点，表明这些方法具有为临床宫颈癌预防、筛查工作提供参考的价值。

PO-0912

EDTA-K2 Improves the Detection Sensitivity of SARS-CoV-2 IgM and IgG Antibodies by Chelating Colloidal Gold in the Immunochromatographic Assay

Xiumei Hu
Nanfang Hospital, Southern Medical University

Objective The coronavirus disease (COVID-19) pandemic, caused by severe acute respira_x0002_tory syndrome coronavirus 2 (SARS-CoV-2), is now rapidly spreading globally. Serological tests are an important method to assist in the diagnosis of COVID-19, used for epidemiolo_x0002_gical investigations. In this study, we aimed to investigate the impact of different types of vacuum collection tubes on the detection of SARS-CoV-2 IgM and IgG antibodies, using the colloidal gold immunochromatographic assay (GICA). Patients and **Methods** A total of 112 patients with COVID-19 and 200 healthy control subjects with no infection were enrolled in this study. Their serum and plasma were collected into four different types of vacuum blood collection tubes. SARS-CoV-2 IgM and IgG specific antibodies in the plasma and serum were then detected by GICA and chemilumines_x0002_cence assay (CA), respectively. In addition, the particle sizes of different colloidal gold solutions in the presence of different anticoagulants and coagulants were evaluated by both laser diffraction (Malvern) and confocal laser microscope, respectively.
Results Our results revealed that anticoagulated plasma with EDTA-K2 improved the positive detection rate of SARS-CoV-2 IgM antibodies. Furthermore, our results shown that the detection results by GICA and CA were highly consistent, especially, the results of EDTA-K2

antic_x0002_oagulated plasma detected by GICA was more consistent with CA results. We confirmed that EDTA-K2 could improve the detection sensitivity of SARS-CoV-2 IgG antibodies by chelating excessive colloidal gold compared with sodium citrate or lithium heparin, these methodologies did not appear to cause false positives. Colloidal gold particles could be chelated and aggregated by EDTA-K2, but not by sodium citrate, lithium heparin and coagulants.
Conclusion GICA is widely used to detect antibodies for the advantages of convenient, fast, low cost, suitable for screening large sample and require minimal equipment. In this study, we found that EDTA-K2 amplified the positive antibody signal by chelating colloidal gold and improved the detection sensitivity of SARS-CoV-2 IgM and IgG antibodies when using the GICA. Therefore, we suggested that EDTA-K2 anticoagulated plasma was more suitable for the detection of SARS-CoV-2 antibodies.

PO-0913

奴卡菌的菌种分型及耐药性分析

杨佩红、周柯、张鹏亮、周磊、刘家云
空军军医大学西京医院

目的 了解奴卡菌的菌种分型及对常用抗菌药物的耐药性，为临床合理用药提供依据。
方法 收集经 VITEK MALDI-TOF MS 技术鉴定，并进行 16S rRNA 基因测序确认非重复的 24 株奴卡菌，采用微量肉汤稀释法检测 12 种抗菌药物的最低抑菌浓度。
结果 24 株奴卡菌来源于本院 2015 年 1 月～2020 年 11 月非重复的临床标本，其中痰液 14 份（58.33%）、肺泡灌洗液 4 份（16.67%）、抽出物 3 份（12.5%）、脓液 2 份（8.33%）、分泌物 1 份（4.17%）；24 位感染患者中，肺部感染占 79.17%（19/24）,其余可见皮肤、足部、脑部等部位感染。所有奴卡菌测序分型结果为：盖尔森基兴奴卡菌 9 株，脓肿奴卡菌 4 株，北京奴卡菌、鼻疽奴卡菌、豚鼠耳炎奴卡菌、新奴卡菌、天美奴卡菌各 2 株，巴西奴卡菌 1 株。选择早期未形成明显干燥且菌龄＜48h 的疑似奴卡菌落进行直接质谱鉴定，VITEK MALDI-TOF MS 技术与基因测序结果的一致性为 91.67%(22/24)。 24 株奴卡菌对利奈唑胺、阿米卡星的敏感性最高，未发现耐药菌株；对磺胺甲基异恶唑的耐药率为 4.17%（1/24）；对亚胺培南、阿莫西林/棒酸、头孢曲松、妥布霉素、米诺环素、多西环素、莫西沙星的耐药率在 12.50～33.33%之间；对克拉霉素、环丙沙星的耐药率较高，分别为 62.50%、75.00%。
结论 临床分离的奴卡菌以盖尔森基兴奴卡菌为多数；奴卡菌对克拉霉素、环丙沙星耐药率较高，利奈唑胺、阿米卡星、磺胺甲基异恶唑对其有良好的抗菌活性。

PO-0914

高毒力肺炎克雷伯菌的毒力基因、耐药机制及分子流行病学研究

李洪甫、胡同平
内蒙古科技大学包头医学院第一附属医院

目的 本研究的目的是分析内蒙古包头地区某三级教学医院 KPN-PLA 患者的临床、微生物学和分子流行病学特征，并与血、尿标本来源 KPN 的荚膜血清型、毒力因子及耐药情况进行对比。
方法 对 2016 年 1 月-2019 年 12 月内蒙古包头地区某三级教学医院收治的 78 株 KPN-PLA 病例 KPN 分离株进行系统研究和全面阐述，并与随机选取的同时期血、尿标本来源 KPN 分离株各 78 株进行对比。采用拉丝试验、聚合酶链反应(PCR)、药敏试验和多位点序列分型等方法对 KPN 的毒力因子、耐药情况和 ST 分型进行鉴定。
结果 78 例 KPN-PLA 病例中，大多数是老年男性，并且有 53.8%的患者伴有糖尿病。脓肿多为右侧单发(44.9%)。常用抗菌药物耐药率较低(<10%)，但仍有 1 株为碳青霉烯耐药菌株。尿标本 KPN

分离株比 KPN-PLA 穿刺液标本和血标本 KPN 菌株具有更高的耐药性。HmKP、aero（+）、K1 和 K2 血清型分别占 80.8%、89.7%、56.4%和 26.9%。除 iroNB(3.8%)外，毒力因子(rmpA、irp2、entB、iucD、aero、wacg、iutA、kfu、ybtA、iroN、fimH、mrkD)的检出率较高(69.2%-100.0%)。KPN-PLA 穿刺液标本 KPN 分离株比血、尿标本 KPN 分离株毒力因子阳性率更高。此外，还发现 ST23 是包头地区 KPN-PLA 的优势序列类型(32.1%)。

结论 KPN-PLA 标本 KPN 分离株具有比血、尿标本来源更强的毒力，并已出现碳青霉烯耐药的 HvKP 菌株，应引起临床高度重视，采取有效措施控制其传播。

PO-0915

云南省艾滋病患者分离新生隐球菌的药物敏感性试验与临床分析

高丽、樊红丽、杨丹丹、谢祺、张桂仙、李正伦
云南省传染病医院

目的 了解云南省艾滋病患者分离新生隐球菌的分布、耐药性及临床治疗效果。

方法 对 2010 年 1 月至 2020 年 12 月临床总共分离的 424 株新生隐球菌，用 VITEK2 Compact 全自动微生物分析仪鉴定菌种，用 ATB FUNGUS 3 板条检测 5 种抗真菌药物的敏感性，并对临床资料进行分析。

结果 424 株新生隐球菌以脑脊液检出比例最高，占 62.50%（265/424）；血液次之，占 30.90%（131/424）；排名第三的是痰液，占 2.83%（12/424）。424 株新生隐球菌对唑类抗真菌药物（除氟康唑外）MIC 均≤2μg/ml，多烯类的两性霉素 B MIC≤4μg/ml，氟康唑及 5-氟胞嘧啶的 MIC≤64μg/ml。对两性霉素 B、氟康唑、5-氟胞嘧啶的敏感性分别为 95.28%（404/424）、80.66%（342/424）、75.71%（321/424）。5 种抗真菌药物的流行病学折点分别为：5-氟胞嘧啶和氟康唑——16μg/ml；两性霉素 B、伊曲康唑和伏立康唑——0.5μg/ml。

结论 新生隐球菌随着抗真菌治疗的实施，有非野生菌株从临床分离，除两性霉素 B 敏感性较高外，其他两种药物均存在不同程度的非敏感株，治疗首选两性霉素 B 和 5-氟胞嘧啶联合治疗。隐球菌作为临床重要的致病真菌，实验室及临床均应给予高度重视。

PO-0916

Clinical and Microbiological Characterization of Invasive Pulmonary Aspergillosis Caused by Aspergillus lentulus in China

Shuying Yu 、Yingchun Xu
Peking Union Medical College, Chinese Academy of Medical Sciences

Invasive Aspergillosis (IA) due to Aspergillus lentulus is associated with high mortality. In this study, we investigated the clinical and microbiological characteristics of 6 fatal cases of proven or probable IA caused by A. lentulus in China. Underlying immunosuppression, prior antifungal exposure and intensive care unit (ICU) hospitalization were important risk factors for invasive A. lentulus infection. Phenotypic differences were observed for A. lentulus isolates including slower growth, reduced sporulation and inability to grow at 48°C, compared with Aspergillus fumigatus complex. ITS sequencing was unable to distinguish A. lentulus from A. fumigatus, but sequencing of the benA, CaM and rod A loci enabled reliable distinction of these closely-related species. Phylogenetic analysis further confirmed that the ITS region had little variation within the Aspergillus section Fumigati whilst the benA gene offered the highest intraspecific discrimination. Microsatellite typing results revealed that only loci on chromosomes 1, 3, 5 and 6b generated detectable amplicons for identification. All A. lentulus isolates showed in vitro resistance to

multiple antifungal drugs including amphotericin B (MIC range 4 to 8 μg/ml), itraconazole (MIC 2 μg/ml), voriconazole (MIC of 4~16 μg/ml) and posaconazole (MIC of 0.5~1 μg/ml). However, MECs for the echinocandin drugs, ranged from 0.03~0.25, ≤0.008~0.015 and ≤0.015~0.03 μg/ml for caspofungin, micafungin and anidulafungin, respectively. A. lentulus is an emerging fungal pathogen in China, causing fatal disease and clinicians as well as laboratories should be alert to their increasing presence.

PO-0917

Genetic Characterization of Carbapenem-resistant Escherichia coli from China, 2015 - 2017

Fengtian Li[2]、Kun Ye[1]、Xin Li[1]、Liyan Ye[1]、Ling Guo[1]、Lifeng Wang[1]、Jiyong Yang[1]
1. Laboratory Medicine Department, First Medical Center of Chinese PLA General Hospital
2. 中国人民解放军总医院第一医学中心

The molecular characteristics of carbapenem-resistant Escherichia coli (CREco) remain unclear.
Methods We conducted a multi-center bacterial resistance monitoring project from 2015 to 2017. The minimum inhibitory concentrations of CREco were determined by broth microdilution method. The genome sequencing of CREco isolates was performed, and single-nucleotide polymorphism (SNP) was analyzed.
Results A total of 144 CREco isolates collected from 10 cities in China were involved in this study. ST167 (n=43) is the most popular type, followed by ST410 (n=14), ST131 (n=9). There were 102 (70.83%) CREco isolates that produced various NDMs, including NDM-1 (n=16), NDM-4 (n=1), NDM-5 (n=79), NDM-6 (n=2) and NDM-9 (n=4). In addition, 15 isolates produced KPC-2, three isolates were IMP-4 positive, and three isolates produced OXA-48. Genetic relatedness and phylogenetic analysis showed that isolates with the same ST had a high degree of homology. Some STs (including ST167, ST410, ST131, ST46, ST405 and ST617) exhibited a trend of outbreak.
Conclusions The majority of CREco belonged to ST167, followed by ST410 and ST131, and most of them carried various NDM-coding genes. The spread of high-risk clones of CREco has occurred in different regions of China.

PO-0918

肠杆菌目细菌快速碳青霉烯酶表型检测方法评价

徐绣宇
重庆医科大学附属第一医院

目的 利用 A 类碳青霉烯酶和 B 类碳青霉烯酶活性分别可以被苯硼酸和乙二胺四乙酸抑制的原理，评价实验室自建快速碳青霉烯酶表型检测方法区分肠杆菌目细菌碳青霉烯酶种类的特异性和灵敏度，评估其用于筛查和鉴定肠杆菌目细菌碳青霉烯酶的临床价值。
方法 连续收集临床分离的碳青霉烯耐药肠杆菌目细菌共 257 株，使用 Vitek MS 全自动细菌鉴定系统进行细菌鉴定，采用微量肉汤稀释法对厄他培南、亚胺培南和美罗培南三种碳青霉烯类抗生素的最低抑菌浓度进行验证。同时采用 PCR 扩增及测序检测碳青霉烯酶基因。其中 117 株碳青霉烯酶基因阳性菌株作为实验组，进行快速碳青霉烯酶表型检测，比较其结果和分子生物学结果的一致性。
结果 117 株碳青霉烯酶基因阳性的菌株的快速碳青霉烯酶表型检测实验结果中，41 株菌生长可被苯硼酸抑制，提示产 A 类碳青霉烯酶。66 株菌生长可被乙二胺四乙酸，提示产 B 类碳青霉烯酶。10 株菌生长仅在苯硼酸和乙二胺四乙酸共同存在时被抑制，提示共同产 A 类碳青霉烯酶和 B 类碳青霉烯酶。PCR 及测序证实 117 株产碳青霉烯酶菌株中，41 株携带 blaKPC-2，44 株携带

blaNDM-1，13 株携带 blaNDM-5，5 株携带 blaIMP-4，1 株携带 blaIMP-8，10 株同时携带 blaKPC-2 和 blaNDM-1，3 株同时携带 blaIMP-8 和 blaNDM-1。
结论 肠杆菌目细菌快速碳青霉烯酶表型检测能准确区分肠杆菌目细菌碳青霉烯酶类型，快速且操作简便，6 小时内可得到检测结果，且能检测出同时产 A 类碳青霉烯酶和 B 类碳青霉烯酶的菌株，适用于临床微生物实验室常规使用。

PO-0919

An efficient SERS platform for Staphylococcus aureus and Listeria monocytogenes ultrasensitive detection via lectin-modified magnetic SERS substrate and streptavidin/aptamer-functionalized SERS tags

Siyun Cheng
徐州医科大学

Objective in order to establish a rapid, accurate and highly sensitive new analytical technique technology for simultaneous detection of *S. aureus* and *L. mono.*
Methods a high-performance SERS-label biosensor for bacteria sensitive detection was construct by using a dual-recognition strategy (Scheme 1). Lectin from Triticum vulgaris (wheat germ agglutinin, WGA) was modified on the surface of Fe_3O_4@Au nanoparticles as magnetic separation for broad-spectrum recognition and efficient bacterial enrichment. Streptavidin (SA)-AuNP integrated with biotin-modified aptamers (bio-aptamers) were fabricated as pathogen-specific SERS probe. In brief, the Fe_3O_4@Au-WGA MNPs were added into sample solution which contain one or more species of bacteria, and incubated for 15 min; during this process, Fe_3O_4@Au-WGA anchored onto the surface of bacteria via strong hydrogen bonding and hydrophobic interactions between WGA molecules and the bacterial cell wall. Then, the Fe_3O_4@Au-WGA-bacteria complexes were magnetically separated and incubated with specific aptamer-modified SERS tags for 45 min to form Fe_3O_4@Au-bacteria-SERS tags sandwich configurations. By magnetic separation, the obtained sandwich complexes were rinsed once with PBST solution to remove excess SERS tags, and their characteristic Raman signals (DTNB for *S. aureus* and MBA for *L. mono*) were measured by a Raman instrument. The generated signal intensity of sandwich complexes was proportional to the concentration of the bacteria in the samples, which provide the foundation for quantitative analysis.
Results Compares with the previous SERS label-based bacteria detection methods, the major innovations of our proposed strategy could manifest in three aspects. First, monodispersed magnetic nanosphere (~200 nm) with roughness Au shell was employed as multifunction platform which not only provide strong magnetic enrichment capacity but also offer excellent SERS property to further enhance the characteristic signal of SERS tags. Second, phytagglutinin WGA was modified onto the Fe_3O_4@Au carrier to provide broad-spectrum recognition ability and high affinity for *S. aureus* and *L. mono* in complex environment. Third, streptavidin was introduced into SERS tags to improve the stability of AuNPs and the coupling efficiency of aptamer. Fe_3O_4@Au-WGA allowed effective separation of 8 species of Gram-positive and Gram-negative pathogen (including *S. epidermidis, P. aeruginosa, S. aureus, L. mono, E. coli, A. baumannii, S. sonnei, and S. typhi*) from PBS solution with efficiency from about 41% to 94%. We select *S. aureus* and *L. mono* as the model bacterias for SERS detection. Under optimal conditions, a strong linear relationship was found between the Raman signal intensity at 1331 cm^{-1} and the logarithmic concentration of *S. aureus*, and between Raman signal intensity at 1588 cm^{-1} and the logarithmic concentration of *L. mono*, respectively, from 10^7 cells/mL to 10 cells/mL, with correlation coefficient (R^2) = 0.993 for *S. aureus*, and R^2 = 0.978 for *L. mono*. The limits of detection (LODs) of the proposed platform for *S. aureus* and *L. mono* was calculated to be 3 and 5 cells/mL, respectively, based on signal-to-noise ratio (SNR) of 3 criterion. Compared with the most of

SERS label-based biosensors for bacteria detection, the method reported in this work exhibited better performance including higher sensitivity, faster testing speed, and more detection channels. The applicability of our platform in practical applications is verified by the detection of low-concentration *S. aureus* and *L. mono* in human urine and orange juice.
Conclusion in this paper, we develop an ultra-sensitive and selective SERS platform based on the efficient and broad-spectrum capture ability of lectin-modified Fe_3O_4@Au MNPs and specific binding ability of streptavidin/aptamer-functionalized SERS tags. As an ultrasensitive and highly selective biosensor for simultaneous detection of *S. aureus* and *L. mono*, the proposed assay has great potential in the application multiple bacteria.

PO-0920

艰难梭菌相关性腹泻模型的构建及肠道菌群结构特征研究

杨芳、刘文恩
中南大学湘雅医院

目的 （1）采用 C57BL/6 小鼠构建 CDAD 动物模型，并通过临床和病理指标对模型进行评估，为研究艰难梭菌致病机制、制备疫苗及评估新治疗方案等提供体内实验工具；（2）利用 Hiseq 高通量测序平台对小鼠粪便标本中细菌 16S rRNA 基因 V4 区进行测序分析，揭示肠道菌群失衡与 CDI 之间的相互关系，为依赖肠道菌群调节手段进行 CDI 防治提供理论依据。
方法 （1）使用艰难梭菌产毒标准菌 RT 027 对 C57BL/6 小鼠进行灌胃，观察记录小鼠一般情况、体重变化，收集粪便进行细菌培养与质谱鉴定，并对培养阳性的艰难梭菌进行毒素基因检测与核糖体分型，采集小鼠肠组织和血液标本分析小鼠肠道炎症病变及感染情况。（2）利用 Hiseq 高通量测序平台对模型组和对照组小鼠粪便标本中细菌 16S rRNA 基因 V4 区进行测序，通过 OTU 分析及物种注释、样品内多样性分析、两组间多样性参数比较和基于 Spearman 距离的 PCoA 分析、两组间物种组成聚类分析及组间显著性差异分析研究 CDAD 模型小鼠和对照组小鼠的粪便菌群结构差异。
结果 （1）建模期间模型组 C57BL/6 小鼠体重明显减轻，7 只小鼠出现稀便，腹泻发生率达 58.3%，其粪便艰难梭菌培养均为阳性，为产毒素的 RT 027，肠组织病理学检查显示所有腹泻小鼠均出现中至重度炎症，模型组小鼠 WBC、中性粒细胞百分率（N%）以及 hs-CRP 均有所升高，但差异无统计学意义。对照组小鼠各项指标均未见明显异常。（2）CDAD 模型较对照组小鼠的肠道菌群多样性及表达丰度显著降低。在门水平上 CDAD 小鼠较对照组拟杆菌门和厚壁菌门细菌比例明显减少，而变形菌门在模型组中比例显著增多。CDAD 小鼠与产丁酸相关的毛螺菌科和瘤胃球菌科等厌氧菌比例显著降低，与产乳酸相关的乳杆菌科等细菌比例则显著升高，与产内毒素相关的肠道条件致病菌如埃希菌属、摩根菌属、克雷伯菌属、变形杆菌属和耶尔森菌属等肠杆菌科细菌比例显著增加，与宿主肠黏膜及抗炎症相关的 Mucispirillum schaedleri 丰度降为 0。
结论 （1）经混合抗菌药物连续灌胃后予以克林霉素腹腔注射诱导处理，采用核糖体 027 型产毒艰难梭菌菌株灌胃，可成功建立稳定的小鼠艰难梭菌相关性腹泻模型。（2）CDAD 模型小鼠较对照组小鼠的肠道菌群组成及表达丰度显著降低，毛螺菌科和瘤胃球菌科等厌氧菌可能成为肠道菌群拮抗艰难梭菌的关键细菌，但需进一步研究。

PO-0921

纳米孔测序技术在感染性疾病中的应用

付宇[1]、赵瑾[2]、田宏攀[2]、周俊英[2]、陈良君[2]、李一荣[2]
1. 武汉大学中南医院
2. 武汉大学中南医院检验科

目的 近年来火热的纳米孔靶向测序技术（nanopore targeted sequencing, NTS）属于第三代测序技术，又被称做单分子测序技术。纳米孔测序技术的原理是当长的单链 DNA 稳定穿过纳米生物孔的时候，因为不同碱基有不同的电导率，会使电荷发生变化，从而短暂地影响纳米孔的电流强度，根据电流强度的改变，就能读出核酸分子序列。长期以来，感染性疾病诊断的金标准是实验室培养，但是病原体培养的方法耗时长，阳性率低且极容易被污染，不能及时指导临床。因此，本研究对包括脑脊液，胸腹水等在内的六个标本类型采用纳米孔测序技术，同时结合病人的临床表现，培养结果等综合判断纳米孔测序技术在临床运用中的可行性。
方法 我们收集了 2020 年 1 月-2021 年 3 月 1046 个病人的总共 1226 个临床标本（包括 129 个脑脊液标本，149 个胸腹水标本，448 个纤支镜灌洗液标本，87 个尿液标本，327 个血液标本，76 个伤口分泌物标本），采用纳米孔测序的方法检测这些标本中可能存在的病原微生物。同时，我们也收集了这些病人相应的临床表现，感染指标和用药信息进行总体分析。对于培养结果为阴性以及不相符合的标本，我们为了验证纳米孔测序结果的准确性，还专门设计了种特异性引物进行普通 PCR 以及巢式 PCR 扩增，且扩增产物进行了一代测序。
结果 根据病例和临床表现，所有病人可以分为感染性疾病组(infectious disease, ID, 720/1046, 68.8%)和非感染性疾病组（non-infectious disease, NID, 316/1046,31.2%）。ID 组中，肺部感染的病人占大多数（400/720, 55.56%），接下来是泌尿系统感染（76/720，10.56%），血流感染（72/720，10%）等。纳米孔测序的灵敏度和特异度分别是 88.49%（1076/1216），53.48%（238/445）。在感染性疾病中，纳米孔测序结果与 PCR 和一代测序验证的符合率为 73.98%（253/342），其中纤支镜灌洗液的符合率最高（84.05%，137/163），其次是胸腹水（75%，48/64）；在脑脊液中，符合率最低，为 52.63%（10/19），可能是由于脑脊液是无菌体液，微生物载量很低，所以检出率不高。
结论 纳米孔测序技术在病原体鉴定方面较培养来说具有更高的灵敏性，并且受抗生素使用的影响较培养小得多。纳米孔测序技术在不同的标本类型中针对不同微生物的灵敏度不同，未来可以根据具体临床标本类型和潜在的病原微生物种类做出相应改进，以使纳米孔测序技术更好地应用于临床中。

PO-0922

Trends in antimicrobial resistance in bloodstream infections at a large tertiary-care hospital in China: a 10-year retrospective study (2010-2019)

Cailin Liu
The First Affiliated Hospital of Zhengzhou University

Objectives Bloodstream infections (BSIs) are considered as a major cause of morbidity and mortality all over the world. The purpose of this study was to explored the distribution and antimicrobial resistanc trends of pathogens causing BSIs at a large tertiary-care hospital in Henan province, east-central China.
Methods In this surveillance study, blood culture specimens were routinely taken from patients with fever or suspicion of sepsis from 2010 to 2019 at the First Affiliated Hospital of Zhengzhou University. Identification of organisms was carried out using the VITEK 2 Compact system and/or the VITEK MS system. Antimicrobial susceptibility tests were carried out by the minimum

inhibitory concentration (MIC) method and/or the disk diffusion according to Clinical & Laboratory Standards Institute guidelines.
Results A total of 18180 strains were isolated from blood culture specimens, the most common pathogen was E. coli (21.6%), followed by CoNS (18.8%), K. pneumoniae (13.0%), S. aureus (6.6%), E. faecium (5.0%), A. baumannii (4.4%), and P. aeruginosa (3.8%). The resistance rates of E. coli to ceftazidime, cefotaxime, cefepime and aztreonam showed a significant declined trend, and the frequency of carbapenem-resistant E. coli was below 6.0% over time. It is noteworthy that the proportion of carbapenem-resistant K. pneumoniae exhibited sharp upward trend during the ten years (from 6.7% to 56.7%). The prevalence of carbapenem-resistant A.baumannii has remained at a high level (>75%). In contrast, the resistance rates for P. aeruginosa against all tested agents were lower than 25%, and the resistance rates to aminoglycosides and fluoroquinolones showed a significant downward trend. The frequency of methicillin-resistant CoNS maintained a high level over the past decade (>70%), however, the isolation rate of MRSA ranged from 58.0% to 34.9%, showed a significant decline.
Conclusions It was particularly noteworthy that the dramatic and consistent increase in carbapenem-resistance in K. pneumoniae during the 10-year surveillance period and effective infection control measures and stewardship efforts should be taken to prevent the spread. Our results indicate the the importance of active surveillance for bacterial etiology and their antibiotic resistance causing BSIs.

PO-0923

Etiological characteristics and change of cerebrospinal fluid related measurements in HIV/AIDS patients with central nervous system infection in Chongqing

Ming Luo[1]、Xiaofeng Li[1]、Xiaoying Wang[2]、Jing Wang[1]
1. Chongqing publpic health center
2. 重庆医药高等专科学校

Objective To analyze the characteristics of pathogens and cerebrospinal fluid (CSF) related measurements in HIV/AIDS patients with central nervous system (CNS) infection in Chongqing, and provide guidance for effective diagnosis and treatment of these patients.
Methods A total of 173 HIV/AIDS patients with CNS infection and 198 HIV/AIDS patients with non-CNS infection that hospitalized in the Chongqing Public Health Medical Center were enrolled. CSF and blood from the patients were collected for microbiological pathogen identification and drug susceptibility testing. CSF related measurements were determined and compared between different groups.
Results Of the 173 microbiological pathogens that isolated from the CSF of HIV/AIDS patients with CNS infection, the most prevalent one was Cryptococcus neoformans (58.38%), followed by Mycobacteria tuberculosis (22.54%), and coagulase negative staphylococci (11.5%). While for HIV/AIDS patients with non-CNS infection, Talaromyces marneffei was the dominate pathogen in blood culture (40.91%), followed by coagulase negative staphylococci (11.5%), and Cryptococcus neoformans (10.61%). Cryptococcus neoformans was sensitive to mostly commonly used anti-fungi agents. 7.69% of HIV/AIDS patients infected with Mycobacteria tuberculosis in CNS was resistant to rifampicin. Compared with the blood samples of HIV/AIDS patients with non-CNS infection, significantly higher protein levels, and lower levels of chloride and glucose were observed in CSF of HIV/AIDS patients with CNS infection (all $P < 0.011$). Moreover, the levels of protein, adenosine deaminase (ADA) and lactic dehydrogenase (LDH) in CSF samples were significantly increased in HIV/AIDS patients infected with mycobacteria tuberculosis than other groups (all $P < 0.037$).
Conclusion The distribution and antimicrobial susceptibility of pathogens causing CNS and blood infection in HIV/AIDS patients were variant. The CSF related measurements varied with different

pathogenic infection, which could be benefit for early pathogenic diagnosis of CNS infection in HIV/AIDS patients.

PO-0924

Isolation and characterization of a lytic Staphylococcus aureus phage WX 2 against Staphylococcus aureus biofilm

郑瑞
云南省第一人民医院

Staphylococcus aureus is a Gram-positive pathogen bacteria which causes a wide range of symptoms in human. Bacteria biofilm is the multicellular community of microorganisms that attached to non-biological and biological surfaces. In this study, a virulent phage WX was isolated from slaughter house. It was belonged to the Myoviridae family and Phage WX has ability of sterilize most clinical strains of S. aureus which were isolated from clinical patients in the first people's hospital of Yunnan province. Phage WX has better anti-biofilm effect than streptomycin in high concentration S. aureus culture of. Collaboration of phage WX and streptomycin have better anti-biofilm effect than alone of WX or streptomycin in low concentration S. aureus culture and phage WX has better anti-biofilm effect than streptomycin in high concentration S. aureus culture. The data of this study provided a strong evidence of application phage for reduce S. aureus biofilm growth and was important for replace of antibiotics in clinic.

PO-0925

Enhanced antimicrobial and antibiofilm activity of colistin combined with resveratrol against colistin-resistant Pseudomonas aeruginosa in vitro and in vivo

Lingbo Wang
Department of Clinical Laboratory, The First Affiliated Hospital of Wenzhou Medical University

Multidrug-resistant (MDR) Pseudomonas aeruginosa infections pose a serious threat to public health. Colistin is considered as the last resort antimicrobials, but in recent years, colistin-resistant strains is increasing. This study aimed to investigate the antimicrobial and antibiofilm activity of resveratrol in combination with colistin against colistin-resistant Pseudomonas aeruginosa isolates in vitro and in vivo. Antimicrobial susceptibility tests, checkerboard assays, and time-kill assays were performed to investigate the antibacterial and synergistic activity of resveratrol combined with colistin in vitro. The neutropenic mouse thigh infection model and G. mellonella infection model were used to investigate the combined antimicrobial activity in vivo. Biofilm formation assays and Scanning electron microscopy (SEM) were used to evaluate the antibiofilm efficacy. The susceptibility testing showed that the MIC of resveratrol was >512 μg/mL, which showed no antimicrobial activity against Pseudomonas aeruginosa. Checkerboard assay indicated that the combination of resveratrol and colistin showed great synergy effect. Furthermore, biofilm formation assays and SEM showed synergistic antibiofilm activity. The synergy of this drug combination partially disrupts the bacterial cell envelope resulting in a decreased number of bacteria. Further in vivo treatment experiments demonstrated that this combination could decrease the number of bacteria ≥2log10 CFU/ml after 24 h of therapy in mice infection model and the survival rate of G. mellonella improved obviously compared with single drug and control group. The combination of resveratrol and colistin is a valuable prototypical combination that has a high clinical potential, suggesting an attractive option for the treatment of MDR Pseudomonas aeruginosa infections

PO-0926

Genetic analysis of KPC-2-producing Klebsiella pneumoniae ST11 from Respiratory Departments of a Tertiary Care Hospital in Beijing, China, 2010-2018

Ling Guo
First Medical Center of Chinese PLA General Hospital

Background Carbapenem-resistant Klebsiella pneumoniae (CRKP) belonging to sequence type 11 (ST11) is a significant pathogen causing hospital-associated outbreaks in China and a major contributor to the spread of carbapenemases. This genetic lineage emerged several decades ago and remains a major global health care challenge.
Methods A total of 155 ST11 type KPC-2-producing K. pneumoniae isolates were collected from a respiratory departments between 2009 and 2018 from a tertiary care hospital in China. The genome sequencing of these isolates was performed on a HiSeq X Ten sequencer using a paired-end library with an average insert size of 350 bp. Single-nucleotide polymorphism (SNP) analysis was performed using the SNP-based CSI-Phylogeny-1.4 tool on the web site of the Center for Genomic Epidemiology. The tree file was visualized by iTOL. Plasmid replicon types and resistance genes were identified using PlasmidFinder, and ResFinder, respectively. The multilocus sequence type (MLST) was determined using the MLST 1.8 server. Fifteen isolates were selected for subsequent single-molecule real-time (SMRT) sequencing with a sheared DNA library with average size of 10 kb on a PacBio RS II. Genome sequences were annotated with the Rapid Annotations using Subsystem Technology (RAST) pipeline, combined with BLASTP/BLASTN searches. Alignment of the complete sequences of the *bla*$_{KPC-2}$-carrying plasmids and virulence-carrying plasmids f was performed by using BRIG and Easyfig.
Results In this study, genomic epidemiology was used to investigate the emergence, evolution, and persistence of different ST11 KPC-2 producing CRKP outbreak-causing clones at respiratory departments of a tertiary care hospital over 9 years. ST11 CRKP emerged in 2012 in these departments, then caused several outbreaks and persisted in the whole respirotary departmens. The phylogenetic analysis of 155 ST11 isolates demonstrated three genetically distinct clades (A, B, C). Except five strains belonging to KL25, most of clade A strains belonging to KL47 serotype (n=120, 77.4%) emerged firstly in 2012 and could been divided into nine subclades, A1-A9. Clade B belonging to KL64 serotype newly emerged in the end of 2016 and could be divided into subclade D1 and D2. Clade C belonging to KL16 serotype emerged only between 2013 and 2016. Although clade C did not persist but 62.5% (5/8) isolates co-possessed the *bla*$_{KPC-2}$ and *bla*$_{OXA-48}$ genes. The *bla*$_{KPC-2}$-carrying plasmids documented diversity, which included multireplcons: IncFII(pHN7A8)/IncpA1763-KPC (5/15), IncFII(pHN7A8)/IncR (6/15) , IncR(1/15) and IncpA1763-KPC (1/15),and unnamed type (1/15). The analysis of genetic environment of blaKPC-2 genes showed nine IS*26*-based composite transposons which had a basic core structure IS*Kpn27*-*bla*$_{KPC-2}$-ΔIS$_{Kpn6}$ structure forms. WGS revealed that the strains harboured a plasmid, which carried multidrug resistance genes and virulence-encoding genes
Conclusions In this study, twelve clone transmissions of KPC-2-producing-ST11 were observed within the same respiratory departments over nearly a decade. Findings in this study provide evidence of active plasmid evolution in K. pneumoniae and suggest that surveillance of multidrug-resistant and hypervirulent *K. pneumoniae* is urgently needed.

PO-0927

宏基因组测序对血液病患者合并毛霉菌病的诊断价值

许颖出、徐春晖、朱国庆
中国医学科学院血液病医院（血液学研究所）

目的 探讨宏基因组测序技术（metagenomic next-generation sequencing, mNGS）对血液病患者合并毛霉菌病的诊断效果及临床用药提示。
方法 回顾性分析中国医学科学院血液病医院 2020 年 6 月至 2021 年 6 月期间，采用 mNGS 技术检出的毛霉感染患者的实验室和临床特征，分析 mNGS 技术对血液病患者合并该类真菌感染的应用价值。
结果 一年期间共 242 例患者送检外周血 mNGS 检测，10 例患者检出毛霉，检出率为 4.1%，其中 6 例为米黑根毛霉，3 例为米根霉，1 例为小孢根霉。10 例患者中男性 8 例（80%），中位年龄为 43（20-57）岁。6 例为急性髓系白血病，3 例为再生障碍性贫血，1 例为急性淋系白血病。临床表现主要为发热（100%，10/10）、肺感染（80%，8/10）等。8 例（80%）患者新发斑片影，磨玻璃影，团状、片状实变影。实验室数据显示，10 例患者中粒缺者占 40%（4/10）, 1,3-β-D-葡聚糖均未增高，PCT 增高见于 4 例（40%）患者，Crp 增高见于 7 例（70%）患者。mNGS 检出毛霉 reads 的中位数为 167（6-6500）。10 例患者均据 mNGS 结果被调整抗生素用药，7 例好转，平均发热时间为 10 天；3 例病情加重后放弃治疗，平均发热时间为 12 天。
结论 血液病患者外周血 mNGS 检出毛霉具有较高的临床符合度，其无偏倚、报告周期短的特征可作为难以培养，实验室特异性检查缺乏的毛霉感染诊断的方法之一。

PO-0928

成都地区淋球菌耐药监测结果分析

罗才会、李春花、李红霞
电子科技大学附属医院·四川省人民医院

目的 了解 2013-2019 年成都地区淋病奈瑟菌对 5 种抗生素的耐药趋势及产 β-内酰胺酶淋球菌(PPNG)和质粒介导的高度耐四环素淋球菌(TRNG)的流行状况，为本地区淋病治疗方案的制定及预防控制措施的制订提供科学依据。
方法 收集自 2013-2019 年从我院性病门诊患者的泌尿生殖道分泌物中分离得到的 719 株淋病奈瑟菌，用琼脂稀释法测定头孢曲松、青霉素、大观霉素、环丙沙星、阿奇霉素和四环素的最小抑菌浓度(MIC)，用纸片酸度法检测 β-内酰胺酶，按 WHO 西太区淋病奈瑟菌耐药监测指南推荐的标准判断药物敏感性，采用 SPSS20.0 软件进行统计学分析。
结果 2013-2019 年共收集 719 株淋病奈瑟菌，检测出 PPNG 366 株 50.90%)、TRNG 315 株(43.81%)；青霉素、环丙沙星和阿奇霉素的耐药率分别为 90.54%、99.58%、24.61%；2018 年偶发现一株耐大观霉素菌株；未发现头孢曲松耐药菌株，但是其中敏率从 11.82%上升到 46.34%。7 年间，青霉素、环丙沙星的 MIC50 和 MIC90 均已超过耐药标准，大观霉素、头孢曲松的 MIC50 和 MIC90 均在敏感范围，阿奇霉素的 MIC50 在敏感范围，但 MIC90 超过耐药标准。
结论 持续监测淋球菌的耐药性十分重要，头孢曲松和大观霉素在成都地区可以作为治疗淋病的优选药物，具有良好疗效。发现的一株大观霉素耐药菌株和头孢曲松的中敏率逐年递增，应该引起临床医生的高度警惕及相关部门的高度重视，在临床上规范用药，加强对大观霉素和头孢曲松的耐药监测，及时发现耐药菌株的情况，防止耐药菌株的爆发流行。

PO-0929

抗生素治疗如何加重器械相关感染

何磊、李敏
上海交通大学医学院附属仁济医院

目的 器械相关感染经常在医院发生。由于器械上很容易形成生物被膜，而生物被膜对宿主本身和抗生素等具有强大的抵抗力，因此这种感染治疗起来特别困难。然而人们对器械上生物被膜形成的动态过程和调控机制仍知之甚少。
方法 我们收集了三年内临床器械相关金黄色葡萄球菌感染的同一组病人的连续分离株；并对这些分离株进行了溶血能力/生物被膜形成能力等体外表型研究，同时进行了基因组二代测序；接着基于构建的遗传分析工程菌，通过体外模拟和体内动物模型证实二代测序所筛选基因变异在调控生物被膜形成的机制；最后通过体内外实验找到可以有效针对生物被膜靶标的抗生素作为器械感染的有效治疗手段。
结果 在所有被调查的连续追踪病例中，群体感应功能失调的突变体在感染过程中超过了整个人群，强烈地促进了生物被膜的形成，从而增强了抗生素耐药性和细菌的持续感染能力。我们进一步在器械相关感染的小鼠模型中表明，用常用的糖肽和氟喹诺酮类抗生素治疗可提高群体感应功能失调突变的发生率并加重疾病。与此形成鲜明对比的是，利福平并未引发群体感应功能障碍，这为临床观察到的利福平治疗葡萄球菌感染的异常疗效提供了解释。
结论 我们的结果表明，器械相关感染是一个动态的过程，涉及特定的遗传适应，增加细菌的传染性。此外，通过揭示抗生素对这一过程的重要影响，我们的研究为此类感染的管理提供了重要建议。

PO-0930

产单核细胞李斯特菌致糖尿病性尿毒症患者严重脓毒血症 1 例并文献复习

肖华亮[1]、陈宗耀[2]、刘晓[2]、邹彦矫[2]、袁成良[2]
1. 德阳市人民医院检验科
2. 德阳市人民医院检验科

目的 为加强医务工作者对产单核细胞李斯特菌的认识，促进检验科与临床科室之间的沟通交流，更好的为患者服务。
方法 通过 MALDI-TOF MS 质谱鉴定技术快速对血培养中分离出的产单核细胞李斯特菌进行鉴定，并再次用 16S rRNA 基因测序检测技术进行验证。根据欧洲抗菌药物敏感性试验委员会标准，运用纸片扩散法（K-B 法）进行药敏试验，结合患者的病史及临床症状进行病例讨论，并对相关发病机制和文献进行复习讨论。
结果 经过鉴定该患者血培养所分离出的细菌为产单核细胞李斯特菌，药敏结果显示对氨苄西林敏感。由于患者有食用过夜剩饭剩菜的习惯，加上长期血液透析治疗，抵抗力低下，结合患者糖尿病病史，因此推测可能存在产单核细胞李斯特菌由胃肠道感染的途径。入院后最初经验性给予头孢哌酮舒巴坦抗感染治疗，但疗效差，相关炎症指标持续上升，达到严重浓度血症标准。待检验科血培养结果回报后，根据指南《热病：桑福德抗微生物治疗指南（第 44 版）》同时结合药敏结果更换为氨苄西林抗感染治疗，患者降钙素原、超敏 CRP 等指标持续降低，同时积极控制血糖、规律透析，患者住院期间总共进行了 17 天静脉及口服氨苄西林抗感染治疗最终治愈出院。已有大量文献提出针对产单核细胞李斯特菌不适当的经验性抗生素治疗会导致病情加重。因此，一旦证实或高度怀疑是产单核细胞李斯特菌感染，应当尽快调整治疗方案，使用合适的抗生素进行治疗。于是对产单核细胞李斯特菌的快速鉴定显得尤为重要，同时相关研究显示了 MALDI-TOF MS 系统可对产单

核细胞李斯特菌进行有效检测和鉴定，因此能使临床医生至少提前 24 小时获得准确的鉴定结果，为临床合理用药提供有力的支持。
结论 1、感染性疾病要重视病原学的搜寻，积极运用血培养、血浆降钙素原等检查手段来提高临床工作者的诊疗正确性，基层医院要从自身实际情况出发选择合适的治疗方案；2、病原学的鉴定要重视时效性，微生物工作者应不断提高自身的水平，灵活配制各种检查技术及时准确的鉴定出病原菌；3、加强检验科与临床的沟通，若检出少见菌、罕见菌要及时主动通知临床，积极的进入到临床疾病的诊治中，结合病史资料、临床症状等共同判断，更好的为患者服务。

PO-0931

淋病奈瑟菌的检出情况及药敏结果分析

徐优耀、张桂华
中国医科大学附属第一医院鞍山医院

目的 通过对全院淋病奈瑟菌分离情况和耐药性的研究，旨在为临床合理用药及有效治疗提供依据。
方法 统计 2015 年 4 月 1 日-2019 年 4 月 1 日全院分离诊断的淋病奈瑟菌，用淋病奈瑟菌检测试剂盒行药敏试验的检测。
结果 67 株淋球菌对头孢曲松耐和对头孢克肟耐药率为 0(0 /67) ，对阿奇霉素耐药率为 8.95%(6 /67)，对四环素耐药率为 38.8% (26 /67) ，对大观霉素耐药率为 11.94% (8/67)，对环丙沙星及青霉素耐药率均为 100% ，这与淋球菌的全国的耐药情况相一致。
结论 通过分离出的 67 株淋球菌对头孢曲松、头孢克肟、阿奇霉素敏感，对环丙沙星、青霉素、四环素、大观霉素耐药，旨在研究本院淋病奈瑟菌的分离情况，为临床合理用药及有效治疗提供依据。

PO-0932

质粒介导新生儿产 NDM-5 酶肺炎克雷伯菌分子耐药机制研究

张欢欢、杨晋
连云港市第一人民医院

目的 产新德里金属 β-内酰胺酶（NDM-5）肺炎克雷伯菌不断的出现，给全球公共健康带来了巨大威胁。本研究通过收集连云港市第一人民医院新生儿病房 2018 年 9 月-2019 年 9 月携带 blaNDM-5 基因肺炎克雷伯菌，分析新生儿病房菌株主要克隆群以及耐药机制。
方法 本研究通过 MALDI-TOF MS 进行菌株鉴定。通过药敏试验和 PCR 技术来分析菌株耐药性和耐药基因携带情况。通过多位点序列分型和脉冲场凝胶电泳分析菌株同源性。对携带 blaNDM-5 基因菌株进行质粒接合试验和 Southern blot 印迹，分析耐药质粒的特征；通过全基因组测序更加深入的了解 blaNDM-5 基因上下游基因环境，明确耐药基因的传播机制。
结果 本研究收集 12 株产 NDM-5 酶肺炎克雷伯菌。菌株均为多重耐药菌，其对碳青霉烯类、单环 β-内酰胺酶类、头孢菌素类、酶抑制剂复合制剂类均耐药。12 株耐药菌均携带 blaSHV-11 基因和 blaTEM-1 基因。同源性分析显示菌株均为 ST337 型，并属于 PFGE 同一克隆型。接合实验均成功，说明携带 blaNDM-5 基因的质粒具有高度的自主转移性。质粒分析显示 blaNDM-5 基因均位于约 47kb IncX3 质粒上。进一步的全基因组测序结果显示携带 blaNDM-5 基因的质粒序列完全一致，该质粒长度为 47, 474bp，与经典型质粒 pNDM-MGR194 核苷酸相似度超过 99%，blaNDM-5 基因位于典型的 ISAba125-IS5-blaNDM-5-bleMBL-trpF-IS26 结构中。
结论 该研究首次报道了产 NDM-5 酶 ST337 型肺炎克雷伯菌在新生儿病房的克隆传播，blaNDM-5 基因均位于约 47kb IncX3 型质粒，与经典型质粒 pNDM-MGR194 高度同源，该型质粒是传播 blaNDM-5 的重要载体，在新生儿病房有扩散风险。

PO-0933

Anti-psychotic drug thioridazine acts as a potent anti-microbial agent for MDR: a clinical strains-based study

Lin Yin
The Second People's Hospital of Hunan Province

Purpose The multidrug resistant (MDR) strains are emerging worldwide as a public health threat. The aim of the study was to comprehensively investigate the effect of anti-psychotic drug thioridazine on common MDR clinical isolated strains, and provide new strategies for the therapeutics of MDR infections.
Methods Bacteria were isolated from the clinical patients. The identification and susceptibility testing of isolated strains in this study were completed by MALDI-TOF mass spectrometry and VITEK 2 Compact analysis system, respectively. The antibacterial efficacy of thioridazine in vitro was assessed by agar dilution method.
Results A total of 156 strains were isolated from the clinical patients. Samples mainly come from blood, sputum, bronchoalveolar lavage, urine, cerebrospinal fluid, puncture fluid and wound secretion. Among these strains, 63 were susceptible strains and 93 were MDR strains. Specifically, MDR Gram-positive coccus included 3 methicillin-resistant Staphylococcus aureus (MRSA) and 7 MDR Enterococcus. MDR Gram-negative bacilli included 66 non-fermentative bacilli (17 Pseudomonas aeruginosa and 49 Acinetobacter baumannii) and 17 enterobacteriaceae (11 Klebsiella pneumoniae and 6 Escherichia coli). MRSA, MDR Enterococcus and MDR Acinetobacter baumannii were significantly inhibited by thioridazine at low concentrations (20 μM). MDR Pseudomonas aeruginosa and MDR Escherichia coli were inhibited by thioridazine at middle concentration (40 μM). MDR Klebsiella pneumoniae were inhibited by thioridazine at high concentration (100 μM). Moreover, all of susceptible strains were also inhibited by thioridazine at different concentration, except for susceptible Escherichia coli. Notably, common MDR clinical isolated strains shown susceptibility against thioridazine regardless of sample source.
Conclusion The present study shows that thioridazine is an effective drug against common MDR clinical isolated strains, which provides an alternative strategy for MDR and has a highly translational value.

PO-0934

中国血流感染金黄色葡萄球菌优势克隆种群特点研究

陈凤宁、陈宏斌、尹玉瑶、王辉
北京大学人民医院

本研究旨在调查中国血流感染金黄色葡萄球菌的种群结构及特点，探究优势克隆形成及传播机制。我们回顾性收集了全国各地区 16 家大型教学医院 2019-2020 年共 484 株血流感染金黄色葡萄球菌，并对 142 株优势克隆（ST59,ST5,ST398,ST239）进行了全基因组测序和比较基因组、体内外表型实验分析。
基于最大似然法构建的系统发育树表明，各 ST 被精确划分为不同的 lineage，且各 ST 内部又被划分为 3 个主要的 subgroup；进一步的 spa、*SCCmec*、Agr 和 IEC 分型发现优势克隆 ST59 主要是 t437-IVa(2B)-agrI-IEC type B；VFDB 和 Resfinder、CARD 数据库的分析表明各 ST 具有特异的毒力和耐药基因；基于 Scoary 的全基因组关联分析表明 ST5 的种群特异基因与肠毒素、ESAT-6 分泌系统相关，ST59 主要和细胞壁合成蛋白相关，ST398 主要和寡肽转运系统相关。142 株菌对氟喹诺酮类药物的敏感性在各 ST 差异最大；ST398 和 ST59 以及具有较强的溶红细胞能力，其中 ST398-MRSA 比 MSSA 具有更强的蛋白酶水解和溶红细胞能力，说明 ST398 在获得耐药性的同时不发生适应性代价，但 ST5-MRSA 的蛋白酶水解能力和溶红细胞能力却弱于 MSSA。这可能与其

特异的毒力和耐药基因组合相关。ST398 的蛋白酶水解能力明显强于其它 STs，但生物被膜形成能力弱于其他 STs，可能是由 ST398 特异的寡肽转运酶造成。总之，我们通过基因组和表型研究发现中国血流感染金黄色葡萄球菌呈现多克隆趋势，且各 ST 在基因组和体外适应性具有不同特点，基于全基因组测序的比较基因组和 GWAS 分析有助于找到各 ST 的特异性关键分子，从而对感染性疾病的精准诊疗提供指导。

PO-0935

二代测序技术应用于中枢神经系统感染的研究进展

杨传坤
东南大学附属中大医院

中枢神经系统（central nervous system,CNS）感染可引起严重的并发症和后遗症，由于临床实验室检测手段的限制，超过一半的 CNS 感染病例最终都无法明确诊断。早期快速明确 CNS 感染的病原体，对于降低 CNS 感染的病死率和减少后遗症都有重要的作用。目前临床应用最广泛的 CNS 感染病 原体检测方法主要包括：脑脊液病原体形态学鉴定、外周血或脑脊液培养、脑脊液和血清的病原体抗体检测以及脑脊液的基因检测；但总体阳性率较低，使 CNS 感染的诊治面临极大的困难。 本文综述了以二代测序（NGS）为基础的宏基因组测序技术以确诊 CNS 感染的研究，因其具有高通量、高灵敏度等特点，在微生物检测方面具有显著的优势。并对 NGS 在 CNS 感染病原体诊断及其所面临的问题与挑战等方面进行总结，作为一种分子诊断手段，二代测序技术为确定 CNS 感染的病原体提供了精准的结果，具有重大的意义。

PO-0936

Phenotypic and genotyic methods for detecting methicillin-resistant Staphylococcus aureus

Peiyao Jia、Qiwen Yang
Department of Clinical Laboratory, Peking Union Medical College Hospital, Peking Union Medical College, Chinese Academy of Medical Sciences

Objective The aim of this study was to evaluate and compare the phenotypic and genotypic methods for detection of Methicillin Resistant Staphylococcus aureus (MRSA), and investigate the prevalence of clinical isolated MRSA in China.
Materials/Methods Non-repetitive 1190 S.aureus were collected from 16 hospitals from 2014 to 2015. Antimicrobial susceptibility testing was performed by the broth dilution method accoding to CLSI. Cefoxitin susceptibility was determined by Disk diffusion method. All the Staphylococcus aureus were screened for the presence of the genes mecA, mecC and nuc, and 38 S.aureus were selected for the dectection for the expression of mecA gene.
Results The susceptibility of these 1190 isolates of Oxacilin and Cefoxitin were52.2%(621/1190) and 52.4%(623/1190), respectively. All the S.aureus were susceptible for Linezolid, Tedizolid, Vancomycin, Teicoplanin, Dptomycin. Among 1190 isolates from S. aureus, 621 (52.4%) isolates were positive for mecA gene by PCR method. The results of cefoxitin disk diffusion method with 100% sensitivity and 99.65% specificity was the same as PCR method. Oxacillin broth dilution method had 99.68% sensitivity and 99.65% specificity.
Conclusions Among the three laboratory diagnostic methods of MRSA, result of cefoxitin disk diffusion method with high sensitivity and specificity was the same as PCR method for detection mecA gene. Cefoxitin disk diffusion method can be used as an alternative method to PCR especially at those microbiology laboratories without molecular facilities. Mutiple real-time PCR has the advantage of high isolation rate and high sensitivity. It is one of the effective methods for the detection of MRSA.

PO-0937

基于 EUCAST 判读标准的血培养快速药敏实验评价

颜令
重庆市人民医院

目的 评价按 EUCAST 折点，血培养阳性瓶培养细菌为临床常见革兰氏阴性杆菌时（大肠埃希菌、肺炎克雷伯菌、铜绿假单胞菌和鲍曼不动杆菌），K-B 直接药敏实验适用性。
方法 本实验共收集培养细菌为大肠埃希菌、肺炎克雷伯菌、铜绿假单胞菌和鲍曼不动杆菌血培养瓶 168 例。168 例血培养瓶从仪器取出时均做血培养直接药敏实验，同时转种至血平板，培养过夜后作 K-B 法药敏实验，血培养直接药敏实验和 K-B 法药敏实验均按 EUCAST 要求进行。分别在血培养直接药敏实验 6 小时和 8 小时对结果进行读数，并按 EUCAST RAST 折点进行结果判读。K-B 法药敏实验在培养 16-18 小时进行读数，结果按 EUCAST 折点进行判读。对血培养直接药敏实验 6 小时和 8 小时判读结果与 K-B 法药敏实验结果进行比较。
结果 在本次实验，大肠埃希菌、肺炎克雷伯菌和鲍曼不动杆菌 92%抑菌圈在 6 小时可测定，几乎所有抑菌圈在 8 小时均可测定。对于铜绿假单胞菌培养 6 小时虽然抑菌圈仍较薄，但可以勉强测量，在 8 小时则抑菌圈非常清晰。在 6h 时大肠埃希菌、肺炎克雷伯菌、鲍曼不动杆菌和铜绿假单胞菌的药敏分类一致性分别为 96.54%、97.74%、93.98%和 94.03%，8h 时药敏分类一致性分别为 98.88%、98.53%、94.63%和 96.11%。在 6 小时判读时，大肠埃希菌、肺炎克雷伯和鲍曼不动杆菌各有 2 个非常严重错误，铜绿假单胞菌有 3 个非常严重错误。在 8 小时则未出现非常严重错误。
结论 基于 EUCAST 对大肠埃希菌、肺炎克雷伯菌、铜绿假单胞菌和鲍曼不动杆菌的血培养直接药敏实验早期判读结果是可靠的。

PO-0938

儿童碳青霉烯类耐药肺炎克雷伯菌感染 80 例临床特征及分子流行病学分析

杨俊文[1]、高凯杰[1]、周娟娟[1]、李珂[1]、张嵘[2]、杨俊梅[1]
1. 河南省儿童医院郑州儿童医院
2. 浙江大学附属第二医院

目的 研究郑州大学附属儿童医院碳青霉烯类耐药肺炎克雷伯菌（CR-KPN）感染儿童临床特征及分子流行病学分析，为碳青霉烯类耐药肺炎克雷伯菌感染儿童诊治及预防提供参考。
方法 收集郑州大学附属儿童医院 2018 年 12 月--2019 年 3 月 CR-KPN 感染患儿 80 例病历信息，对其分离出的 85 株 CR-KPN 进行药敏试验、聚合酶链反应(PCR)法及测序检测碳青霉烯酶、ESBL 酶基因及多位点序列分析，并对其临床资料进行统计分析。
结果 研究期间 CR-KPN 检出率高达 52.4%；年龄分布主要以 1 岁以下新生儿、婴儿为主 74 例（92.5%），入住科室主要为新生儿诊疗中心（42 例，52.5%）及儿童重症监护室（25 例，31.3%），耐药菌株分离标本主要为呼吸道标本（67 株，78.8%）、血液（11 株，12.9%）；80 例患儿中 65 例（81.3%）应用三代头孢菌素、碳青霉烯类等广谱抗菌药物，75 例（93.8%）有入住 ICU 史，59 例（73.8%）存在气管插管等侵入性操作史；85 株细菌对 β-内酰胺类抗菌药物耐药性均超过 90%，对阿米卡星、氟喹诺酮类、四环素耐药性略低 79%左右，对复方新诺明、氯霉素等耐药率较低均低于 30%；ESBL 酶基因主要为 CTX-M（68 株，80.0%）、SHV（24 株，28.2%），碳青霉烯酶基因主要为 KPC-2（60 株，70.6%）、NDM-5（16 株，18.8%），MLST 分型主要为 ST11（60 株，70.6%）、ST188（10 株，11.8%）。
结论 儿童碳青霉烯类耐药肺炎克雷伯菌感染率较高，应当引起重视；感染患儿主要为新生儿、婴儿，入住科室主要为监护室，分布这类病人及病区应当积极采取措施有效防治；85 株肺炎克雷伯

菌对非 β-内酰胺类抗菌药物耐药性略低，碳青霉烯酶主要为 KPC，临床救治患儿可参考药敏实验及耐药机制结果合理选用抗菌药物；分离菌株亲缘关系较近，应注意控制医院感染发生。

PO-0939

Au NC@NDM-1@Au NC 电化学生物传感器的构建及超灵敏检测多重耐药菌的研究

张立群
陆军军医大学第二附属医院检验科

目的 构建金纳米笼/NDM-1 LNA 探针/金纳米笼（Au NC/NDM-1/Au NC）三明治型电化学传感器检测系统，实现临床样本中多重耐药菌（Multidrug-Resistant Organism，MDRO）的直接、快速、精准和定量检测。
方法 设计合成锁核酸(LNA)修饰的捕获探针和信号探针，两种探针的 5'端均修饰有巯基，并且与目标基因的部分序列互补。首先在电极表面静电吸附 ZnO 溶胶-凝胶及氧化石墨烯，通过恒电位沉积法将 Au NC 沉积到电极表面。然后将 NDM-1 特异性 LNA 探针固定于电极表面，当溶液中含有目标基因时，捕获探针和信号探针分别与其对应的互补序列进行杂交，形成 Au NC/NDM-1/Au NC 结构。核酸杂交复合物在电极表面发生氧化还原反应，从而产生电化学信号，利用循环伏安法（CV）、差分脉冲伏安法（DPV）和电化学阻抗图谱法（EIS)表征修饰电极的电化学行为。
结果 锁核酸探针可识别单个碱基的错配，与靶 DNA 分子结合具有很高的热稳定性和亲和力，可与待检的 NDM-1 基因直接结合，无需 PCR 扩增，在大肠杆菌等干扰细菌存在的条件下，抗干扰能力强，选择性好。该电化学生物传感器的检测线性范围为 1 pg/L~100 μg/L，检出限低至 1 pg/L。方法学比较结果显示，电化学生物传感器与 PCR 法检测结果的符合率 100 %。另外，该电化学传感器制备简单，操作简便，电极孵育和扫描检测在 30 分钟内即可完成。
结论 本研究创建的电化学检测新方法，可以直接、快速、特异、灵敏地检测 NDM-1，为多重耐药菌的快速特异提供了新策略。

PO-0940

IMP-38-producing high-risk ST307 Klebsiella pneumoniae strains

赵娟[1]、王思怡[1]、刘宁[2]、刘文恩[1]
1. 中南大学湘雅医院
2. 中南大学湘雅二医院

Objectives To investigate the prevalence of blaIMP-38 among carbapenem-resistant Klebsiella pneumoniae isolates from a tertiary care hospital in central China.
Methods CRKP collected in a Chinese tertiary hospital were detected blaIMP-38. MLST was performed for genetic background typing. PacBio and Illumina whole-genome sequencing was conducted on one representative IMP-38-producing K. pneumoniae strain.
Results Fourteen (2.72%) blaIMP-38-positive strains were detected from 515 clinical CRKP isolates. The 14 isolates all belonged to the high-risk clone ST307. Genome sequencing of an ST307 strain WCGKP294 showed that it contained a circular chromosome and two plasmids. Phylogenetic analysis placed WCGKP294 in the global ST307 cluster, WCGKP294 doesn't contain the chromosomal fluoroquinolone resistance-associated mutations and IncFIIK/IncFIBK plasmid associated blaCTX-M-15 that frequently found in other global ST307 strains.
Conclusions high-risk ST307 clone continues to acquire different antimicrobial resistance genes, which should be closely monitored.

PO-0941

青蒿琥酯联合头孢菌素类药物对 CRKP 抗菌活性的分析

晏国威[1]、向延根[2]、马小华[2]、潘建华[2]、喻容[2]、石国民[2]
1. 长沙市第一医院
2. 长沙市中心医院

为探讨青蒿琥酯(artesunate, ASN)单独或联合头孢菌素类药物对多重耐药(multidrug-resistant, MDR) 肺炎克雷伯菌的抗菌活性。本研究收集 2018 年长沙市中心医院临床分离的多重耐药肺炎克雷伯菌菌株 32 株。分为单独用药组：青蒿琥酯(ASN)组、头孢曲松钠(CRO)/头孢他啶(CAZ)组和联合应用组。采用细菌动 态生长曲线法观察青蒿琥酯联合头孢菌素类药物对多重耐药肺炎克雷伯菌的生长影响；采用微量肉汤稀释 法检测青蒿琥酯单独或联合头孢菌素类药物对多重耐药肺炎克雷伯菌的抗菌作用；采用 RT-PCR 技术检测 外排泵基因 A crB mRNA 以及其调控基因 MarA 和 A crR mRNA 的表达水平。结果显示，终浓度为 2 048 滋 g/mL ASN 联合头孢曲松钠、头孢他啶明显地抑制了多重耐药肺炎克雷伯菌的生长，曲线走向平缓；终浓度为 1 024 滋 g/mL ASN 联合头孢曲松钠、头孢他啶对多重耐药肺炎克雷伯菌的 MIC50 与单独用药组比较显著减 低，均有统计学意义(K=68.07, P 约 0.05; K=62.34, P 约 0.05)。1 024 滋 g/mL ASN 联合头孢曲松钠、头孢他啶均以 相加作用为主；2 048 滋 g/mL 青蒿琥酯和头孢曲松钠、头孢他啶联用时，可以抑制外排泵基因 A crB 的表达， 2 048 滋 g/mL 青蒿琥酯联合 512 滋 g/mL 头孢曲松钠明显抑制正向调控子 MarA 的表达，而对于负性调控子 A crR 的表达没有明显影响。青蒿琥酯能显著改善多重耐药肺炎克雷伯菌对头孢曲松钠以及头孢他啶的敏感 性，其机制可能与下调外排泵基因 A crB 的表达有关。

PO-0942

Phenotypic and Genotypic Characterization of Linezolid Resistance Coagulase-negative Staphylococci Possessing cfr-Carrying Plasmid

Fei Jiang[2]、Ping Ma[1]
1. Department of Laboratory Medicine, The Affiliated Hospital of Xuzhou Medical University
2. Department of Laboratory Medicine, the Affiliated Hospital of Xuzhou Medical University

Dependence on linezolid was recently described as significant growth acceleration of linezolid-resistant Staphylococcus epidermidis isolates upon linezolid exposure in German and Greece. This study aimed to investigate coagulase-negative Staphylococci (CNS) clinical isolates exhibiting linezolid resistance and possibility of dependence on linezolid in China. Resistance phenotypic and genotypic characterization of thirteen CNSs were investigated by antimicrobial susceptibility testing and polymerase chain reaction (PCR). Homology of isolates was estimated by pulsed field gel electrophoresis (PFGE). Characterization of cfr plasmids was carried out by S1 nuclease-PFGE, southern blotting and whole genome sequencing (WGS). Growth curve analysis was conducted with and without linezolid to determinate possibility contribution of linezolid dependence to linezolid resistance CNSs dissemination. All CNSs had linezolid MICs >256 μg/mL and were typed into three PFGE profiles. Mutation in 23S rRNA and cfr gene was identified in all isolates. Southern blotting and WGS indicated that cfr gene was located on a plasmid of 39.5 kb, revealing 99.98% and 99.99% identity to the sequence of the cfr-harbouring plasmid pSR01 and pH46-29 respectively. The cfr gene was flanked by two copies of an IS256-like element ISEnfa4 family transposase, with a downstream MerR family transcriptional regulator and a orf gene. Thirteen CNSs did not exhibit linezolid-dependent upon exposure from 8μg/mL to 128μg/mL. The clonal dissemination caused by plasmid harboring cfr gene in the CNSs need to be raised serious concerns. Linezolidine-dependent growth under linezolid selective pressure is not a common phenotype in Staphylococcus spp. at present.

PO-0943

Clinical Utility of In-house Metagenomic Next-generation Sequencing for the Diagnosis of Lower Respiratory Tract Infections and Analysis of the Host Immune Response

Si Liu、Yuyao Yin、Hongbin Chen、Hui Wang
Peking University People's Hospital

Background Only few pathogens that cause lower respiratory tract infections (LRTIs) can be identified due to limitations of traditional microbiological methods and the complexity of the oropharyngeal normal flora. Metagenomic next-generation sequencing (mNGS) has the potential to solve this problem.
Methods This prospective observational study sequentially enrolled 93 patients with LRTI and 69 patients without LRTI who visited Peking University People's Hospital in 2019. Pathogens in bronchoalveolar lavage fluid (BALF) specimens were detected using mNGS (DNA and RNA) and traditional microbiological assays. Human transcriptomes were compared between LRTI and non_x0002_LRTI, bacterial and viral LRTI, and tuberculosis and nontuberculosis groups.
Results Among 93 patients with LRTI, 20%, 35%, and 65% of cases were detected as definite or probable pathogens by culture, all microbiological tests, and mNGS, respectively. Our in-house BALF mNGS platform had an approximately 2-working-day turnaround time and detected more viruses and fungi than the other methods. Taking the composite reference standard as a gold standard, it had a sensitivity of 66.7%, specificity of 75.4%, positive-predictive value of 78.5%, and negative-predictive value of 62.7%. LRTI-, viral LRTI–, and tuberculosis-related differentially expressed genes were respectively related to immunity responses to infection, viral transcription and response to interferon-γ pathways, and perforin 1 and T-cell receptor B variable 9.
Conclusions Metagenomic DNA and RNA-seq can identify a wide range of LRTI pathogens, with improved sensitivity for viruses and fungi. Our in-host platform is likely feasible in the clinic. Host transcriptome data are expected to be useful for the diagnosis of LRTIs.

PO-0944

blaNDM-33, a novel variant of blaNDM in an Escherichia coli isolate from hospital sewage

Tao Wang、Hong Du
Department of Clinical Laboratory,TheSecond Affiliated Hospital of Soochow University,Suzhou,China

Objectives The prevalence of carbapenemase-resistant Enterobacteriaceae (CRE) has increased since the early 2000s, which represents a potential public health threat. Hospital sewage systems often become reservoirs of drug-resistant bacteria. blaNDM carrying strains pose a threat to the use of most clinically commonly antibiotics. Several variants of the NDM have recently been reported. The survey to characterize a blaNDM-33 we first found located in IncX3 plasmid from Escherichia coli in hospital sewage.
Methods The blaNDM-33 gene and its genetic background were determined by PCR and whole-genome sequencing. Conjugation experiment was performed to assess the horizontal transferability of the plasmid carried blaNDM-33. Cloning experiment was used pET28a plasmid for ligation then transformed into DH5α. The antibiotic susceptibility assay was determined by broth microdilution methods.
Results The HD6415, which we isolated from hospital sewage, showed multiple resistance and was highly resistant to meropenem, ertapenem, imipenem, ceftazidime, and gentamicin. The novel blaNDM-33 was existed in HD6415 isolate, which belonged to ST650. The blaNDM-33 gene just has a single nucleotide difference (G214A) encoding an amino acid substitution (A72T)

compared with blaNDM-5. The blaNDM-33 was located in the Tn125-related blaNDM-33 region from an IncX3-type plasmid pHD6415-NDM that can transferred horizontally. Additionally, blaNDM-33 was resistant to carbapenems, ceftazidime, piperacillin/tazobactam but susceptible to tigecycline, colistin, and aztreonam.
Conclusions This study report a novel blaNDM variant blaNDM-33, which is carried by a self-transmissible IncX3-type plasmid from an E. coli isolate in China. NDM-33 shows the similar activity against carbapenems as NDM-5. The rapid increase variants of "superbugs" from NDM-producing have become a worldwide concern for health workers. Hospital sewage systems may be a reservoir of multidrug-resistant bacteria, increasing the prevalence of drug-resistant bacteria.

PO-0945

ST11 型碳青霉烯耐药高毒力肺炎克雷伯菌分子流行病学研究

王伟
徐州医科大学附属医院

目的 对徐州市某院 ST11 型碳青霉烯耐药高毒力肺炎克雷伯菌进行分子流行病学调查。
方法 收集徐州医科大学附属医院 2018 年 1 月至 2018 年 12 月临床分离的 26 株碳青霉烯耐药高毒力肺炎克雷伯菌（carbapenemase resistant hypervirulent *Klebsiella pneumoniae* , CR-hvKP）。PCR 检测常见的碳青霉烯酶耐药基因 (*bla*$_{KPC}$, *bla*$_{NDM}$, *bla*$_{IMP}$, *bla*$_{OXA-48}$, *bla*$_{VIM}$)，超广谱 β-内酰胺酶基因 (bla$_{CTX-M}$, bla$_{TEM}$, bla$_{SHV}$), 荚膜血清型基因 (K1, K2, K5, K20, K54, K57) 和毒力基因 (rmpA, kfu, aerobactin, entB, ybtS, fimH, mrkD, allS)。采用多位点序列分型和脉冲场凝胶电泳对 CR-hvKP 进行同源性分析。
结果 26 株 CR-hvKP 菌株均为多重耐药菌，对 b 内酰胺类、喹诺酮类、氨基糖苷类抗菌药物均表现为 100%耐药，对四环素耐药率为 69.2%，未发现对替加环素和多粘菌素耐药的菌株。26 株 CR-hvKP 均携带碳青霉烯酶耐药基因，主要携带 *bla*$_{KPC-2,}$ 占 96.2% (25/26)。K1、K2 阳性率分别为 53.8%(14/26)和 7.7%(2/26)。常见毒力基因携带率均超过 50%，其中 entB (100%, 26/26), aerobactin (92.3%,24/26), mrkD (92.3%, 24/26), fimH (88.5%, 23/26), rmpA (80.8%, 21/26), iron (80.8%, 21/26), ybtS (57.7%, 15/26) 和 allS (57.7%,15/26)。在 26 株 CR-hvKP 中共鉴定出 5 种 ST 分型，以 ST11 为主，占 87.5%（21/26）。PFGE 结果显示， 26 株 CR-hvKP 分为 7 个不同的 PFGE 簇群。簇群 A 和 C 为主要的簇群，分别占分离株的 19.2%（5/26）和 53.8%（14/26）。同一时期内，在某重症监护室病房 5 位患者中分离出了 7 个属于簇群 C 的 ST11 分离株，且具有相同的耐药表型、碳青霉烯耐药基因，这表明在这个病区局部暴发了 CR-hvKP 感染。
结论 本院流行的 CR-hvKP 多是 ST11 型由质粒介导的产 KPC-2 酶的 CRKP 菌株，耐药机制与 CRKP 菌株高度相似，局部存在暴发流行，应当实施一种基于分子生物学检测方法的实时、有效的防控手段降低此类细菌的流行。

PO-0946

通过人群规模的横断面及队列研究发现肠道菌群与高血压的流行现状与未来风险均显著相关

郑慧敏[1]、何彦[1]、李泽文[1]、吴为[2]、周宏伟[1]
1. 南方医科大学珠江医院
2. 广东省疾病预防控制中心

目的 高血压患者肠道菌群发生显著的变化，且多项动物研究表明肠道菌群与高血压存在因果关系，可能是高血压的全新风险因子和干预靶标，但菌群在高血压中是否发挥关键作用尚需流行病学数据的支撑。本研究采用横断面及纵向队列研究数据，尝试回答两个问题：（1）高血压流行与肠道菌

群均存在显著的地域差异，那么菌群的地域差异与高血压流行现状是否显著相关？（2）肠道菌群与未来的高血压发病风险是否显著相关？

方法 通过分层整群随机抽样的方式调查广东省 14 个地区（包括 3 个高收入地区和 11 个中低收入地区）共 5379 人的高血压流行状况，采用统一标准化流程测量血压等体检指标以及全程冷链收集粪便样本，通过 16S rRNA 基因测序鉴定粪便肠道菌群。另外纳入一项针对广州市中老年社区人群的纵向随访队列，并对其中正常血压人群进行随访，探究肠道菌群与高血压发病风险的关联。

结果 研究首先通过 5379 人的横断面研究，分析正常血压、高血压前期、未经治疗高血压、经治疗高血压四类人群，发现高血压存在等级递进式的菌群变化规律，其中以大肠杆菌、拟杆菌、普氏菌、阿克曼菌等为主要变化特征，进而建立高血压菌群紊乱指数（HDI）来量化紊乱程度，HDI 与高血压的比值比（OR）为 1.82（95% CI: 1.68 to 1.97; P<0.001）。横断面研究所调查 14 个地区的平均 HDI 为 0.38 至 0.55，表明由于地域差异的存在，部分地区的肠道菌群比其他地区更具有高血压紊乱的特征，即“地区性菌群紊乱”，且地区 HDI 与高血压患病率显著相关（R=0.85，P<0.001），HDI 解释了 34%广东省高收入地区和中低收入地区的高血压患病率差异，高于年龄、水果摄入等因素。纵向队列共入组 1173 人，其中 309 人在入组时血压正常并完成平均 2.95 年的随访，分析发现在校正了年龄、性别和 BMI 后 HDI 与未来发生前高血压/高血压的风险显著相关（HDI 上四分位相对下四分位高血压风险：OR: 2.64, 95% CI: 1.13 to 6.12，P = 0.024；HDI 四分位由低到高，高血压风险逐渐上升, P-trend = 0.027）。

结论 本研究首次发现肠道菌群与高血压的流行现状及未来风险均显著相关，为研究菌群与高血压的关系提供了重要的人群支撑数据。同时研究也是首次提出地域性菌群紊乱（geographical dysbiosis）这一概念，提示靶向地区性菌群紊乱开展人群菌群干预可能是控制慢病流行的潜在公共卫生手段。

PO-0947

Co-occurrence of fosA5, blaSHV-145 and blaOXA-48 among a Klebsiella pneumoniae high-risk ST16 from a tertiary hospital in China: focusing on the phylogeny of OXA-48 genes from global Klebsiella pneumoniae isolates

xiaoli cao
Nanjing Drum Tower Hospital

An imipenem intermediate Klebsiella pneumoniae isolated from blood culture was subjected to whole genome sequencing analysis and the global evolutionary relationship of blaOXA-48 gene was constructed. We found that this OXA-48-producing isolate co-carried oqxAB, fosA5, and blaSHV-145, and MLST (Multi-locus sequence typing) assigned this isolate into an international high-risk clone ST16. Further analysis showed that fosA5, oqxAB, and blaSHV-145 were found in chromosome, whereas blaOXA-48 was carried on a conjugative IncL/M plasmid. The phylogeny of OXA-48 genes from global Klebsiella pneumoniae isolates displayed 2 clades, indicating a simple evolutionary history and a strong transmission ability of OXA-48-producing K. pneumoniae.To the best of our knowledge, this is the first report on the co-occurrence of fosA5, blaSHV-145 and blaOXA-48 among the K. pneumoniae ST16 in China and for the first time we prescribed the blaOXA-48 evolutionary phylogenomic of global -producing K. pneumoniae.

PO-0948

Exploring Microbial Diversity in Environment of Aseptic Ward with 16S rRNA Sequencing

Huafang Sheng、Liping Qu、Dingqiang Chen
Microbiome Medicine Center, Division of Laboratory Medicine, Zhujiang Hospital, Southern Medical University, Guangzhou, China

Exploring microbial community in hospital environment is important for patients' health.This study aims to explore the environmental microbial community of aseptic wards in a large teaching hospital. We collected samples from floors and walls of 6 aseptic wards and hands of patients, and set control samples for sampling process, DNA extraction and PCR during experimental process. Through the alpha and beta diversity analysis, we found that bacteria of the control group and the ward group were clustered separately, and each group had a unique microbial community structure. Most of the sequences in control group were derived from commonly reported contaminating bacteria from environment and showed low abundance in ward groups. While in ward group, *Staphylococcus* (14.23%) was significantly abundant. Specifically speaking, *Acinetobacter* (25.67%), *Streptococcus* (6.28%) and *Enterococcus* (14.26%) were mostly found in floor, wall and hand groups respectively. This study was helpful for revealing reliable microbiome of low biomass environment by setting control samples in every steps.

PO-0949

Characterization of fosfomycin resistance and molecular epidemiology among carbapenem-resistant Klebsiella pneumoniae strains from two tertiary hospitals in China

Haichen Wang 、Changhang Min、Mingxiang Zou
Xiangya hospital, Central South University

Background Fosfomycin has been proven to be a vital choice to treat infection caused by multidrug resistance bacteria, especially carbapenem-resistant *Klebsiella pneumoniae* (CRKP). However, fosfomycin resistant cases has been reported gradually. In this study, we reported the fosfomycin-resistant rate in CRKP strains and further revealed the molecular mechanisms in resistance gene dissemination.
Results A total of 294 non-duplicated CRKP strains were collected. And 55 fosfomyin-resistant strains were detected, 94.5% of which were clustered to sequence type (ST) 11 by PCR followed up sequencing. PFGE further revealed two major groups and four singletons. The positive rates of genes responsible to fosfomycin and carbapenem resistance were 81.8% (*fosA3*), 12.7% (*fosA5*) and 94.5% (bla_{KPC-2}), respectively. Genomic analysis confirmed insertion sequence (*IS*) 26 was the predominant structure surrounding *fosA3*. The *fosA3* genes in six isolates were located on plasmids which were able to transfer to *E. coli* J53 recipient cells by means of conjugation.
Conclusions Although the resistant rate of CRKP to fosfomycin is relatively low in our area, considering its gene is located on transferrable plasmid and inserted in IS structure, continuous monitoring is still needed.

PO-0950

基于比较基因组学研究不同来源表皮葡萄球菌的基因组特征以及识别眼源性菌株标志性致病基因

林舒丹
温州医科大学

目的 表皮葡萄球菌常定植于人类皮肤、粘膜以及眼表，是医院感染最常见病原菌之一。我们通过泛基因组分析和全基因组分析了解包括眼内等不同来源的表葡基因组特征，明确其致病性与生物膜形成以及耐药性的关系；经系统发育分析揭示不同来源表葡的进化关系；利用比较基因组学分析毒力基因和耐药基因在不同来源的表葡中富集情况，寻找与眼内炎致病相关的标志性基因。
方法 从眼外伤引起的感染性眼内炎患者中分离 11 株表葡，对其进行全基因组测序，获得外伤性眼内炎来源的表葡全基因组；加以整合公共数据库不同来源的表葡全基因组，最后共达 187 株。按不同生态位来源分为眼、呼吸道、皮肤、血液，以及宿主不同健康状态分为疾病组和健康组。用 BPGA 进行不同来源菌株的泛基因组分析；构建基于核心 SNP 位点的最大似然树；对所有基因组进行 ST、SCCmec 分型，毒力、耐药性分析，并分组进行 Fisher'exact 检验，FDR 校正，筛选与表葡致病、生物膜形成显著相关的基因，观察其在不同来源菌株中富集情况，寻找与感染性眼内炎相关的标志性基因，并进行 PCR 验证。特定耐药基因进行体外药敏试验验证。
结果 表皮葡萄球菌是一个开放的基因组，单独眼部来源的表皮葡萄球菌可以形成相对稳定的核心基因组。从进化上看，表皮葡萄球菌分为两个群体，健康皮肤来源分离株的集中于 I 簇，ST2 和 ST5 型的临床分离株集中于 II 簇，眼源性分离株较分散，且 ST 分型多为未知。我们筛选多个与疾病来源表皮葡萄球菌相关的关键基因，其中 icaABCDR，sdrF,sdrG,fbe，Uhpt 和 essD 被鉴定为毒力基因。生物膜形成相关的基因 icaABCDR、pgaC 在眼源性菌株中并不富集，在血液来源的菌株中显著富集，而 sdrG 在眼部显著富集，转录调控基因 lrpC,CysL 存在于所有感染性眼内炎来源的表葡中。分析菌株的耐药性基因发现，喹诺酮类基因 norA 存在于所有菌株中，94/187 株为 mecA 阳性菌，提示为耐甲氧西林表皮葡萄球菌，且 96.8%集中于进化分支 II 簇中，眼源菌株中 mecA 基因携带率 5/11，与体外药敏试验结果一致。
结论 表皮葡萄球菌的泛基因组呈开放性，从进化上看有两个致病差异显著的来源；本研究中分离的眼内炎相关表葡虽然在进化上较分散，但与临床致病菌株距离接近，证明其致病性；引起眼内感染的表葡与生物膜形成无直接关系，sdrG,CysL 或作为眼致病性表葡的标志性基因；菌株 mecA 基因携带率与体外药敏试验一致，且耐甲氧西林表皮葡萄球菌的致病性更强。

PO-0951

Genomic Features and Comparative Genomic Analysis of Streptococcus sp. v1. nov., Isolated from an Endophthalmitis patient

Yutong Kang[1]、Yongliang Lou[2]、Meiqin Zheng[1]
1. Eye Hospital of Wenzhou Medical University
2. 温州医科大学

Endophthalmitis is an acute inflammatory intraocular condition that can cause permanent vision loss. The treatment strategy and visual outcome partly depend on identification of the agents of pathogens. In the study, metagenomic sequencing was conducted to investigate the microbial and antibiotic resistance genes (ARGs) composition in vitreous (intraocular body fluid) of an endophthalmitis patient, whose progresses rapidly and accompanied by severe pain. Metagenomic sequencing data revealed that the vitreous sample was predominated by Streptococcus, with a low-diversity microbiome in the vitreous. Main ARG types contained Beta-

lactam, macrolide-lincosamide-streptogramin, and multidrug. At last, Metagenome-assembled genome sequence of Streptococcus sp. v1. nov. was isolated. The Tetra Correlation Search (TCS) analysis uncovered that the closest relative of the Streptococcus sp. v1. nov. was Streptococcus mitis SK321. Pan/core genome analysis for Streptococcus sp. v1. nov. and TCS top 25 hits strains revealed that most unique genes of Streptococcus sp. v1. nov. were linked to ABC Transport system, which could indicate unique virulence and pathogenic potentials of Streptococcus sp. v1. nov. In addition, a total of 7 virulence factors were identified, and the overwhelming of them were classified into “Offensive virulence factors”. The high pathogenicity of Streptococcus sp. v1. nov. could be a reason for the patient’s rapid disease progression. Our study was first isolated an ocular pathogen with highly virulent based on metagenomic sequencing and bioinformatics analysis, which has important reference value for revealing the composition and genome characteristics of pathogens in endophthalmitis patient in the future.

PO-0952

碳青霉烯耐药肠杆菌临床特征和分子流行病学：一项单中心前瞻性队列研究

黄世峰
重庆医科大学附属第一医院

背景 旨在描述中国西南地区碳青霉烯耐药肠杆菌（CRE）的临床特征和分子流行特征。
方法 我们进行了一项前瞻性队列研究，纳入 2018 年 6 月 1 日至 2019 年 12 月 31 日期间被诊断患有 CRE 感染患者的 CRE 菌株，并收集患者的基本信息。对 CRE 菌株进行了菌种鉴定和分子鉴定，包括菌株分型。采用多位点序列分型(MLST)对不同分离时间的菌株进行分子分型。使用 PHYLOViZ 软件分析菌株间的进化关系，评估菌株间的序列类型（ST）和相关流行病学数据之间的关系。
结果 在研究期间共纳入 128 株菌株。其中 CRE：产碳青霉烯酶的肠杆菌（CPE）71 株（55.5%），非 CPE 57 株（44.5%）。最常见的耐碳青霉烯肠杆菌株为肺炎克雷伯菌(69 株,53.9%)。肺炎克雷伯菌最常见的序列型别是 ST11 型（43 株，33.6%）。ST11 型肺炎克雷伯菌主要产 KPC-2。在 CRE 感染的 128 位患者中，CPE 和非 CPE 感染患者的 DOOR 没有显著性差异。在感染的第 30 天，这些患者中有 35 名（27.3%，95%CI20-35）死亡。在大多数产生 KPC-2 的肺炎克雷伯菌中，都鉴定出了克隆关系。
结论 CPE /非 CPE 鉴定和 CRE 耐药机制的鉴定对于更好地指导 CRE 感染患者的临床管理至关重要，特别是在有 ICU 入住史和有肝病史的患者中。不论是否产碳青霉烯酶，CRE 感染均与高死亡率和不良后果有关。

PO-0953

内蒙古包头地区金黄色葡萄球菌致病机制及分子流行病学研究

李雅倩、胡同平
内蒙古科技大学包头医学院第一附属医院

目的 了解内蒙古包头地区临床上金黄色葡萄球菌的分布情况、耐药情况、分子流行病学情况以及毒力基因携带情况，为预防和治疗金黄色葡萄球菌引起的感染提供参考。
方法 1.收集 2017 年 1 月-2019 年 12 月内蒙古包头地区 11 所上报全国细菌耐药监测网的三级医院的金黄色葡萄球菌临床分离株，对数据采用 WHONET 5.6 软件和 SPSS 20.0 软件进行统计分析。2.对用全自动微生物鉴定仪初筛为甲氧西林耐药的金黄色葡萄球菌(Methicillin-resistant Staphylococcus aureus ,MRSA)采用头孢西丁纸片扩散法、聚合酶链式反应（Polymerase chain

reaction，PCR）技术检测常见的耐药基因 mecA。随机选取 MRSA 25 株和甲氧西林敏感的金黄色葡萄球菌（MSSA）25 株作为试验菌株，并采用 PCR 技术进行葡萄球菌蛋白 A 基（SPA）因分型和多位点序列分型（MLST）,采用多重 PCR 技术进行葡萄球菌染色体 mec 盒子(SCCmec)分型，MLST 结果用 eBURST 软件进行遗传信息分析。3.对上述 50 株金葡菌通过 PCR 技术检测以下几种常见的毒力基因：hla、hld、pvl、lukED、seh、seb、eta、tsst。

结果 1.三年共收集金黄色葡萄球菌 2562 株，共检出 MRSA 347 株，检出率为 13.5%，主要的标本来源为伤口分泌物占 39.6%（1015/2562）。万古霉素、利奈唑胺和替加环素的敏感率为 100%，MRSA 的耐药率要显著高于 MSSA 的耐药率，且具有统计学意义（P＜0.05）。2.MLST 分型的优势型别为 ST59 共 26 株，其中 MRSA 15 株，MSSA 6 株；SPA 分型的优势型别为 t437 为主共 19 株，其中 MRSA 13 株，MSSA 6 株；SCCmec 分型以 SCCmec IVa 为主共 14 株。3. 溶血素 hld 和 hla 的检出率为 100%，表皮剥脱毒素 eta 的检出率为 0，至少同时携带 2 种毒力基因，同时携带 3 种以上毒力基因的占 82%。

结论 1.该地区金葡菌主要分离自皮肤软组织和呼吸道标本，与国内外报道一致；MRSA 的检出率较低，未发现耐万古霉素、利奈唑胺和替加环素的菌株。2.本地区 MRSA 的主要流行株为 ST59-MRSA IVa-t437,与国内流行趋势相同，MSSA 的主要流行株为 ST59 -t437。3.该地区 MRSA 的毒力较强，耐药趋势严峻，临床应严格监测耐药菌的产生，合理使用抗菌药物。

PO-0954

SARS-CoV-2 receptor ACE2 is expressed in human conjunctival tissue, expecially in diseased conjunctival tissue: the evidence of COVID-19 infection by ocular surface

Shengjie Li、wenjun cao
Eye & ENT Hospital, Shanghai Medical College, Fudan University

Coronavirus disease 2019 (COVID-19) virus has currently caused major outbreaks worldwide. The virus is mainly transmitted through respiratory droplets and by close contact with infected individuals. Angiotensin-converting enzyme 2 (ACE2) is a major cellular-entry receptor for the COVID-19 virus, whether it is expressed by the conjunctival tissue is largely unknown. In this study, human conjunctival tissues from 68 subjects were obtained, which included 10 subjects with conjunctival nevi, 20 subjects with conjunctivitis, 9 subjects with conjunctival papilloma, 16 subjects with conjunctival cyst, 7 subjects with conjunctival polyps, and 6 ocular traumas as normal subjects. Expression of ACE2 was evaluated by immunohistochemistry, immunofluorescence, reverse transcriptase-quantitative polymerase chain reaction assay, and western blot assay. We observed the expression of ACE2 by conjunctival tissues, expecially in conjunctival epithelial cells. ACE2 was also expressed in the conjunctival lamina propria lymphocytes and vascular endothelial cells. ACE2 was significantly ($p<0.001$) overexpressed in conjunctival cells obtained from subjects with conjunctivitis, conjunctival nevi, conjunctival papilloma, conjunctival cyst, and conjunctival polyps epithelial cells when compared to that in conjunctival epithelial cells obtained from control subjects. A significant difference in ACE2 expression between conjunctivitis tissues and other diseased conjunctival tissues was observed ($p<0.001$). ACE2 is present in conjunctival epithelia, especially in patients with diseased conjunctiva, which might provide a possible route of entry for the COVID-19 virus. Thus, increase the awareness of eye protection is necessary.

PO-0955

The mechanism of destroyed intestinal flora on EBV infected NPC through regulating SCFAs and inflammatory factors

Haiye Jiang、Xinmin Nie
The Third Xiangya Hospital of Central South University

Background Nasopharyngeal carcinoma (NPC) is a malignancy of nasopharynx with a sophisticated etiology that mostly arisen in southern China. There is a consensus that the occurrence of NPC is associated with Epstein-Barr virus (EBV) infection. Current studies uncovered that the imbalance of intestinal microbiota is associated with NPC. Meanwhile, it is found that the metabolites of intestinal microbiota, such as short chain fatty acids can promote the carcinogenesis of EBV.
Methods To compare the differences in intestinal microbiota compositions and biological functions among 10 patients with EBV-infected NPC (EBV_I), 25 patients with NPC who haven't detected EBV-DNA (EBV_0) and 25 healthy controls (HC), we compared the intestinal microbiota DNA sequencing and hematological testing results between every two groups using bioinformatic methods. Meanwhile, short-chain fatty acids (SCFAs) were used to treat EBV-infected NPC cell lines.
Results Compared to EBV_0 and HC group, the intestinal microbiota structures of the patients in the EBV_I showed significant changes. In EBV_I, Ruminococcus gnavus, Clostridium symbiosum, Clostridium hathewayi and Clostridium ramosumwere significantly increased, while Gemmiger formicilis and Alistipes onderdonkii were significantly decreased. Several kinds of SCFAs and inflammatory factors were significantly increased in EBV_I, and it was found that these SCFAs and inflammatory factors were significantly positively correlated with bacteria. R. gnavus was significantly positively correlated with EBV-DNA (P=0.035, R=0.27), propionic_acid (P<0.001, R=0.64), butanoic_acid (P<0.001, R=0.55), valeric_acid (P<0.001, R=0.66), TNF_alpha (P<0.001, R=0.70), while was significantly negatively correlated with IFN_gama (P<0.001, R=0.53). After treated with SCFAs, EBV-DNA was increased significantly EBV-infected NPC cell (P<0.01).
Conclusion This research discovered that EBV infected NPC were associated with structural imbalances in the intestinal microbiota, with R. gnavus and opportunistic pathogens that promoted the elevation of SCFAs and inflammatory factors being significantly increased, while probiotics significantly decreased. Based on these findings, we can regulate the target intestinal flora and its metabolites to improve the occurrence and development of NPC.

PO-0956

mNGS 检测技术在儿童重症社区获得性肺炎中的应用

张鹏、刘勇、邹红雁、姜艳芳
吉林大学第一医院

目的 分析宏基因组二代测序技术（metagenomics next-generation sequencing, mNGS）在儿童重症社区获得性肺炎中的诊断价值。
方法 选取 2018 年 1 月至 2021 年 3 月在吉林大学第一医院儿科住院治疗的 37 例重症社区获得性肺炎患儿，留取肺泡灌洗液（Bronchoalveolar lavage fluid，BALF）标本同时进行 mNGS 病原检测和传统病原检测。比较两种技术的病原体检出结果及阳性率。
结果 37 例患儿的 BALF 同时进行传统病原检测和 mNGS 检测,细菌检出率 mNGS 明显高于传统检测方法（75.7% vs. 20.6%）,差异有统计学意义（P＜0.05）。病原菌阳性率与 2 种以上病原体感染上,mNGS 明显高于传统检测方法（94.6%vs. 54.1%, 42.9% vs. 8.1%）,差异有统计学意义

（P<0.05）。在 mNGS 检测与传统检测结果不一致的病原体、细菌与真菌中,培养阴性多于 mNGS 阴性结果。在复合感染中,mNGS 明显高于传统检测方法（67.6%vs. 24.3%）,差异有统计学意义（P<0.05）。

结论 在儿童重症社区获得性肺炎中，BALF mNGS 对病原菌的检出率高于传统检测方法，尤其是复合感染时诊断价值更高，能够对重症社区获得性肺炎提供早期诊治依据。

PO-0957

CRISPR 核酸检测技术与常规实验室检查诊断儿童结核病的效能分析

吕纯阳、李明远、江咏梅
四川大学华西第二医院

目的 探究和比较基于规律间隔成簇短回文重复序列（Clustered regularly interspaced short palindromic repeats，CRISPR）的新型核酸检测技术和常规实验室检查方法诊断儿童结核病的诊断效能

方法 纳入四川大学华西第二医院疑似结核病住院患儿 143 人，采集入院用药前第一次标本提取核酸，协同阴阳性对照以 IS6110 插入序列为靶标，经重组酶聚合酶扩增（RPA）后以 Cas12a 检测，制定前后荧光变化的差值或倍数值阴阳性判断 cutoff 值，以微生物学阳性和临床诊断为标准分别计算 CRISPR 技术的灵敏度、特异度。再计算 CRISPR 技术在不同部位结核、不同治疗情况结核下的诊断阳性率，相同标本进行 qPCR、MGIT 液体培养、涂片抗酸染色并计算上述诊断效能指标，与 CRISPR 技术比较。

结果 以诊断为标准，CRISPR 技术差值和倍值敏感度均为 73.3%，高于 qPCR（48.8%）、MGIT 液体培养（17.4%）、涂片抗酸染色（3.5%）。CRISPR 技术差值和倍值特异度分别为 83.9%和 89.3%，低于 MGIT 液体培养、涂片抗酸染色（均为 100%）。该技术在有微生物证实的患儿中灵敏度提升为 81.3%，特异度则为 53.2%，低于 qPCR（67.5%）。CRISPR 技术在肺泡灌洗液标本中灵敏度最高（差值 78.9%，倍值 89.5%），高于 qPCR(78.9%)和微生物学方法。该技术在痰液中的灵敏度为 73.3%、80.0%，在胃液中的灵敏度为 73.5%、67.6%，高于 qPCR 和微生物学方法。肺外标本 CRISPR 技术灵敏度为 66.7%。CRISPR 技术在呼吸道、胃液、肺外标本的特异度为 75~90.5%，低于微生物学方法。CRISPR 技术（差值）在肺结核、肺外结核、肺内外均结核中的阳性率分别为 71.1%、75%、75.8%，倍值则为 71.1%。87.5%、72.7%。qPCR 上述阳性率为 37.5%~60.6%，培养则为 13.3%~37.5%。CRISPR 核酸检测技术（差值）在初治、复治结核中阳性率为 72.1%、76%，倍值则分别为 70.5%、80.0%，均高于 qPCR 和微生物学方法。

结论 基于 CRISPR 的核酸检测技术灵敏度高于常规实验室诊断方法，特异性较好，是诊断儿童结核病较好的新型实验室检查方法。

PO-0958

益生菌来源的肽聚糖水解酶靶向 MDP-NOD2 调节肠稳态并治疗炎症性肠病

高杰、周宏伟
南方医科大学珠江医院

背景和目标 益生菌因其调节肠稳态的作用而具有治疗的炎症性肠病的潜力，但活菌定植能力差异、作用机制不明等原因限制其临床疗效。近年研究发现益生菌的代谢产物（后生元）也能发挥类似益

生活菌的功效，成为治疗炎症性肠病药物开发的重要方向。因此，鉴定具有治疗作用的后生元，具有重大临床需求。
方法和结果 通过系统文献检索，筛选出 4 种在临床研究中对炎症性肠病具有治疗效果的益生菌单菌（鼠李糖乳杆菌，干酪乳杆菌，副干酪乳杆菌，罗伊氏乳杆菌）；分析了这 4 个菌种下 10 个菌株的基因组，发现其中 8 株菌均编码一种分泌型的蛋白（相似度>75%），这里命名为 L.PH。利用多个肠炎模型及前期发表的结肠蛋白递送系统，证明了 L.PH 对肠炎小鼠的治疗效果。进一步生物信息学分析及实验鉴定发现 L.PH 是一种肽聚糖水解酶，能高效水解大分子肽聚糖生成胞壁酰二肽（MDP），一种 NOD2 配体。通过构建活性位点突变蛋白，及产物回补实验，明确了 L.PH 通过水解肽聚糖产生 MDP 改善肠炎。最后通过 NOD2-/-小鼠，阐明了 L.PH 通过 MDP-NOD2 调节肠稳态并治疗肠炎的机制。
结论 我们发现了 L.PH 是多个益生菌共有效应蛋白，并阐明了其靶向 MDP-NOD2 调节肠稳态并治疗炎症性肠病的效果及机制。

PO-0959

Resistance mechanism of Carbapenem-resistant Klebsiella pneumoniae in a tertiary hospital in Hunan, China

Xuan Liu、Wenen Liu、Mao Zhou、Xin Li、Qianqian Qi、Zijuan Jian、Xia Chen、Qun Yan
Department of Clinical Laboratory Xiangya Hospital, Central South University

Background The increasing prevalence of carbapenem-resistant Klebsiella pneumoniae (CRKP) brings severe challenges to the clinical anti-infection diagnosis and treatment. However, there were few comprehensive analyses of multiple resistance mechanisms in Central and Southern China, especially lack of research on porin deficiency. This study aimed to analyze the multiple antibiotic resistance mechanisms of CRKP and characterize CRKP isolates.
Methods The CRKP isolates at a tertiary hospital in central China from January 2018 to December 2018 were collected. Clinical characteristics and drug resistance of CRKP in this study were analyzed. Sixteen kinds of carbapenem resistance related genes including blaKPC-2, blaNDM-1, blaVIM, blaIMP, blaGES, blaOXA-48, blaCIT, blaCTX-M-9, blaDHA, blaCTX-M-25, blaACT, blaMOX, blaFOX, blaEBC, OmpK-35 and OmpK-36 were detected by polymerase chain reaction (PCR). Comparative analysis of distribution of resistant genes in departments were performed.
Results A total of 152 CRKP strains were collected, which had low resistant to tigecycline (3/152, 2.0%), amikacin (74/152, 48.7%), trimethoprim-sulfamethoxazole (75/152, 49.3%). The PCR detection rates of blaKPC-2 (119/152, 78.3%) ranked top one in resistance genes and negative rate of OmpK35 / 36 was 21.1% (32/152). The distribution of blaKPC-2, blaNDM-1 and blaCIT were different between departments ($p<0.05$), and pediatric wards had a high carrying rate of blaNDM-1. Production carbapenemase may be the main resistance mechanism.
Conclusions The main resistance genotypes of CRKP are blaKPC-2 (119/152,78.3%). And the resistance mechanism of most CRKP may be carbapenemase production. And some departments, such as pediatrics, are prevalent in NDM-KP, which should be paid great attention to prevent its further spread in hospitals.

PO-0960

高通量测序技术在结核性脑膜炎诊断中的临床应用研究

林敏涛、邓颖颖
南方医科大学珠江医院

目的 探究高通量测序技术（mNGS）在结核性脑膜炎（TBM）诊断中的价值。

方法 回顾性纳入 2017 年 8 月至 2019 年 5 月本院外送进行的 mNGS，筛选出送检标本类型为脑脊液（CSF）的病例进行分析，以 2010 年 TBM 诊断标准作为诊断依据，查阅并记录其辅助诊断结果，比对 mNGS、抗酸染色法、培养法、结核分枝杆菌核酸定量（TB-PCR）、WBC 镜检、CSF 糖、CSF 蛋白检查结果，计算出灵敏度（Se）、特异度（Sp）、阳性似然比（+LR）、阴性似然比（-LR）的差异，并比较不同方法的诊断价值。
结果 观察组 mNGS 阳性率 100%，Se、Sp、+LR、-LR 分别为 100%、88.9%、9.01、0，均优于其它检验方法。
结论 CSF 的 mNGS 检测可作为早期诊断 TBM 的重要指标。

PO-0961

一种艰难梭菌检测、治疗后动态监测和预测高毒力流行的多重数字 PCR 方法的建立

秦娟秀、李敏
上海交通大学医学院附属仁济医院

目的 艰难梭菌是抗生素相关腹泻最重要致病菌，且国内流行菌株与国外多不同。然而，目前缺乏高灵敏的动态监测和高毒力菌株预测方法。因此拟通过新建一种多重数字 PCR 方法（CD-DDPCR），进行艰难梭菌检测、治疗后动态监测和预测高毒力菌株流行。
方法 本研究搜集三家医院（上海交通大学医学院附属仁济医院，上海杨浦区中心医院和上海交通大学医学院附属同仁医院）腹泻标本 50 例，同时进行艰难梭菌谷氨酸抗原和毒素（A+B）检测，毒素培养、艰难梭菌数字 PCR 方法和艰难梭菌荧光 PCR 方法检测。艰难梭菌数字 PCR 和艰难梭菌荧光 PCR 并进行相关统计学分析。
结果 成功建立艰难梭菌多重检测体系，通过不同毒素型别的艰难梭菌和 11 种临床常见致病菌检测，证明该体系没有交叉反应，有很好的特异性。菌株 CFU/mL 从 105 to 102 ，DDPCR DNA 的含量（copies/ul）与其有很强的线性关系（R2>99.5）；同时将新的方法学和传统毒素培养及 GDH 检测方法学比较，灵敏度、特异性和符合率分别为 94.4%、87.5%和 90.0%。且与艰难梭菌感染的严重性呈正相关。通过对一例病人的动态监测，发现该方法能更早法发现艰难梭菌的再感染。同时本方法也检测一株高毒力菌株（tcdA+,tcdB+、ctdB+和 tcdC18bp 缺失），MLST 测序方法鉴定为 ST197。
结论 新建的同时检测艰难梭菌毒素 A，毒素 B 和二元毒素 B 以及调控基因 tcdC 多重 PCR 体系，能更灵敏的进行艰难梭菌检测、治疗后动态监测和预测高毒力菌株流行。

PO-0962

临床常见多重耐药阴性菌主动筛查方法的建立

徐成钰
苏州市独墅湖医院（苏州大学附属独墅湖医院）

目的 所谓的多重耐药菌指的是三种或以上的抗菌药物同时存在耐药的菌株。抗生素的广泛使用以及临床上常见的介入治疗，使得细菌的耐药性越来越高，甚至出现了“超级细菌”，其中碳青霉烯耐药的革兰阴性杆菌最为常见，包括 CRE、耐碳青霉烯类鲍曼不动杆菌、亚胺培南耐药铜绿假单胞菌、美罗培南耐药的铜绿假单胞菌和唑类耐药念珠菌等。越来越多的研究把主动筛查作为防控临床常见多重耐药阴性菌出现的一项干预措施。分析探讨临床常见的多重耐药阴性菌的种类并建立主动筛查机制，及时为临床提供精准的检验报告和用药指导。

方法 对从苏州某三甲医院各科室中采集的临床标本，如咽拭子、肛拭子和痰液等进行培养。利用不同菌株发酵产物和对药物的敏感性的不同，将其置于不同的药物选择培养基中培养，观察其生长情况，进行筛查。EDTA 作为 MBL 的络合剂，可以对金属酶进行筛选。
结果 常见的多重耐药阴性菌有耐碳青霉烯类的肠杆菌科、铜绿假单胞菌还有其他碳青霉烯耐药阴性杆菌如洋葱伯克霍尔德菌、鲍曼不动杆菌、嗜麦芽窄食单胞菌、和黄杆菌。加有美罗培南的中国蓝平板中可筛选出耐碳青霉烯类肠杆菌科，十六烷三甲基溴化铵培养基中加入亚胺培南或者美罗培南可以筛查出铜绿假单胞菌。
结论 通过对检出多重耐药菌的分析，为控制医院院内感染和临床合理使用抗菌药物提供了可靠的科学依据。

PO-0963

一种用于快速检测隐球菌脑膜炎病原体的环介导等温扩增微流体模块

田月如
复旦大学附属华山医院

目的 隐球菌性脑膜炎具有高发病率和高死亡率，对全球构成公众威胁。目前用于隐球菌性脑膜炎诊断的整合性检测信息仍然有限。本研究开发一种具有实用性的整合性微流体模块用于隐球菌性脑膜炎诊断。
方法 我们采用 4 个重复过滤膜结构来提高目标捕获并简化富集过程，结合裂解酶消化、碱裂解和加热方法来优化微流控模块上隐球菌的核酸提取，联合环介导等温扩增检测单元进行靶标基因扩增，最后选择便携式紫外线手电筒照射扩增产物以获得肉眼可见的视觉检测结果。
结果 整合性检测模块降低了直接处理隐球菌样本的暴露风险。它无需任何额外的仪器，提供了一种简单、可靠且高效的检测备选方法。
结论 该整合性微流控模块具有实用前景，可作为辅助方法用于疾病诊断。有望在隐球菌性脑膜炎治疗期用于辅助疗效评估和随访。

PO-0964

Genetic Characteristics of OXA-48-producing Enterobacterales from China

Lifeng Wang、Ling Guo、Kun Ye、Jiyong Yang
Chinese PLA General Hospital

Background In China, OXA-48-producing Enterobacterales have been identified sporadically, causing only small-scale outbreaks in certain regions. This study aimed to investigate the molecular epidemiology, transmission and evolution of OXA-48-producing Enterobacterales and pOXA-48 from mainland of China.
Methods We conducted a multi-center bacterial resistance monitoring project from 2013 to 2018. The genome sequencing of OXA-48-produicng isolates was performed. Single-nucleotide polymorphism (SNP) was analysed. Eleven isolates were selected for subsequent single-molecule real-time (SMRT) sequencing. Genome sequences were annotated, and alignment of the complete sequences of the blaOXA-48-carrying plasmids from a subset of isolates that underwent long read sequencing was performed.
Results A total of 41 OXA-48-producing Enterobacterales were involved in this study, including 34 K. pneumoniae, 3 E. coli, 3 E. cloacae and one K. oxytoca. OXA-48-produicng K. pneumoniae (OXAKp) ST383, ST147 and ST11 caused outbreaks of different scales in our hospital. In

addition, OXA-48-producing E. coli ST156 and ST648, E. cloacae ST414 and ST418, and K. oxytoca ST34 were also identified. The blaOXA-48 gene was embedded in a Tn1999.2 structure, which was located in IncL plasmids with different sizes (63.58~109.14 kb). Importantly, K. pneumoniae ST11 co-producing KPC-2 and OXA-48 has been identified in our hospital and it was possible that KPC-2-producing K. pneumoniae ST11 obtained the blaOXA-48-carrying plasmid during the spread. A novel blaOXA-48-carrying IncL plasmid with size of 109 kb has been identified from OXAKp ST11. It was possible that two plasmids in OXAKp ST383 were integrated to form this larger plasmid.
Conclusions The OXA-48-produicng Enterobacterales were sporadic in China. Importantly, K. pneumoniae ST11 co-producing KPC-2 and OXA-48 has emerged and caused outbreak in China. This high-risk multidrug-resistant clone exhibited high compatibility and strong integration ability with foreign resistant plasmids.

PO-0965

重症监护病房住院患者艰难梭菌分离株的微生物学特征研究

崔颖超、董丹凤、苏同轩、江岑、倪琪、王道盛、陈炜、彭奕冰
上海交通大学医学院附属瑞金医院

目的 艰难梭菌（Clostridioides difficile，CD）已经成为全世界最常报道的医源性腹泻的主要病原体。研究表明，艰难梭菌感染是一种毒素介导的疾病，尽管毒素是最关键的致病因素，但细菌粘附、定植并形成对环境有抵抗力生物膜的作用已逐渐得到重视。本研究对上海交通大学医学院附属瑞金医院重症监护病房（Intensive Care Unit，ICU）患者分离得到的 58 株艰难梭菌菌株进行一系列微生物学特征试验，以探究中流行株的表型优势与致病情况的关联性。
方法 对 58 株艰难梭菌分离株进行毒素基因检测，并通过多位点序列分型技术进行菌株基因分型。进一步进行菌株生物膜形成试验、菌株动力试验、菌株对细胞粘附能力试验及菌株抵抗吞噬杀伤能力试验。
结果 该时间段内 ICU 中艰难梭菌分离株毒素型检测结果以 A+B+型为主、多位点序列分型以 ST81 和 ST2 为主。其次，发现 ST129、ST35 型别菌株表现出相对较高形成生物的膜能力、较高粘附力及较强抵抗吞噬杀伤的能力。此外，流行占比最高的 ST81 型别菌株显示出较强的形成生物膜及运动方面的能力。
结论 本研究表明流行菌株存在致病表型上的相应优势，也提示了临床检测菌株分型的重要性。因此，对入住 ICU 病房的高危易感人群实行 CD 的常规监测十分必要，其次对已患有 CDI 的患者检测其菌株型别，掌握菌株的表型特征，对其治疗和预后更有价值。

PO-0966

传统药敏试验与 HAIN 线性探针技术在结核分枝杆菌药敏中的方法学比较

孙月荣、陶贵华
德州市第二人民医院

目的 以传统药敏试验为金标准，比较 HAIN 线性探针(HAIN LPA)技术在耐多药结核分枝杆菌检测中检测方法的优劣。
方法 分别收集 2013 年-2014 年抗酸涂片阳性的痰标本和经培养阳性的结核分枝杆菌菌株各 379 份，用传统的结核菌比例法药敏试验和 HAIN 线性探针技术两种实验方法检测痰标本和菌株对异烟肼（INH）、利福平（REF）的敏感性。

结果 对 379 例痰涂片抗酸杆菌阳性的标本用 HAIN LPA 技术和传统药敏试验检测异烟肼、利福平敏感性，结果显示两种方法对 INH 耐药的检测结果无统计学意义（χ2=1.43, P>0.05），灵敏度为 65.15%，特异度为 96.49%，阳性预测值为 79.63%，阴性预测值为 92.92%，一致性为 91.03%。对 REF 耐药的结果无统计学意义（χ2=0.36, P>0.05），灵敏度为 98.21%，特异性为 97.83%，阳性预测值为 88.71%，阴性预测值为 99.68%，一致性为 97.89%。用 HAIN 线性探针技术检测痰标本中结核分枝杆菌对异烟肼耐药的检出阳性率与传统药敏试验相比较阳性率无差异（χ2=3.56，P>0.05），对利福平耐药的检出阳性率无差异（χ2=3.13，P>0.05）。对 379 例结核分枝杆菌菌株用 HAIN LPA 技术检测检测异烟肼、利福平的敏感性与传统药敏试验结果进行对照分析，HAIN LPA 技术与检测 INH 耐药的的结果无统计学意义（χ2=3.25, P>0.05），灵敏度为 68.33%，特异性为 98.75%，阳性预测值为 95.35%，阴性预测值为 94.31%,一致性为 94.46%。对 RFP 检测结果无统计学意义（χ2=0.51, P>0.05），灵敏度为 96.23%，特异度为 97.24%，阳性预测值为 85%，阴性预测值为 99.37%，一致性为 97.10%。用 HAIN 线性探针技术检测结核分枝杆菌菌株对异烟肼耐药的检出阳性率与传统药敏试验相比较阳性率有差异（χ2=12.19，P<0.05），对利福平耐药的检出阳性率无差异（χ2=3.27，P>0.05）。

结论 与传统药敏试验相比，应用线性探针技术检测痰标本及菌株对异烟肼、利福平的敏感性，检出率差异无统计学意义，加之线性探针技术检测药敏实验较之传统法的快速性，线性探针技术适合在临床上广泛应用。

PO-0967

MALDI-TOF MS 联合 VITEK@ 2 Compact 对阳性血培养样本病原菌快速鉴定和直接药敏试验的研究

张灏旻[1]、何志亮[2]
1. 上海交通大学医学院附属仁济医院
2. 广州中医药大学第三附属医院

目的 评估一种基于基质辅助激光解析电离飞行时间质谱(MALDI-TOF MS)联合梅里埃 VITEK@ 2 Compact 全自动药敏分析系统直接对阳性血培养瓶中细菌沉淀快速鉴定及直接药敏试验方法的临床应用价值。

方法 使用 MALDI-TOF MS 对 Triton X-100 裂解法富集的菌体进行快速鉴定，同时 VITEK@ 2 Compact 全自动药敏分析系统对分离胶促凝管富集的菌体进行直接药敏试验。以 CLSI M52 为参考文件，将快速鉴定和直接药敏试验的结果与纯培养菌落的 MALDI-TOF MS 鉴定和 VITEK@ 2 Compact 药敏试验的结果进行对比。

结果 快速鉴定法对 100 株革兰阳性菌、140 株革兰阴性菌和 19 株酵母菌的鉴定符合率分别为 84.00%、92.14%和 68.42%。与常规方法 AST 结果相比，直接药敏试验法对 125 株革兰阴性菌的 CA 为 97.98%(1944/1984)，VME 为 0.40%(8/1984)，ME 为 0.59%(3/1984)；62 株革兰阳性菌的 CA 为 96.89%(717/740)，VME 为 0.27%(8/740)，ME 为 1.89%(3/740)。

结论 MALDI-TOF MS 联合 VITEK@ 2 Compact 直接对细菌沉淀快速鉴定和直接药敏试验方法可以快速准确的鉴定出病原体和药敏结果，对提高实验室检验效率和提前指导临床使用抗生素有重要意义。

PO-0968

A TTP-incorporated Scoring Model for Predicting Mortality of Solid Tumor Patients with Bloodstream Infection Caused by Escherichia coli

Qing Zhang
Tianjin Medical University Cancer Institute and Hospital

Objective Mortality is a well-recognized complication of Gram-negative bloodstream infection (BSI). Few mortality-scoring model is currently available for solid tumor patients who are predisposed to develop Escherichia coli-caused bloodstream infection (ECBSI). We aimed to develop a mortality-scoring model by using information from blood culture time to positivity (TTP) and other clinical variables.
Methods A cohort of 509 solid tumor patients who were admitted to hospital with ECBSI and received empirical antimicrobial therapy was retrospectively enrolled. Survivors and non-survivors were compared to identify the risk factors of 30-day in-hospital mortality. Univariable and multivariable regression analyses were adopted to identify the mortality-associated predictors. Risk scores were assigned by weighting the regression coefficients with corresponding natural logarithm of the odds ratio for each predictor.
Results 315 and 194 solid tumor patients with ECBSI were distributed in the development and validation groups, respectively. Six mortality-associated predictors were identified and included in the scoring model: acute respiratory distress (ARDS) (8.777 [2.337-3.296]; 2) (odds ratio [95% confidence interval]; assigned score point), TTP ≤ 8h (2.788 [1.360-5.716]; 1), inappropriate antibiotic therapy (3.667 [1.921-7.000]; 1), blood transfusion (2.849 [1.499-5.414]; 1), fever ≥ 39 ℃ (3.034 [1.448-6.357]; 1) and metastasis (3.385 [1.67-6.861]; 1). Prognostic scores were categorized into three groups that predicted mortality: low-risk (<10% mortality, 0-1 points), medium-risk (10%–20% mortality, 2 points), and high-risk (>20% mortality, ≥3 points). The TTP-incorporated scoring model showed excellent discrimination and calibration for both groups, with AUC being 0.833 versus 0.844, respectively, and no significant difference in the Hosmer-Lemeshow test (6.709, P=0.48) and the Chi-square test (6.993, P=0.46). Youden's index showed the best cut-off value of ≥3 with 76.11% sensitivity and 79.29% specificity. TTP-incorporated scoring model had higher AUC than no TTP-incorporated model (0.837 vs 0.817, P<0.01).
Conclusion Our TTP-incorporated scoring model was associated with improving capability in predicting ECBSI-related mortality. It can be a practical tool for clinicians to identify and manage bacteremic solid tumor patients with high risk of mortality.

PO-0969

中枢神经系统酵母菌感染的临床和免疫特征分析

李正康
广东省人民医院

目的 从临床和免疫的角度分析中枢神经系统真菌感染的特征。
方法 收集 2012 年-2019 年间在广东省人民医院脑脊液培养的结果，设置酵母菌感染组和细菌感染组进行病例对照研究。
结果 满足纳入和排除标准的酵母菌感染组 49 例，细菌组 25 例。常见枢神经系统酵母菌感染病原体是新型隐球菌感染（35 例，占 71.43%），其次是白色念珠菌和无名假丝酵母菌（各 3 例），男女感染率没有差别，以成年人感染多见。体外药敏试验发现，绝大部分酵母菌对常见五类抗真菌药物（两性霉素 B、5-氟胞嘧啶、氟康唑、伊曲康唑和伏立康唑）敏感。与细菌感染进行组间比较发

现，酵母菌感染组具有系统性红斑狼疮基础疾病的比例（11/49，22.45%）显著高于细菌感染组（1/25，4.00%）（χ2=4.147，P=0.042）；酵母菌感染组有 3 例 HIV 感染患者（6.12%），细菌组为 0，但两组无统计学差异。酵母菌感染组血常规的淋巴细胞值、脑脊液生化中的氯化物浓度、患者体内 CD3+CD4+/CD3+CD8+和 CD3+CD4+的比例均显著低于细菌感染组（P 值均<0.05）；但脑脊液常规中的白细胞数值和免疫细胞检测中 CD3+CD8+的比例则相反，酵母菌组更高。
结论 机会性真菌感染与患者的免疫功能低下或失调有关。

PO-0970

腿伤凯斯特菌生物学特性及质谱自建库方法的建立

吴伊雪
中国人民解放军南部战区总医院

目的 了解腿伤凯斯特菌（Kerstersia gyiorum）的特点，结合鉴定结果、生长属性和药敏结果分析其病原学特征。同时应用基质辅助激光解吸电离飞行时间质谱（MALDI-TOF MS）系统 SARAMS Preminu 软件建库，为今后临床诊断提供依据。
方法 采用回顾性分析方法，收集本院临床患者呼吸道标本中分离出来的 17 株细菌，通过 16S rRNA 测序鉴定为腿伤凯斯特菌；采用生化反应管检测这些细菌的生化特性;测定菌株最低抑菌浓度（MIC）并分析药敏结果；同时用其中的 13 株菌进行蛋白指纹图谱数据采集，应用 MALDI-TOF MS 系统 SARAMS Preminu 软件完成 13 株菌进行自建库，并用另外 4 株菌进行验证。
结果 收集的 17 株细菌在 Vitek 2 全自动微生物鉴定仪和 MALDI-TOF MS 都不能鉴定出来，后经 16S rRNA 基因测序鉴定为腿伤凯斯特菌，该菌的生长特点与粪产碱菌(Alcaliges Faecalis)相似，都会蔓延生长，但部分生化特性不同；药敏试验结果显示该菌对阿米卡星、头孢他啶、亚胺培南、美罗培南、粘菌素和哌拉西林-他唑巴坦等多种抗菌药物呈现出高度敏感，而环丙沙星呈现中介或耐药；本研究还对这 13 株菌进行蛋白指纹图谱数据采集，建立菌株数据库，相关质谱数据通过菌株在相同培养环境下所得蛋白指纹图谱数据进行优化。用另外 4 株进行验证应用自建腿伤凯斯特菌数据库，可正确鉴定腿伤凯斯特菌，置信度大于 90%。
结论 Vitek 2 全自动微生物鉴定仪和 MALDI-TOF MS 都不能鉴定出腿伤凯斯特菌，本研究可以通过自建菌库准确鉴定该菌，与其他亲缘关系较近的鲍特菌属（Bordetella）、无色杆菌属（Achromobacter）可较好区分。同时本研究的腿伤凯斯特菌的鉴定准确性高，适用于临床直接检测，从而有利于临床工作者对患者的诊治。本研究结果更新了已有的数据库，同时也为其他细菌菌库的建立提供了很好的借鉴。

PO-0971

利用合成生物学抗消化道肿瘤大肠杆菌工程菌株的构建

高冬芳
山东大学第二医院

癌症是目前人类致死率最高的疾病之一，传统的癌症治疗主要为放疗和化疗。但是传统的治疗手段无法准确的定位于目标肿瘤、不能有效穿透肿瘤组织并且对正常组织细胞具有杀伤作用，导致治疗效果有限、副作用明显。随着合成生物学的发展，构建可特异性杀伤肿瘤细胞的工程菌是肿瘤生物治疗的全新发展方向。由于静脉注射的安全性及机体耐受性尚缺乏保证，口服是生物工程菌肿瘤治疗的理想给药方式，但细胞因子易受消化酶降解影响其应用。因此，用基因工程技术编辑非致病性细菌表达细胞因子，保护其不受胃酸降解, 进入肠道直接释放细胞因子到效应部位, 从而减少细胞因子剂量, 减轻全身副作用，在应用于消化道肿瘤的治疗时具有良好的前景。

本实验选取益生菌 E. coli Nissle 1917 作为平台菌株。利用前期工作中构建的大肠杆菌融合表达平台（Cel-CD），融合表达细胞因子 IL-18(携带肠激酶酶切位点)，一方面借助细菌载体融合表达可以减少胃内酸性环境及蛋白酶的降解；同时 Cel-CD 的分泌特性使 IL-18 被工程菌株分泌到胞外。到达肠道后，在肠激酶的作用下分离融合蛋白 Cel-IL 得到活性 IL-18，IL-18 与肠上皮细胞的细胞因子受体结合，激发一系列的机体抗肿瘤免疫应答。 利用 E. coli Nissle 1917 在消化道肿瘤组织处聚集生长的特性，借助来源于海洋发光细菌费氏弧菌(Vibrio fischeri) 的 LuxI/LuxR 群体感应系统构建大肠杆菌工程菌。通过感应菌体密度启始来源于假结核耶氏菌（Yersinia pseudotuberculosis）侵袭素 inv 的表达，侵染肿瘤组织并借助内源性 CDase 杀伤肿瘤细胞。

1) 构建大肠杆菌细胞因子 IL-18 融合分泌系统；2）群体感应（Quorum Sensing, QS）模块的构建 ；3）单质粒的靶向性平台菌株的构建；4）工程菌对消化道肿瘤杀伤作用的检测

本实验将 Cel-CD 融合表达平台应用于生物治疗工程菌的构建，提高了细胞因子的药物利用率，为肿瘤细菌治疗提供了全新的应用实例，具有良好的临床应用前景。

PO-0972

高毒力肺炎克雷伯菌的毒力特性及其对 RAW264.7 细胞炎症相关因子表达的影响

毕建蝶、杜艳、刘淑敏（通讯作者）
昆明医科大学第一附属医院

目的 比较分离自本院病人的一株高毒力肺炎克雷伯菌（hypervirulent Klebsiella pneumoniae，hvKP）和一株碳青霉烯类耐药的高毒力肺炎克雷伯菌（Carbapenem-resistant hypervirulent Klebsiella pneumoniae，CR-hvKP ）的毒力特性，探讨不同毒力的肺炎克雷伯菌对鼠源巨噬细胞 RAW264.7 炎症相关因子表达的影响。

方法 首先对收集的两株高毒力菌株进行黏液拉丝实验、PCR 扩增高毒力质粒和荚膜血清型相关基因（rmpA、rmpA2、iucA、iutA 等）及多位点序列分型(MLST)；随后进行细菌抗吞噬实验：以标准菌株 BAA1706 为对照，分为标准菌株组、 hvKP 组、CR- hvKP 组，将培养至对数生长周期的三组细菌按感染复数（multiplicity of infection,MOI)100:1 比例与 RAW264.7 细胞共培养 4h,分别计数细胞内细菌的存活率；最后取 4h 共培养上清液进行 ELISA 实验检测 TNF-α、IL-6、IL-1β 的表达情况。

结果 两株临床菌株均为高黏液表型，表达高毒力质粒相关基因，判定为高毒力菌株，其中 hvKP 的 MLST 为 23，荚膜血清型为 K1，CR-hvKP 的 MLST 为 36，荚膜血清型为 K62。在感染 4h 后，巨噬细胞 RAW264.7 内各组细菌存活情况为标准菌株>hvkp>CR-hvkp，差异均有统计学意义（P 均<0.001）。与标准菌株相比，TNF-α 的表达水平在 hvkp（P=0.007）和 CR-hvkp（P=0.009）感染后显著升高,而 IL-6 的表达水平在 hvkp（P=0.002）和 CR-hvkp（P=0.033）感染后略微升高,且与 CR-hvkp 相比 hvkp（P=0.036）更能促进 IL-6 的表达而对 TNF-α 的表达无显著差异。IL-1β 的表达在三株菌中均无显著差异。

结论 相对于标准肺炎克雷伯菌,高毒力肺炎克雷伯菌具有高黏液表型及抗巨噬细胞吞噬能力强的特性,且感染鼠源巨噬细胞 RAW264.7 细胞后,主要通过释放促炎因子 TNF-α 和 IL-6 引起更严重的炎症反应。

PO-0973

sIgA 在糖尿病的发生进程中与肠道微生态的初探

曾通旭
兰州市第二人民医院

目的 通过高脂饮食来制备前期糖尿病（Pre-DM）模型及高脂饮食联合小剂量多次注射链脲佐菌素（STZ）制备 2 型糖尿病（T2DM）模型,观察在糖尿病发生过程中肠道微生态与 sIgA 的相关性。
方法 通过前期预实验,将 C57BL/6J 试验小鼠随机分为 6 组：正常组（A 组）、Pre-DM 20 天（B 组）、Pre-DM 40 天（C 组）、Pre-DM 60 天（D 组）、Pre-DM 80 天（E 组）,在 80 天之后高脂饲喂联合小剂量多次注射链脲佐菌素制备 T2DM 模型（F 组）。各实验组测定空腹血糖腹腔注射糖耐量实验（IPGTT）,取粪便进行 16SrRNA 测序，采用 ELISA 法测定 sIgA 及胰岛素水平,胰腺做抗胰岛素抗体免疫组化实验,采用比浊法做 hs-CRP、应用流式细胞术检测 CD3+、CD3+CD8+、CD3+CD4+等 T 淋巴细胞亚群的比例。
结果 通过成功构建动物模型，16SrRNA 高通量二代测序发现 T2DM 发病进程中厚壁菌门、梭菌门、变形菌门、蓝藻菌门的菌群丰度等随着血糖的升高出现不同的变化趋势，胰岛素抵抗伴随着整个发病过程，可能慢性炎症与终胰岛素抵抗具有相关性。发现 T2DM 发病进程中细胞免疫与体液免疫出现不同程度的紊乱。
结论 肠道菌群丰度的变化伴随着 T2DM 的整个发病进程中，提示肠道菌群丰度与 SIgA 及部分免疫指标与 T2DM 的整个发病进程中具有一定的相关性.

PO-0974

Multiple carbapenemases genes clonal dissemination in carbapenem-resistant Enterobacterales strains mediated by multiple plasmids in China

Jun Li[1]、Mingxiang Zou[2]
1. Department of Clinical Laboratory, Xiangya Hospital, Central South University
2. Xiangya Hospital

Background The spread of carbapenem-resistant Enterobacterales (CRE) is an emerging clinical problem. The aim of this study was to investigate the molecular epidemiology of CRE isolates from China.
Methods CRE isolates were collected from 11 hospitals (three primary hospitals, seven general hospitals and one children's hospital) between October 2015 to July 2018. These isolates were subjected to multiple phenotypic and molecular tests, including in vitro antimicrobial susceptibility testing, PCR, pulsed-field gel electrophoresis (PFGE), and multilocus sequence typing (MLST).
Results Among the 399 CRE isolates, 51.6% (206/399) carried carbapenemases genes, and three carbapenemase genes were detected, including blaKPC-2, blaNDM-1 and blaIMP, with the rate of 29.8% (119/399), 17.5% (70/399), and 4.0% (16/399), respectively. The blaKPC-2 (33.4%, 117/350) and blaNDM-1 (61.5%, 16/26) were the predominat genes in K. pneumoniae and E. coli, respectively. The main genes in CRE isolated from adults and children were blaKPC (85.5%) and blaNDM-1 (76.5%), respectively. Notablely, blaKPC-2-positive ST11 K. pneumoniae carried by IncFII plasmids distributed not only in general hospital, but primary hospital, suggesting that it was clonal transmission. In addition, clonal distribution of blaNDM-1-positive ST2407 K. pneumoniae located on IncX3 plasmids and blaIMP-38-positive ST307 K. pneumoniae were also detected in the children's Hospital.
Conclusions The distribution of carbapenemase genes were different in species and also in adults and children. Multiple carbapenemase genes in CRE strains were clonal dissemination in

our regions mediated by multiple plasmids. Therefore, CRE monitoring should be strengthened and measures should be adopted.

PO-0975

6 例人型支原体致手术后感染的临床回顾性分析

唐朋[2]、邱宗文[1]、全念[1]、黄微微[1]、王晶晶[1]、陈奎[1]、李涛[1]、张立群[1]
1. 陆军军医大学第二附属医院检验科
2. 陆军军医大学第二附属医院检验科

目的 分析总结人型支原体（Mycoplasma hominis，Mh）引起的外科手术后感染病例的临床特征、治疗策略、实验室检测及其药物敏感性，以期对其引起的非典型感染的临床诊断和治疗用药有一定指导意义。
方法 收集本院 2019 年 1 月至 2020 年 8 月 Mh 致术后感染病例共 6 例，对病例资料进行数据汇总并对 Mh 的药物敏感性进行分析。
结果 6 例患者均为手术部位切口感染，表现为：手术部位积液，切口红肿、疼痛、不易愈合，多数患者低热。患者感染症状普遍较轻，容易被临床忽视，使用 β-内酰胺类药物经验性治疗效果不佳，感染周期长达 11-27d。实验室检测中，C-反应蛋白（CRP）升高明显，52.4-200 mg/L；中性粒细胞比例（NEUT %）升高，76.0%-94.8%；白细胞计数（WBC）基本正常；降钙素原（PCT）正常，其他指标无异常。Mh 对强力霉素、美满霉素等四环素类药物普遍敏感（6/6，100%）；氨基糖苷类药物，壮观霉素敏感性较好（5/6，83.3%）；大环内脂类药物中，交沙霉素敏感性较高（5/6，83.3%），而罗红霉素、阿奇霉素、克拉霉素均不敏感（0/6，0%）；喹诺酮类药物中，加替沙星敏感性较好（4/6，66.7%），左氧氟沙星敏感性较低（1/6，16.7%），氧氟沙星、环丙沙星、司帕沙星均不敏感（0/6，0%）。
结论 Mh 可引起泌尿生殖系统之外的外科手术后切口感染，一般发生在手术后 4-14 d，感染症状较轻，主要表现为切口红肿热痛等炎症反应，一般使用 β-内酰胺类药物经验性治疗效果不佳；Mh 感染主要引起 CRP、NEUT %升高明显，而 WBC、PCT 等指标基本正常；Mh 对四环素类药物普遍敏感，可作为临床治疗首选，但对其他种类抗菌药物敏感性不等，需结合药敏试验结果选择使用。

PO-0976

Aggregation of MPBA-AuNPs based rapid photothermal detection of foodborne pathogens

Wenjia Dong、Laibao Zheng、Yongliang Lou
Wenzhou Medical University

Rapid and portable detection of foodborne pathogens is of great significance for food safety and public health. The colorimetric methods based on naked-eye have been demonstrated to be a suitable qualitative method for point-of-care testing (POCT). However, analytical instruments like a microplate reader must be needed for the quantitative assay. To overcome its limitation, we herein report a novel photothermal method for foodborne pathogens based on the photothermal effect of aggregated mercaptophenylboronic acid-functionalized AuNPs (MPBA-AuNPs) induced by MPBA to translate the colorimetric detection into a simple temperature measurement using thermometers as the readout.

The working principle of the thermometric detection method for bacteria based on the photothermal effect of aggregated MPBA-AuNPs induced by excess MPBA is shown in Scheme 1. The well-dispersed MPBA-AuNPs appear red with maximum photothermal conversion efficiency at about 520 nm. However, when excess MPBA was added into MPBA-AuNPs, more MPBA could attach to AuNPs through Au-S, which results in the neutralization of the repulsion among

MPBA-AuNPs and the aggregation of MPBA-AuNPs through the formation of cyclic ester among the boronic acid group of MPBA(J. Huang et al., 2020). And, the color of aggregated MPBA-AuNPs will change to blue with maximum photothermal conversion efficiency at about 660 nm. When added excess MPBA, MPBA-AuNPs will turn aggregated and the color of the solution will change to blue, showing a larger temperature increase under 660 nm irradiation. However, bacteria could absorb MPBA-AuNPs onto its surface through the boronic acid of MPBA and the cis-diol groups of polysaccharides of bacteria(Liu et al., 2012). Then, if the excess MPBA were added to the mixed solution, MPBA-AuNPs will remain separated due to the protection of bacteria. Therefore, the color of the solution remains red and the temperature change is not obvious. And the degree of the aggregation has some relationship with the number of bacteria. Thus, the bacteria concentration can be detected by the temperature change using a pen-style digital thermometer easily.In conclusion, using *E. coli* O157:H7 as a model target, a good linear relationship is observed between temperature increase and bacteria concentration from 10^5-10^9 cfu mL^{-1} (R^2 = 0.9877) with a detection limit of 1.97×10^4 cfu mL^{-1}, which is three orders of magnitude lower than of the MPBA-AuNPs-based colorimetric assays. The proposed photothermal method provided a universal platform for rapid and portable detection of broad-spectrum bacteria strains in real samples.

PO-0977

Nanoparticle-enzyme complexes and the personal glucose meter based potable detection and antimicrobial susceptibility testing of pathogens

Yunqiu Shen、Laibao Zheng、Yongliang Lou
Wenzhou Medical University

Rapid detection of pathogens and assessment of antimicrobial susceptibility is of great importance for public health, especially in resource- limiting regions. Herein, we developed a simple, portable, and quantitative detection method for bacteria using AgNPs-invertase complexes and PGMs without multiple washing and rinsing steps. In the presence of bacteria, the invertase could be released from AgNPs-invertase complexes where its enzyme activity of invertase was inhibited. Then, the enzyme activity of invertase was restored and could convert sucrose into glucose measured by a commercially PGM. There was a good linear relationship between PGM signal and concentration of E. coli (from 1×10^2 cfu/mL to 1×10^7 cfu/mL) or S. aureus (from 1×10^3 cfu/mL to 1×10^7 cfu/mL), with the limit of detection of 2.99 cfu/mL and 7.59×10^2 cfu/mL respectively. Our proposed biosensor was proved to be a rapid and reliable method for antimicrobial susceptibility testing within 4 h with consistent results of MIC testing.
The detection principle of our designed potable and sensitive biosensor for bacteria detection using nanoparticle-enzyme complexes and the PGM is schematically illustrated in Scheme 1. The biosensor combines three main components: (a) invertase, an anionic enzyme, to provide signal amplification and convert sucrose into glucose measured by PGMs; (b) sucrose, a catalytic substrate of invertase; (c) PEI-AgNPs, a cationic nanoparticle, which could recognize bacteria and reversibly bind to invertase, inhibiting the catalytic activity. The catalytic activity of invertase is inhibited without denaturation by forming AgNPs-invertase complexes through electrostatic interaction. However, in the presence of bacteria, the cationic AgNPs competitively binds to the anionic surface of bacteria to displace the invertase with the recovery of enzyme activity. The active invertase converts sucrose into glucose, which could be measured by a commercially PGM. Thus, the concentration of bacteria could be quantified using a PGM.

PO-0978

In vitro activity of aztreonam–avibactam against metallo-β-lactamase-producing Enterobacteriaceae—A multicenter study in China

biying zhang、hong du
the Second Affiliated Hospital of Soochow University

Carbapenem-resistant Enterobacteriaceae (CRE) has increasinglybecome an significantincreasinglypublic health problemconcern. CRE is now detected in almost every province in China., including both metallo-β-lactamase (MBL) (e.g. NDM) andserine carbapenemases (e.g. KPC). Here, MBL-producer are particularly problematic as theyweren't inhibited by novelβ-lactamase inhibitors (e.g. avibactam). In this study, weaim toevaluate the in vitro susceptibility of aztreonam-avibactam, a novel monobactam andβ-lactamaseinhibitor combination, against MBL-producingEnterobacteriaceae in China.we collected161 metallo-β-lactamase (MBL) producing Enterobacteriaceae isolates were collected from six multi-centertertiarycare hospitals in Chinaresearch cities frombetweenOctober2016 toandSeptember2017. All isolates were identifiedcharacterizedby mass spectrometry for speciation, molecular detection (for sequence types, carbapenemase gene, andESBL-CTXgenes,mcr-1), and antibiotic susceptibility testing test. Klebsiella pneumoniae was simultaneously identified sequence types, serotype types, common virulence genes by multiplex PCR. Klebsiella pneumoniae (n=73, 45.4%) and Escherichia coli (n=53, 32.9%) accounted forthe first two of the isolateswere the most common species,. theTheisolates were collectedfrom respiratory tract (n=51, 31.7%), andurinary tract (n= 46, 25.6%) were the majority., withmore than half of the isolates (n = 94, 58.4%) carrying two or more of the screen antibiotic resistance genes. Multiplex PCR of Klebsiella pneumoniae showed ST11 type (n=13, 17.8%), K64 serotype (n=11, 15.1%), K47 serotype (n=2, 2.7%) with two isolates carrying virulence genes. Clinical common antibiotic Antimicrobialsusceptibility testing showed 81.4% isolateswere resistant tothat the resistance rate of aztreonam, and was as high as81.4%,which as a targeted treatment for MBL-Enterobacteriaceae ,the resistance rate of cefazolin, ceftazidime, ceftriaxone, cefotaxime, ampicillin-sulbactam, amoxicillin-clavulanic acid and piperacillin-tazobactam were all over 90%. After the combined use of aztreonam-avibactam, significantly reduced the MIC of the aztreonam-resistant isolates by more than 8-fold (range: ≤ 0.125 to 4μg/ml), withexceeding96.9% of theisolates wereinhibited at aztreonam-avibactam concentration ≤ 1/4μg/ml, suggesting that the combinedcombinationuseof aztreonam-avibactam mayis highly potent against become a new dawn as a candidate for the treatment ofMBL-producing Enterobacteriaceae infections, especiallyin China.

PO-0979

MALDI-TOF 质谱机器学习法进行微生物识别和药敏试验的相关性研究

赵亚楠
内蒙古自治区内蒙古人民医院

目的 基质辅助激光解吸/电离质谱飞行时间质谱(MALDI TOF MS)用于临床微生物实验室，以满足快速、低成本和准确鉴定微生物的需求。最近，机器学习技术被用来最大限度地利用 MALDI-TOF MS 中包含的信息。本文系统性地回顾和评价使用机器学习法分析 MALDI-TOF MS 质谱，从而细化物种鉴定和简化抗菌素耐药性的测定。

方法 我们利用 PubMed/Medline、Scopus 和 Web of Science 检索了已有的基于机器学习的 MALDI-TOF 质谱用于微生物种类鉴定和抗菌药物敏感性鉴定的文献。根据 PRISMA 指南进行系统评价，并对学习模型机器进行质量评估。纳入标准 查阅利用机器学习 MALDI-TOF 质谱法进行微生物种类和抗菌药物敏感性鉴定的原始研究的相关文献，研究以单一蛋白质和多肽为重点，排除相关案例研究和综述文章。

结果 在符合我们纳入标准的 36 项研究中，27 项采用机器学习进行物种鉴定，9 项采用抗生素敏感性测试。支持向量机法、基因演算法、人工神经网络法和快速分类器是最常用的机器学习算法。这些研究的质量介于差和很好之间。大多数研究报告了如何解释这些预测因素(约 88.89%)，同时提出了这些算法在临床应用的可能(100%)，但只有 4 项研究(11.11%)在外部数据集上验证了机器学习算法。

结论 基质辅助激光解吸/电离和飞行时间质谱(MALDI-TOF MS)技术通过促进精确和快速的物种鉴定，使微生物领域发生了革命性的变化。最近，越来越多的研究利用机器学习法优化 MALDI TOF MS 质谱分析。然而，这篇综述表明，目前的机器学习支持方法存在一定的缺陷，必须加以解决，使其广泛可用，并将其纳入临床常规。能够更好的解决相关问题，更好的服务于临床。

PO-0980

无背景耐甲氧西林金黄色葡萄球菌超敏检测技术研究

胡孝林[1,2]、罗阳[1,2]
1. 重庆大学医学院智慧检验与分子医学中心
2. 重庆大学医学院公共实验中心

Methicillin-resistant Staphylococcus aureus (MRSA), as one of the most common multidrug-resistant bacteria in hospital acquired infections, is mainly transmitted between patients and medical staff, patients and patients. Sensitive and accurate identification of Methicillin-resistant Staphylococcus aureus (MRSA) is of great significance. Due to the limitation of detection technology, most methods have background signal, which affects the interpretation of results. Herein, we describe an background-free sensing strategy based on aptamer-functionalized magnetic beads (AFMBs) and molybdenum disulfide (MoS2) nanosheets. AFMBs, as a tool to capture MRSA, are in charge of signal convertion, while MoS2 nanosheets are responsible for readout with near-zero background fluorescence. The detection signal was found to be linear from 10 to 106 CFU/mL with a detection limit of 6.4 CFU/mL. Besides, the method is highly specific and has good consistency with the culture method. This strategy provides a new road for establishing a universal pathogen detection platform.

PO-0981

环介导恒温扩增技术在呼吸道感染常见细菌临床检测中的应用评价

卫清[1,2]、李荷楠[2]、彭秋生[2]、杨硕[2]、王启[2]、王占伟[2]、王知任[2]、王辉[2]
1. 深圳市中医院
2. 北京大学人民医院

背景 传统的细菌培养为下呼吸道感染诊断的金标准，但其检验周期长且敏感性低。环介导恒温扩增技术（Loop-mediated isothermal amplification，LAMP）方法简单、检测快速，可应用于临床呼吸道感染常见细菌的快速检测。

目的 评估环介导恒温扩增技术对呼吸道感染常见 7 种细菌的检测能力。

方法 回顾性分析 2019 年 11 月至 2021 年 3 月 240 例北京大学人民医院疑似下呼吸道感染患者的呼吸道标本（痰和肺泡灌洗液）。利用自动化核酸提取仪提取 DNA 后，利用特异性引物进行环介导恒温扩增，检测呼吸道感染常见 7 种病原菌，肺炎克雷伯菌（KP）、鲍曼不动杆菌（AB）、金黄色葡萄球菌（SA）、铜绿假单胞菌（PA）、肺炎链球菌（SP）、卡他莫拉菌（MC）和流感嗜血杆菌（HI）。检测结果与常规细菌培养结果进行比较，分析环介导恒温扩增的灵敏性和特异性，评估优化不同菌种的阳性判断值（CT 值），探讨环介导恒温扩增技术在临床上的应用价值。
结果 本研究共检测 218 例痰和 22 例肺泡灌洗液样本，其中基于培养方法含有 7 种目标菌的样本 178 例，采用环介导恒温扩增法检测出 7 种目标菌的样本共 176 例。从提取核酸到环介导恒温扩增结果检出的平均检测时间为 2~3 小时，可同时检测多个样本。对 7 种常见呼吸道病原菌 HI、KP、AB、MC、SA、PA、SP 的最佳 CT 值分别为 18.5、20、20、15、25、19 和 18。检测灵敏度和特异性分别是：KP（90.7%，94.1%），AB（84.0%，94.2%），PA（90.8%，89.1%），MC（75.0%，99.2%），SA（81.8%，97.4%），HI（75.0%，90.3%），SP（33.3%，95.4%）。KP，AB 和 PA 的环介导恒温扩增技术结果与痰培养半定量结果具有较好的符合率，R2 值分别是 0.8557，0.8044 和 0.9243。
结论 环介导恒温扩增技术操作简单、快速。与培养方法相比，环介导恒温扩增检测的特异性较高（89.1%-99.2%），对于肺炎克雷伯菌、鲍曼不动杆菌、金黄色葡萄球菌和铜绿假单胞菌的检测灵敏度较高（81.8%-90.8%），可用于临床呼吸道感染病原菌的快速诊断。环介导恒温扩增技术结果与痰培养半定量结果符合率较好。流感嗜血杆菌和肺炎链球菌由于培养阳性标本量较少，有待进一步评估。

Outbreak of KPC-producing Klebsiella pneumoniae ST15 strains in a Chinese tertiary hospital: resistance and virulence analyses

Jiansheng Huang[1]、xiuying chen[2]、yunan zhao[1]、yang shi[1]、hui ding[1]、jianfen xu[1]、xinmi zhao[1]、rongzhen wu[1]、zhigang zhao[1]
1. Lishui Central Hospital, Lishui, Zhejiang, China
2. 丽水市疾控中心

Carbapenem-resistant Klebsiella pneumoniae (CRKP) is a major cause of clinical infection. However, KPC-producing K. pneumoniae ST15 strains are occasionally identified and have never been reported to cause hospital outbreaks in China. In this study, pulsed-field gel electrophoresis (PFGE) and whole-genome sequencing (WGS) were used to characterize 32 KPC-producing K. pneumoniae ST15 strains, which were collected at a Chinese tertiary hospital. Susceptibilities, resistance genes, virulence factors and clinical performances of the ST15 strains were comparatively analysed with corresponding ST11 strains. The ST15 strains were distributed in 7 wards, mainly in the intensive care unit (ICU, 24/32, 75%). PFGE results from 24 strains covering all the wards presented a similarity of more than 92%, indicating clonal spread. In 84% of the ST15 strains, the imipenem (IPM) and meropenem (MEM) minimum inhibitory concentrations (MICs) were ≤ 8 and ≤ 16 μg/mL, respectively, both of which were 4-fold lower than those of the ST11 strains. The infection rates of the ST15 and ST11 strains were 28.1% and 43.9%, respectively (P=0.018). PCR evaluation and WGS indicated that all the CRKP strains shared a 100% identical blaKPC-2 genetic structure, though a synonymous mutation and a Gly115-Asp116 (GD) insertion in the OmpK36 were identified in the ST15 and ST11 strains, respectively. None of the ST15 strains were positive for hypervirulence factors; however, the positive rate was 92.7% (38/41) in the ST11 isolates. To the best of our knowledge, this is the first description of nosocomial outbreaks caused by KPC-producing K. pneumoniae ST15 strains in China.

PO-0983

基于组织透明技术的脑胶质瘤中微生物三维可视化研究

孙海涛[1]、赵佳佳[1]、贺电[1]、李婷[1]、骆韵豪[1]、柯以铨[1]、郭琳琅[1]、周宏伟[1]、郭洪波[1]、吴武田[2]
1. 南方医科大学珠江医院
2. 暨南大学粤港澳中枢神经再生研究院

目的 运用组织透明技术和荧光标记结合光学显微成像及图像三维重建技术以及胶体金免疫电镜技术，验证人脑胶质瘤中微生物存在的可能性及其分布情况。
方法 在本研究团队前期建立的组织透明技术体系（OPTIClear pipeline）基础上进一步优化，以人脑胶质瘤为主要研究对象，选择 3 例我院人脑胶质瘤手术样本，并切取大小为 1cm×1cm×0.5mm 的胶质瘤组织块作为实验样本，以小鼠脑组织和小肠组织样本分别作为阴性和阳性对照，选择细菌细胞壁脂多糖(lipopolysaccharide,LPS)和磷壁酸(lipoteichoic acid, LTA)的特异性抗体进行标记，将实验样本整体组织透明化处理后在激光扫描共聚焦显微镜下扫描，选择组织块深部厚度为 100μm 的区域进行扫描和三维重建，在排除样本表面微生物污染的前提下，明确脑胶质瘤中是否存在微生物及其分布情况。并应用多种传统组织形态学**方法** 荧光原位杂交（FISH）、免疫组织化学（IHC/IF）和胶体金免疫电镜进行检测，对同一组织中是否存在微生物进行进一步验证。
结果 成功建立了人脑组织样本中微生物组织病理学三维可视化的研究体系，并通过此方法检测到脑胶质瘤组织深部存在 LPS 特异性信号，结合细菌 16S rRNA FISH 和免疫组化及胶体金免疫电镜检测结果显示，胶质瘤组织样本肿瘤中存在细菌的特异性信号，常定位于细胞内，散在分布，呈不规则形态，可为梭形或圆形。
结论 本研究提供了脑胶质瘤中存在细菌的有利证据，本团队的发现和建立的基于组织透明技术的完整大尺寸样本三维可视化的方法结合特异性荧光标记技术有望揭开脑胶质瘤中微生物的全貌，有助于更好地理解胶质瘤微环境中微生物群体与肿瘤细胞的直接交互作用。

PO-0984

米诺环素对白念珠菌的体外抑制作用分析

邹莉、梅昭、关涛、邓群
宜昌市第一人民医院

目的 初步探讨米诺环素对白念珠菌的体外抑制作用及其机制，为进一步研究米诺环素对抗白念珠菌的机制提供实验基础，为临床抗真菌治疗提供依据。
方法 收集分离的 46 株酵母菌临床样本，其中白念株菌 17 株、热带念珠菌 7 株、葡萄牙假丝酵母菌 4 株、近平滑念珠菌 4 株、光滑念珠菌 10 株、拟平滑假丝酵母菌 4 株。使用纸片扩散法对 46 株临床菌株进行药物敏感实验；采用电镜观察米诺环素对白念珠菌在 YPD 固体培及液体陪养基中的形态学变化；XTT 法检测白念珠菌生物膜和浮游细胞代谢活性；检测比较白念珠菌 caspase 3 的活化程度，对比分析各组之间差异。
结果 46 株酵母菌临床菌株中，米诺环素对白念珠菌表现出最强的抑制作用；与空白对照组比较，米诺环素处理后的白念珠菌的菌丝增长明显受抑制，在米诺环素浓度 256μg/ml 时展示出最佳抑制效果，随着米诺环素浓度增高，菌丝增长缓慢仍明显受抑制(P<0.01)。米诺环素处理后的白念珠菌生物膜活性显著降低(P<0.01)，且随着米诺环素浓度的增加，抑制作用更加明显，而米诺环素对白念珠菌浮游细胞活性没有明显改变；与对照组相比，256μg 组胞内 Caspase 3 酶活化程度升高，有显著性差异(P<0.05)，512μg 和 1024μg 组胞内 Caspase 3 酶活化程度明显高于对照组(P<0.01)，而三个实验组间的 Caspase 3 酶活化程度并无显著性差异(P>0.05)。
结论 米诺环素可抑制体外白念珠菌的生长，主要表现在菌量减少、激活 Caspase 3 酶活性从而诱导白念珠菌生物膜活性下降和凋亡，这可能与生物膜和 caspase 酶活性相关。

PO-0985

Outer membrane vesicles from Hypervirulent Klebsiella pneumoniae mediate virulence factor transfer

Yuneng Hua
southern medical university

Objective Hypervirulent Klebsiella pneumoniae(HvKp) has emerged as an important nosocomial pathogen, which is more virulent than classical Klebsiella pneumoniae (CKp) and carbapenem-resistant Klebsiella pneumoniae (CRKP). Hypervirulent Klebsiella pneumoniae can naturally secrete outer membrane vesicles, which are potent virulence factors, may acting as mediators of inter- and intra-species communication. It is crucial to determine the pathogenic mechanism of outer membrane vesicles from Hypervirulent Klebsiella pneumoniae.
Design Outer membrane vesicles from Hypervirulent Klebsiella pneumoniae and classical Klebsiella pneumoniae are isolated, characterized and verified by sequential differential centrifugation, transmission electron microscopy, NanoSight analysis and Western blotting. Virulence factors relates to Hvkp-OMVs and their intra-species communication are analyzed by transwell, reverse transcription-PCR, flow cytometry, enzyme linked immunosorbent assay and proteome analysis. To identify the role of Hvkp-OMVs in bacteria-bacteria interactions in vitro and in vivo.
Results we indicate that Hvkp-OMVs may promote virulent plasmids and proteins transfer from HvKp to CKp or CRKP, contribute to potential dissemination of virulence-encoding elements among Klebsiella pneumoniae.
Conclusion To date, this work demonstrates that HvKp OMVs are mediating virulence factors transfer and allowing increase the virulence level of CKP or CRKP.

PO-0986

头孢地尔联合其他抗菌药物对碳青霉烯耐药肠杆菌目细菌的体外活性研究

邹俊扬、王晓娟
北京大学人民医院

目的 本研究旨在探讨头孢地尔联合其他抗菌药物对碳青霉烯耐药肠杆菌目细菌的体外抗菌作用，为临床提供以头孢地尔为基础的联合治疗的体外活性证据。
方法 收集 2018 年 1 月至 2020 年 7 月期间北京两家三级医院病毒性肺炎合并碳青霉烯耐药肠杆菌目细菌（Carbapenem-resistant Enterobacteriales，CRE）感染患者分离出的 13 株非重复 CRE，从中筛选出 5 株 CRE，3 株携带 *bla*$_{KPC}$ 的肺炎克雷伯菌和 1 株携带 bla$_{NDM}$ 的大肠埃希菌和 1 株携带 *bla*$_{NDM}$ 的阴沟肠杆菌。在 2016 年至 2018 年 CRE network 监测项目筛选 4 株肺炎克雷伯菌，包括 1 株携带 *bla*$_{NDM-9}$，1 株携带 *bla*$_{IMP-4}$ 的，1 株携带 *bla*$_{OXA-48}$ 和 1 株同时携带 *bla*$_{KPC-2}$+*bla*$_{NDM-1}$，1 株携带 *bla*$_{VIM-1}$ 的阴沟肠杆菌，共计 10 株 CRE。检测乏铁的阳离子调节（iron-depleted Cation adjusted Mueller-Hinton broth，ID-CAMHB）和阳离子调节肉汤（Cation adjusted Mueller-Hinton broth，CAMHB）对头孢地尔、美罗培南、替加环素、多粘菌素 B 和左氧氟沙星抗菌药物敏感性试验是否存在影响。采用棋盘法检测以头孢地尔为基础联合美罗培南、替加环素、多粘菌素 B 或左氧氟沙星的两药联合药敏试验对携带不同碳青霉烯酶基因型的 CRE 的体外抗菌协同能力。
结果 ID-CAMHB 对替加环素和美罗培南发挥体外抗菌活性有影响，ID-CAMHB 中 80%的实验菌株 MIC 相比于 CAMHB 上升 1～3 个稀释度。在 ID-CAMHB 中，头孢地尔联合替加环素抗菌活性最好，该方案对 80%（8/10）的实验菌株表现出协同作用。其次为头孢地尔联合美罗培南或美罗培南联合左氧氟沙星，分别对 40%（4/10）和 30%（3/10）的实验菌株具有协同作用。头孢地尔联合多

粘菌素 B 仅对 1 株 CRE 中表现协同作用。在 CAMHB 中，头孢地尔联合美罗培南或头孢地尔联合替加环素分别表现出 10%（1/10）和 20%（2/10）的协同作用。在 ID-CAMHB 中，各种抗菌药物组合对 100%产 *bla*$_{KPC}$、*bla*$_{IMP}$、*bla*$_{VIM}$和 *bla*$_{OXA-48}$的 CRE 表现出较好的协同和相加作用。对于共产 *bla*$_{KPC}$ 和 *bla*$_{NDM}$ 的菌株，头孢地尔联合替加环素、美罗培南、多粘菌素或左氧氟沙星在两种肉汤中均未表现出协同作用。

结论 头孢地尔与替加环素联合使用可提高抗菌活性，是治疗 CRE 感染的一种有潜在价值的选择，仍需更多试验去验证。

PO-0987

碳青霉烯耐药铜绿假单胞菌分子流行病学和耐药机制研究

宋贵波、周飞
昆明医科大学第一附属医院

目的 了解昆明市两家医院微生物室分离的碳青霉烯耐药铜绿假单胞菌（CRPA）的分子流行病学特点和耐药机制。

方法 收集两院 2017 年 1 月至 2021 年 2 月微生物室分离的 81 株 CRPA，采用 MIC 法和 K-B 法检测其对常用抗菌药物的敏感性；采用多位点序列分型（MLST）检测其序列型（ST）并绘制最小生成树，进行同源性和遗传进化分析；聚合酶链式反应（PCR）扩增碳青霉烯酶酶基因（bla KPC、bla GES、bla IMP、bla VIM、bla SPM、bla NDM 和 bla OXA-40），经测序和 BLAST 比对确定其基因型；采用 PCR 扩增 oprD 基因全长，Sanger 测序并与标准菌株铜绿假单胞菌 PAO1 的 oprD 序列进行比对分析其突变；PCR 扩增 MexAB-OprM 外排泵过表达菌株的外排泵调节基因 mexR、nalC 和 nalD，结果进行 BLAST 比对分析其突变；应用微量滴定板试验检测其生物膜形成。

结果 81 株 CRPA 菌株对常用抗菌药物均表现出较高的耐药性；MLST 分型结果分为 36 种不同的 ST，其中 ST3645、ST3646、ST3647、ST3648 和 ST3649 为本研究中新发现的 ST，ST3390 为最常见的类型，占 41.98%（34/81）；碳青霉烯酶基因检测结果显示，其中 30 株携带 bla IMP-9 基因，22 株携带 bla VIM-2 基因，1 株携带 bla NDM-1 基因，未检出 bla KPC、bla GES、bla SPM 和 bla OXA-40 耐药基因；oprD 的突变分析显示，仅 3 株未发生任何形式的突变，在 78 株发生 oprD 突变的类型中，以碱基的插入或缺失造成的移码突变最常见（68/81），其中 nt109 位置缺失碱基 A 是最常见的突变之一（37/68），且 34 株 ST3390 均发生该突变；外排泵过表达的菌株有 17 株，占 20.99%，其调节基因蛋白的突变分析显示 NalC 蛋白的突变最常见，其突变类型有 G71E、A145V、Q182K、L206V 和 S209R；MexR 蛋白的突变类型有 V115E、L119K、V126E 和 L135H，其中菌株 CRPA51 发生 mexR 基因 nt135-146 的碱基缺失；NalD 蛋白的突变类型有 W49S 和 N130S，其中菌株 CRPA04 发生 nalD 基因 nt89 缺失碱基 A；微量滴定板形成试验检出形成生物膜的菌株有 74 株，占 91.35%。

结论 ST 型别丰富多样且 ST3390 耐药菌株存在院内播散和克隆传播，提示须严格做好耐药菌株的来源及传播的持续监测和感染防控措施；孔蛋白 OprD 的缺失或突变伴随生物膜形成是 81 株 CRPA 菌株的主要耐药机制。

PO-0988

基于熵驱动无酶扩增系统构建新型荧光传感器用于快速检测 HPV-18 E6/E7 mRNA

许伟、吴国球
东南大学附属中大医院

目的 本研究基于核酸链置换反应（熵驱动）的无酶扩增系统，以 HPV-18 E6/E7 mRNA 为链置换反应起始触发物，通过循环扩增反应生成大量信号产物；通过荧光纳米微球捕获信号产物，并构建荧光检测系统，实现对 HPV-18 E6/E7 mRNA 的快速、灵敏检测。本方法可应用于临床人乳头状瘤病毒感染的快速筛查。

方法 1.熵驱动扩增系统的构建：通过 NCBI 数据库对 HPV-18 基因组进行分析，选取保守区段的特异序列作为目标检测序列；在目标序列的基础上设计构建一种基于熵驱动的无酶扩增循环体系；利用数学模型分析该方法的理论可行性，并用非变性聚丙烯酰胺凝胶电泳验证核酸链间的程序性杂交方案；通过调整体系中各核酸链间的比例，以及改变反应的时间、温度、以及缓冲体系，获得最佳反应条件；研究核酸单、多点突变对检测结果的影响，评价该系统的灵敏度、特异度等。2.荧光传感器的构建及初步评价：在核酸链上标记生物素和地高辛，使其能被标记有亲和素的荧光纳米微球所捕获，从而实现信号的二次放大；使用修饰过抗地高辛抗体的试纸条对核酸-纳米微球复合物进行捕获；通过层析试纸条中的荧光纳米微球，将产物转化成荧光信号，并将信号进一步放大，以小型荧光扫描仪检测荧光信号，构建了一种基于熵驱动无酶扩增系统的荧光传感器。

结果 1.熵驱动扩增系统的构建：通过 NCBI 数据库查询到 HPV18 的全基因序列，并从其 E6/E7 基因保守序列中筛选出特异序列作为检测靶标；通过核酸计算软件 NUPACK 辅助设计了一套基于链置换反应的无酶等温扩增循环系统；理论计算结果显示产物转化效率可达到 99%；非变性凝胶电泳结果证实了核酸链之间可以实现程序性核酸置换，最终生成可与荧光纳米微球结合的核酸产物；；体系最佳反应条件为：100 nM 复合物 SBO、100 nM 链 F，避光恒温 37℃反应 60 min；在最优反应条件下靶标浓度在 100 pM 到 10 nM 之间时，该扩增体系中荧光强度与待测靶标浓度的对数呈线性关系，线性相关方程为 Y=395042logC-276257, R2=0.9753，最低检测下限约为 5 pM；该系统特异度高，单碱基错配可致荧光信号下降 95%以上；探针冻干 30 天内检测结果无统计学差异，（P=0.08）。、

结论 本研究成功构建了一种基于熵驱动的核酸无酶扩增系统，可实现扩增产物的信号放大，并通过偶联基于侧流免疫层析的荧光纳米放大系统，可实现目标 RNA 分子的有效检测。该传感器具有灵敏度高、特异度好、方法简便、成本低廉、快速检测等优点，可对 HPV-18 E6/E7 mRNA 进行快速检出，在临床 HPV 快速筛查中具有良好的应用前景。

PO-0989

ICU 念珠菌血流感染患者的临床特点及死亡的相关危险因素

陈霞、李艳明、刘文恩、杨勇文
中南大学湘雅医院

目的 分析重症监护病房（Intensive Care Unit，ICU）念珠菌血流感染的病原菌分布、患者临床特点及死亡相关危险因素。

方法 采用回顾性分析法，收集中南大学湘雅医院 2016 年 1 月至 2020 年 12 月 ICU 念珠菌血流感染患者的临床资料，感染相关指标以及预后情况，分析念珠菌血流感染病原菌分布及患者的临床特点。并根据预后将患者分为死亡组和生存组，采用单因素卡方检验及多因素 logistic 回归分析其死亡相关危险因素。

结果 在 80 例血流念珠菌感染患者中，白念珠菌感染率最高（36.3%）。药敏结果表明各种念珠菌均为野生型，对两性霉素 B 相对敏感。白念珠菌对氟康唑、伊曲康唑、伏立康唑相对敏感（均≥96.6%），非白念珠菌对氟康唑、伊曲康唑、伏立康唑有一定程度的耐药。80 例患者中死亡 29 例(36.3%)。单因素分析显示急性生理学与慢性健康状况 II（Acute Physiology and Chronic Health Evaluation II，APACHEⅡ）评分≥20、糖尿病及机械通气与念珠菌血流感染患者死亡相关。多因素 logistic 回归分析提示 APACHEⅡ评分≥20 是念珠菌血流患者死亡的独立危险因素（OR=0.220,95%CI：0.078~0.619，P=0.004）。

结论 白念珠菌是 ICU 患者念珠菌血流感染最常见的菌种。APACHEⅡ评分≥20 是念珠菌血流感染患者死亡的独立危险因素。

PO-0990

脆弱拟杆菌通过下调 NF-κB 信号通路抑制 TNF-α 诱导的结肠上皮细胞炎症反应

何秋月[1]、杜艳[2]、牛敏[2]
1. 昆明医科大学第一附属医院检验科
2. 昆明医科大学第一附属医院检验科

目的 探讨脆弱拟杆菌抑制 TNF-α 诱导的结肠上皮细胞 hcoEPIC 炎症反应的机制,以期发掘脆弱拟杆菌作为新一代益生菌的益生功能，为 CRC 的预防和治疗提供新的益生菌疗法。

方法 以 TNF-α 为诱导剂建立体外细胞炎症模型并分为 4 组, 即对照组、BF 组、TNF-α 诱导组、BF+TNF-α 组。首先用 BF 与正常结肠上皮细胞 hcoEPIC 共培养 4 小时，分别检测 BF 对 hcoEPIC 的粘附和侵袭能力；随后先用 TNF-α 诱导 hcoEPIC 细胞 4 小时后加入 BF 共培养，24 小时后分别用 CCK8 实验和 Annexin V-FITC/PI 法检测细胞存活率和凋亡情况情况；进一步采用 Western bloting 从蛋白水平检测不同处理组中 hcoEPIC 细胞内 NF-κB 信号通路关键蛋白 P-NF-κBp65 和 p-IκBα 的变化，再用 qPCR 方法从分子水平验证 NF-κB 和 IκBα mRNA 水平；最后用 ELISA 法检测该通路下游细胞因子 IL-1β、TNF-α、IL-10 的表达。

结果 脆弱拟杆菌能够粘附于正常结肠上皮细胞 hcoEPIC 上，但并不侵袭损伤细胞。与正常对照组相比，脆弱拟杆菌单独处理并不影响 hcoEPIC 细胞的细胞存活率和凋亡（P>0.05），但能显著降低由 TNF-α 诱导的细胞损伤和凋亡（P<0.05）；与 TNF-α 单独处理组相比，BF+TNF-α 组中 P-NF-κBp65 和 p-IκBα 蛋白表达水平和 NF-κB mRNA 和 IκBα mRNA 水平显著降低（P<0.05），细胞上清液中 IL-1β、TNF-a 的生成减少，IL-10 的释放增加（P<0.05）。

结论 脆弱拟杆菌能在体外增加 TNF-α 诱导的结肠上皮细胞存活率、抑制细胞凋亡和损伤；下调 NF-κB 信号通路、减少促炎性细胞因子 IL-1β、TNF-α 释放，增加抗炎性细胞因子 IL-10 的产生来对抗 TNF-α 诱导的炎症反应。

PO-0991

艰难梭菌感染的影响因素和治疗情况分析

高红林
广东省人民医院

目的 了解艰难梭菌感染的影响因素和分析艰难梭菌感染患者的治疗情况。

方法 回顾性分析广东省人民医院 2016 年 1 月 1 日-2020 年 12 月 31 日期间的 39 例艰难梭菌感染患者的基本资料，治疗方案以及预后情况；共有 39 例艰难梭菌 感染病例，其中男性患者占 79.49%，年龄大于 65 的患者占 56.41%，经检验， 对照组和病例组的大便性状、慢性肾脏损伤、

过去 3 月内有住院史、头孢菌素、喹诺酮类、侵入性机械通气、患者结局、年龄、治疗使用的抗生素个数有显著差 异（P<0.05），慢性肾脏损伤、过去 3 月内有住院史和治疗使用的抗生素个数是艰难梭菌感染的独立危险因素。39 例患者中，以甲硝唑治疗的患者为主占比 35.90%，其中治愈率 78.57%，未针对艰难梭菌使用抗菌药物的患者治愈率 83.33%。

结论 相比起其他患者，长期住院、高龄且患有基础疾病患者更易患艰难梭菌感染，应该控制存在独立危险因素患者的住院时间，且应严谨使用抗生素，对于已经艰难梭菌感染的患者医生应该先考虑调节肠道菌群，合理使用抗生素。

PO-0992

金属酶非泵出机制导致按蚊伊丽莎白菌对碳青霉烯类和氨曲南/阿维巴坦耐药

张晓兵、常彦斌、张代琴
重庆医科大学附属第一医院

目的 近年来，按蚊伊丽莎白菌感染日趋增加，且有爆发的报道，由于耐药模式存在地区差异性，本文回顾性分析该菌感染临床特征及可能的耐药机制。

方法 1）收集我院菌株，16S rRNA 鉴定。2）回顾性分析该菌感染患者临床资料,回归分析感染和死亡危险因素。3）测定该菌常用抗生素 MIC。4）检测该菌碳青霉烯酶和超广谱 β 内酰胺酶基因。5）碳青霉烯酶和五种外排泵基因克隆转化工程菌，测量转化株和空载质粒转化株 MIC，分析可能耐药机制。

结果 1）16S rRNA 鉴定：40 株脑膜炎伊利莎白菌 39 株应为按蚊伊丽莎白菌。2）Logistic 回归分析表明：39 例感染患者，冠心病、慢性阻塞性肺病、6 个月内手术史、贫血和全身性激素使用是感染独立危险因素；脑血管疾病、慢性阻塞肺疾病、鼻胃管置入、贫血是院内死亡危险因素，而贫血是死亡唯一独立危险因素。3）药敏实验**结果** 米诺环素 100%敏感、头孢他啶、头孢他啶/阿维巴坦、氨曲南、氨曲南/阿维巴坦、粘菌素均耐药。4）39 株按蚊伊丽莎白菌 blaGOB、blaBlaB、blaCME 基因阳性率分别为 94.9%、94.9%和 92.3%，未检出其他常见碳青霉烯酶基因和超广谱 β 内酰胺酶基因。5）基因功能显示：两种金属酶 BLAB 和 GOB 与碳青霉烯类耐药有关，blaCME 与头孢菌素类和单环类耐药有关；五种假定外排泵与该菌耐药并没有直接关系。

结论 1）传统微生物鉴定法易将按蚊伊丽莎白菌鉴定为脑膜炎伊丽莎白菌；该菌感染患者死亡率较高，冠心病、慢性阻塞性肺病、6 个月内手术史、贫血和全身性激素使用是该菌感染独立危险因素，贫血是死亡独立危险因素贫血是死亡的独立危险因素，应该高度重视。2）根据体外药敏试验结果，建议将米诺环素作为治疗该菌感染的首选抗生素。3）金属酶 BLAB 和 GOB 导致了该菌对碳青霉烯类和氨曲南/阿维巴坦耐药，而五种假定外排泵在耐药性方面没有发挥作用。

PO-0993

耐消毒剂基因 qacEΔ1-sul1 在 CRE 中的流行病学分析及其机制研究

陈丹丹
宁德市闽东医院

目的 检测耐碳氢酶烯类药物的肠杆菌科细菌（以下简称 CRE）中的的 qacEΔl-sull 基因，并对该基因在 CRE 的流行情况进行分析

方法 采用全自动微生物分析系统 VITEK 2-COMPACT 的鉴定卡、药敏卡进行细菌鉴定和药敏试验，应用 PCR 扩增法对 qacEΔ1-sul1 基因进行扩增，并测序分析

结果 检测 15 株耐碳氢酶烯药物的肺炎克雷伯杆菌中有 14 株携带 qacEΔI-sull 耐消毒剂基因，检出率的阳性率为 93%（14/15）
结论 耐消毒剂 qacEΔI-sull 基因极高的检出率表明肠杆菌科细菌对消毒剂的抗性极高,这种高抗性可导致医院常规消毒剂在正常规定使用浓度下无效,从而对环境耐药菌造成污染严重，此现象应引起医务人员对消毒剂浓度使用和医院感染的高度重视 。

PO-0994

创伤弧菌赖氨酸乙酰化的蛋白质组学分析

卢兆莲
山东大学第二医院

创伤弧菌(V. vulnificus)是一种嗜盐的河口细菌，可引起伤口坏死性感染或败血症，死亡率很高。赖氨酸乙酰化作为一种普遍的翻译后修饰(PTM)，几乎在细胞的各个方面发挥着重要的调控作用。在这里，我们使用抗乙酰赖氨酸免疫沉淀富集低丰度的 PTM 蛋白，然后进行 LC-MS/MS 分析。总的来说，我们在 841 种蛋白中检测到 2035 个赖氨酸乙酰化位点，占细胞总蛋白的 18.5%。乙酰基的生物信息学分析表明其在代谢调节中具有重要作用。更确切地说，参与碳代谢和生物合成的蛋白质是乙酰化的潜在目标。此外，通过对乙酰化组的研究，我们发现了两种乙酰化基序，一种是赖氨酸或精氨酸在+4/+5 位置，另一种是酪氨酸、组氨酸或苯丙氨酸在-1/+1 位置。此外，蛋白质相互作用网络分析表明，蛋白质乙酰化可以调节多种相互作用。本研究是创伤弧菌中的第一个乙酰基，为深入探讨创伤弧菌中赖氨酸乙酰化的生理作用提供了重要的开端。

PO-0995

Acquired mucoid phenotype of Acinetobacter baumannii: impact for the molecular characteristics and virulence

Wulin Shan、Huanhuan Zhang、Jinsong Kan、Meiling Yin、Jiayun Zhang、Lingling Wan、Renliang Chang、Ming Li
The First Affiliated Hospital of University of Science and Technology of China

Background Acinetobacter baumannii (A. baumannii), a major hospital-acquired pathogen, is a serious health threat and poses a great challenge to healthcare providers. Presently, limited studies focus on mucoid A. baumannii. The aim of this study was to analyze molecular characterization, virulence and its regulatory mechanism of mucoid A. baumannii.
Methods All strains, including multidrug-resistant mucoid (AB-R-M), multidrug-resistant non-mucoid (AB-R-NM) and carbapenem-susceptible non-mucoid A. baumannii (AB-S-NM), were isolated from different patients. The biofilm-forming ability was detected by crystal violet staining. Multilocus sequence typing (MLST) was performed on A. baumannii strains, and the virulence was determined in Balb/c mice injected by intraperitoneally (i.p.). mRNA sequencing was carried out to compare whole transcriptomes of mucoid and non-mucoid strains.
Results We observed the colonies of mucoid A. baumannii were moist, irregular round, with an elevated surface, and the wire drawing was positive. Gram staining data showed no difference in the morphology between mucoid and non-mucoid A. baumannii, and all strains were gram-negative coccidiella. Mucoid phenotype of A. baumannii could stably inherit regardless of transmitting these mucoid strains to 15 generations in the blood agar or 5 generations in the broth. Antibiotic susceptibility testing showed that all mucoid strains were multidrug-resistant. Notably, mucoid phenotype and antibiotic resistance weren't correlated with the amount of biofilm produced by A. baumannii. MLST data demonstrated that types of mucoid A. baumannii were ST2. Most (82.6%, 38/46) multidrug-resistant non-mucoid strains also belonged to the molecular type, ST2, and other types including ST129, ST158, ST195, ST80 and ST3. Additionally, mucoid

A. baumannii were more virulent than non-mucoid isolates in mouse model. Finally, our comparative transcriptomic data showed that the significantly altered 720 genes were mainly involved in six processes, including metabolic, cellular process, membrane, membrane part, catalytic activity and binding. Based on the GO enrichment, these genes are mainly enriched in transposon- and DNA-associated processes with significant q-values as calculated by the Benjamini-Hochberg procedure (q-values < 0.05). Bioinformatics analysis and literature review suggested that 15 genes, especially for IX87_RS16955 (acnA), IX87_RS10800 (XanP), IX87_RS12875 (GlmM), IX87_RS00885 and IX87_RS12395 (bfr), were possibly associated with the phenotype and virulence of mucoid A. baumannii.
Conclusions Our study comprehensively describes the molecular characterization, virulence and candidate regulatory genes of mucoid A. baumannii. Mucoid phenotype was adaptive response of A. baumannii to external stress and could be inherited stably. The morphology of mucoid A. baumannii was significantly different from non-mucoid strains. Besides, mucoid A. baumannii were resistant to most antibiotics, showed no biofilm-forming ability, belonged to ST2 type, and had high virulence. Notably, ST2 strains, associated with multidrug-resistance, potentially have spread in Anhui, China. Furthermore, our comparative transcriptomic data indicated that 15 genes were possibly associated with mucoid formation and virulence regulation of mucoid A. baumannii. The data would improve our understanding of phenotypic characteristics and the virulence of mucoid A. baumannii, and also provide novel insights in the prevention and therapeutics against these strains-related infections.

PO-0996

基于表面增强拉曼光谱鉴定志贺菌四种血清型

李佳
南京大学医学院附属鼓楼医院

背景 志贺菌感染形势严峻，但其检测与药敏需 3 天以上，无法满足临床需求。表面增强拉曼光谱(SERS)技术具有快速、高灵敏度和指纹特征光谱等优势，但对临床样本分析处于探索阶段。
目的 我们尝试将 SERS 技术用于志贺菌快速检测，并建立志贺菌四种主要血清型的数据库。
方法 首先制备纳米银溶胶，通过透射电镜、紫外可见分光光度仪对所制备的纳米材料进行分析表征。筛选出 SERS 增强效果最佳的材料作为检测志贺菌的活性基底，分别检测福氏志贺菌、宋内志贺菌、痢疾志贺菌、鲍氏志贺菌的拉曼信号，并通过 SIMCA 软件对所测得的数据进行正交偏最小二乘法判别分析(OPLS-DA)，结合十折交叉检验验证此方法的准确性。
结果 在拉曼位移为 550～1800cm-1 光谱内，福氏志贺菌有 6 处明显的拉曼谱峰，宋内志贺菌有 7 处明显的拉曼谱峰，痢疾志贺菌有 8 处明显的拉曼谱峰，鲍氏志贺菌有 5 处明显的拉曼谱峰。四种不同血清型志贺菌的拉曼谱峰位置以及强度区别明显。志贺菌四种不同血清型之间在 OPLS-DA 得分图中虽有一些重叠，但有明显的分离趋势，而且 R2X(cum)=0.983，表明重新组合的几个变量所能解释的 X 变量的比例已达 98.3%，说明该模型预测能力较好。通过十折交叉检验得到测试集的正确率为 95.22%。
结论 初步研究表明表面增强拉曼光谱结合 OPLS-DA 统计分析可作为临床志贺菌四种血清型检测的一种手段。

PO-0997

临床白色念珠菌感染诱导人气道上皮细胞损伤的作用研究

史清梅、孟繁君、王利新
宁夏医科大学总医院

目的 探究临床白色念珠菌感染对人气道上皮细胞的免疫损伤作用。
方法 分离临床白色念珠菌菌株并进行产膜能力分析；体外构建原代人气道上皮细胞培养损伤模型。酶标法检测细胞 ROS 和 LDH 水平；ELISA 法检测细胞 LDH 和细胞因子 hBD2、GM-CSF、G-CSF 的释放；Western blot 法检测细胞紧密连接蛋白 ZO-1 以及 MAPK 信号通路中 ERK1/2、JNK 和 p38 总蛋白及磷酸化蛋白表达水平。
结果 对临床分离的白色念珠菌进行产膜能力分析，并成功构建人上皮细胞损伤模型，与对照组相比，白色念珠菌感染可明显诱导上皮细胞 LDH 释放，促使胞内活性氧 ROS 的累积、细胞因子表达增加，进而下调细胞紧密连接蛋白 ZO-1 的表达，激活 MAPK 信号通路相关蛋白 p38、ERK1/2 的表达。
结论 白色念珠菌感染人气道上皮细胞造成免疫损伤主要通过激活 MAPK 信号通路 p38、ERKs 介导的氧化应激发挥作用。

PO-0998

尿路感染 B 群链球菌的耐药特征与 CAMP 试验敏感性分析

时翠销、王刚、黄颖、李亚娟、徐元宏
安徽医科大学第一附属医院

目的 研究尿路感染 B 群链球菌的耐药特点、耐药基因分布情况及 CAMP 试验敏感性和编码 CAMP 因子的 cfb 基因的表达情况。
方法 采用纸片扩散法和 Vitek 2 Compact 仪器法测定抗菌药物的敏感性，D 试验检测红霉素诱导的克林霉素耐药，PCR 法检测抗生素相关耐药基因；进行 CAMP 试验，通过检测 16 S rRNA 基因片段及 cfb 基因、生化试验、MALDI-TOF MS 鉴定菌株。
结果 51 株 B 群链球菌对氨苄西林、达托霉素、利奈唑胺、呋喃妥因、青霉素、奎奴普丁/达福普汀、替加环素、万古霉素耐药率为 0，对红霉素、四环素、克林霉素、左氧氟沙星、莫西沙星、环丙沙星耐药率分别为 66.7%、66.7%、49.0%、47.1%、49.0%、47.1%。红霉素和四环素主要耐药基因为 ermB 和 tetM, 喹诺酮类抗生素耐药基因 gyrA 和 parC，它们的检出率都为 78.4%。CAMP 试验结果显示 3 株阴性、9 株弱阳性、39 株阳性，经生化试验、cfb 基因、16 S rRNA 检测、MALDI-TOF MS 鉴定，除 2 株阴性株及 2 株弱阳性株未检测出 cfb 基因，其余方法鉴定均符合为 B 群链球菌的特征。
结论 尿路感染的 B 群链球菌对多种抗生素敏感，对红霉素、克林霉素、四环素、喹诺酮类抗生素耐药性高，耐药基因携带情况与耐药性具有一定相关性；CAMP 试验及 cfb 基因对于 B 群链球菌的鉴定缺乏敏感性。

PO-0999

小檗碱对耐甲氧西林金黄色葡萄球菌体外抑菌作用及其机制的研究

周芳芳、王蕾
上海市第八人民医院

目的 观察中药单体成分小檗碱及联合三种抗生素（庆大霉素、左氧氟沙星、阿米卡星对耐甲氧西林金黄色葡萄球菌的抑菌效果；探究小檗碱对 MRSA 的抑菌机制，为中药单体成分小檗碱在抗菌中的临床应用奠定基础。
方法（1）采用微量肉汤稀释法测定小檗碱、GEN、LEV、AMI 对 26 株临床分离的 MRSA 的最低抑菌浓度（Minimum Inhibitory Concentration，MIC），同时采用棋盘法测定小檗碱联合 GEN、LEV、AMI 对 MRSA 的 MIC，观察小檗碱对 MRSA 的抑菌效果；（2）采用时间杀伤曲线研究小檗碱联合抗生素对 MRSA 的抑菌动力学；采用培养基电导率实验观察小檗碱对 MRSA 通透性的改变；透射电子显微镜观察不同浓度小檗碱作用后 MRSA 形态学的变化。
结果 小檗碱对 26 株 MRSA 的 MIC 范围为 32~256 μg/mL。小檗碱分别联合庆大霉素、左氧氟沙星、阿米卡星对 MRSA 均有明显的抑菌效果。8 μg/mL、16 μg/mL、32μg/mL、64 μg/mL、128μg/mL 小檗碱作用菌体 4 小时后，电导率分别增加了 24.49% 、34.59%、50.34%、89.12%、91.84%。透射电子显微镜观察发现低浓度（8μg/mL；1/8 MIC）小檗碱对细菌无明显破坏作用，MRSA 菌体结构完整；高浓度（512 μg/mL；8 MIC）小檗碱诱导 MRSA 的细胞壁结构大量破坏溶解，菌体内容物大量外泄，导致细菌裂解死亡。
结论 小檗碱对 MRSA 有较理想的抑菌效果；小檗碱分别联合庆大霉素、左氧氟沙星、阿米卡星对 MRSA 均有明显的抑菌作用；低浓度小檗碱通过改变细胞膜通透性，从而达到抑制细菌的作用；而高浓度小檗碱通过破坏和溶解 MRSA 细胞壁的结构，从而达到杀灭细菌的作用。

PO-1000

Characterization of a novel B1 subclass metallo-β-lactamase gene, blaAFM-1, located on an IncW-type conjugative plasmid in Alcaligenes faecalis

Yingcheng Qin
Southern medical universty Nanfang hospital

Background and objective Metallo-β-lactamases (MBLs), due to the strong hydrolysis and plasmid-mediated properties, make carbapenems resistance widely spread, and due to the lack of effective carbapenemase inhibitors of carbapenem-resistant bacteria, carbapenem-resistant bacteria cause us great attention.
The novel type of MBLs, blaAFM-1 gene (GenBank accession number: MK143105.1) was first discovered in an Alcaligenes faecalis strain by us. It is quite different from other currently known acquired B1 MBLs genes, and the highest necleotide homology with NDM-type genes is only 85%. Like the other MBLs, AFM-1 enzyme also has two metal ions, and the AFM-1 enzyme has the ability to hydrolyze carbapenems. This research focuses on the genomics study of different strains carrying the blaAFM-1 gene from different species, which provides a theoretical basis for future research on the blaAFM-1 gene.
Methods Whole-genome sequencing (WGS) technology was used to sequence a Alcaligenes faecalis strain AN70 including blaAFM-1 gene. Conjugation assay was performed. Cloning and expressing of blaAFM-1 were designed to verify the function of AFM-1 to hydrolyze carbapenems and common β-lactamase substrates. CarbaNP was conducted to confirm AFM-1 belongs to

carbapenemase. Homology modeling was applied to predict the spacial structure of AFM-1. We also screened out strians that carried blaAFM-1 gene by conventional PCR and sequencing.
Results Through the analysis of WGS data of AN70 strain, blaAFM-1 was identified on a conjugative IncW-type plasmid, and one novel class 1 integron gene cassette array arranged as aacA3-blaOXA-21-catB3-dfrA1b was found on the AN70 chromosome. Transfer of the blaAFM-1-bearing plasmid from AN70 to E.coli J53 conferred meropenem resistance to the transconjugants at a frequency of 1.3×10−5, transconjugator also demonstrated reduced susceptibility of carbapenems and common β-lactamase substrates. Cloning of blaAFM-1 (pET-28a-AFM-1-Top10) was inhibited by imipenem-EDTA in MBL Etest experiment and it showed resistance to carbapenems and common β-lactamase substrates. AN70 and its clone (pET-28a-AFM-1-Top10) can hydrolyze imipenem. AFM-1 enzyme was composed of an αβ/βα sandwich structure, with two zinc atoms at its active site, similar to other B subclass metallo-β-lactamases. Through the conventional PCR, we also screened out 4 strains that carried blaAFM-1 gene.
Conclusions BlaAFM-1 is a novel B1 subclass carbapenemase gene, which could render the carbapenems and common β-lactamase antibiotics ineffective. What's more, the horizontal transfer of blaAFM-1 via plasmid conjugation allows antibiotic resistance to spread widely in bacteria. Further kinetic parameters and prokaryotic expression of AFM-1 enzyme are needed to study.

PO-1001

基于高通量测序探究复发性流产人群生殖道核心菌群

赵付菊[1]、陈艺升[2]、高晶[2]、李翠[2]、王志恒[2]、杜美蓉[2,3,4]、应春妹[2]
1. 复旦大学附属华东医院
2. 复旦大学附属妇产科医院
3. 国家人口和计划生育委员会计划生育药具重点实验室
4. 上海市女性内分泌相关疾病重点实验室

目的 复发性流产（recurrent spontaneous abortion，RSA）发病机理复杂，至少一半人群病因不明，对于该病诊断和治疗仍是临床医生面临的棘手难题。本研究拟探究 RSA 人群阴道微生物群特征，分析是否存在疾病相关核心菌群，以期为该病辅助诊断及病因提供新思路。
方法 2009 年 9 月至 2020 年 1 月共招募 RSA 患者 120 例及分娩 2 次或以上活胎健康对照人群 20 例，采集其阴道分泌物，利用 Illumina MiSeq PE300 高通量测序平台对样本中细菌 16S 核糖体 RNA 进行 V3-V4 区测序，过滤和拼接后获得有效序列，通过 RDP 贝叶斯算法对其进行物种注释，采用 Chao 及 Shannon 指数分析样本中微生物丰度及多样性，主坐标分析法分析组间样本微生物群落构成，运用曼-惠特尼 U 检验分析两组人群阴道微生物群物种差异，最后利用线性回归分析鉴别核心菌群。
结果 RSA 人群阴道微生物群丰度及多样性较对照人群有所下降，其中菌群丰度下降有显著统计学差异。两组人群菌群构成有显著差异，共发现 34 种差异菌属，RSA 人群阴道巨球型菌属相对丰度显著升高；而沙雷氏菌属及嗜血杆菌属等 11 种菌属在该人群中缺失；余 22 种菌属相对丰度较对照组有所降低，其中 5 个菌属包括棒状杆菌属、红球菌属、假单胞菌属、鞘氨醇单胞菌属及伯克霍尔德菌属为组间差异核心菌群。
结论 基于二代测序方法发现 RSA 人群与健康对照人群相比阴道微生物群物种丰度及组成存在显著差异，其中棒状杆菌属、红球菌属、假单胞菌属、鞘氨醇单胞菌属及伯克霍尔德菌属为疾病相关核心菌群，而巨球型菌属可能与病因有关。

PO-1002

新冠肺炎疫情中呼吸道常见病原体 IgM 抗体联合检测结果分析

高春波、苏丽菊
哈尔滨市第一医院

目的 对疑似新冠肺炎病例的诊断提供鉴别诊断依据，以便及时进行临床分类、隔离和治疗；掌握新型冠状病毒疫情下，我院发热门诊疑似新冠肺炎患者和普通呼吸道感染性疾病患者主要病原体感染的流行情况及新型冠状病毒确诊者有无其他病原体的合并感染情况，为临床精准治疗提供新的依据。

方法 分析自 2020 年 1 月 21 日~2020 年 3 月 3 日，我院 1479 例患者血清中呼吸道主要病原体 IgM 抗体联合检测结果，其中包括新型冠状病毒确诊者 9 例，发热门诊疑似新冠肺炎患者 741 例和普通呼吸道感染性疾病患者 729 例。我们采用间接免疫荧光法同时检测 9 项呼吸道感染病原体的 IgM 抗体，包括嗜肺军团菌(LP)、肺炎支原体(MP)、肺炎衣原体(CP)、Q 热立克次体(COX)、腺病毒(ADV)、呼吸道合胞病毒(RSV)、甲型流感病毒(IFA)、乙型流感病毒(IFB)及副流感病毒(PIVs)，并对结果进行分析比较。

结果 1479 例患者血清 9 项病原体 IgM 抗体总阳性率为 24.14%，混合感染检出率为 6.02%，其中肺炎支原体检出率最高（11.50%），和其他病原体阳性率比较差异均具有统计学意义(P<0.05)，其次为乙型流感病毒(5.0%)；9 例新型冠状病毒肺炎感染者 9 项呼吸道感染病原体的 IgM 抗体均为阴性；741 例发热门诊疑似新冠肺炎患者 9 项呼吸道病原体检出率为 16.46%，其中乙型流感病毒阳性检出率最高为 7.69%；729 例普通呼吸道感染性疾病患者阳性率为 32.24%，其中肺炎支原体(MP)阳性检出率最高为 18.66%。

结论 本时期我院新型冠状病毒肺炎感染者与 9 项呼吸道病原体无合并感染；呼吸道感染主要病原体为肺炎支原体，发热门诊疑似新冠肺炎患者的呼吸道主要病原体为乙型流感病毒。

PO-1003

碳青霉烯耐药肺炎克雷伯菌基因组流行病学特征及耐药机制研究

孙青阳
中国人民解放军联勤保障部队第 903 医院

目的 肺炎克雷伯菌（Klebsiella pneumoniae）是一种常见的医院感染性病原体，随着碳青霉烯类抗生素在临床的广泛使用，碳青霉烯类耐药肺炎克雷伯菌（CRKP）的分离率逐年上升。本研究旨在明确多重耐药肺炎克雷伯菌的分子流行病学特征与耐药机制，并应用全基因组测序（WGS）溯源本院分离的 CRKP 同源性及传播途径，为 CRKP 感染的治疗和医院感染控制提供科学依据。

方法 收集本院 2016 年 4 月 1 日～2018 年 3 月 31 日期间，分离自两院区不同标本类型的 138 株肺炎克雷伯菌，对常见抗生素采用平板稀释法和肉汤稀释法测定最低抑菌浓度（minimum inhibitory concentrations, MICs），聚合酶链反应（PCR）明确菌株是否携带碳青霉烯耐药基因，采用脉冲场凝胶电泳（Pulsed-field gel electrophoresis, PFGE）分析菌株间的同源性，利用 Illumina Hiseq X10 与 PacBio RS II 高通量测序平台进行全基因组测序，通过菌株基因组相似性分析本院 CRKP 暴发流行株，追踪这些菌株的可能传播途径。

结果 138 株肺炎克雷伯菌中有 47 株为 CRKP，47 株 CRKP 除对磷霉素（耐药率 38.3%）、替加环素（耐药率 10.6%）、多黏菌素（耐药率 2.1%）相对敏感外，对其余 18 种抗菌药物（耐药率>74.5%）。47 株 CRKP 均检出 blaKPC-2 基因；PFGE 分型检测出 16 株 CRKP 属于同一克隆，其余 PFGE 型别菌株分布离散性较大，散发于不同时期和不同病区。利用菌株间核心基因组 SNP 序列差异构建系统发生树，可将 16 株 ST11 型菌分成 2 簇，未发现两院区之间的传播流行。

结论 CRKP 可通过获得携带多重耐药菌的质粒促使耐药菌在院内传播与暴发流行，全基因组测序可为追踪 CRKP 院感暴发流行与传播提供更为准确的研究手段。

PO-1004

蚯蚓小分子量抗菌肽对革兰阴性菌抑菌效果研究

聂兆超
山东大学第二医院

目的 通过应用大孔树脂对蚯蚓小分子量的抗菌肽进行初步分离纯化，研究所提取抗菌肽对临床常见革兰阴性菌的抑菌作用，探索应用大孔吸附树脂对蚯蚓小分子量的抗菌肽进行分离纯化的可行性。
方法 将蚯蚓匀浆，反复冻融，浸提，高速离心，经过超滤柱超滤截留，得到低分子量的多肽。100℃加热法除去杂蛋白，用大孔吸附树脂吸附，解吸。有机溶剂丙酮沉淀解吸物质，初步纯化了蚯蚓低分子量的抗菌肽。用微量肉汤稀释法检测所提取的抗菌肽对广泛耐药型和非广泛耐药型铜绿假单胞菌、鲍曼不动杆菌、粘质沙雷菌等的抑菌作用，并统计最小抑菌浓度。采用 SPSS 进行统计学分析。
结果 蚯蚓在匀浆、磷酸盐缓冲液浸提后，经过超滤柱超滤截留，得到了一部分抗菌肽，经过 100℃加热灭活后，除去了一部分不耐热的杂蛋白，剩余含量约占 21.7%。后经大孔树脂进一步纯化得到的抗菌肽对广泛耐药型和非广泛耐药型铜绿假单胞菌、鲍曼不动杆菌、粘质沙雷菌均有不同程度的抑制作用。虽然不同菌种其 MIC 的范围有所不同，但是菌种间的 MIC_{50} 较为集中。
结论 应用大孔树脂对蚯蚓小分子量抗菌肽的初步分离提取有一定的可行性，采用本研究方法提取的抗菌肽，对临床常见革兰阴性菌具有广谱的抗菌活性。

PO-1005

2019-2020 年临沂地区耐碳青霉烯类肠杆菌耐药基因型及耐药性分析

高春海、孙淑红
临沂市人民医院

目的 了解我院耐碳青霉烯类肠杆菌（CRE）的产酶类型及头孢他啶-阿维巴坦（CZA）对该类细菌的药物敏感性，为临床合理用药提供依据。
方法 选取 2019 年 1 月～2020 年 12 月临床标本分离获得的 179 株 CRE，用改良碳青霉烯灭活试验（mCIM 试验）和乙二胺四乙酸（EDTA）协同碳青霉烯灭活试验（eCIM 试验）和 GeneXpert 两种方法检测碳青霉烯酶，用 K-B 法检测 CZA 的药物敏感性。
结果 179 株 CRE 中，mCIM 阳性 174 株（97.2%），eCIM 阳性 147 株（84.5%）；产丝氨酸酶 27 株（15.5%），金属酶 147 株（84.5%）。GeneXpert 检测结果与 mCIM、eCIM 表型检测结果一致。174 株 mCIM 阳性菌株对 CZA 的敏感率为 33.3%（58/174），其中 27 株产丝氨酸酶菌株敏感率为 96.3%（26/27），147 株产金属酶菌株 100%耐药。
结论 CZA 对产丝氨酸酶 CRE 有较高敏感性，检测 CRE 是否产碳青霉烯酶以及产酶类型有利于指导临床对该药物的合理利用。

PO-1006

诺卡菌菌种分布及耐药状况分析

于嘉崴
滨州医学院烟台附属医院

目的 本实验旨在研究 2017 年至 2019 年从中国烟台分离出的 19 株诺卡氏菌的物种分布和药物敏感性。

方法 通过对 16SrRNA 基因片段(1480bp)的测序和布鲁克微生物质谱(MALDI-TofMS)进行明确的物种鉴定。用微溴稀释法检测分离物对 15 种常用抗生素的敏感性。
结果 运用上述两种方法，将 17 株诺卡氏菌分离株从 19 个标本中鉴定了出来，并且证实出了五个物种，然而这两种方法还存在一些漏洞，MALDI-TofMS 常常将盖尔森基兴诺卡菌的两株菌株误认为是豚鼠诺卡菌。在鉴别出的物种中最常见的是鼻疽诺卡菌。在本次试验中，所有分离出来的菌株均对甲氧苄啶/磺胺甲恶唑和阿米卡星敏感，其次是利奈唑胺和替加环素。某些抗生素的敏感性和最低抑菌浓度与该物种显著相关。
结论 这些关于诺卡氏菌菌种分布和抗生素耐药性检测的结果进一步加深了我们对中国烟台地区诺卡氏菌多样性的理解，从而支持更准确的经验治疗的实施。

PO-1007

MALDI TOF MS 快速检测产碳青霉烯酶肺炎克雷伯菌的应用

袁晨燕
东南大学附属中大医院

目的 快速检出产碳青霉烯酶的肺炎克雷伯菌可为临床相关感染用药及控制医院感染提供依据，利用基质辅助激光解吸电离飞行时间质谱(matrix-assisted laser desorption/ionization-time of flight mass spectrometry, MALDI-TOF MS）建立鉴定产碳青霉烯类肺炎克雷伯菌的试验平台可对产碳青霉烯酶的肺炎克雷伯菌进行快速筛选。
方法 收集我院 2019 年 4 月 1 日至 2019 年 5 月 20 日分离肺炎克雷伯菌，依据对碳青霉烯类的活性可分为 CRKP 和 CSKP，对碳青霉烯类耐药的肺炎克雷伯菌 CRKP 进行改良的碳青霉烯灭活试验（mCIM），用水解底物法检测碳青霉烯酶的活性，其与 0.5mg/ml 美罗培南共孵育 1 小时候后以 MALDI TOF MS 检测特征水解蛋白峰。
结果 共分离得到肺炎克雷伯菌 210 株，其中 109 株为 CRKP（51.9%），109 株 CRKP 中 mCIM 试验阳性率为 80.07%；MALDI TOF MS 底物水解法阳性率为 78%；基于 MALDI TOF MS 的筛选模型在 CRKP 和 CSKP 中得到 3 个差异蛋白峰，分别位于 6100m/z, 11108m/z 和 13048m/z。
结论 基于 MALDI TOF MS 的 CRKP 快速筛选技术有望缩短筛选时间，为临床感染用药和院内感染控制提供有力的支持

PO-1008

呼吸道感染病原体检测方法的选择

公衍文
山东大学第二医院

目的 了解呼吸道感染病原体检测方法优缺点，选择最合适的检测策略。
方法 病原学诊断对呼吸道感染性疾病尤其重要，针对病原体抗原、抗体、核酸等通开展了一系列检验项目，将不同检测项目异同比较，以及不同检测方法/组合的选择建议如下。
结果 （1）门急诊社区获得性肺炎（CAP）患者：怀疑病毒性肺炎，如条件允许首选“甲型/乙型流感及呼吸道合胞病毒核酸联合快速检测”， 其次是“呼吸道病原体抗原检测”，可选择“呼吸病原体 IgM 抗体检测”作为辅助诊断。以上检验项目优势是检验周期短（0.5-1h），在急诊检验就可完成检测。（2）需要住院或需要进一步明确病原的 CAP 患者，如条件允许，建议做细菌培养+“13 种呼吸道病毒核酸检测”或“呼吸道病原体谱抗体，有助于及时确认感染病原体。（3）医院获得性肺炎（HAP）患者，如条件允许，可选择 13 种呼吸道细菌核酸检测，或细菌/真菌培养（可获得药敏结果）。（4）对病原体难以明确的急危重症患者，可选择外送做 mNGS，但最好能与微生物室沟通，排除正常菌群和定植菌，选择合适的常规方法对可疑病原菌做进一步确认。（5）对疑似结核杆菌

感染患者，抗酸染色、结核培养、结核杆菌 DNA 检测、Gene-Xpert 的检出限分别是 10^5CFU/mL、10^4CFU/mL、10^3CFU/mL、10^2CFU/mL，可以根据临床需要以及患者经济能力进行选择。结核感染 T 细胞检测能反映患者是否接触或感染过结核杆菌（不能确定是否为现症感染），阴性预测值大且有助于不易获得标本的肺外结核感染诊断。
结论 呼吸道疾病的诊断往往需要“组合拳”，不同检验项目或检验方法各有其优缺点，选择最合适的某一项或某些检验项目，才能较为准确的实现疾病的诊断、疗效监测、预后判断等目的。

PO-1009

去泛素化酶 USP24 促进 TBK1 的降解调控 EV71 感染的机制研究

顾锦[2]、史伟峰[1]
1. 苏州大学附属常州市第一人民医院
2. 苏州大学附属常州市第一人民医院

Objective We used loop-mediated isothermal amplification (LAMP) to detect the nucleic acid of EV71, and provide the basis for the rapid diagnosis of EV71 infection in clinic. EV71 possesses a complex immune escape mechanism that hinders the innate immune response of host cells. Innate immunity is the body’s first line of defense against infection by pathogenic microorganisms. When they invade host cells, the host recognizes pathogen-associated molecular patterns (PAMPs) through its pattern recognition receptors (PRRs). The downstream aptamer protein cascades are then stimulated to activate the corresponding signaling pathways in host cells and induce the production of type I interferon (IFN-I) and various pro-inflammatory cytokines to resist the infection of pathogenic microorganisms. Previous studies have shown that deubiquitinating enzymes play an important role in antiviral innate immunity. This paper aims to explore the regulatory mechanism of deubiquitinating enzyme USP24 in the innate immune response caused by EV71 infection, so as to provide a new idea for clinical treatment of hand, foot and mouth disease.
Methods Fourteen pharyngeal samples were collected, EV71 as well as 19 kinds of common respiratory viruses were detected by LAMP. Human rhabdomyosarcoma (RD) cells were infected with EV71 for 8 h postinfection (poi). The total RNA of the cells was extracted and the expressions of 88 deubiquitinating enzymes were analyzed by PCR microarray. USP24 knockdown plasmids (shUSP24) were transfected into RD cells at 48 h, and total RNA was extracted from the cells. The replication level of EV71 and the expression of USP24 mRNA were detected by RT-qPCR, and then the production of IFN-β was further detected. The phosphorylation level of transcription factor IRF3 was detected by Western blot. The interaction between USP24 and TBK1 was detected by immunocoprecipitation method.The overexpressed plasmids of TBK1 with Ub, Ub-K48 or Ub-K63 mutated plasmids were co-transfected into HEK293T, respectively, and the effects of USP24 on TBK1 ubiquitination and protein stability were analyzed.
Results Among the 14 pharyngeal samples, 22 viruses were positive by LAMP, including 2 cases of human rhinovirus combined with EV71, 4 cases of human rhinovirus, 6 cases of human rhinovirus combined with coxsackie virus A6, 2 cases of human parainfluenza virus type 1 or 3. Whereas, EV71 and coxsackie virus A6 were further confirmed using q-PCR by Changzhou CDC. EV71 infection promoted the expression of USP24. Immunoprecipitation assay showed that endogenous USP24 could interact with TBK1, and USP24 specifically removed the K63 ubiquitin chain of TBK1 molecule to reduce its stability, thereby inhibiting downstream type I interferon expression and antiviral immune response. The level of p-IRF3 in RD cells was not significantly increased after EV71 infection. However, the level of p-IRF3 was distinctly upregulated after knockdown of USP24 gene, and the mRNA and protein levels of IFN-β were remarkably increased. Knockdown of USP24 promoted the nuclear translocation of IRF3 by

immunofluorescence antibody detection, and inhibited EV71 replication and reduced the cytopathic effect.
Conclusion LAMP method can quickly detect EV71 in clinical samples, and provide the basis for clinical diagnosis of EV71 infection. EV71 infection can upregulate the expression of USP24. Subsequently, USP24 specifically removes the K63 ubiquitin chain on TBK1 molecule and redues the stability of TBK1 protein, which negatively regulates the TBK1-mediated IFN-I innate immune signaling pathway.

PO-1010

Mechanism of Notch Signal Regulating Alveolar Epithelial Cell Autophagy in Klebsiella Pneumoniae

Zhiyun Shi 、Wei Jia
Medical Experimental Center, General Hospital of Ningxia Medical University

Objective To investigate the molecular mechanism of Notch signaling regulating alveolar type II epithelial cell autophagy in Klebsiella pneumoniae infection.
Methods Klebsiella pneumoniae (KPN) -infected human alveolar type II epithelial cells (ACEII) A549 cell model was constructed. The autophagy inhibitor 3-Methyladenine (3-MA) and γ-secretase inhibitor (DAPT) were used to 24 hours, 48 hours, and 72 hours of action on A549 cells. Real-time fluorescent quantitative PCR was used to detect the mRNA expression of autophagy-related genes LC3 and Notch signal pathway Notch1. Western blot was used to detect the protein expressions of LC3 and Notch1. ELISA was used to detect the cell supernatant INF-γ, TNF-α and IL-1β.

Result The results showed that human alveolar typeⅡ epithelial cell A549 model infected with Klebsiella pneumoniae could significantly up-regulate the expression of Notch1 and autophagy-related protein LC3 and promote the production of inflammatory factors (IL-1β, TNF-α, INF-γ) at 24h, 48h and 72h after infection. The inhibition of autophagy by 3-MA can down-regulate the expression of autophagy-related proteins LC3 and Notch1 and the production of inflammatory cytokines. DAPT inhibition of Notch signal can down-regulate the expression of Notch1 and LC3 and the production of inflammatory factors.

Conclusion Klebsiella pneumoniae infection of typeⅡ alveolar epithelial cells can activate Notch signal and induce autophagy. Autophagy-related proteins LC3 and Notch1 have the same trend at transcriptional and protein expression levels. Autophagy and Notch signals play an important role in Klebsiella pneumoniae infection of alveolar typeⅡ epithelial cells.

PO-1011

MALDI-TOF MS 对临床侵袭性丝状真菌的快速鉴定技术的研究

谢良伊
湖南省人民医院

目的 评价基质辅助激光解吸电离飞行时间质谱（MALDI-TOF MS）技术在临床常见丝状真菌鉴定中的应用价值。
方法 收集 2017 年 4 月-2019 年 7 月本院各种类型临床标本中分离培养的 65 株丝状真菌，以及某三甲医院惠赠的 26 株丝状真菌。对这 91 株丝状真菌通过传统形态学鉴定、DNA 测序及 MALDI-TOF MS 鉴定方法后，以 DNA 测序结果为标准，与另外 2 种方法的鉴定结果进行统计学比较，评价 MALDI-TOF MS 在临床丝状真菌鉴定上的应用。

结果 在 28℃和 35℃条件下培养的菌株经质谱仪鉴定后，χ2 检验显示 P>0.05，提示培养温度差异对结果无统计学意义；以 DNA 测序结果为金标准，传统形态学方法的正确鉴定率为 81.3%（74/91），而基于 MALDI-TOF MS 技术的正确鉴定率可达 97.8%（89/91）；研究中，使用“甲酸乙腈提取法”提取蛋白后，丝状真菌质谱鉴定的正确率为 90.1%（82/91），而“磁珠研磨法”提取蛋白后的质谱鉴定率则为 97.8%（89/91）。
结论 临床常规工作中使用质谱仪鉴定常见丝状真菌时，培养温度不会影响质谱鉴定结果；改良“磁珠研磨法”提取蛋白后质谱仪鉴定的正确率优于质谱仪推荐“甲酸乙腈提取法”；MALDI-TOF MS 技术在常见丝状真菌的鉴定上，相比于传统形态学鉴定来说，该技术更快速、客观、高效及准确。

PO-1012

Pleural fluid GSDMD is a novel biomarker for the early differential diagnosis of pleural effusion

Pu Li[1]、jing shi[2]
1. Second Affiliated Hospital, Chongqing Medical University
2. First Affiliated Hospital, Chongqing Medical University

Objective Gasdermin D (GSDMD), controlling pyroptosis in cells, has multiple physiological functions. The diagnostic role of GSDMD in pleural effusion (PE) remains unknown.
Methods Sandwich ELISA kits that we developed were applied to measure the level of GSDMD for 335 patients with the definite cause of PE, including transudative pleural effusion, tuberculous pleural effusion (TPE), parapneumonic pleural effusion (PPE), and malignant pleural effusion (MPE). The diagnostic accuracy of the Light’s criteria vs the new marker GSDMD was performed. Clinical follow-up of 40 cases of PPE was conducted and divided into efficacy group and non-efficacy group according to therapeutic outcome. Nucleated cells (NCs) in pleural effusion were isolated and further infected with bacteria to verify the cell source of GSDMD.
Results The diagnostic accuracy of GSDMD for the diagnosis of PE were 96% (sensitivity) and 94% (specificity). The receiver operating characteristic (ROC) curve indicated that GSDMD can be an efficient biomarker for differential diagnosis of transudative pleural effusion and other groups (all AUC ＞ 0.973). Noteworthily, the highest AUC belonged to tuberculosis diagnosis of 0.990, and the cut-off value was 18.40 ng/mL. Moreover, the same cut-off value of PPE and MPE was 9.35 ng/mL. The combination of GSDMD, adenosine deaminase (ADA) and lactate dehydrogenase (LDH) will further improve the diagnostic efficiency especially between TPE and PPE (AUC = 0.968). The AUC of GSDMD change at day 4 could predict the therapeutic effect at an early stage was 0.945 (P < 0.0001). Interestingly, bacterial infection experiments further confirm that the pleural fluid GSDMD was expressed and secreted mainly by the NCs.
Conclusions GSDMD and its combination not only candidates as the potentially novel biomarker to separate PEs early and effectively, but also monitor disease progression.

PO-1013

碳青霉烯类耐药肺炎克雷伯菌耐药基因型及分子流行病学研究

谢强
安徽省滁州市第一人民医院

目的 分析本院耐碳青霉烯肺炎克雷伯菌（CRKP）的耐药情况及耐药基因型及分子流行病学情况，为临床治疗提供依据。
方法 收集并鉴定临床分离非重复 CRKP28 株。采用 VITEK-2 compact 全自动微生物鉴定药敏分析仪鉴定和药敏试验，碳青霉烯酶抑制剂增强试验检测 A 类丝氨酸碳青霉烯酶和 B 类金属 β 内酰胺

酶，使用全基因组测序技术（WGS）检测常见的耐药基因，采用多位点序列分析（MLST）和核心基因组多位点序列分析（cgMLST）软件对序列进行分析，并构建最小生成树（MST）。
结果 28 株肺炎克雷伯菌对碳青霉烯类和头孢菌素类抗菌药物的耐药率为 100%。碳青霉烯酶抑制剂增强试验显示 25 株 A 类丝氨酸碳青霉烯酶阳性，2 株 B 类金属 β 内酰胺酶阳性，1 株阴性。全基因组测序结果显示，28 株 CRKP 检出的耐药基因较多，其中超广谱 β 内酰胺酶 SHV 和 CTX-M 基因的携带率为 100%，TEM-1 的携带率为 85.71%；碳青霉烯类抗菌药物的耐药基因分布情况为：25 株携带 KPC-2 基因，2 株携带 NDM-5 基因，1 株携带 OXA-48 基因。MLST 分型显示，共有 6 个 ST 型，其中 ST15 型（20 株，71.43%）为我院主要流行型,另有 ST11 型（4 株，14.29%），ST110（1 株，3.57%）,ST306（1 株，3.57%），ST447（1 株，3.57%），ST5328（1 株，3.57%）；cgMLST 分型显示，CC1 簇（16 株，57.14%）为院内流行株,另有 CC2 簇（3 株，10.71%）和 CC3 簇（3 株，10.71%）。
结论 本院分离的 CRKP 对抗菌药物的耐药率较高，其中 ESBLs 的检出率为 100%，对碳青霉烯类抗菌药物的耐药机制主要是携带 KPC-2 基因，以 ST15 型为主要流行型，同时 CC1 簇亚型在院内有小范围的播散。

PO-1014

A Case of Invasive Disseminated Fusariosis in a Child with Acute Leukemia

Hong He、Yongxian Cao
The Affiliated Hospital of Qingdao University

Objective To investigate the clinical and pathological characteristics, diagnosis and treatment of invasive disseminated fusariosis with hematological malignancies, and to illustrate the correlation between initial fungal treatment and therapeutic effect.
Method A 16-year-old boy with invasive Fusarium disease after allogeneic stem cell transplantation for his acute lymphoblastic leukemia was selected, who was admitted to the hematological ward of Affiliated Hospital of Qingdao University on June 20, 2019, and his clinical manifestation and treatment was studied and analyze. Then we searched PubMed database by the key words of "malignant", "hematological diseases", "invasive Fusarium disease" and "invasive fuasriosis" January 1, 2010 to December 31, 2019, to summarize the clinical characteristics, diagnosis and treatment of hematological malignancies combined with invasive Fusarium disease. This study was approved by the medical ethics committee of Affiliated Hospital of Qingdao University.
Results Skin papules, erythema, vesicles and other changes occurred right on the day of bone marrow transplantation of the 16-year-old boy. Then, local light scab formed, the color became darker after scratching, followed by local sclerosis, pain, accompanied by central necrosis, scab and fever and other systemic infection, the area of skin changes expanded gradually spread to the whole body., Spores and hyphae were found in the smears of exfoliated cells by microscopically, the blood culture was positive, and the smear of blood culture positive specimens showed Fusarium megaconidia. DNA of the strain was extracted and was amplified by PCR, and its internal transcribed spacer of gene fragment was sequenced and compared, and the strain was identified as Fusarium oxysporum. Voriconazole was given for treatment, and the skin lesions slightly improved 2 weeks later. The boy was advised to continue treatment and was followed up for one month. Then he was lost to follow up. Among the 18 reported cases of invasive Fusarium infection, 12 were males and 6 females; The age ranged from 12 days to 69 years with a median of 16 years. The main clinical manifestations were persistent fever, ineffective to chemotherapy and anti-infection treatment, and poor prognosis; Skin lesions are common in limbs and buttocks, trunk and head and face. 12 cases were treated with systemic antifungal therapy, and 6 cases (33.33%) were treated with surgery, including surgical debridement (2 cases) and local excision (4 cases). 10 cases (55.56%) were cured, 1 case

(6.00%) was improved, 3 cases (16.70%) were lost to follow-up, and 4 cases (22.00%) died of the disease, all of them were disseminated infection.
Conclusion Patients with hematological malignancies have low immunity, those got Fusarium infection have high mortality of disseminated infection, thus early diagnosis and reasonable treatment was necessary. During the treatment of hematological malignancies, effective and sufficient antifungal therapy is the key to successful treatment. Amphotericin B combined with posaconazole can be used as one of the options for the treatment of invasive Fusarium disease.

PO-1015

新型质粒相关替加环素耐药基因 tet(Y)在鲍曼不动杆菌中的鉴定

王知任、李荷楠、张建港、王晓娟、王辉
北京大学人民医院

目的 随着替加环素耐药鲍曼不动杆菌的发生与传播成为日益严重的全球健康威胁，质粒介导的耐药基因引起人们的关注，了解质粒介导的耐药基因的遗传结构、功能与可转移性变得更加重要。本研究旨在报道与鉴定一株中国临床鲍曼不动杆菌中的一种新型质粒介导的替加环素耐药基因 *tet*(Y)。
方法 通过药敏试验和全基因组测序筛选得到带有替加环素耐药基因 *tet*(Y)的鲍曼不动杆菌 2016GDAB1。对菌株进行了基因组生信分析以研究 *tet*(Y)的遗传环境和可能来源。进行质粒电转化构建 *tet*(Y)表达菌株并进行相关表型试验以验证 *tet*(Y)的功能，同时还通过接合试验和体外细菌传代检测了质粒的可转移性和稳定性。
结果 从一例医院获得性肺炎患者支气管肺泡灌洗液中分离到携带 MFS 外排泵编码基因 *tet*(Y)的替加环素耐药鲍曼不动杆菌 2016GDAB1。2016GDAB1 属于非流行的序列类型(ST)355^{oxf}，该 ST 多在动物中报导。*tet*(Y)位于一个 72,156 bp 的质粒上，遗传环境分析表明 Tn*5393* 可能在 *tet*(Y)传播中起作用，而与 GenBank 中携带 *tet*(Y)菌株的进化分析暗示 2016GDAB1 的 *tet*(Y) 来源可能为气单胞菌而非不动杆菌。通过电转化发现 *tet*(Y)在大肠埃希菌 DH5α 和鲍曼不动杆菌 ATCC17978 中的过表达使菌株四环素、米诺环素和多西环素的 MIC 增加了 8 到 128 倍而替加环素增加了 2 到 4 倍。接合实验发现携带 *tet*(Y)的质粒 p2016GDAB1 未能成功转移到替加环素敏感的受体菌株中。稳定性实验发现携带 *tet*(Y) 的质粒可以在宿主和非天然宿主菌株中稳定维持，不易丢失。
结论 本研究首次在鲍曼不动杆菌中鉴定出替加环素耐药基因 *tet*(Y)，可以介导低水平替加环素耐药，Tn*5393* 可能在其传播中发挥作用。

PO-1016

Droplet encoding and pairing-based microfluidic multiplex digital LAMP enables high-content detection of lower respiratory tract infection pathogens

Dongyang Cai、Jingjing Zou、Dayu Liu
Guangzhou First People's Hospital

Objective To develop a microfluidic multiplex digital LAMP assay for high-content detection of lower respiratory tract infection (LRTI) pathogens.
Methods We fabricated a microfluidic chip with 20,700 calabash-shaped microwells (one small microwell with a diameter of 90 μm, 65 μm in depth; one large microwell with a diameter of 135 μm, 110 μm in depth; set a 15 μm overlap; 50 μm spacing). The entire experiment procedure performed on the chip was as follows (Figure 1): 1) a volume of 50 μL LAMP reactant without primers was dispersed into 1 nL droplets (sample droplets, 124 μm in diameter) with a droplet-generation device. The droplets were infused into the chip via micropipette and then trapped into the large microwells by the resultant of drag force and buoyancy force; 2) Each input of LAMP

primers was pre-mixed with a unique ratio of three colorimetric indicators - cresol red, bromothymol blue, and orange G, and standardized to a final concentration of 400 μM. Each input was respectively dispersed into 0.268 nL droplets (primer droplets, 80 μm in diameter) with another droplet-generation device. A fraction of each set of primer droplets was pooled into a single tube to form a droplet library. After thoroughly mixing, the primer droplets were infused into the chip via micropipette and then randomly trapped into the small microwells. 3) Contents of primer droplets were decoded by bright-field imaging the whole chip and processed with a machine learning-based custom program. Afterwards, coalescence of the paired droplets was achieved via an electrical impulse. 4) Finally, the chip was submerged in 67 °C water bath to perform the LAMP reaction and the fluorescence signal was measured from each microwell at the assay end.
Results We successfully generated monodisperse sample droplets and primer droplets, which is essential for successful droplet trapping and LAMP reaction (Figure 2A, B). We observed high-efficient trapping of sample droplets and primer droplets at the effectiveness of 98.9% and 98.4%. The average droplet pairing and merging efficiencies were 96.9% and 98.0%, respectively (Figure 2E). As a proof-of-concept, we pre-mixed colorimetric indicators with three different primer pairs tarting dominating LRTI bacteria, namely *Escherichia coli* (cresol red), *Klebsiella pneumoniae* (orange G), and *Staphylococcus aureus* (bromothymol blue), respectively, and the sample was *Escherichia coli* genomic DNA (Figure 3B-D). After the LAMP reaction, only the droplets encoded with cresol red showed a significant increase in fluorescence intensity (Figure 3E).
Conclusions This manuscript describes a droplet encoding and pairing-based multiplex digital LAMP technology. We have performed a proof-of-concept study to validate its capability to rapidly develop highly multiplexed detection panels. We envision that this technology could serve as an alternative for rapid point-of-care detection of LRTI pathogens in source-limited settings.

PO-1017

BacT/ALERT VIRTUO 血培养系统和 FAN®Plus 血培养瓶的临床应用评估

刘素玲、赵云虎、周典荣、张鑫强、王蔚莎、顾兵、侯铁英
广东省人民医院

目的 评估 BacT/ALERT VIRTUO 血培养系统和 FAN®Plus 血培养瓶对于菌血症患者的实验室诊断效能。
方法 广东省人民医院 6 个 ICU 科室和 3 个普通科室 2020 年 6 月-2021 年 5 月临床疑似 1772 例菌血症患者进行血培养，每名患者采集 2 个部位（包括导管血），每部位采集 16-20ml 血量，一个部位注入 FA plus 和 FN plus 一套瓶，于 BacT/ALERT VIRTUO 系统培养，另一个部位注入 FX 树脂需氧瓶和溶血素厌氧瓶，于 BACTEC FX400 系统培养；培养时间均设置为 5 天。比对两种血培养系统的所有血瓶的采血量、报阳时间及菌种鉴定；其中阳性率比较包含 BacT/ALERT VIRTUO 血培养系统和 BACTEC FX400 系统培养系统的所有入组标本，报阳时间比较为 BacT/ALERT VIRTUO 血培养系统和 BACTEC FX400 系统培养系统均报同一种菌的 TTD 比较。
结果 BacT/ALERT VIRTUO 系统阳性复苏率高于 BACTEC FX400 系统，分别为 9.7%和 7.7%。在血培养上机培养 0-8h 初期阶段，BacT/ALERT VIRTUO 系统阳性复苏率显著高于 FX 系统（9.4%：1.9%）。
结论 BacT/ALERT VIRTUO 系统培养是一种可靠且可缩短菌血症实验室诊断 TAT 的有效血培养系统。

PO-1018

比对评估一种自配粪便样本保存液保持细菌活性的能力

陈晓娇、段卓、翁少娟、何彦、周宏伟
南方医科大学珠江医院

目的 探索一种能在室温条件下维持粪便中细菌活性的自配样本保存液，对其性能进行对比分析。
方法 采集 6 个健康个体的粪便样本，分别用一种商品化样本运送培养基（室温）、自配样本保存液（室温）及-80℃三种不同条件保存样本。每种保存方式均在样本采集后 3 小时、3 天、1 周三个时间点，通过 SYTO 9/PI 双色荧光染色剂分别对样本中所有的细菌和细胞膜受损的细菌（死菌）进行标记，通过 CytoFLEX 流式分析仪（Beckman）对样本进行细菌计数，并评估样本中活性细菌的比例。对三种不同保存方式在一定时间内维持细菌活性的能力进行评估。
结果 在样本采集后 3 小时、3 天和 1 周三个不同的时间点，商品化运送培养保存的样本均检测到最高的活性细菌比较(89.29±5.22，87.76±4.12，74，77±10.90)，自配样本保存液次之(82.84±8.19，79.39±6.68，70.69±9.49)，-80℃条件下（57.35±13.81，60.08±14.91，60.78±15.10）保存的样本中活性细菌比例最低；但在三个时间点下，自配样本保存液组细菌活性比例与商品化培养基组均无统计学差异（p=0.266，p=0.135, p=0.490）），而均显著高于-80℃组（p<0.001，p<0.001，p=0.001）。此外，自配保存液组与商品化培养基组在 1W 时，细菌活性比 3H 时的活性比例显著降低，而-80 度组三个时间点的细菌活性则无统计学差异。
结论 该自配样本保存液能在室温条件下较好的维持细菌活性，优于目前实验室样本保存金标准——-80℃保存，且与商品化样本运送培养基效果相当，或可用于缺乏冰箱等实验室保存条件下对样本进行暂存。

PO-1019

优化头孢哌酮/舒巴坦、替加环素、多黏菌素 B 在鲍曼不动杆菌血流感染患者中的给药方案：基于全国血流感染细菌耐药监测联盟（BRICS）的蒙特卡洛模拟研究

辛娜
西安医学院第一附属医院

目的 应用蒙特卡罗模拟研究头孢哌酮/舒巴坦、替加环素、多黏菌素 B 治疗鲍曼不动杆菌血流感染的疗效，预测和评价不同抗菌药物的抗菌效果，进而优化临床给药方案。
方法 借助全国血流感染细菌耐药监测联盟（Brics）平台收集 2018-2019 年血流感染来源的鲍曼不动杆菌 514 株,使用文献公开发表的头孢哌酮/舒巴坦、替加环素、多黏菌素 B 的药动学参数，基于药动学/药效学(PK/PD) 理论利用蒙特卡洛模拟法，计算不同给药方案在各特定的 MIC 值获得的目标概率，即达标概率（PTA）和累积反应分数（CFR），以 PTA 或 CFR≥90%作为临床疗效评价的指标。
结果 治疗鲍曼不动杆菌引起的血流感染，头孢哌酮/舒巴坦（2:1）给药方案 3g q6h、4.5g q8h、4.5g q6h 在最低抑菌浓度（MIC）为 32ug/ml 时，可获得大于 90%的目标 PTA 值；4.5g q6h 的给药方案在 MIC 为 64ug/ml 时，仍可获得大于 90%的目标 PTA 值。替加环素推荐剂量（50mg q12h）,在 MIC≤0.25ug/ml 时，可获得大于 90%的目标 PTA 值。多黏菌素 B 1.25mg/kg 1h 输注 q12h 给药方案，可使 MIC≤1ug/ml 的细菌的 PTA 达到 90%以上，高剂量的多黏菌素给药方案(负荷 2 mg/kg 2h 输注后 2.5 mg/kg/day 持续输注) 在 MIC 为 2ug/ml 时，可提供较高的 PTA（96.83%）。

结论 鲍曼不动杆菌对头孢哌酮/舒巴坦群体耐药率较高导致 CFR 值较低，临床治疗中可能需要使用其他抗生素或将头孢哌酮/舒巴坦与其他抗菌药物联合使用取得更好的治疗效果。替加环素建议使用 100mg q12h 的给药方案，多黏菌素 B 建议使用负荷 2.5 mg/kg 2h 输注后 1.5 mg/kg 1h 输注 q12h，负荷 2 mg/kg 2h 输注后 2.5 mg/kg/day 持续输注的给药方案。

PO-1020

三种结核分枝杆菌检测方法的临床诊断效能评价

姜长宏
南方医科大学珠江医院

目的 评价涂片抗酸染色镜检（简称“涂片法”）、荧光探针法聚合酶链式反应（简称“PCR-荧光探针法”）、利福平耐药实时荧光定量核酸扩增（Xpert MTB/RIF，简称“Xpert 法”）3 种结核分枝杆菌检测方法的临床诊断效能。
方法 收集 2020 年 1 月至 2021 年 4 月南方医科大学珠江医院收治的 76 例疑似结核病患者的相关标本，用涂片法、PCR-荧光探针法、Xpert 法同时进行检测。以临床诊断作为参考标准，分别计算 3 种检测方法的检出阳性率、灵敏度、特异度、阳性预测值、阴性预测值、总符合率，并计算 Kappa 值做一致性分析，绘制 ROC 曲线评价其临床诊断效能。
结果 参照最新版结核病分类标准（WS196-2017）以及肺结核诊断标准（WS288-2017），76 例疑似病例最终诊断为结核病患者 41 例，非结核病患者 35 例。涂片法、PCR-荧光探针法、Xpert 法的检出阳性率分别为：28.9%、44.7%、50.0%。以临床诊断作为参考标准，3 种检测方法的灵敏度分别为：48.78%、80.49%、92.68%，特异度分别为：94.29%、97.14%、100.0%，总符合率分别为：69.74%、88.16%、96.05%，Kappa 值分别为：0.41、0.77、0.92，ROC 曲线下面积分别为：0.709、0.878、0.952。
结论 以临床诊断为参考标准，Xpert 法对检测结核分枝杆菌的灵敏度、特异度高，其诊断准确度也最高，诊断效能较好，其次是 PCR-荧光探针法、涂片法。而涂片法联合 Xpert 法对检出非结核分枝杆菌具有一定提示意义。

PO-1021

lasB 基因对铜绿假单胞菌外膜囊泡的影响

张佳星
重庆市人民医院

背景 铜绿假单胞菌又称绿脓杆菌（Pseudomonas aeruginosa，PA）广泛分布于自然界及健康人的皮肤、肠道和呼吸道，可引起多种感染，全球 10-15%的院内感染与 PA 有关，在铜绿假单胞菌感染宿主时，会通过一些分泌系统分泌蛋白毒力因子损害宿主细胞，目前已知的铜绿假单胞菌分泌系统有五种，以Ⅲ型分泌系统（type III secretion system，T3SS）的研究最为广泛。与其他分泌系统不同，铜绿假单胞菌通过分泌外膜囊泡（onter membrane vesicle，OMV，）可以帮助铜绿假单胞菌分泌不可溶的分子并与可溶性的物质形成复合物，使可溶性物质在它的保护下更加专一的到达作用靶点。PA 的 lasB 基因编码的弹性蛋白酶 LasB 能降解 T3SS 分泌系统的分泌蛋白。本研究拟通过比较 lasB 缺陷株和正常株的外膜囊泡形态结构及生物学功能，证实 lasB 对 PA 外膜囊泡的影响。
目的 研究 lasB 基因对铜绿假单胞菌外膜囊泡形态、蛋白及生物学活性的影响。
方法 密度梯度超速离心提取并纯化铜绿假单胞菌标准株 PAO1 和 lasB 基因缺陷株 PAO1lasB-的外膜囊泡，负染电镜观测形态，聚丙烯酰胺凝胶电泳鉴定其蛋白构成；建立外膜囊泡和细菌感染正常

人外周血单个核细胞 PBMC 模型，检测 lasB 缺陷后，外膜囊泡保护细菌免遭 PBMC 的吞噬能力的变化及诱导炎性因子 IL-6、IL-8 的表达水平。
结果 lasB 缺陷后，PAO1 分泌的外膜囊泡形态无改变，其所含蛋白减少，保护细菌免受宿主细胞吞噬的能力降低，诱导 PBMC 表达炎性因子 IL-6、IL-8 的能力降低。
结论 lasB 对铜绿假单胞菌的外膜囊泡的生物学活性有重要影响。

PO-1022

我国多中心碳青霉烯耐药粘质沙雷菌耐药机制及分子流行病学研究

江振东、孟涵、王启、王辉
北京大学人民医院

目的 研究我国多中心碳青霉烯耐药粘质沙雷菌耐药表型、基因型、质粒转移性，通过全基因组测序和生物信息学手段分析同源性，以探究耐药机制和分子流行病学特征，为 CRSM 的临床诊治和耐药监测提供理论依据。
方法（1）收集 48 株来自 CRE Network 的粘质沙雷菌，利用基质辅助激光解析电离串联飞行时间质谱进行鉴定；利用微量肉汤稀释法及琼脂稀释法进行药敏试验；利用改良碳青霉烯灭活试验和 EDTA 协同改良碳青霉烯灭活试验对其产酶情况进行筛查；（2）利用聚合酶链式反应检测酶基因型，进一步比对确定亚型；（3）通过质粒接合实验探究菌株酶基因转移性；（4）基于 Illumina NextSeq 550 平台进行全基因组测序，分析菌株携带耐药基因，利用 Roary v3.11.2 提取核心基因组，在 RAxML v8.2.10 上通过 GTR 模型构建系统进化树。
结果（1）48 株碳青霉烯耐药粘质沙雷菌中，产碳青霉烯酶菌株占比 75%（n=36/48），其中 KPC 为主要酶型，占比 77.8%（n=28/36）；（2）质粒接合实验中三株分别携带 blaKPC-2、blaKPC-3 和 blaNDM-1 的菌株成功转移并得到接合子，接合子 PCR 扩增都检测到相应酶基因，接合子药敏显示其对碳青霉烯、头孢他啶耐药性都有所提高，且携带 blaNDM-1 耐药基因的质粒接合效率高于 blaKPC-2、blaKPC-3；（3）系统进化树显示可能存在同源性的菌株在地域分布上和发生时间上有所集中，可能存在地区内播散。
结论（1）48 株来自全国多家中心的 CRSM 主要耐药机制为产 KPC-2 型碳青霉烯酶；（2）48 株 CRSM 对碳青霉烯、头孢菌素、喹诺酮类药物敏感性较差，对阿米卡星、米诺环素和磷霉素敏感性较好；（3）同一时间、同一地域的菌株有一定的同源性，极有可能存在耐药株的播散；（4）blaKPC、blaNDM 都可以成功转移接合，且 NDM 的接合效率高于 KPC。

PO-1023

耐碳青霉烯肠杆菌科细菌头孢他啶/阿维巴坦的敏感性分析及疗效评价

许雨乔
江苏省人民医院（南京医科大学第一附属医院）

目的 分析非金属碳青霉烯酶耐碳青霉烯类肠杆菌科细菌（CRE）对头孢他啶/阿维巴坦（CAZ/AVI）敏感性及 CAZ/AVI 抗感染疗效。
方法 选取 2019 年 9 月-2020 年 5 月南京医科大学第一附属医院临床分离 CRE 菌株 170 株，采用 mCIM 联合 eCIM 检测碳青霉烯酶酶型，Kirby-Bauer 法检测 CAZ/AVI 敏感性，并用肉汤稀释法对抑菌圈直径为 20~22 mm 的菌株进行复核。根据患者是否使用 CAZ/AVI 治疗分为试验组和对照组，通过倾向性匹配获得 37 对患者，比较两组临床疗效。

结果 170 株 CRE 菌株中产丝氨酸酶 130 株，产金属酶 35 株。CAZ/AVI 总敏感率为 78.8%（134/170），产丝氨酸酶 CRE 菌株敏感率为 99.2%（129/130），产金属酶 CRE 菌株敏感率为 0。52 株 CAZ/AVI 抑菌圈直径为 20~22 mm 的菌株经肉汤稀释法复核一致率为 99.4%（51/52）。试验组和对照组患者基线值基本一致，试验组总有效例数和呼吸道感染有效例数均高于对照组（P<0.05）。

结论 产非金属碳青霉烯酶 CRE 对 CAZ/AVI 有较高敏感性，CAZ/AVI 可显著提高治疗 CRE 感染的有效率。

PO-1024

Mycoplasma pneumoniae lipids license TLR4 for activation of NLRP3 inflammasome and autophagy to evoke a proinflammatory response

Haodang Luo[1,2]、Jun He[1]、Xiaoxing You[2]、Yimou Wu[2]
1. 南华大学附属南华医院检验科
2. 南华大学衡阳医学院病原生物学研究所

Mycoplasma pneumoniae is an obligate pathogen that causes pneumonia, tracheobronchitis,pharyngitis, and asthma in humans. It is well recognized that membrane lipoproteins are

immunostimulants exerting as LPS and play a crucial role in the pathogenesis of inflammatory responses upon M. pneumoniae infection. Here, we report that the M. pneumoniae-derived lipids are another proinflammatory agents. Using an antibody-neutralizing assay, RNA interference, or specific inhibitors, we found that TLR4 is essential for M. pneumoniae lipid-induced TNF-α and IL-1β production. We also demonstrated that NLRP3 inflammasome, autophagy, and NF-κB-dependent pathways are critical for the secretion of proinflammatory cytokines, while inhibition of TLR4 significantly abrogates these events. Further characterisation revealed that autophagy-mediated inflammatory responses involved the activation of NF-κB. In addition, the activation of NF-κB also promoted lipid-induced autophagosome formation, as revealed by assays using pharmacological inhibitors, 3-MA and Bay 11-7082, or silencing of atg5 and beclin-1. These findings suggest that, unlike the response to lipoprotein stimulation, the inflammation in response to M. pneumoniae lipids is mediated by the TLR4 pathway, which subsequently initiates the activation of NLRP3 inflammasome and formation of a positive feedback loop between autophagy and NF-κB signalling cascade, ultimately promoting TNF-α and Il-1β production in macrophages.

PO-1025

Antioxidant and antibacterial study of 10 flavonoids revealed rutin as a potential anti-biofilm agent in Klebsiella pneumoniae strains isolated from hospitalized patients

Zhibin Wang[1]、Zixuan Ding[1]、Zhaoyinqian Li[1]、Yinhuan Ding[1]、Fan Jiang[2]、Jinbo Liu[1]
1. The Affiliated Hospital of Southwest Medical University
2. 山东大学

The emergence of multi-drug resistance(MDR) and extensively drug-resistance(XDR) of *Klebsiella pneumoniae* strains have brought great threaten to conventional antibiotics. Previous studies showed that plant-derived flavonoids have inhibitory functions on pathogens. However, In *K.pneumoniae*, the antibacterial activities of different flavonoids on the growth and biofilm

formation remain a mystery. The aim of the present study is to evaluate the antioxidant abilities of different flavonoids, to screen active ingredients and to identify their inhibitory effects on *K. pneumoniae* growth and biofilm formation.Totally 10 flavonoids representing 4 major categories were screened and used in this study. The antioxidant capacity of each flavonoid was evaluated through DPPH assay. Rutin showed highest level of free radical scavenging capacity, followed by kaempferol, luteolin, quercetin, apigenin, hesperidin, sinensetin, naringenin, naringin and 3,5,6,7,8,3',4'-heptamethoxyflavone. The inhibitory effects of rutin and naringin on bacteria growth were also compared.The lowest MICs of rutin were found against *K. pneumoniae* ATCC700603(1024μg/mL) and E.coli ATCC25922(512μg/mL). However, the MBICs were not found. Rutin showed strong inhibitory ability against both the growth curve and biofilm production. The expression profiles of 15 biofilm-related genes were analyzed in biofilm cells both with and without rutin treatment. The *luxS* gene and *wabG* gene were down-regulated significantly by rutin treatment. The correlation analysis showed the *mrkA* gene expression was positively correlated with the biofilm biomass accumulation.Our study indicated the biofilm production is correlated with several genes expression rather than one. The *mrkA* gene expression was positively correlated with the biofilm biomass accumulation. Our study screened rutin as a potential agent to inhibit the *K. pneumoniae* biofilm formation.

PO-1026

新型疫苗佐剂增强鹦鹉热衣原体多表位融合抗原抗感染保护作用研究

李育萌[1]、陈恩[1]、谢小平[1]、刘双全[1]、吴移谋[2]
1. 南华大学附属第一医院
2. 南华大学

目的 构建基于病毒样颗粒以及纳米颗粒的新型疫苗佐剂，进一步优化、完善 Cps 的多表位融合疫苗。

方法 基于 CNPs 以及 HBc-144 构建 CNPs/HBc-144 新型疫苗佐剂，通过理化性质检测分析新型佐剂的及稳定性以形态结构。免疫 7 d 后，取肺组织以及注射部位肌肉组织进 H&E 染色。分别收集每次免疫 BALB/c 小鼠的血清、鼻腔灌洗液以及生殖道灌洗液，检测血清 IgG、IgA 以及 sIgA 抗体水平；流式细胞术检测细胞内 CD4+、CD8+细胞水平以及 CD44/CD62 分泌水平，并检测细胞上清以及细胞内细胞因子水平；随后检测感染 BALB/c 小鼠的肺组织 Cps 载量、肺上清炎症因子水平以及病理损伤情况。qRT-PCR 检测心、肝、脾等组织中的 Cps 载量。

结果 经理化检测分析，CNPs/HBc-144-Ags 为大小相似的圆形颗粒结构，且分布均匀。连续免疫 7 d 后，BALB/c 小鼠体重平稳，注射部位肌肉以及肺组织结构完好。CNPs/HBc-144-Ags 在免疫 BALB/c 小鼠体内诱导产生的血清 IgG、IgA 水平均随免疫次数增加显著上升，CNPs/HBc-144-Ags 诱导的 sIgA 则显著高于对照组。免疫 BALB/c 小鼠脾细胞上清中 IFN-γ、IL-2 以及 IL-17A 分泌水平均显著上升，且细胞内 IFN-γ 水平也显著高于对照组。此外，CNPs/HBc-144-Ags 组 BALB/c 小鼠脾细胞中 CD44/CD62 的分泌水平要显著高于对照组。CNPs/HBc-144-Ags 能够有效降低 Cps 感染后 BALB/c 小鼠肺组织衣原体载量、减轻肺组织的炎性病理损伤，并有效减少 Cps 的含量。

结论 CNPs/HBc-144 新型疫苗佐剂能显著增强 Cps 多表位融合抗原诱导的黏膜免疫以及细胞免疫应答，同时促进记忆性 T 细胞分泌，形成记忆性免疫应答抵抗 Cps 体内感染。

PO-1027

重组可溶表达结核分枝杆菌新基因编码蛋白 Rv2742 的相互作用蛋白质组研究

王红[1]、万李[2]、武舒佳[3]、常蕾[4]、万康林[2]、张瑶[4]、徐平[4]、戴二黑[1]
1. 石家庄市第五医院
2. 中国疾病预防控制中心传染病预防控制所传染病诊治协同创新中心
3. 北京国家蛋白质科学中心； 武汉大学基础医学院；
4. 北京国家蛋白质科学中心

目的 Rv2742 是我们课题组基于蛋白质基因组学技术从结核分枝杆菌（Mycobacterium tuberculosis H37Rv）中发现并验证的遗漏注释基因。本研究旨在利用结核分枝杆菌自身的细胞裂解液和免疫亲和纯化质谱（IP-MS）在蛋白质通量鉴定上的优势，筛选遗漏注释基因编码蛋白质 Rv2742 在结核菌中的相互作用蛋白质，克服普通微生物学实验室对结核分枝杆菌使用的限制，实现 Rv2742 在结核分枝杆菌中的蛋白质相互作用网络，并据此探索其在结核分枝杆菌中所参与的生物学功能。
方法 首先对 pMAL-c2X 空载和已构建好的 pMAL-c2X-Rv2742 载体，经 IPTG（异丙基硫代半乳糖苷）诱导表达、直链淀粉树脂亲和纯化后获得麦芽糖结合蛋白（MBP）和 MBP-Rv2742 的融合蛋白作为诱饵蛋白；分别取等摩尔蛋白与 H37Rv 非变性全细胞蛋白质裂解物孵育，进行 MBP pull-down 实验；将两次生物学重复实验得到的与 MBP 和 MBP-Rv2742 诱饵蛋白结合的蛋白质复合物洗脱收集，10% SDS-PAGE 凝胶电泳验证，并通过液相色谱串联质谱法（LC-MS/MS）分析、筛选出 Rv2742 在结核菌中的互作蛋白质，然后将筛选到的蛋白质进行 GO（Gene ontology）和互作网络分析。
结果 本实验共筛选出 105 个 Rv2742 的潜在相互作用蛋白质，其定位主要分布在细胞壁、细胞质膜和细胞外区域等细胞组分中，功能上主要参与低氧应激、宿主共生、运输、毒力因子分泌等生物学过程。
结论 Rv2742 可能参与结核菌致病过程，侵入人体后，积极应对宿主低氧、一氧化氮环境，与宿主共生的同时释放毒力因子。

PO-1028

172 例新生儿及儿童脑脊液分离菌的分布及耐药性分析

闵亮、周树平、余晓君、周艳、杜琴、柯江维
江西省儿童医院

目的 了解江西省儿童医院 2015 年 1 月-2019 年 12 月连续 5 年临床送检脑脊液标本中分离菌的分布及对常用抗菌药物的耐药性。
方法 对 5 年间所有临床送检的脑脊液标本按《全国临床检验操作规程》进行细菌培养和分离鉴定，采用 BD 公司 PHONX-100 全自动细菌鉴定药敏系统对培养出的细菌进行鉴定和药敏试验，按 CLSI2020 版标准对药敏结果进行判断，并使用 WHONET5.6 软件进行统计。
结果 剔除重复菌株后自 15124 例脑脊液标本分离出 172 株菌，阳性率为 1.13%，其中革兰阳性菌 111 株，占 64.5%，革兰阴性菌 60 株，占 34.9%，真菌 1 株，占 0.6%。172 株菌中检出前 5 位的是肺炎链球菌 52 株（30.2%）、大肠埃希菌 37 株（21.5%）、无乳链球菌 19 株（11%）、屎肠球菌 15 株（8.7%）、 凝固酶阴性葡萄球菌 11 株（6.4%），检出新型隐球菌 1 株。小于 28 天新生儿检出第一位的细菌为大肠埃希菌，占 37%（27/73），药敏结果统计显示革兰阳性菌中屎肠球菌对氨苄西林的耐药率已达 100%，肺炎链球菌对青霉素非敏感率为 94.2%，未发现对青霉素不敏感的无乳链球菌，未发现对万古霉素、利奈唑胺和替考拉宁耐药的革兰阳性球菌。革兰阴性杆菌中检出最多的是大肠埃希菌，占所有检出阴性杆菌的 61.7%（37/60)，药敏结果统计显示其对氨苄

西林、哌拉西林耐药率较高，均在 80%以上，而对带有酶抑制剂药物如氨苄西林/舒巴坦、哌拉西林/他唑巴坦耐药率均为 11.4%，头孢噻肟及头孢吡肟的耐药率为 45.9%及 40.5%，碳青霉烯类抗生素亚胺培南及美罗培南耐药率均为 5.4%。
结论 本研究样本中阳性率较低，值得注意的是 PRSP 检出率极高、也有部分 CRE 的检出，应重点加强临床对特殊耐药菌如 PISP、PRSP、VRE、CRE、MRSA 等菌株的传播防范及其防控管理。

PO-1029

肺炎克雷伯菌头孢地尔耐药性的研究

鲍金凤[1,2]、顾兵[3]、王成彬[1]
1. 中国人民解放军总医院第一医学中心
2. 徐州医科大学
3. 广东省人民医院

背景 碳青霉烯耐药的肺炎克雷伯菌的检出率不断升高，有限的治疗药物给临床带来了极大的困难。头孢地尔是一种新型五代头孢菌素，对碳青霉烯耐药的肺炎克雷伯菌有良好的抗菌活性。
目的 探究肺炎克雷伯菌对头孢地尔的耐药机制，寻找头孢地尔的耐药靶点，为开发新的药物及遏制耐药性的发生做好准备。
方法 体外诱导肺炎克雷伯菌 NTUH-K2044 对头孢地尔由敏感到耐药，对耐药前后菌株进行生长曲线测定，生物膜形成能力检测，碳氮及 ATP 代谢能力检测，然后进行蛋白组学分析，比较耐药前后菌株差异表达蛋白，并对相关蛋白进行生信分析。
结果 肺炎克雷伯菌对头孢地尔耐药后，生长速率降低，生物膜形成能力减弱；发生上调蛋白 507 个，下调蛋白 428 个。GO 及 KEGG 分析结果显示，这些差异显著蛋白多参与亚麻酸代谢、蛋白运出、阳离子抗菌肽(CAMP)耐药性、磷酸肌醇代谢、赖氨酸降解等通路。差异蛋白聚类分析显示，下调显著蛋白聚焦于碳氮代谢、两组分系统、ABC 转运体等通路；上调显著蛋白聚焦于代谢、蛋白转运、细菌分泌、β 内酰胺酶抗性 CAMP 抗性等通路。
结论 肺炎克雷伯菌对头孢地尔耐药后，生物膜形成能力减弱，碳氮及 ATP 代谢能力降低，铁转运相关蛋白下调。ABC 转运体通路及两组分通路的共同调节了肺炎克雷伯菌对头孢地尔的耐药性。

PO-1030

结核分枝杆菌新基因编码蛋白抗原性研究及其在结核病诊断中的应用初探

王红、戴二黑
石家庄市第五医院

目的 结核分枝杆菌临床诊断缺乏高特异性、超灵敏的生物诊断标志物，本研究旨在筛选用于结核菌体液免疫检测的特异性基因编码蛋白抗原及抗原组合，为结核病的快速诊断研发提供技术支撑。
方法 首先分别筛选了 pGEX-4T-2、pET-28a、pET-32a、pMAL-c2X 四种表达载体构建目的基因的重组表达菌株；尝试目的基因密码子和表达条件优化，实现异丙基-β-D-硫代半乳糖苷诱导目的蛋白的可溶性表达后进行亲和纯化；对纯化获得的目的蛋白进行质谱验证；通过软件对这些新编码蛋白进行 B 细胞可信表位的预测；并用 ELISA 技术评估这些新编码蛋白在结核病体液免疫诊断中的潜在应用价值。
结果 1 pMAL-c2X 表达载体均有效实现了 22 个新编码蛋白的可溶性诱导表达。新基因编码蛋白经质谱检测，序列正确。2 通过软件进行 B 细胞表位预测，发现这些新蛋白均具有高可信的表位，且为先前尚未报道的表位。3 初步血清学比较发现，pMAL-c2X 空载在检测中背景干扰最小，适于后续融合表达蛋白的血清学抗原性筛选。对 pMAL-c2X 载体获得的融合蛋白进行了血清学检测，共筛

选到 2 个潜在抗原 TB38.76 和 TB26.88。抗原 TB38.76 在结核病患者的灵敏度是 68.33%，特异度为 72.5%。TB38.76 在菌培养阳性的患者中，灵敏度是 90%，特异度为 55%；抗原 TB26.88 在菌培养阳性患者中，灵敏度是 80%，特异度为 50%。4 TB26.88、TB38.76、38 kDa 蛋白和商品化试剂盒进行并联试验或串联试验后，具有互补性，可提高对结核病的诊断效率。

结论 1.利用大肠杆菌异源表达系统，成功构建了 22 个 MTB 新基因的重组质粒，且在 pMAL-c2X 载体中均实现了高可溶性诱导表达。2. 22 个新抗原筛选获得了 2 个潜在的新抗原 TB26.88 和 TB38.76，与已知抗原和商品化试剂盒在结核病诊断中呈现互补性。

PO-1031

乙醇脱氢酶在鲍曼不动杆菌群体感应及生物膜形成中的作用

张康见
山东大学第二医院

目的 多重耐药鲍曼不动杆菌(multiple drug-resistant Acinetobacter baumannii, MDR-AB)是导致临床感染治疗失败的主要原因之一。而群体感应 (quorum sensing, QS)在抗生素耐药形成中发挥重要的作用，但其具体机制仍未明晰。固本研究通过对浮游和生物膜状态下的鲍曼不动杆菌进行转录组测序，获得一系列差异表达基因，经生物信息学技术分析候选差异表达基因可能参与调控的细菌细胞组分、参与的代谢过程和具备的生物学功能。

方法 QRT-PCR 验证测序结果。建立群体感应分子检测体系，分析 C12-HSL 对生物膜形成的影响。以微孔板法定量，结晶紫染色和扫描电镜定性检测其生物膜的形成能力。

结果 转录组测序结果分析发现 A1S_0109、1S_0112~ A1S_0114 及乙醇脱氢酶基因 A1S_2098 与群体感应系统相关并表达上调。QRT-PCR 验证差异表达基因的表达情况，结果与测序数据一致。群体感应分子 C12-HSL 的加入使鲍曼不动杆菌生物膜的形成能力增强，且细菌运动性亦增强。双硫仑（200μM）处理后，鲍曼不动杆菌生物膜内细菌乙醇脱氢酶的活性减弱，群体感应相关基因的表达下调，生物膜形成能力下降。双硫仑对鲍曼不动杆菌生物膜形成的抑制作用在临床分离株中同样有效。

结论 鲍曼不动杆菌生物膜的形成与群体感应系统相关。群体感应增强，鲍曼不动杆菌的生物膜形成能力和细菌运动性增强。乙醇脱氢酶在鲍曼不动杆菌生物膜形成中发挥重要作用。双硫仑处理后鲍曼不动杆菌乙醇脱氢酶活性减弱，同时群体感应基因表达下调，生物膜形成能力下降。

PO-1032

A Smart Efficient Nanocomposite Serving Dual Roles Cruelly Combat Carbapenem-Resistance Acinetobacter baumannii, the Promising Alternative Therapy

Xisheng Li
the Third Xiangya Hospital, Central South University

Purpose In the face of the abundant production of various types of carbapenemases, the antibacterial efficiency of imipenem seen as “the last line of defence” is weakening. Following, the incidence of carbapenem-resistant *Acinetobacter baumannii* (CRAB), which can generate antibiotic-resistant biofilms, is increasing. Based on the superior antimicrobial activity for silver nanoparticles against multifarious bacterial strains compared with common antibiotics, we constructed the silver nanocomposite whose core was silver nanoparticle to tackle the current dilemma, and silver nanocomposite was able to function as a novel smart pH-sensitive nanodrug system.

Method Preparation of silver nanoparticles; Characterization and the release characteristics of silver nanocomposite; Assay for antibacterial effects and research on antibiofilm activity of silver nanocomposite in vitro; Assessing influence on CRAB-infection MLE-12 cells by counting, apoptosis evaluation and CLSM; A series of cell experiments to verify toxicity and biocompatibility in vitro; Constructing mice model of carbapenem-resistant *A. baumannii* pneumonia and studying therapy in vivo; Experiments of toxicity research in vivo; Statistical analysis.
Results 1. Smart pH-sensitive silver nanocomposite was effective in acidic infected environments to release more imipenem and Ag+, which can kill A. baumannii together. The release rates of imipenem and Ag+ at pH=7.4 within 48 h were 62.73 ± 0.97% and 52.37 ± 1.73%, respectively. However, at pH=5.0 and 48 h, imipenem and Ag+ released from the silver nanocomposite were 88.37 ± 0.83% and 86.73 ± 1.47%, respectively.
2. This platform significantly enhanced antibacterial efficiency, while increasing the generation of reactive oxygen species and the damage of oxidative membrane, as well affecting the cell wall formation and the metabolic pathways.
3. According to the results of crystal violet staining, LIVE/DEAD Backlight bacterial viability staining, and RT-qPCR, this silver nanocomposite downregulated the levels of ompA expression to prevent foramation of biofilms.
4. This nanocomposite could also inhibit cell death induced by carbapenem-resistant *Acinetobacter baumannii* infection. The percentage of dead MLE-12 cells was 91.28 % for treatment of PBS, instead the numbers of dead cells were negligible for treatment of the silver nanocomposite. The MLE-12 cell line treated with the silver nanocomposite did not exhibit remarkable apoptosis, and the ratio was only 7.74 ± 1.23%.
5. The nanodrug system had a crucial impact on the efficient therapeutic efficacy in vivo by cytokine regulation and tissues repair acceleration. The images from HE and TUNEL assay of lung tissue sections suggested outstanding therapeutic efficacy of silver nanocomposite against CRAB-infected mice. The values of TNF-α and IL-6 obtained with silver nanocomposite treatment (approximately 30 pg/mL) were lowest among all seven groups. The silver nanocomposite was optimal in promoting the expression of VEGF and PECAM1 compared with other treatments.
6. The silver nanocomposite not only had excellent biosafety, biocompatibility, and hemocompatibility but also produced fewer side effects.
Conclusion The sliver nanocomposite is regarded as the pH-sensitive efficient antibacterial nanocomposite, which plays an excellent role in revolting with carbapenem-resistance *Acinetobacter baumannii* in vitro and in vivo. For one thing, this functionalized nanodrug system can be devoted to synergistically killing A. baumannii; for another, it is able to protect the released imipenem from hydrolyzing by carbapenemase. It is undisputed that there are preeminent biocompatibility and hemocompatibility, as well as high biosafety for this nanodrug system. This platform significantly enhanced antibacterial efficiency, while increasing the generation of ROS and the damage of oxidative membrane, as well affecting the cell wall formation and the metabolic pathways. It makes contributions to affecting on host-pathogen interaction, regulating immune response, and accelerating tissues repair. In summary, the constructed nanodrug system not only is considered as a supernal clinical application but also provides a new efficient antimicrobial therapeutic strategy.

PO-1033

动态显色法测定真菌(1,3)-β-D-葡聚糖试剂盒性能验证评价

吕星
中南大学湘雅二医院

目的 在 ATI-320 LKM 动态试管仪上采用动态显色法检测真菌(1,3)-β-D-葡聚糖，评价真菌(1,3)-β-D-葡聚糖检测试剂盒性能指标。
方法 根据美国临床实验室标准化委员会制定的评价方案对湛江安度斯公司生产的真菌(1,3)-β-D-葡聚糖检测试剂盒进行了回收试验、精密度试验、分析测量范围验证实验、干扰试验及参考区间试验。

结果 湛江安度斯公司所生产的真菌(1,3)-β-D-葡聚糖检测试剂盒的两个浓度水平质控品的实验室精密度 CV 为 7.0%；回收率 95.2%~103.5%。有关于线性评价的相关系数 r=0.990,而线性的回归方程为 Y=0.95X+206；不同浓度的血红蛋白在干扰试验中均对测定(1-3)-β-D-葡聚糖产生严重干扰。数据表明低于 1450 度的乳糜对测定(1,3)-β-D-葡聚糖产生的干扰不明显，浓度为 1450 度的乳糜会造成大于 10%的负偏差；浓度为 0.072g/L 的结合胆红素标本对测定(1,3)-β-D-葡聚糖产生不明显干扰。浓度大于 0.144g/L 的结合胆红素标本对测定（1,3)-β-D-葡聚糖产生明显干扰。浓度为 0.01g/L 的非结合胆红素标本对测定(1,3)-β-D-葡聚糖产生不明显干扰。其他浓度的非结合胆红素标本对测定(1,3)-β-D-葡聚糖均产生明显干扰。

结论 安度斯公司在国内推出的 G 试验试剂盒在正确度及精密度、抗干扰、线性等方面的性能达到临床要求，值得推广应用。

Risk factors for carbapenemase-producing organisms among inpatients in Scotland: A national matched case-control study

Shengyuan Zhao[1,2]、Meghan Perry[3]、Sharon Kennedy[4]、Julie Wilson[5]、Margo Chase-Topping[6,7]、Eleanor Anderson[8]、Michael Lockhart[4]、Mark Woolhouse[2,9]

1. Department of Clinical Laboratory, Xiangya Hospital, Central South University, Changsha, Hunan, China
2. Usher Institute, University of Edinburgh, Edinburgh, United Kingdom
3. Regional Infectious Diseases Unit, Western General Hospital, Edinburgh, United Kingdom
4. Public Health Scotland, Glasgow, United Kingdom
5. Antimicrobial Resistance and Healthcare Associated Infection (ARHAI) Scotland, NHS National Services Scotland, Glasgow, United Kingdom
6. The Roslin Institute, University of Edinburgh, Edinburgh, United Kingdom
7. The Royal (Dick) School of Veterinary Studies, University of Edinburgh, Edinburgh, United Kingdom
8. NHS Greater Glasgow and Clyde, Glasgow, United Kingdom
9. Centre for Immunity, Infection and Evolution, School of Biological Sciences, University of Edinburgh, Edinburgh, United Kingdom

Aim To determine risk factors for carbapenemase-producing organisms (CPOs) and to determine the prognostic impact of CPOs.

Methods This is a retrospective matched case-control study. Inpatients across Scotland in 2010-2016 were included. Patients with a CPO were matched with 2 control groups by hospital, admission date, specimen type, and bacteria. One group comprised patients either infected or colonized with a non-CPO and the other group were general inpatients. Conditional logistic regression models were used to identify risk factors for CPO infection and colonization, respectively. Mortality rates and length of postisolation hospitalization were compared between CPO and non-CPO patients.

Results In total, 70 CPO infection cases (with 210 general inpatient controls and 121 non-CPO controls) and 34 CPO colonization cases (with 102 general inpatient controls and 60 non-CPO controls) were identified. Risk factors for CPO infection versus general inpatients were prior hospital stay (adjusted odds ratio [aOR], 4.05; 95% confidence interval [CI], 1.52-10.78; P = .005), longer hospitalization (aOR, 1.07; 95% CI, 1.04-1.10; P < .001), longer intensive care unit (ICU) stay (aOR, 1.41; 95% CI, 1.01-1.98; P = .045), and immunodeficiency (aOR, 3.68; 95% CI, 1.16-11.66; P = .027). Risk factors for CPO colonization were prior high-dependency unit (HDU) stay (aOR, 11.46; 95% CI, 1.27-103.09; P = .030) and endocrine, nutritional, and metabolic (ENM) diseases (aOR, 3.41; 95% CI, 1.02-11.33; P = .046). Risk factors for CPO infection versus non-CPO infection were prolonged hospitalization (aOR, 1.02; 95% CI, 1.00-1.03; P = .038) and HDU stay (aOR, 1.13; 95% CI, 1.02-1.26; P = .024). No differences in mortality rates were detected between CPO and non-CPO patients. CPO infection was associated with longer hospital stay than non-CPO infection (P = .041).

Conclusions A history of (prolonged) hospitalization, prolonged ICU or HDU stay; ENM diseases; and being immunocompromised increased risk for CPO. CPO infection was not associated with increased mortality but was associated with prolonged hospital stay.

PO-1035

16S rRNA 靶向测序联合荧光定量 PCR 对血流感染人型支原体的鉴定

曾童、张小团、刘卓然
南华大学附属第二医院

目的 对南华大学附属第二医院产妇血培养“假阳性”标本进行微生物学分子检测，以进一步明确导致孕妇产后不明原因发热的病原谱，并指导临床诊治。
方法 对患者报阳性的需氧和厌氧血培养瓶培养物涂片后革兰染色镜检，进行细菌形态学初级检查，同时转种普通培养基培养；根据初级结果及临床特征对血培养物做支原体培养及药敏试验；采用 16S rRNA 靶向测序技术鉴定血培养物中可能存在的病原菌，根据测序结果进行人型支原体荧光定量 PCR 作进一步证实，同时验证荧光定量 PCR 法检测血培养物的可行性。
结果 将源于同一患者的两瓶“假阳性”瓶内血样进行病原学鉴定。涂片染色后镜下观察，未见典型细菌。转种普通培养至哥伦比亚血琼脂平板、麦康凯平板等细菌培养平板 48 h 后未见菌落生长。将血培养物集菌后进行支原体培养，结果亦呈阴性。随后进行 16S rRNA 基因测序鉴定，显示此产妇血液中存在人型支原体（序列相似度 99.93%），荧光定量 PCR 证实血培养物中的病原体为人型支原体。
结论 造成该孕妇产后持续性高热的原因为人型支原体血流感染，采用荧光定量 PCR 法检查结果可靠。对于产科不明原因发热送检的血培养“假阳性瓶”，采用 16S rRNA 测序和/或联合荧光定量 PCR 可提高支原体血流感染的检出效率。

Mechanism of the emergence of hypervirulent and carbapenem-resistant Klebsiella pneumoniae: mobilization of virulence plasmids under the help of conjugative plasmids?

Dongxing Tian
Huashan Hospital, Shanghai Medical College, Fudan University

Hypervirulent and carbapenem-resistant Klebsiella pneumoniae (hv-CRKP) has emerged as a threatening pathogen puzzling many scientists and clinicians. The mechanism of the acquisition of pK2044-like virulence plasmid by carbapenem-resistant Klebsiella pneumoniae (CRKP) is still unknown. Hypervirulent NTUH-K2044, carbapenem-resistant JS187 and HS11286 strains have been completely sequenced before, and were selected as representative strains to explore the mechanism of the mobilization of pK2044-like virulence plasmids. The virulence and resistance phenotype experiments were also performed in these strains and their corresponding transconjugants. The conjugative KPC plasmid pKPHS2 of HS11286 could be transferred to hypervirulent NTUH-K2044, and transconjugant NTUH-K2044-pKPHS2 was obtained. Although KPC plasmid could be stable in NTUH-K2044 after 25 passages, NTUH-K2044-pKPHS2 didn’t exhibit the dual phenotype of hypervirulence and carbapenem-resistance for the fitness costs. The transconjugant NTUH-K2044-pKPHS2 could acquire carbapenem resistance during subculturing but lost hypermucoid phenotype. The mucoid NTUH-K2044-pKPHS2 remained

hypervirulence but did not obtain carbapenem-resistance, while non-mucoid NTUH-K2044-pKPHS2 acquired high carbapenem-resistance but had a decreased virulence phenotype. We speculated that the fitness costs of KPC plasmid in hypervirulent NTUH-K2044 possibly result in the less common detection rate of carbapenem-resistant and hypervirulent Klebsiella pneumoniae (CR-hvKp) in hospital than hv-CRKP strains. We further performed conjugation experiment which NTUH-K2044-pKPHS was as a donor and carbapenem-resistant JS187 as a recipient, and virulence plasmid pK2044 could be transferred to JS187 under the help of the conjugative KPC plasmid pKPHS2. The transconjugant JS187-pK2044 had the dual phenotype of hypervirulence and carbapenem resistance. S1-PFGE and draft plasmids genome sequencing confirmed the simultaneous mobility of pK2044 and pKPHS2. In conclusion, our study confirmed a pathway of the mobilization of pK2044-like virulence plasmid to CRKP strains and provided a possible explanation of the lower detection rate of CR-hvKp strains than hv-CRKP strains in clinical settings.

PO-1037

6353 份血培养检出病原菌的分布及耐药性分析

何天娇
西安医学院第一附属医院

目的 通过检测血培养中的病原菌，并分析其耐药性，旨在为临床提供合理的用药参考。
方法 对本院 2018 年 1 月至 2019 年 12 月的血培养标本进行回顾性分析，采用 K-B 或 MIC 法对分离的主要病原菌进行药敏试验，使用 WHONET5.6 软件对病原菌的分布和药敏结果进行分析。
结果 在本实验纳入的 6353 份血培养标本中，共分离出病原菌 327 株，阳性率为 5.1%（327/6353），其中革兰阴性菌 184 株（占 56.3%）；革兰阳性菌 139 株（占 42.5%）；真菌 4 株（占 1.2%）。排名前 5 位的病原菌依次为：大肠埃希菌（占 30.9%）、人葡萄球菌（占 12.8%）、肺炎克雷伯菌（占 10.1%）、表皮葡萄球菌（占 8.0%），以及溶血葡萄球菌（占 6.4%），其中大肠埃希菌和肺炎克雷伯菌检出产超广谱 β-内酰胺酶的菌株分别为 32.7%和 45.5%；耐甲氧西林金黄色葡萄球菌的检出率为 7.1%，检出了对碳青霉烯类药物耐药的肠杆菌科细菌，检出率为 4.7%，未检出对万古霉素、替考拉宁、替加环素耐药的葡萄球菌。
结论 本院血培养存在阳性率低问题，需要加强临床科室的沟通，提高血培养送检，定期对血流感染病原菌的分布及耐药性进行分析，为临床医生经验用药提供依据。

PO-1038

The recombinant protein TPF-1 upregulates the secretion of IL-6 and IL-8 and promotes endothelial angiogenesis through the ERS/PI3K/ Akt and ROS/ NF-κB pathways

Ting Cao、Jialun Cai、Shuangquan Liu
The First Affiliated Hospital of University of South China

Aims In this study, human umbilical vein endothelial cells (HUVEC) were used as target cells to investigate the role of Treponema pallidum recombinant protein TpF-1 in promoting angiogenesis, and to further explore the mechanism of ERS/PI3K/AKT and ROS/NF-κB signaling pathway in TpF-1 promoting angiogenesis, which laid a foundation for studying angiogenesis and vascular inflammation caused by Treponema pallidum infection.
Methods 1. After stimulating HUVEC with different concentrations of TPF-1, CCK8 was used to detect cell proliferation and activity. The endoplasmic reticulum structure of cells was observed by transmission electron microscope. The expression levels of IL-6, IL-8 and VEGF-A in HUVEC

were detected by RT-PCR and ELISA, and detection of angiogenesis by in vitro angiogenesis assay.
2. After stimulating HUVEC with different concentrations of TPF-1, WB test detected the expression of proteins related to HUVEC ERS/PI3K/Akt and ROS/NF-κB pathway. ROS production was detected by flow cytometry. Immunofluorescence assay was used to detect nuclear translocation of NF-κ B.
3.After ERS, PI3K, AKT, ROS and NF-κB inhibitors pretreated HUVEC, WB detected the expression of related pathway proteins. Flow detection of ROS production. The expression levels of IL-6, IL-8 and VEGF-A were detected by RT-PCR and ELISA. Transwell and in vitro angiogenesis assay were used to detect migration and tube-forming ability of HUVEC.
Results 1. After stimulating HUVEC with different concentrations of TPF-1, the cell activity was enhanced, the endoplasmic reticulum structure was obviously swollen and broken, and the expression of IL-6 and IL-8 in HUVEC was up-regulated in a dose-dependent manner, which promoted the in vitro angiogenesis of HUVEC, but the expression of VEGF had no obvious change.
2. TPF-1 can up-regulate the expression of ERS-related proteins BIP, PERK and IRE1-α in a dose-dependent manner, after ERS inhibitor is used, the expression of ERS-related proteins is significantly down-regulated and the in vitro angiogenesis ability of HUVEC is inhibited.
3. The expressions of PI3K and AKT, IL-6 and IL-8 were significantly down-regulated after adding inhibitors of PERK and IRE1-α.
4.TPF-1 can up-regulate the production of ROS, and after using ROS inhibitor, it can significantly reduce the expression of p-65, the nuclear translocation of NF-κB, the expression of IL-6 and IL-8, and finally inhibit angiogenesis.
Conclusions 1.TpF-1 can promote HUVEC to secrete IL-6 and IL-8 to induce angiogenesis.
2. TPF-1 can stimulate the formation of endothelial cell tubes via the ERS(PERK、IRE1α)/PI3K/Akt pathway.
3.TpF-1 can induce endothelial cell tube formation through ROS/NF-κB pathway.

PO-1039

苯唑西林敏感 MRSA(OS-MRSA)多中心研究

刘俊兰、李敏
上海交通大学医学院附属仁济医院

Oxacillin-susceptible mecA-positive MRSA represents an important issue, as its oxacillin susceptibility contributed to misidentification and potential therapeutic failure, but limited data on the current status of OS-MRSA infection in Chinese hospitals are available. This multicenter study revealed that OS-MRSA represented 1.8% of total isolates. Of 17 OS-MRSA, 10 were ST59, followed by ST965, and 11 carried SCCmec IV, while 5 carried SCCmec V, but only one was PVL-positive, 16 had point mutations within mecA promoter. VITEK 2 system exhibited deficiency, whereas cefoxitin disk diffusion should be supplemented in detecting S. aureus with borderline MICs. This study has characterized phenotypically and molecularly OS-MRSA in China, and provided insights into effective management of OS-MRSA.

PO-1040

葡萄球菌激酶 SAK 活化 NLRP3 炎性小体促进社区获得性金黄色葡萄球菌肺部感染

王亚楠
上海交通大学医学院附属仁济医院

目的 明确葡萄球菌激酶 SAK 在高毒力社区获得性金黄色葡萄球菌（CA-SA）中的作用及机制。为及时的诊断与感控措施的实施以及设计新的抗感染药物或疫苗提供潜在的药物靶标和依据。
方法 检测不同临床菌株的 SAK 表达和分泌水平。构建 sak 基因敲除株，通过半定量生物被膜实验检测 SAK 对生物被膜形成的作用。在野生小鼠与 CRAMP−/−小鼠上构建肺炎模型进一步明确 SAK 在 CA-SA 侵袭性感染中的作用。取小鼠肺组织抽提总 RNA，通过 RNA 测序探究 SAK 对宿主基因表达的作用。并通过体外实验进一步验证 RNA 测序的结果。
结果 SAK 在 CA-SA 流行株 ST398 和 ST59 中的表达水平明显高于医院获得性的金葡菌。SAK 对金葡菌生物被膜形成的抑制作用主要是通过促进纤溶来实现。此外，小鼠肺炎模型结果表明感染野生型 ST398 的小鼠，其肺部的充血水肿明显更严重，肺组织 CFU 计数更高，并表现出更严重的炎细胞浸润，推测 SAK 能够促进金葡菌的肺部感染；并通过 CRAMP−/−小鼠进一步证实 SAK 的抗菌肽中和作用并非其促进感染的主要机制。RNA 测序结果表明，SAK 可促进固有免疫相关基因的表达，还可促进 NLRP3 炎性小体的激活，并通过体内外实验进一步证实。此外，SAK 可促进细胞活性氧的生成，进而促进 NLRP3 炎性小体的激活，介导肺组织的炎症性损伤。
讨论 本研究强调了控制炎症反应在急性肺部感染中的意义，炎性-抗炎反应失衡是金葡菌肺炎的重要致病机制，高毒力 CA-SA 流行株 ST398 在早期肺炎感染过程中通过 SAK 促进活性氧的生成，从而促进宿主固有免疫炎症反应的激活，尤其是 NLRP3 炎性小体的激活，可促使细胞焦亡，增强炎症因子的释放，加剧炎症性组织损伤。

PO-1041

感染性病原菌宏基因组检测标本预处理方法探索

朱盈、杨启文
中国医学科学院北京协和医院

目的 近年来，血流感染发病率逐年上，而其诊断依赖于病原菌的鉴定，但由于血液中病原菌浓度极低，培养慢且阳性率低，将不受靶标限制的宏基因组学测序技术用于病原菌诊断能带来极大的便利。本课题主要针对宏基因组学测序技术一大难题——血流感染患者标本中大量人类核酸对病原菌核酸检测带来的干扰进行研究，设计了三种去宿主（人源）核酸方法皂素（Saponin）去宿主核酸法、SDS 去宿主核酸法和水洗法，从中选出最优方法。
方法 向无菌血液样本中分别注入金黄色葡萄球菌、肺炎克雷伯菌、白色念珠菌模拟临床血流感染患者血液标本，对标本进行去宿主核酸处理、核酸提取、qPCR，通过比较对照组及实验组样本的 Cq 值评价各方法的去人源核酸效果以及病原菌核酸丢失量。
结果 皂素去宿主法中，人源核酸去除效果较好：GAPDH 基因=10.13，s2=1.02；β-actin 基因=12.76，s2=0.63，而病原菌核酸发生富集：= -1.32，s2=6.79。SDS 去宿主法中人源核酸去除效果好：GAPDH 基因=11.13，s2=0.30；β-actin 基因=14.30，s2=1.29，但病原菌核酸也发生了丢失：= 2.46，s2=4.43。水洗法中人源及病原菌核酸发生了富集， GAPDH 基因=-4.23，s2=0.38；β-actin 基因=-4.05，s2=0.96；病原菌= -0.73，s2=4.84。
结论 综合考虑去宿主核酸及病原菌核酸丢失量两方面，使用皂素去宿主核酸法处理含菌血液样本效果最理想。

PO-1042

Iron-rich conditions induce virulence and OmpA changes of Acinetobacter baumannii

Hui Liu[1]、Chunyuan Cao[2]、Fu lan Qiu[1]、Haonan Huang[1]、xiunian Hu[1]
1. Fujian Longyan First Hospital
2. 福建省龙岩市疾控中心

Background Iron ions affect the expression of outer membrane protein A (OmpA), a major pathogenic protein in Acinetobacter baumannii.
Objective To analyze the effect of iron ions on the expression of the OmpA protein of A.baumannii and explore its association with the virulence of OmpA.
Methods Site-directed mutagenesis was used to construct OmpA gene deletion strains and gene repair strains. The OmpA protein expression of A. baumannii under culture with different contents of iron ions were detected. The virulence of A. baumannii with different OmpA protein expression levels was evaluated in macrophages and mice.
Results OmpA protein levels of the three strains were enhanced under iron-rich conditions and were reduced in the presence of the iron-chelating agent 2,2'-bipyridine. A. baumannii wild type and +OmpA had a remarkable toxic effect on RAW246.7 macrophages ($P<0.05$), while the ΔOmpA had a significantly reduced toxic effect on RAW246.7 macrophages ($P<0.05$). The levels of the inflammatory factors IL-1β, IL-6, IL-8, and TNFα in the mice spleen were significantly increased in the +OmpA strain treatment group compared with the ΔOmpA strain group (all $P<0.05$). In addition, the levels were higher in the presence of iron ions than in the presence of the chelating agent.
Conclusion Iron-rich conditions increase the OmpA protein expression of A. baumannii. Strains with high OmpA protein expression were more invasive, which may be a key determinant of A. baumannii infection and pathogenicity. Iron control strategies mightbe used for the management of A. baumannii.

PO-1043

Repurposing eltrombopag as an antimicrobial agent against multidrug-resistant Staphylococcus aureus

Pengfei She、Shijia Li、Linying Zhou、Yong Wu
The Third Xiangya Hospital of Central South University

Because of the excessive use of antibiotics, methicillin-resistant Staphylococcus aureus (MRSA) has become prevalent worldwide. Moreover, the persisters formed in S. aureus biofilms are protected to the action of antimicrobials and cause persistence and relapse of infections. Thus, the discovery of antibiotics with excellent anti-persister and anti-biofilm activities is urgently needed. In the present study, eltrombopag (EP), a classic thrombopoietin receptor agonist, exhibited potential antimicrobial activity against multidrug-resistant (MDR) S. aureus and its persisters, alone or in combination with vancomycin. Through our mechanistic studies, EP was found to disrupt the proton motive force and inhibit the transport of iron across S. aureus cell membranes. The in vivo anti-infective efficacy of EP was further confirmed in the MRSA infection models. In addition, the cytotoxicity of EP against mammalian cells and the in vivo toxicity of EP in animal models were not observed at the tested concentrations of EP. Collectively, these results indicate that EP could be considered a potential novel antimicrobial agent against recalcitrant infections caused by MDR S. aureus and its persisters.

PO-1044

抗高血压药对 MRSA 及其持留菌的抗菌作用和机制研究

徐兰兰、佘鹏飞、陈丽华、李诗佳、周林颖、Zubair Hussain、刘亚倩、伍勇
中南大学湘雅三医院

目的 探索抗高血压药坎地沙坦酯对金黄色葡萄球菌（MRSA）及其持留菌的抗菌作用和机制。
方法 通过微量肉汤稀释法检测坎地沙坦酯的抗菌谱；通过棋盘稀释法检测其和传统抗生素的联合抗菌效果；通过摇菌培养和菌落稀释计数测其时间-杀菌曲线；通过持留菌杀菌试验和膜渗透试验探索其对 MRSA 持留菌的杀菌效果及相应的机制；通过膜渗透试验、膜去极化测试、ATP 释放试验、扫描电镜和透射电镜探索其对 MRSA 的作用机制；通过 XTT 实验和结晶紫染色,探索对其生物膜抑制和根除效果；通过激光共聚焦显微镜（CLSM）探索其对生物膜结构和形态的影响；通过人红细胞溶血试验和 CCK-8 细胞毒性实验测其红细胞溶血率和细胞毒性；通过一步耐药法和连续耐药试验测其对细菌诱导耐药产生的能力；通过小鼠皮肤脓肿模型探索其体内抗菌效果。
结果 坎地沙坦酯对革兰氏阳性菌，尤其是金黄色葡萄球菌，具有较强的抗菌活性，且不易诱导产生耐药性，具有较弱的溶血率和细胞毒性。此外，棋盘稀释法结果表明，坎地沙坦酯联合庆大霉素和妥布霉素对金黄色葡萄球菌的协同抑菌指数值为 0.375，表现为协同抗菌作用。在联合时间杀菌曲线中，联用组在 12 h 时可使细菌数量相比对照组下降约 5 个 Log10。且坎地沙坦酯可以阻止金黄色葡萄球菌生物膜形成并杀死持留菌。通过对其作用机制分析，我们发现坎地沙坦酯可以破坏金黄色葡萄球菌细胞膜通透性,使膜电位和 ATP 下降,并引起膜结构改变。最后，小鼠皮肤脓肿模型证明坎地沙坦酯在体内具有相似的抗菌作用。
结论 坎地沙坦酯可能是治疗金黄色葡萄球菌相关感染的潜在抗菌剂。

PO-1045

Antimicrobial resistance, genetic characterization and molecular epidemiology of Ureaplasma species in males with infertility

Lihong Zhao
Tai'an City Central Hospital

Objectives This study aimed to study the antimicrobial resistance, genetic characterization and molecular epidemiology of Ureaplasma species in order to provide clinicians sufficient data to select optimal strategies of treatment for genitourinary tract infections of infertile male patients.
Methods Firstly, a total of 817 clinical semen specimens were detected for Ureaplasma species by molecular detection. Secondly, culture and identification of Ureaplasma species were achieved by using Mycoplasma ICS Test, and the antimicrobial susceptibility tests were determined by using broth microdilution assay. Then the tetracycline resistance genetic determinants in Ureaplasma species were identified by PCR and the fluoroquinolone and macrolide resistance genetic determinants were identified by DNA sequencing. Finally, the molecular epidemiology of Ureaplasma species was studied by both multilocus sequence typing (MLST) and expanded MLST (eMLST) schemes.
Results Among the 817 semen specimens, 320 (39.17%) specimens were positive for Ureaplasma species. The percentages of resistance in 320 isolates against LEV, MXF, TET and ERY were 47.5%, 39.38%, 19.69%, and 3.75%, respectively. The tet(M) and int-Tn genes were detected positive in all the tetracycline-resistant isolates. One macrolide-resistant UU isolate had a novel amino acid alteration (R66T) in L4 ribosomal protein and another UU isolate harbored a novel alteration (S109T) in L22. In fluoroquinolones-resistant isolates, S83L substitution in the ParC was predominant. In this area, ST22 and eST16 were most prevalent ST and eST, respectively. One ST and 3 eSTs were newly identified in this study.

Conclusions This study has demonstrated that ERY can be first line therapy for Ureaplasma species infections.

PO-1046

Developing two rapid protein extraction methods using focused-ultrasonication and zirconia-silica beads for filamentous fungi identification by MALDI-TOF MS

Yating Ning、Li Zhang、Yingchun Xu
Peking Union Medical College Hospital, Chinese Academy of Medical Sciences & Peking Union Medical College

Filamentous fungi identification by Matrix-assisted laser desorption ionization time-of-flight mass spectrometry (MALDI-TOF MS) has been challenging due to the lack of simple and rapid protein extraction methods and insufficient species coverage in the database. In this study, we created two rapid protein extraction methods for filamentous fungi: an one-step zirconia-silica beads method (ZSB) and a focused-ultrasonication method (FUS). The identification accuracy of two methods were evaluated with the VITEK MS, as well as number of spectra peaks and signal-to-noise ratio with M-Discover 100 MALDI-TOF MS compared to the routine method. The better method was applied to build a filamentous fungi in-house spectra library for the M-Discover 100 MS, and then another one and routine method were performed in parallel to verify the accuracy and commonality of the in-house library. Using the two optimized methods, the dedicated operating time before MALDI-TOF MS analysis was reduced from 30 mins to 7 (ZSB) or 5 (FUS) mins per sample, with only a few seconds added for each additional strain. And both two methods identified isolates from most mold types equal to or better than the routine method, and the total correct identification rate using VITEK MS was 79.67%, 76.42% and 76.42%, respectively. On the other hand, the two rapid methods generally achieved higher maximum and minimum S/N ratios with these isolates tested as compared to the routine method. Besides, the ZSB method produed overall mean of maximum and minimum S/N ratio higher than that by FUS. An in-house library of M-Discover MS was successfully built from 135 isolates from 42 species belonging to 18 genera using the ZSB method. Analysis of 467 isolates resulted in 97.22% correctly identified isolates to the species level by the ZSB method versus 95.50% by the routine method. The two novel methods are time- and cost-effective and allow efficient identification of filamentous fungi while providing a simplified procedure to build an in-house library. Thus, more clinical laboratories may consider adopting MALDI-TOF MS for filamentous fungi identification in the future.

PO-1047

MKT-077 选择性清除外排泵高表达唑类耐药真菌的作用机理研究

张明
山东大学第二医院

目的 白色念珠菌是临床常见的致病真菌，抗真菌药物种类少以及耐药的多发严重制约着白色念珠菌感染的治疗，因而寻找新型、特别是针对耐药菌的抗真菌药物具有重要意义。
方法 微生物和肿瘤均存在旁系敏感现象，即某种耐药突变会增加对其它类型药物的敏感性。我们利用该特性，采用荧光标记的敏感菌和耐药菌共培养模型对天然分子和药物分子库进行筛选，发现对由外排泵 MDR1 高表达引起的唑类耐药菌具有选择性清除作用的小分子。并通过寻找 MDR1 高表达株与其母体菌株的差异揭示该化合物的选择性作用机制。

结果 高通量筛选发现具有抗肿瘤活性的花菁染料类分子 MKT-077 对由外排泵 MDR1 高表达引起的唑类耐药菌具有选择性清除作用，其最小抑菌浓度为唑类敏感株的 1/8。机制实验表明 MKT-077 的选择性与胞内药物含量累积差异有关，且 MKT-077 的摄取依赖于质子梯度。
结论 MKT-077 对由外排泵 MDR1 高表达引起的唑类耐药菌具有选择性清除作用。

PO-1048

利用细菌肽聚糖结构构建革兰阳性细菌的超灵敏检测方法

韩道宾[1]、丁世家[2]
1. 山东大学第二医院
2. 重庆医科大学

目的 病原微生物感染的早期鉴定对于临床感染性疾病的早期诊断、治疗指导具有重要的意义。目前临床上传统的微生物检测方法较为耗时，且灵敏性有待提高。因此，本课题整合了革兰阳性细菌自身肽聚糖结构和金属纳米材料的优点，以及两者之间的高度亲和作用，基于电化学平台开发了免二抗、无酶、快速的细菌检测新方法。
方法 首先在电极表面依次修饰碳纳米管和金纳米粒子，增强导电性和有效反应面积。接下来，修饰特异性抗体，并且通过抗体捕获靶细菌。而后再加入铂镍铜三金属纳米立方体，革兰阳性细菌的肽聚糖结构可以稳固的结合金属纳米立方。最后利用铂镍铜纳米立方体的自身电化学特性及类过氧化物酶作用实现细菌的快速灵敏检测。
结果 方法在 1.5×102 - 1.5×108 CFU/mL 的检测范围内具有良好的线性关系，并且最低检测限达到了 42 CFU/mL。本方法完全可以在加入靶物质后 2 小时内实现结果的输出，免去了传统细菌过夜培养的时间。此外，本检测方法具有较高的特异性，能选择性的对革兰阳性细菌进行快速灵敏的检测。以上结果说明该方法具有良好临床适用性。
结论 本文首次基于细菌肽聚糖结构和铂镍铜三金属纳米立方体的高度亲和作用构建了细菌检测的新方法，具有免二抗、无酶等优点，并且方法在快速检测的基础上具有较高的特异性。该方法为临床病原微生物的检测和即时检验（POCT）提供了新的技术支持，具有广阔的临床应用前景。

PO-1049

Clinical Epidemiology and Resistance Phenotype of Invasive Escherichia coli in Children

Yang Li、Wei Li、Yunzhen Tao、Yunzhong Wang、Xuejun Shao
苏州大学附属儿童医院，Children's Hospital of Soochow University

Objective To investigate the clinical epidemiology and drug resistance of invasive *Escherichia coli* (*E. coli*) isolates at a children's medical center in east China and provide guidance for clinical treatment and nosocomial infection control.
Methods 67 invasive *E. coli* strains were isolated in Children's Hospital of Soochow University from January 2018 to December 2019. The strains were identified by automatic mass spectrometer and the drug susceptibility were analysed by VITEK 2 compact system. PCR was also performed to detect the genes of carbapenemases, extended-spectrum β-lactamases (ESBLs) and AmpC β-lactamases.
Results 67 invasive *E. coli* strains were isolated from blood (88.06%) and cerebrospinal fluid (11.94%). They were mainly from the departments of neonatology (37.31%), hematology (31.34%), and intensive care units (10.45%). 65.67% of patients were boys and 34.33% were girls. Among them, 44.78% was younger than 1 month, 31.34% was between 1 and 12 months old, 23.88% was between 1 and 18 years old. The drug sensitivity results showed that 67 invasive *E. coli* strains were not resistant to imipenem, meropenem, ertapenem and amikacin.

Among them, 25 invasive *E. coli* strains produced ESBLs at the same time. PCR results showed that the carbapenemase genes of 67 invasive *E. coli* strains were *NDM-1* (2.99%) and *OXA-1* (1.49%). ESBLs genes were *TEM-1* (62.69%) and *CTX-M-14* (34.33%). Besides, AmpC β-lactamase genes were *ACT-1* (64.18%), *FOX-1* (44.78%), *CIT-1* (2.99%), *CMY-2* (2.99%) and *DHA-1* (1.49%).
Conclusion The drug resistant rate of invasive *E. coli* from children was not high and the carriage proportion of β-lactam antibiotic resistance genes was lower than invasive *Klebsiella pneumoniae*. The mechanism of β-lactam antibiotic resistance was mainly attributed to the genes of *TEM-1*, *CTX-M-14*, *ACT-1* and *FOX-1*.

PO-1050

不同血培养瓶对 4 种常见抗菌药物中和能力比较

杨会林、陈娟、闫津津、闫津津、文明明
北京大学深圳医院

目的 研究不同血培养瓶对 4 种临床常用抗菌药物的中和效果。
方法 选取 4 种临床常用抗菌药物亚胺培南、哌拉西林/他唑巴坦、万古霉素、卡泊芬净，分别使用推荐质控菌株配对，进行血培养瓶细菌生长模拟试验，观察上机培养后细菌能否报阳及报阳时间，评估不同血培养瓶对抗菌药物的中和能力。
结果 亚胺培南/大肠埃希菌组，梅里埃 FN plus 瓶报阳，报阳时间为 12.4±0.3h，梅里埃 FA plus、BD Aerobic、BD Anaerobic 均超过 5 天不报阳；哌拉西林/他唑巴坦/铜绿假单胞菌组，梅里埃 FA plus、BD Aerobic 均能报阳，平均报阳时间分别为 16.2±0.3h、18.1±0.4h；万古霉素/金黄色葡萄球菌组，梅里埃 FA plus、FN plus、BD Aerobic 能报阳，平均报阳时间分别为 16.7±0.4h、24.1±0.6h、31.3±3.9h，BD Anaerobic 超过 5 天不报阳。卡泊芬净/白色念珠菌组，梅里埃 FA plus、BD Aerobic 能报阳，平均报阳时间为 47.1±3.3h、42.9±2.0h。
结论 梅里埃 FA plus、BD Aerobic 具有中和万古霉素、哌拉西林/他唑巴坦、卡泊芬净的能力，FA plus 具有中和亚胺培南、万古霉素的能力；使用抗菌药物前采集血培养很重要，应根据临床抗菌药物使用习惯选择合适的培养瓶；

Effect of CAP10 gene on immune response in mice infected with Cryptococcus neoformans

liping lin、Shanshan Chen、Junhui Zhang、Xianghui Li、Juan Wu、Ni Lin
Fujian medical university

Objectives The capsule associated protein 10 gene (CAP10) is indispensable to the formation of the polysaccharide capsule, and is closely related to virulence of the Cryptococcus (C.) neoformans. However, the role of CAP10 in the pathophysiology of cryptococcosis is still not well understood. This study aims to investigate the association of CAP10 expression with the immune responses to infected mice with C. neoformans.
Methods The shRNA expression plasmid was designed to interfere with the synthesis of CAP10. The animal model was established with C. neoformans wt strain H99, cap10-shRNA C. neoformans and PBS control in the respiratory tract. On the 7 days and 21 days after infection, mice lung histopathological examination and homogenate culture were performed, and cytokines expression level in the serum of mice were quantitatively detected.
Results The cap10-shRNA group may alleviate pathological lesions in pulmonary C. neoformans infection, and a lower degree of inflammatory cells was observed in the cap10-shRNA group. The fungal burden was significantly lower in the cap10-shRNA group, indicating

that the clearance towards C. neoformans was somehow affected. In addition, interference with CAP10 altered the expression profile of Th1, Th2, Th17 and Treg type cytokine. Down-regulation of CAP10 was beneficial to the balance of Th1/Th2 and Th17/Treg ratios.
Conclusions Collectively, our results showed that the expression of CAP10 was associated with an antifungal immune response in mice, suggesting that CAP10 regulates the inflammatory response. Therefore, we expect that the CAP10 gene will become a new molecular therapeutic target in cryptococcosis treatment.

PO-1052

丝状真菌培养条件对质谱鉴定的影响因素研究

袁凯旋、陈晓丽、叶龙
广东省人民医院（广东省医学科学院）

目的 以 Vitek MS 为平台，探究丝状真菌在不同培养基、不同培养温度和不同培养时间对质谱鉴定正确率的影响，以筛选适合本实验室丝状真菌质谱鉴定的理想培养条件，提高鉴定正确率。
方法 将从临床分离到的经过测序和形态学确认的 100 株丝状真菌分别接种于沙氏葡萄糖培养基（SDA）、马铃薯葡萄糖琼脂培养基（PDA）及 28℃和 37℃共四种组合培养条件下进行培养。在确定其最佳培养条件之后，在其培养的第 2、3、4、5、7、8、9 天对其进行质谱鉴定，以鉴定正确率的差异性从而筛选出丝状真菌的最佳培养条件。
结果 不同培养基比较，SDA 鉴定正确率为 85.5%，PDA 鉴定正确率为 73%，两种培养基准确性的鉴定率有显著差异(c^2=9.503，P=0.003)，其中使用 SDA 鉴定率最高。不同温度进行比较，28℃下总鉴定正确率为 80%，37 度下总鉴定正确率为 78.5%，两种温度比较其鉴定正确率无显著差异(c^2=0.137，P=0.805)。菌株培养 2~9 d 的质谱鉴定正确率分别为 93%、90%、79%、68%、62%、62%、56%、55%，随着培养时间的延长正确率随着下降，比较不同培养天数下的鉴定正确率，差异有统计学意义(c^2=75.189，P=0.000），2d 和 3d 正确率最高，差异无统计学意义（c^2=0.084，P=0.772）。
结论 使用 SDA 培养基在 28℃或 37℃下培养丝状真菌 2~3 d 进行质谱鉴定能取得良好的鉴定结果。

PO-1053

Identifcation of a novel bocaparvovirus in a wild squirrel in Kunming, Yunnan Province, China

Jiali Wang
Yunnan Province Hospital of Infection Disease

In December 2017, a squirrel (Callosciurus phayrei) died 2 days after capture in Kunming, and its intestinal tract, heart, liver, spleen, lung, and kidney were subjected to metagenomics analysis. Reassembly and verifcation by reverse transcrip_x0002_tion PCR of contigs generated by next-generation sequencing yielded a 5176-nt sequence, which was designated "squirrel bocaparvovirus" (SQBOV). Phylogenetic trees based on the aa sequences of NS1, NP1, and VP1 showed that SQBOV formed an independent branch in the bocaparvovirus phylogenetic tree. The amino acid sequence identity of the NS1 of SQBOV to those of other bocaparvoviruses was below the threshold of 85% that is used to demarcate species within the genus, indicat_x0002_ing that it should be considered a member of a new bocaparvovirus species. To our knowledge, this is the frst report of a bocaparvovirus in squirrels. Our fndings will enable further studies of viral diversity in rodents and of the genetic diversity and host range of bocaparvoviruses.

PO-1054

糖尿病足患者金黄色葡萄球菌分离株毒力的初步研究

罗振[1]、黄卯[2]
1. 中南大学湘雅三医院
2. 中南大学湘雅医学院检验系

目的 确定糖尿病足患者金黄色葡萄球菌分离株的毒力及相关的毒力因子，为后续研究提供依据。
方法 收集中南大学湘雅三医院微生物室分离鉴定的来源于糖尿病足（31 例）、血流感染（22 例）、分泌物标本（31 例）的金黄色葡萄球菌；利用体外溶血实验检测金黄色葡萄球菌分离株的毒力；利用反向 CAMP 实验检测金黄色葡萄球菌是否产 β 溶血素（β-toxin）；利用蛋白水解实验鉴定胞外蛋白酶的活性。
结果 糖尿病足分离株金黄色葡萄球菌的溶血活性明显高于血流感染和分泌物分离株，而血流感染菌株和分泌物分离株的溶血活性无明显差异；反向 CAMP 实验将糖尿病足分离出金黄色葡萄球菌分为 β-toxin+ 和 β-toxin— 分离株；β-toxin+ 分离株的溶血活性明显高于 β-toxin— 分离株；血清能显著抑制 β-toxin+ 和 β-toxin— 分离株的溶血活性，但是高密度脂蛋白（HDL）仅能显著抑制 β-toxin+ 分离株的溶血活性，而不影响 β-toxin—分离株的溶血活性。基因敲除 PSM 或 agr 基因能显著降低 RJ-2（β-toxin+）的溶血活性。丝氨酸蛋白酶抑制剂（PMSF）和金属蛋白酶抑制剂（EDTA）并不影响 β-toxin— 分离株的溶血活性及蛋白分解能力。自溶素抑制剂（SPS）能显著抑制 β-toxin— 分离株的溶血活性及蛋白分解能力，而不影响 β-toxin+ 分离株；
结论 糖尿病足患者金黄色葡萄球菌分离株的毒力增加，PSM 是 β-toxin+ 分离株的主要毒力因子，而是自溶素是 β-toxin—分离株的主要毒力因子。

PO-1055

bla 系统在苯唑西林敏感 mecA 阳性金黄色葡萄球菌中发挥重要调控作用

简颖、李天铭、赵林、李敏
上海交通大学医学院附属仁济医院

目的 苯唑西林敏感 *mecA* 阳性金黄色葡萄球菌（OS-MRSA）在世界各地均有报道，临床重要性越发受到关注，然而其发生机制却仍不清楚。本研究通过高通量全基因测序技术来分析 OS-MRSA 与苯唑西林耐药 *mecA* 阳性金黄色葡萄球菌（OR-MRSA）野生株的基因差异，并构建突变菌株探索 OS-MRSA 的形成机制。
方法 对 9 株 OS-MRSA 以及 77 株 OR-MRSA 临床分离株进行二代测序，选择代表性 OS-MRSA 菌株 ET-13、ET-16 在苯唑西林培养基中逐步诱导为耐药表型并进行二代测序分析。使用 CLC Genomics Workbench 对测序数据进行分析，构建系统发育树，分析差异基因。选取 OS-MRSA 代表菌株 ET-16 及其诱导耐药菌株 ET-16I，使用二者构建的突变株来分析目标 *bla* 调控基因对苯唑西林敏感性的影响。E-test 方法用来测量苯唑西林 MIC，并使用 qRT-PCR 以及蛋白印迹实验来确定相关基因的表达情况。
结果 OS-MRSA 和 OR-MRSA 菌株在系统发育树上散在分布，无进化差异关系。差异基因分析时发现在多数 OS-MRSA 菌株（7/9）*blaR1* 基因存在第 488 位 A 碱基缺失，从而造成 BlaR1 蛋白残缺，无法发挥正常功能；为代表菌株 ET-16 过表达 OR-MRSA 来源的 *blaR1* 基因后，其转变为苯唑西林耐药表型。另外，OS-MRSA 诱导耐药菌株测序发现大部分耐药株（5/6）*bla* 调控基因所在的质粒丢失，为代表菌株 16I 回补 OS-MRSA 来源的 *blaR1-blaI* 后，其恢复为敏感表型。

结论 *blaR1* 的碱基缺失造成苯唑西林敏感表型的出现，而在诱导耐药过程中其携带 *bla* 调控系统的质粒丢失后从而转变为耐药表型。*bla* 调控系统在 OS-MRSA 菌株苯唑西林耐药表型的调控中发挥了重要作用。

PO-1056

42 株多重耐药阴沟肠杆菌超广谱 ß-内酰胺酶的检测及基因型分布情况

崔兰英、刘文博、宋熙嫄
哈尔滨医科大学附属第一医院

目的 本文旨在研究临床分离出的多药耐药阴沟肠杆菌产生超广谱 ß-内酰胺酶情况，为临床合理用药提供依据，并对其基因型进行分析。
方法 收集 2020.1—2020.12 期间我院临床分离的 42 株非重复细菌菌株, 采用纸片扩散法（K-B 法）或自动化仪器法进行药物敏感试验, 按美国临床和实验室标准协会的标准判读药物敏感试验结果, 测定 42 株多重耐药阴沟肠杆菌的抗生素耐药情况，采用表型确证试验检测超广谱 ß-内酰胺酶，PCR 方法提取超广谱 ß-内酰胺酶待测基因，并对 PCR 产物进行测序分析。基因引物设计为 TEM，CTX-M-1，CTX-M-2，CTX-M-8，CTX-M-9 及 SHV。
结果 药物敏感试验结果显示 42 株待测阴沟肠杆菌，皆对一代，二代，三代，四代头孢菌素类药物耐药（100%，42/42），11 株对碳青霉烯类抗生素耐药（26.2%，11/42）；替加环素敏感性较高，敏感率占 95.2%（40/42），其次为阿米卡星，敏感率为 57.1%（24/42）。42 株多重耐药阴沟肠杆菌，共有 28 株检测出产超广谱 ß-内酰胺酶，占 66.7%（28/42）。 最常见基因型为 SHV-12，占 60.7%（17/28）；其次为 CTX-M-9，占 21.4%（6/28）。
结论 多重耐药阴沟肠杆菌耐药机制复杂，存在多种耐药机制。其中产生超广谱 ß-内酰胺酶仍然是导致其多重耐药的重要原因，基因型以 SHV-12 为主。

PO-1057

First Report of Oxacillin Susceptible mecA-Positive Staphylococcus aureus in Pediatric Patients in Kunming, China

Mingbiao Ma 、Minjun Chu、Lvyan Tao、Jue Li、Xiaojuan Li、Hailin Huang、Kexuan Qu、Haiping Wang、Li Li、Tingyi Du
Kunming Children's Hospital

Purpose The present study investigated the prevalence characteristics of oxacillin susceptible, *mecA*-positive *Staphylococcus aureus* (OS-MRSA) in pediatric patients in Kunming from January 2019 to December 2020.
Methods A total of 499 *S. aureus* strains were included in the study. All strains were first tested for oxacillin sensitivity using the VITEK 2 Compact Automated Antimicrobial Susceptibility Test System, and all oxacillin-susceptible strains were confirmed to have *mecA* and *mecC* genes by real-time polymerase chain reaction (PCR). E-test susceptibility testing was used to compare the minimum inhibitory concentration (MIC) value distribution characteristics of methicillin-susceptible *S. aureus* (MSSA), methicillin-resistant *S. aureus* (MRSA), and OS-MRSA for oxacillin, cefoxitin, penicillin, vancomycin, erythromycin, and clindamycin. Molecular typing of OS-MRSA was performed by Multilocus sequence typing (MLST) and SCCmec typing. Real-time PCR was used to detect toxin genes of OS-MRSA strains.

Results A total of 45 OS-MRSA strains were detected, for an overall detection rate of 9.02% (45/499), and no mecC-carrying strains were found. E-test susceptibility testing showed that the distributions of MIC values of MSSA, OS-MRSA, and MRSA strains against oxacillin were mainly concentrated at 0.38, 0.38, and 12 μg/mL, respectively; the distributions of cefoxitin MICs of MSSA and MRSA were concentrated at 2 and 32 μg/mL respectively, and MICs of OS-MRSA were concentrated at 2 and 8 μg/mL; the distributions of penicillin, vancomycin and erythromycin MICs against MSSA, OS-MRSA, and MRSA strains showed same centralized points, and were 32, 1, and 256 μg/mL, respectively; the MICs of clindamycin against MSSA was 0.5 μg/mL, while that against OS-MRSA and MRSA were mainly concentrated at 256 μg/mL. All three strain types showed an increasing trend for oxacillin and cefoxitin MIC50 and MIC90, as well as for penicillin and clindamycin MIC50, and no vancomycin-resistant strains were found. The molecular typing of OS-MRSA strains was dominated by ST59-SCCmec IV followed by ST38-SCCmec IV. The carrier rates of hemolysin genes (*hl-a, hl-d*) and fibrinogen-binding clumping factor genes (*clfA, clfB*) were 100% in OS-MRSA strains, followed by 40% (18/45) for enterotoxin genes（*sea,seb*）. The carrier rates of toxic shock syndrome gene (*tsst-1*) and Panton–Valentine leukocidin gene (*pvl*) were low, at 6.67% (3/45) and 4.44% (2/45), respectively.
Conclusion OS-MRSA strains were detected at a high rate in pediatric patients in Kunming, and the molecular typing was mainly ST59-SCCmecIV. OS-MRSA has unique distribution characteristics for MIC values against commonly used antimicrobial agents. The identification ability of automated antibacterial drug sensitivity test detection systems for OS-MRSA is very limited. For children with S. aureus infections, clinicians should be vigilant regarding the presence of OS-MRSA. A combination of phenotypic analysis and molecular detection should be used to improve OS-MRSA identification.

PO-1058

氨溴索联合左氧氟沙星对不同耐药机制肺炎克雷伯菌生物膜形成能力的研究

余潇[1]、黄晨蕾[1]、曹若楠[1]、李婕[1]、朱国萍[2]、李小宁[1]
1. 皖南医学院弋矶山医院
2. 安徽师范大学

目的 研究氨溴索联合左氧氟沙星对不同耐药机制肺炎克雷伯菌生物被膜的形成抑制和清除作用，旨在为临床提供拮抗肺炎克雷伯菌生物膜形成和治疗的新策略。
方法 收集不同耐药机制肺炎克雷伯菌各 15 株，将其分为敏感组、ESBLs 组、CRE 组，采用结晶紫染色法进行生物被膜半定量检测，再从各组中选取 3 株生物被膜产量相近的菌株，采用微量肉汤稀释法测定氨溴索和左氧氟沙星对肺炎克雷伯菌的最低抑菌浓度（MIC）；棋盘稀释法测定不同浓度氨溴索对左氧氟沙星 MIC 的影响以及通过计算部分抑菌浓度指数（FIC）判断联合效果和选择最佳协同浓度；采用结晶紫法联合激光扫描共聚焦荧光显微镜研究不同浓度药物对肺炎克雷伯菌生物被膜的形成抑制试验和清除试验。
结果 3 组细菌生物被膜均在第 5 天达到成熟，两两比较发现敏感组较 ESBLs 组和 CRE 组更易形成且产量更多（F=3.725，P=0.032）；棋盘稀释法显示，随着氨溴索浓度的增加，3 组细菌左氧氟沙星 MIC 值的几何均数均明显下降，呈显著的负相关，且联合药敏结果显示，两药组合均呈现协同作用；在生物被膜形成抑制试验中，随着氨溴索浓度的增加，其抑制率均达到了 75%以上，但其生物被膜清除率却未达到 70%。
结论 氨溴索联合左氧氟沙星对临床早期抑制肺炎克雷伯菌生物被膜形成具有指导意义，且其最佳协同浓度为 0.49mg/ml 氨溴索+4μg/ml 左氧氟沙星。

PO-1059

Comparative genome analysis of multidrug-resistant Pseudomonas aeruginosa JNQH-PA57, a clinically isolated mucoid strain with comprehensive carbapenem resistance mechanisms

Yujiao Wang、Mingju Hao、Wanshan Ma、Xiutao Dong、Xiaofeng Li、Fang Cheng
山东第一医科大学第一附属医院（山东省千佛山医院）

Background The prevalence of clinical multidrug-resistant (MDR) Pseudomonas aeruginosa has been increasing rapidly worldwide over the years and responsible for a wide range of acute and chronic infections with high mortalities. Although hundreds of complete genomes of clinical *P. aeruginosa* isolates have been sequenced, only a few complete genomes of mucoid strains are available, limiting a comprehensive understanding of this important group of opportunistic pathogens. Herein, the complete genome of a clinically isolated mucoid strain *P. aeruginosa* JNQH-PA57 was sequenced and assembled using Illumina and Oxford nanopore sequencing technologies. Genomic features, phylogenetic relationships, and comparative genomics of this pathogen were comprehensively analyzed using various bioinformatics tools. A series of phenotypic and molecular-genetic tests were conducted to investigate the mechanisms of carbapenem resistance in this strain.

Results Several genomic features of MDR *P. aeruginosa* JNQH-PA57 were identified based on the whole-genome sequencing. We found that the accessory genome of JNQH-PA57 including several prophages, genomic islands, as well as a PAPI-1 family integrative and conjugative element (ICE), mainly contributed to the larger genome of this strain (6,747,067 bp) compared to other popular *P. aeruginosa* strains (with an average genome size of 6,445,223 bp) listed in *Pseudomonas* Genome Database. Colony morphology analysis and biofilm crystal staining assay respectively demonstrated an enhanced alginate production and a thicker biofilm formation capability of JNQH-PA57. A deleted mutation at nt 424 presented in *mucA* gene, resulted in the upregulated expression of a sigma-factor AlgU and a GDP mannose dehydrogenase AlgD, which might explain the mucoid phenotype of this strain. As for the carbapenem resistance mechanisms, our results revealed that the interplay between impaired OprD porin, chromosomal β-lactamase OXA-488 expression, MexAB-OprM and MexXY-OprM efflux pumps overexpression, synergistically with the alginates-overproducing protective biofilm, conferred the high carbapenem resistance to *P. aeruginosa* JNQH-PA57.

Conclusion Based on the genome analysis, we could demonstrate that the upregulated expression of *algU* and *algD*, which due to the truncation variant of MucA, might account for the mucoid phenotype of JNQH-PA57. Moreover, the resistance to carbapenem in *P. aeruginosa* JNQH-PA57 is multifactorial. The dataset presented in this study provided an essential genetic basis for the comprehensive cognition of the physiology, pathogenicity, and carbapenem resistance mechanisms of this clinical mucoid strain.

8. The First Affiliated Hospital of Shandong First Medical University & Shandong Provincial Qianfoshan Hospital

Background Recent studies indicated that the monosubstituted deoxystreptamine aminoglycoside apramycin is a potent antibiotic against a wide range of MDR Gram-negative pathogens.
Objectives To evaluate the in vitro activity of apramycin against carbapenem-resistant Klebsiella pneumonia (CRKp) isolates from New York and New Jersey, and to explore mechanisms of apramycin resistance.
Methods Apramycin MICs were determined by broth microdilution for 155 CRKp bloodstream isolates collected from 2013 to 2018. MLST STs, wzi capsular types and apramycin resistance gene aac(3')-IV were examined by PCR and Sanger sequencing. Selected isolates were further characterized by conjugation experiments and WGS.
Results Apramycin MIC50/90 values were 8 and >128 mg/L for CRKp isolates, which are much higher than previously reported. Twenty-four isolates (15.5%) were apramycin resistant (MIC 64 mg/L) and they were all from the K. pneumoniae ST258 background. The 24 apramycin-resistant K. pneumoniae ST258 strains belonged to six different capsular types and 91.7% of them harboured the apramycin resistance gene aac(3')-IV. Sequencing analysis showed that different ST258 capsular type strains shared a common non-conjugative IncR plasmid, coharbouring aac(3')-IV and blaKPC. A novel IncR and IncX3 cointegrate plasmid, p59494-RX116.1, was also identified in an ST258 strain, demonstrating how apramycin resistance can be spread from a non-conjugative plasmid through cointegration.
Conclusions We described a high apramycin resistance rate in clinical CRKp isolates in the New York/New Jersey region, mainly among the epidemic K. pneumoniae ST258 strains. The high resistance rate in an epidemic K. pneumoniae clone raises concern regarding the further optimization and development of apramycin and apramycin-like antibiotics.

PO-1061

碳青霉烯类耐药肠杆菌科细菌基因型检测及耐药性分析

甘龙杰、杨滨
福建医科大学附属第一医院

目的 了解本院碳青霉烯类耐药肠杆菌科细菌（carbapenem resistant Enterobacteriaceae,CRE）的基因型分布及耐药情况。
方法 收集本院临床标本分离的 613 株 CRE,用基质辅助激光解吸电离飞行时间质谱仪进行鉴定,MIC 法进行药敏试验。随机选取 68 株 CRE 进行 PCR 扩增,检测 blaKPC、blaIMP-1、blaVIM-1、blaOXA-48 及 blaNDM-1 等碳青霉烯酶基因;PCR 阳性结果进行 DNA 测序和 BLAST 比对,确定其基因型。

结果 出的 613 株 CRE 中,对临床常用抗菌药物如青霉素类、氟喹诺酮类、头孢菌素类及酶抑制剂的耐药率超过 90%,仅对复方磺胺甲噁唑和阿米卡星的耐药率较低,为 50%左右。68 株 CRE 经 PCR 扩增和 DNA 测序,blaKPC-2 检出 58 株、blaNDM-15 株和 blaIMP-15 株,但未检出 blaVIM-2 和 blaOXA-48 耐药基因。
结论 本院 CRE 常呈现为多重耐药,甚至是泛耐药。CRE 的基因型以 blaKPC-2 型为主,提示须加强院感监测,预防和控制 CRE 菌株在院内扩散传播流行。

PO-1062

ICU 患者艰难梭菌分离培养与流行病学特征研究

曾勇彬、杨滨
福建医科大学附属第一医院

目的 了解 ICU 患者艰难梭菌的定植和感染情况,为预防艰难梭菌的流行提供参考。
方法 收集 2016 年 9 月至 2017 年 6 月福建医科大学附属第一医院 ICU 中 139 例住院时间>7d 的患者的粪便样本,对其进行选择性厌氧培养和质谱鉴定。对艰难梭菌培养阳性标本进行毒素基因（tcdA、tcdB、cdt A、cdtB）的 PCR 检测以及毒素 A、B 表型检测。收集所有患者的临床资料,并对艰难梭菌培养阳性患者的临床特征和实验室检查结果进行单因素分析和多因素回归分析。
结果 艰难梭菌检出率为 17.27%（24/139）。其中,14 株艰难梭菌的 tcdA 和 tcdB 基因检测阳性,占 58.3%（14/24）;10 株为 tcdA 和 tcdB 基因检测阴性,占 41.7%（10/24）。所有菌株二元毒素基因（ctdA/ctdB）均未检出。单因素分析提示,高龄、长时间住院、高淋巴细胞数、使用 β-内酰胺类抗生素是艰难梭菌定植的高危因素;多因素回归分析提示,使用 β-内酰胺类抗生素是艰难梭菌定植的独立危险因素（OR=3.881,P=0.039）。
结论 我院 ICU 可能存在艰难梭菌感染和传播的风险,对具有高龄、长期住院以及使用抗生素等高危因素的患者应进行艰难梭菌的监测,以防艰难梭菌的传播、感染和艰难梭菌相关性腹泻的发生。

PO-1063

肺腺癌与肺鳞癌患者肠道菌群结构分析

安瑞[1,2]、何大强[1]、赵丰[3]、王丽倩[1]、王贤军[1]
1. 浙江大学医学院附属杭州市第一人民医院
2. 南京医科大学附属杭州医院
3. 浙江中医药大学附属第四临床医学院

探讨肺腺癌和肺鳞癌患者肠道菌群结构的多样性及构成。采用单中心病例对照研究， 连续入组 2018 年 9 月至 2020 年 10 月就诊于浙江大学医学院附属杭州市第一人民医院的肺癌患者共 27 例，其中男性 15 例，女性 12 例，同期招募健康体检者作为对照组(HC) 共 20 例，其中男性 9 例，女性 11 例。收集研究对象新鲜粪便样本及相关临床资料，根据病理诊断结果将肺癌患者分为肺腺癌组(AC，纳入 19 例患者，其中男性 8 例，女性 11 例)和肺鳞癌组(SCC，纳入 8 例患者，其中男性 7 例，女性 1 例)。提取粪便样本基因组 DNA，对 16SrDNA V3-V4 区域进行 PCR 扩增，通过 Illumina MiSeq 高通量测序平台进行测序，应用 QIIME 分析肠道菌群结构。采用方差分析、χ2 检验、K-W 检验等方法分析 3 组人群间性别、年龄、α 多样性、菌群相对丰度差异等的差异。AC、SCC 和 HC 三组的年龄分别为(58.74±9.27)岁、(63.38±6.12)岁和(55.65±7.79)岁;AC、SCC 和 HC 三组间在性别、年龄上差异无统计学意义(性别和年龄分别为:χ2=5.155 P=0.076;F=2.598，P=0.086)。三组间肠道菌群 α 多样性无显著性差异，β 多样性分析显示 AC、SCC 与 HC 三组间肠道菌群结构存在显著性差异(P=0.001)。物种差异分析显示，AC 与 SCC 组均存在优势菌属，巨球型菌属和 Erysipelatoclostridium 菌属在 AC 患者肠道中富集，而肠球菌属、韦荣球菌属和

Eubacterium_eligens_group 菌属在 SCC 患者肠道中富集。肺癌患者存在明显的肠道菌群失调，肺腺癌与肺鳞癌患者肠道菌群结构无显著性差异，但肺腺癌与肺鳞癌具有各自独特的菌群。这种肠道微环境的失衡，对研究不同病理类型肺癌的发生发展具有重要意义。

PO-1064

尿液病原菌种类分布和耐药性分析

牛瑜
山东大学第二医院

目的 分析 2016 年-2020 年本院临床科室尿标本中病原菌的种类分布和耐药情况，为临床治疗尿路感染提供理论依据。
方法 按照标本采集规范要求收集清洁中段尿并定量接种培养，使用安图微生物质谱仪对可疑病原菌进行鉴定，并使用 BD M50 全自动药敏仪和西门子 MicroScan Walkaway-96 Plus 全自动药敏仪进行药敏试验，然后使用 WHONET 5.6 软件统计，分析尿液中病原菌菌株种类分布和耐药情况等。
结果 自 2016 年至 2020 年本院尿培养病原菌共计 3938 株，其中大肠埃希菌 1530 株、屎肠球菌 691 株、肺炎克雷伯菌 440 株、粪肠球菌 196 株、奇异变形杆菌 187 株、铜绿假单胞菌 119 株等。尿液中碳青霉烯耐药的鲍曼不动杆菌 70 株、铜绿假单胞菌 25 株、肺炎克雷伯菌 128 株、大肠埃希菌 17 株，碳青霉烯耐药率分别为 72.9%、21.0%、29.1%、1.1%。万古霉素耐药的肠球菌 19 株，均为屎肠球菌，万古霉素耐药率为 2.7%。苯唑西林耐药的金黄色葡萄球菌 15 株，耐药率为 26.8%。
结论 尿液分离菌株以大肠埃希菌占绝大多数（38.9%），其次为屎肠球菌（17.5%）。碳青霉烯耐药率以鲍曼不动杆菌和肺炎克雷伯菌为主。万古霉素耐药的肠球菌均为屎肠球菌。随着诊疗技术的发展、方式的增多，增加了各类机会致病菌引起尿路感染的风险，应在各类治疗过程中注意手卫生，防止交叉感染，尽量避免院内感染的发生。

PO-1065

阴道分泌物革兰染色涂片自动化镜检及形态学人工智能分析系统准确性评估

王瑶、孙宏莉、赵颖、张丽、朱任媛、窦红涛、原英、刘亚丽、刘文静、徐英春
中国医学科学院北京协和医院

目的 评估仕达思 Comet-60au 高倍镜检分析系统对阴道分泌物革兰染色涂片自动化镜检及形态学人工智分析的准确性。
方法 收集 2020 年 1-5 月来自妇产科门诊或健康体检女性患者阴道分泌物标本 400 例，涂片革兰染色，以人工镜检半定量评分结果为对照，评估仕达思 Comet-60au 高倍镜检分析系统自动化镜检及阴道微生态形态学人工智能分析性能。人工镜检由 2 名研究人员分别独立进行并取半定量评分平均值，两人结果差异较大的由第三人镜检并取相近的两次结果均值为对照结果。
结果 与人工镜检结果相比，Comet-60au 系统对阴道菌群密集度、乳杆菌样革兰阳杆菌、阴道加德纳菌或拟杆菌样革兰阴性杆菌、弯曲杆菌的评分基本一致率为 93.3~100%，菌群多样性基本一致率为 85.3%，对酵母样孢子和假菌丝阴阳性一致率为 96.8~98.0%，对白细胞>10 个/每高倍镜视野一致率为 70.5%。对 Nugent 评分分类总符合率为 90.8%，Kappa 值为 0.861（P<0.001）。对真菌镜检总符合率为 97.0%，Kappa 值为 0.929（P<0.001）。
结论 Comet-60au 高倍镜检分析系统能够较为准确、快速地进行阴道分泌物革兰染色涂片自动化镜检及形态学人工智能分析，可大幅提高实验室检测效率并降低人工镜检工作负荷。

PO-1066

Using Routine Laboratory Markers and Immunological Indicators for Predicting Pneumocystis jiroveci Pneumonia in Immunocompromised Patients

Guoxing Tang
Department of Laboratory Medicine, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Background Pneumocystis jirovecipneumonia (PJP) is the most common opportunistic infection in immunocompromised patients. The accurate prediction of PJP development in patients undergoing immunosuppressive therapy remains challenge.
Methods Patients undergoing immunosuppressive treatment and with confifirmed pneumocystis jiroveci infection were enrolled. Another group of matched patients with immunosuppressant treatment but without signs of infectious diseases were enrolled to control group.
Results A total of 80 (40 PJP, 40 non-PJP) participants were enrolled from Tongji Hospital. None of the patients were HIV positive.The routine laboratory indicators,such as LYM, MON, RBC, TP, and ALB, were signifificantly lower in PJP patients than in non-PJP patients. Conversely, LDH in PJP patients was signifificantly higher than in non-PJP controls. For immunological indicators, the numbers of T, B, and NK cells were all remarkably lower in PJP patients than in non-PJP controls, whereas the functional markers such as HLA-DR, CD45RO and CD28 expressed on CD4+ or CD8+ T cells had no statistical difference between these two groups. Cluster analysis showing that decrease of host immunity markers including CD3+, CD4+ and CD8+ T cells, and increase of tissue damage marker LDH were the most typical characteristics of PJP patients. A further established model based on combination of CD8+ T cells and LDH showed prominent value in distinguishing PJP from non-PJP,with AUC of 0.941 (95%CI, 0.892-0.990).
Conclusions A model based on combination of routine laboratory and immunological indicators shows prominent value for predicting the development of PJP in HIV-negative patients undergoing immunosuppressive therapy.

PO-1067

中国临床微生物实验室多黏菌素药物敏感性检测系统性能评估

刘晓妤
北华大学
北京协和医院

目的 自《多黏菌素药物敏感性检测及临床解读专家共识》发布以来，临床实验室所使用的多黏菌素药物敏感性检测系统尚未进行过全面的性能评估，本文旨在对目前国内临床实验室常用的几种药物敏感性检测系统进行评估。
方法 随机选取的 367 株革兰阴性菌，使用微量肉汤稀释法 (BMD)检测菌株对多黏菌素 B/ E 的 MIC，并从中选取 MIC 范围从 0.25 mg/L ->64 mg/L 的 102 株菌（大肠埃希菌 59 株，肺炎克雷伯菌 39 株，不动杆菌属 5 株）对中国目前临床实验室常用的多黏菌素药物敏感性系统进行检测。主要检测的系统和试剂包含 PhoenixTM M50（Becton Dickinson）、多黏菌素 B 药敏条（安图生物）、多黏菌素 B 药敏试剂（康泰生物）、肠杆菌/氧化酶/非发酵菌/氧化酶阳性阴性革兰阴性杆菌鉴定药敏板（迪尔生物）及粘菌素 Etest 药敏条（Liofilchem）。对所有药敏系统使用基本一致率（EA）,分类一致率（CA），非常重大错误（VME）及重大错误（ME）进行评估。
结果 康泰生物系统的 CA、EA 均最高，分别为 98%和 85%，且 VME 最低，迪尔生物系统 CA 最低，为 71.6%，并且 VME 也略有欠缺，为 61.7%。两种 Etest 试带中，安图生物 Etest 条的 CA、EA、VME、ME 分别为 93.1%、78.2%、13.3%和 3.5%，Liofilchem 的 MTS 整体 MIC 偏低，

VME 为 57.8%，相比于 Liofilchem,国产 Etest 条的 MD 为 26.5%。BD 公司的两种板卡纳入研究，分别为 NMIC/ID-4 及 NMIC-413，两种板卡一致性较好，CA、VME 均为 95.1%和 10.6%。
整体而言，康泰系统在本实验中性能较好，PhoenixTM 系统最为稳定，而 Liofilchem MTS 对国内临床菌株并不适用，不能作为临床判断使用。

PO-1068

Species identification and antifungal susceptibility testing of Aspergillus strains isolated from patients with otomycosis in northern China

Ran Jing[1]、Wen-Hang Yang[1]、Meng Xiao[1]、Ying Li[2]、Gui-Ling Zou[3]、Cheng-Ying Wang[4]、Xiu-Wen Li[5]、Po-Ren Hsueh[6]、Ying-Chun Xu[1]
1. Peking Union Medical College Hospital
2. 首都医科大学宣武医院
3. 哈尔滨医科大学附属第四医院
4. 大庆油田总医院
5. 牡丹江市第一人民医院
6. 国立台湾大学医院

Background/Purpose There are limited studies on species distribution and susceptibility profiles of *Aspergillus* strains isolated from patients with otomycosis in China.
Methods A total of 69 confirmed *Aspergillus* species isolates were obtained from ear swabs of patients diagnosed with otomycosis from 2017 to 2018 in northern China. Identification of these *Aspergillus* isolates at the species level was performed using conventional morphological methods and MALDI-TOF MS in combination with molecular sequencing, and *in vitro* susceptibility to nine antifungal agents was evaluated using the Sensititre YeastOne system.
Results The *Aspergillus* section *Nigri* had the greatest distribution of *Aspergillus* isolates. *A. welwitschiae* (n=25) was the most predominant isolate in section *Nigri*, followed by *A. tubingensis* (n=12) and *A. niger* (n=11). Other *Aspergillus* species were also isolated, including *A. terreus* (n=11), *A. flavus/A. oryzae* (n=8), and *A. fumigatus* (n=2). Amphotericin B, posaconazole, and echinocandins were highly *in vitro* active against all the isolates tested. 2.9% (2/69) of the isolates were resistant to azoles in our study, including one *A. niger* isolate with a high MIC value for itraconazole (ITR) (16 mg/L) and one *A. tubingensis* isolate cross-resistant to both voriconazole (VOR) (MIC >8 mg/L) and ITR (MIC >16 mg/L). One *A. welwitschiae* and one *A. niger* isolate both had increased MIC values of 4 mg/L against VOR.
Conclusions *A. welwitschiae* was the most prevalent *Aspergillus* species isolated from patients with otomycosis. Our findings also indicated that the azole-resistant *Aspergillus* section *Nigri* should be utilized to guide clinical medication for otomycosis.

PO-1069

耐甲氧西林金黄色葡萄球菌的临床分布及危险因素分析

王丽、李凯、刁彤、李晓玲、刘正祥
新疆军区总医院

目的 分析某军队医院 2018 年耐甲氧西林金黄色葡萄球菌（MRSA）的临床分布特征及危险因素，为治疗及预防金黄色葡萄球菌（SA）感染提供全面、准确的依据。
方法 收集 2018 年 1—12 月我院临床送检标本中分离出的 SA 作为研究对象。采用梅里埃公司 VITEK MS 微生物质谱检测系统和 VITEK 2 系统进行细菌鉴定和药敏试验，结果判读遵循 2016 年版美国临床实验室标准化协会（CLSI）标准进行判定。应用 WHONET5.6 软件进行耐药性分析。

针对本次住院时间（>5 天）、反复入院、手术、糖尿病、高血压、使用抗生素、年龄（>60 岁）、性别、科室（ICU）等因素，使用 SPSS13.0 统计软件对上述各因素进行 Logistic 分析。首先将各个指标作为自变量，是否感染 MRSA 作为因变量，进行单因素 logistics 回归分析，得出未调整的 OR 值和 P。将经单因素 logistics 回归分析显示显著（p<0.05）的指标纳入多因素 logistics 回归分析，最终得出影响患病的因素，即调整后的 OR 和 P。

结果 2018 年 SA 共分离出 148 株，其中 MRSA 45 株，占 30.41%，重症治疗科病区和骨三科病区比例相对较高。分离出 MRSA 最多的标本来源为分泌物（20 株）和痰液（17 株），占全部分离菌株的 82.22%。中青年组（≤45 岁）是感染占的比例最高的年龄段，达到 48.89%。MRSA 对苯唑青霉素和青霉素（G）耐药率高达 100%，对红霉素、克林霉素、四环素耐药率均达到了 50%以上，未检出对万古霉素、替加环素、利奈唑胺和喹奴普汀/达福普汀耐药的菌株。多因素 Logistic 回归分析显示，住院时间（>5 天）、手术是 MRSA 感染的独立危险因素。

结论 医院需加强对 MRSA 的持续监测，做好 MRSA 的主动筛查工作，合理选择抗菌药物治疗方案，预防 MRSA 的产生和传播，加强抗菌药物合理应用。

PO-1070

碳青酶烯耐药肺炎克雷伯菌的全基因组测序结果分析

赵苏瑛
江苏省中医院

目的 基于基因组学研究碳青酶烯耐药肺炎克雷伯菌的耐药机制和传播机制，深入阐明其产生的原因，为临床的治疗和预防提供实验室依据。

方法 收集一株临床分离的碳青酶烯耐药的泛耐药肺炎克雷伯菌 KPX，测定对常用抗生素的 MIC，MLST 进行基因分型后提取全基因组 DNA 进行全基因组测序和基因功能注释。根据测序结果，选择相关耐药基因在临床收集的另外 50 株碳青酶烯耐药的肺炎克雷伯菌中进行扩增检测，验证其携带情况。

结果 该株 KPX 细菌对除粘菌素和替加环素外的抗生素全部耐药，对获得菌株的基因组进行全基因组测序，最终确定该菌染色体基因序列全长 5,468,925 bp，含有 4 个质粒 ，共有 5984 个蛋白质编码基因，85 个 tRNA 基因和 25 个 rRNA 操纵子。此外，该菌携带有大量耐药基因。MLST 结果显示，该菌基因型为 ST11 型，接近的是一株编号 SCKP020029 (NCBI Accession number: CP029384)的肺炎克雷伯菌，同样为 ST11 型，分离自四川某病人标本。收集的另外 50 株碳青酶烯耐药的肺炎克雷伯菌均产 ESBLs，其中 97%为 ST11 型。PFGE 结果显示分属 3 个克隆。在这些菌株中 ，耐药基因检出率分别为 KPC-2 (98.0%), SHV-11 (98.0%), TEM-1 (76.0%), CTX-M (76.0%), Oqxb1(66%), qnrS (70%), Int1 (42.0%), sul1 (82.0%), sul2 (96.0%), iutA (88%), iucABCD(10%)和 rmpA2 (100%)。

结论 试验结果揭示了院内碳青酶烯类耐药肺炎克雷伯菌的基因组学和流行病学特点。抗生素耐药结果提示了细菌耐药中选择性抗生素耐药压力的作用效应。同时质粒耐药基因在细菌中的传播提示有效的院内感染监测，隔离和控制是减少细菌耐药传播必不可少的措施。

PO-1071

角膜共聚焦显微镜检查联合实验室检测体系在真菌性角膜炎中的应用

金丽丽、郑美琴
温州医科大学附属眼视光医院

目的 分析浙南地区真菌性角膜炎患者的人口学及临床特征，并进一步研究角膜共聚焦显微镜检查、刮片镜检及培养鉴定在诊断真菌性角膜炎上的符合率，探讨联合使用在诊断中的应用价值。
方法 回顾性研究。收集 2016 年 1 月至 2020 年 12 月于温州医科大学附属眼视光医院拟诊为真菌性角膜炎的患者 562 例（562 眼），分析其人口学特征、致病因素、致病菌属、用药史、临床体征及治疗方式，并统计首诊时均行角膜共聚焦显微镜检查、刮片镜检及培养鉴定这三项检查的患者的结果，采用 χ2 检验对这三种病原学检查方法的阳性检出率进行比较,并分析联合使用的诊断效率。
结果 角膜共聚焦显微镜，培养鉴定，刮片镜检阳性检出率分别为为 80.0%，67.6%，42.9%。共聚焦显微镜（χ2=12.153,P<0. 01），培养鉴定（χ2 =6.967,P<0. 01）阳性检出率均高于刮片镜检。联合共焦显微镜检查与刮片镜检，阳性检出率为 93.3%；联合角膜共焦显微镜、刮片镜检、培养鉴定，阳性检出率为 95.7%。农民为主要患病人群，共 332 例（59.1%）。主要分布地区为温州市鹿城区 65 例（11.6%）。植物伤为主要致病因素，共 225 例（40.0%）。9 例（1.6%）为混合感染，其中 5 例（0.8%）合并细菌感染，4 例（0.7%）合并病毒感染。主要致病菌属依次为镰刀菌属 163 例（41.6%）。413 例（73.5%）可见明显溃疡灶，157 例（27.9%）可见前房积脓。69 例（12.3%）来院首诊前使用过糖皮质激素，130 例（23.1%）接受了手术治疗，其中 13 例（2.3%）剜除了眼内容物。
结论 秋季为浙南地区真菌性角膜炎高发期，中老年男性农民为主要患病人群，镰刀菌属是主要的致病菌属. 角膜共聚焦显微镜阳性检出率最高，联合角膜共聚焦显微镜，刮片镜检，培养鉴定这三者检查能提高阳性检出率，有利于真菌性角膜炎的诊断。

PO-1072

银金属有机框架药物联合万古霉素治疗耐甲氧西林金黄色葡萄球菌感染

黄蓉、聂新民
中南大学湘雅三医院 检验科

目的 构建一种具有良好抗菌性的新型的纳米递药系统，通过双重抗感染机制治疗耐甲氧西林金黄色葡萄球菌（MRSA）感染。
方法 以 2-甲基咪唑作为配体，硝酸银提供银离子，制备纳米金属有机框架 Ag-MOF。利用 Ag-MOF 负载万古霉素，形成新型纳米粒子 Ag-MOF-Vanc。检测 Ag-MOF-Vanc 抗菌能力及机制。
结果 Ag-MOF-Vanc 是一种具有 pH 响应性的纳米递药系统，对常见临床菌株有较好的抗菌作用，优于单纯万古霉素，可有效减少万古霉素的用量。Ag-MOF-Vanc 可通过干扰细菌细胞内新陈代谢、催化产生 ROS、破坏细胞膜完整性、抑制生物被膜的形成等多种机制杀伤 MRSA。
结论 Ag-MOF-Vanc 为一种新型有效的药物载体系统，有望用于 MRSA 的抗感染治疗。

PO-1073

Evaluation of Autof MS 1000 and Vitek MS MALDI-TOF System in Identification of Close-Related Yeasts Species Causing Invasive Fungal Diseases

Qiaolian Yi、Meng Xiao、Ying-Chun Xu
Peking Union Medical College Hospital

Matrix-assisted laser desorption ionization-time of flight mass spectrometry (MALDI-TOF MS) has been accepted as a rapid, accurate, and less labor-intensive method in the identification of microorganisms in clinical laboratories. However, there is limited data on systematic evaluation of its effectiveness in the identification of phylogenetically closely-related yeast species.

In this study, we evaluated two commercially available MALDI-TOF systems, Autof MS 1000 and Vitek MS, for the identification of yeasts within closely-related species complexes. A total of 1,228 yeast isolates, representing 14 different species of five species complexes, including 479 of Candida parapsilosis complex, 323 of Candida albicans complex, 95 of Candida glabrata complex, 16 of Candida haemulonii complex (including two Candida auris), and 315 of Cryptococcus neoformans complex, collected under the National China Hospital Invasive Fungal Surveillance Net (CHIF-NET) program, were studied.

Autof MS 1000 and Vitek MS systems correctly identified 99.2% and 89.2% of the isolates, with major error rate of 0.4% versus 1.6%, and minor error rate of 0.1% versus 3.5%, respectively. The proportion of isolates accurately identified by Autof MS 1000 and Vitek MS per each yeast complex, respectively, was as follows; C. albicans complex, 99.4% vs 96.3%; C. parapsilosis complex, 99.0% vs 79.1%; C glabrata complex, 98.9% vs 94.7%; C. haemulonii complex, 100% vs 93.8%; and C. neoformans, 99.4% vs 95.2%.

Overall, Autof MS 1000 exhibited good capacity in yeast identification while Vitek MS had lower identification accuracy, especially in the identification of less common species within phylogenetically closely-related species complexes.

PO-1074

The “Same-Day” AST Report of Pathogens form Urine by A Simple MALDI-TOF MS-based Protocol

Wei Li、Enhua Sun、Yi Zhang
Department of Clinical Laboratory, Qilu Hospital of Shandong University

Backgroud and Purposes In the past years, Matrix-assisted laser desorption ionization–time of flight mass spectrometry (MALDI-TOF MS) has been considered as a rapid and reliable method for identification of microorganisms from positive blood cultures and other clinical specimens such as urine, which from culture plates and positive blood cultures, and also on other clinical specimens such as urine . Previous studies have shown that urine is an optimal sample for direct MALDI-TOF MS identification by MALDI-TOF MS, and some studies have been carried out to improve urine processing and to enhance the direct identification sensitivitycapability of MALDI-TOF MS from urine by improve the urine processing. However, most of these studies just mainly focused only on the direct identification, and there areis limited researchfew studies on methods for the direct AST from urine, especially to determine accurate minimum inhibitory concentrations (MICs). Furthermore, direct AST is more important than pathogen identification itself for fast and precise antibiotic treatment.for determining appropriate antibiotic treatment than bacterial identification itself, and could greatly shorten the time to the final microbiological report. In this study, we investigated a whole MALDI-TOF MS-based workflow to shorten the time of pathogenic diagnosis and effective treatment of UTIs by

combining the flow cytometry for screening, MALDI-TOF MS for microbial identification, and the VITEK 2 system for AST directly from urine samples.
Methods A total of 1,638 consecutive urine samples were submitted to the Clinical Microbiology Laboratory, Department of Clinical Laboratory, Qilu Hospital of Shandong University during September and December 2018 for culture without any chemical preservatives from inpatients and outpatients. Each urine sample had a volume of approximately 30 ml, which was divided into three aliquots using 15ml sterile centrifuge tubes. The first aliquot was used for culture by the Walk Away Specimen Processor (WASP, Copan, Brescia, Italy), and then for UF-1000i screening (Sysmex, Kobe, Japan). If the result of bacterial counts of ≥ 5000 bacteria/μL, the other two aliquots were subsequently processed to prepare bacterial pellets. The second and third aliquot (10 mL urine in a 15-mL sterile centrifuge tube) was vortexed and centrifuged for 1 min at 2,000 g for 1 min to remove leukocytes, cellular debris, leukocytes, and mucus. The resulting supernatant was centrifuged for 5 min at 10,000 ×g for 5 min and then discarded. The resulting pellet was re-suspended in 1mL of 0.45% saline solution (bioMérieux, Marcy l'Étoile, France) to wash the bacterial cells and transferred into a 1.5-mL micro-centrifuge tube. The bacterial suspension was pelleted after centrifugation (10,000 × g for 2min) and washed again by 0.45% saline solution. The bacterial pellet of the second urine aliquot was directly identified by the MALDI-TOF MS (Bruker Daltonik GmbH, Bremen, Germany). Once the reliable direct identification was determined, the bacterial pellet of third urine aliquot was used for direct AST by the VITEK 2 system (bioMérieux, Marcy l'Étoile, France).
Results 307 of 1,638 urine samples were positive by UF-1000i screening. Among them, 265 samples had significant growth of single-microorganism. Two hundred and twenty-nineReliable direct identification was obtained in 229 (86.42%) out of these 265 samples were reliably identified directly from urine and no pathogensbacteria were misidentified. Moreover, species-level identification was obtained in 163 (88.59%) out of 184 samples with Gram-negative bacteria, and 27 (38.03%) samples out of 71 samples with Gram-positive bacteria. VITEK 2 AST was performed in 117 samples of single-microorganism. The data of Enterobacteriaceae showed an agreement rate of antimicrobial categories of 95.1% (1301/1368) with a minor error, major error, and very major error rate of 3.95% (54/1368), 0.88% (12/1368), and 0.07% (1/1368), respectively. For Enterococcus spp., the overall categorical agreement was 92.94% (158/170), with rates for minor errors of 2.94% (5/170) and major errors 4.12% (7/170). The turnaround time of this combined protocol to diagnose UTI was 1 hour for directbacterial identification and 6-24 hours for direct AST, especially 6-8 hours for the Enterobacteriaceae by the VITEK 2 system. Therefore, our MALDI-TOF MS-based combined protocol could provide reliable "same day" report including identification and AST for Enterobacteriaceae, and it would result in earlier and precise antibiotic selection.
Conclusion It was concluded that the simple combined protocol of the flow cytometry, MALDI-TOF MS and VITEK 2 provided a rapid and reliable identification and AST method for UTI patients directly from urine samples, especially in those with Enterobacteriaceae, and it provide reliable "same day" AST report.

PO-1075

纳米孔测序技术在中枢神经系统细菌感染诊断中的应用价值

田宏攀[1]、王维洁[2]、陈良君[1]、周俊英[1]
1. 武汉大学中南医院
2. 湖北中医药大学

目的 研究和评估纳米孔测序技术在中枢神经系统细菌感染中的临床诊断价值。
方法 收集 2019 年 10 月到 2021 年 3 月在武汉大学中南医院临床诊断为中枢神经系统细菌感染的 44 名住院患者的脑脊液标本及病例资料，应用纳米孔测序技术对其进行致病菌检测，并与传统临

床微生物检验（微生物培养和染色）的结果进行比较分析，分别从阳性率、一致性和病原菌种类分布等方面，研究和评估纳米孔测序技术在中枢神经系统细菌感染中的临床诊断价值。
结果 本研究共收集 44 例脑脊液标本进行研究，纳米孔测序结果显示，其中 38 例患者的脑脊液中检出至少一种细菌或真菌，阳性率为 86.36%（38/44）；传统微生物培养中，有 4 例患者培养阳性，阳性率为 9.09%（4/44）。采用 McNemar 检验比较两种检测方法结果的阳性率，两者差异有统计学意义（p=0.00000001518 <0.05），纳米孔测序的阳性率较传统微生物培养高。采用 McNemar 检验比较两种方法在不同科室中的检测结果，在神经内科（p=0.023<0.05）、神经外科（p =0.0000364<0.05）和感染科（p =0.028<0.05）中两种检测方法的阳性率均有显著差异。采用 Kappa 检验比较两种检测方法结果的一致性，结果显示 Kappa=0.03<0.4，一致性较差。统计病原菌种类分布，纳米孔测序检出的病原菌分布为革兰阳性球菌 32.79%（20/61），革兰阳性杆菌 3.28%（2/61），革兰阴性杆菌 42.62%（26/61），真菌 21.31%（13/61）。61 株致病菌中包含 7 株厌氧菌（11.48%）和 2 株苛养菌（3.28%）。脑脊液培养结果为肺炎克雷伯菌 2 株，粪肠球菌 1 株，表皮葡萄球菌 1 株。
结论 纳米孔测序技术相比于传统微生物培养具有快速、敏感度高的优势，在中枢神经系统细菌感染的诊断中具有重要价值。

PO-1076

Antibacterial effect of chitosan-modified Fe3O4 nanozymes on Acinetobacter baumannii

Lin Yu[3]、wenjun wang[1]、peng qin[2]
1. The First Affiliated Hospital of Guangzhou Medical University
2. Guangzhou Medical University
3. The First Affiliated Hospital of Guangzhou Medical University

Objective To determine whether the antibacterial activity of chitosan-modified Fe3O4 (CS@Fe3O4) nanomaterials against Acinetobacter baumannii (AB) is mediated through changes in biofilm and reactive oxygen species (ROS) production.
Methods The broth dilution method was used for bacteriostasis test CS@Fe3O4 Effect of nanoparticles on bacterial growth. The effects of CS@Fe3O4 nanoparticles on biofilm formation were measured using a semi-quantitative crystal violet staining assay. A bacterial ROS detection kit was used to detect the production of ROS in bacteria.
Results CS@Fe3O4 nanoparticles had a significant inhibitory effect on the colony growth and biofilm formation of drug-resistant AB bacteria ($P < 0.05$). The ROS stress assay revealed significantly higher ROS levels in AB subjected to CS@Fe3O4 nanoparticles treatment than the control group ($P < 0.05$).
Conclusion Here, we show that CS@Fe3O4 nanoparticles had an inhibitory effect on AB in vitro, and that this effect was more significant in drug-resistant strains than drug-sensitive ones. Our findings indicate that the antibacterial mechanism of CS@Fe3O4 nanoparticles on drug-resistant bacteria is probably mediated through inhibition of the AB bacteria biofilm and stimulation of AB bacteria to produce ROS. CS@Fe3O4 nanoparticles had no significant inhibitory effect on the biofilm of drug-sensitive bacteria, suggesting that in drug-sensitive bacteria, CS@Fe3O4 nanoparticles probably exert their inhibitory effect through the production of ROS.

PO-1077

Genomic insights into evolution of pathogenicity and resistance of a multidrug-resistant Raoultella ornithinolytica WM1

Meng Wang
Department of Clinical Laboratory, Tianjin First Central Hospital

Raoultella ornithinolytica is a poorly understood opportunistic pathogen, and the underlying mechanisms of its multidrug resistance and pathogenicity have not yet been comprehensively investigated. The multidrug-resistant (MDR) strain, WM1, was isolated from the blood of a male patient in Tianjin, China, in 2018. Here, we describe the complete genome and provide a genomic analysis of R. ornithinolytica WM1. The isolate was resistant to all tested antimicrobials, except for amikacin, tobramycin, and tigecycline. Two plasmids, pWM1-1 (IncHI5) and pWM1-2 (IncR), carried multidrug resistance regions, indicating a close relationship to antimicrobial resistance. A large antimicrobial resistance island (ARI) region resided on pWM1-1 and exhibited complex mosaic structures. These structures mainly resulted from the acquisition of complex integrations of variable regions, including genes conferring resistance to multiple classes of antimicrobials. Moreover, WM1 possessed virulence-related elements that encoded several virulence factors, including type I fimbriae, Escherichia coli common pilus, type II and VI secretion systems, yersiniabactin, enterobactin, and surface polysaccharide, indicating pathogenic potential. Furthermore, the core genome phylogeny and pan-genome analyses revealed extensive genetic diversity of the species R. ornithinolytica. Our analysis indicated the need for stringent infection control, antimicrobial stewardship, periodic resistance monitoring, and rational medication to address the threats posed by MDR R. ornithinolytica strains.

PO-1078

液滴数字化显色分析实现快速耐碳青霉烯细菌检测

王羽[3]、欧阳秀酝[2]、刘大渔[1]
1. 华南理工大学附属第二医院（广州市第一人民医院）
2. 华南理工大学食品科学与工程学院
3. 华南理工大学附属第二医院（广州市第一人民医院）

目的 利用液滴数字化显色分析实现耐碳青霉烯细菌（Carbapenem-resistant Organism, CRO）快速检测。
方法 利用自行设计和加工的流式液滴分析仪以及液滴微流控芯片进行液滴数字化显色分析。实验步骤包括：1.临床样本经过滤处理选择性富集细菌，然后加入碳青霉烯类抗生素美罗培南及细菌活性指示剂刃天青；2.使用微流控芯片对细菌样品进行液滴分散，并在 37 ℃下孵育进行显色反应；3.完成显色反应后，应用流式液滴分析仪检测液滴荧光信号，使用 Python 处理数据快速进行液滴分类识别和阳性率计算，进一步依据 Poisson 算法推算出实验组和对照组的细菌密度，依据细菌活性抑制率判断样本中微生物对于碳青霉烯类抗生素的响应，从而确定样品中是否存在 CRO。
结果 该方法仅需孵育 1 h 即可分辨大肠埃希氏碳青霉烯耐药和敏感质控菌。批量临床样品细菌分离株的活性分析结果显示，液滴数字化显色分析可以准确判定 CRO 与非 CRO，其检测结果与传统方法具有高度一致性。
结论 得益于液滴反应器对于显色因子的富集作用以及数字化分析的精准定量能力，液滴数字化显色分析可快速检测 CRO。这种检测方法有望为 CRO 感染诊断提供快速准确的信息。

PO-1079

Mycobacterium tuberculosis ManLAM binding to TLR2 from mast cells release exosomes to recruit and induce macrophage polarization towards the M2-type

xianru xia
Taihe hospital

Background/Purpose Our previous studies have found that there are more mast cells and more macrophages in pulmonary tuberculosis infection site from patients with chronic active Mycobacterium tuberculosis (M.tb) infection. Given that we speculated whether mannose-capped lipoarabinomannan (ManLAM), a high-abundance lipolysaccharide from M.tb that regulates immunity negatively from many reports, may induce the permanent mast cells (MCs) in tissue and have corss-talk with macrophage to recruit macrophage and cause the persistence infection via some remote signal, exosomes.
Methods We extracted ManLAM from M.tb H37Rv and analyzed the ManLAM bind to ligand of MCs using peptide mass fingerprint (PMF) and Western Blot (WB). Following, we have cultured with mast cell line HMC-1 with the ManLAM extracted from Mycobacterium tuberculosis H37Rv and harvested the exosomes from MCs for proteomics analysis. The target proteins of exosomes' content, cytokines associated with chemokines and polarization of macrophage, were identified and verified by WB, Trans-well, FCM and qRT-PCR respectively.
Results In this research, we found that MCs released exosomes containing high levels of IL-4, IL-13 and CCL-2 through ManLAM binding to TLR2 of MCs. Following, we proved that the exosomes of ManLAM-induced MCs could recruit Mj and promote expression of M2-like macrophage characteristic phenotypic molecules (CD163+) and cytokines (Arginase-1, IL-10 and FIZZ-1).
Conclusions Our research suggested that exosomes from ManLAM-induced MCs recruit macrophage and induce them to polarize towards M2 type to escape immune elimination. It may be another novel clue that M.tb evade immune elimination to cause chronic persistent infection.

东北某三甲医院血流感染碳青霉烯耐药肺炎克雷伯菌的主导序列类型由 ST11 转化为 ST15

陈静静
中国医科大学附属第一医院

目标 探讨我院耐碳青霉烯类肺炎克雷伯菌（CRKP）血流感染的临床特征和分子流行病学特征。
方法 2015.1 至 2020.12 期间，51 名患者被确定为 CRKP 血流感染，其中 42 名患者保存菌株可用于进一步实验。采用 MALDI TOF MS 和 VITEK 系统进行菌种鉴定和药物敏感性检测。聚合酶链反应检测碳青霉烯酶基因、毒力基因和 MLST 基因。此外，还进行拉丝试验和血清杀灭试验以评估 CRKP 分离株的毒力。
结果 随访 6 年间血流感染 CRKP 检出率呈上升趋势，主要涉及重症监护病房、血液内科、呼吸内科等科室。分子流行病学分析表明，KPC-2 是主导的碳青霉烯酶基因，CRKP 的主导序列类型从 ST11 转换为 ST15。与 ST11 CRKP 相比，ST15 CRKP 均对阿米卡星敏感，KfuB 毒力基因呈阳性，且对血清杀伤的抵抗力更强，但感染 ST11 和 ST15 CRKP 的患者死亡率无显着差异。
结论 2015-2020 年期间观察到我院血流感染 CRKP 的主要序列类型从 ST11 转换为 ST15。与 ST11 CRKP 相比，ST15 CRKP 表现出阿米卡星敏感性、KfuB 基因阳性和血清抗性，这提示其可能有更强的毒力。

PO-1081

Metatranscriptomic analysis of host response and microbiome in vagina of severe COVID-19 women patients

Meng Xiao[1]、Bo Lu[2]、Yingchun Xu[1]、Chengqi Yi[2]、Lan Zhu[1]
1. Peking Union Medical College Hospital
2. 北京大学

COVID-19 has become a global pandemic threats and its impact on women's health has drawn great attention. Whilst host response and vaginal microbiome changes in reproductive system of women patients, especially those underlying severe conditions, remained unknown.

In this study, a novel TRACE-seq-based meta-transcriptomic analysis were applied to simultaneously characterize host responses and vaginal microbiome in 16 women patients with COVID-19 in an intensive care unit and five healthy women individuals.

Notably, although SARS-CoV-2 was absent from reproduction system of COVID-19 women patients, indications of systematic immune and defense responses were found in patients' vaginal samples. Transcriptome analysis revealed that expression of IL-36 subfamily cytokines belonging to IL-1 superfamily were up-regulated, whilst IL-36 pathway were previously considered unaffected by COVID-19 in blood and other body sites, indicating that reproductive tract epithelial cells were invovled in defence and immune response. In addition, NF-κB and type I interferon signaling pathways downstream to IL-1/IL-36 pathway were activated in COVID-19 patients. Moreover, we found abnormal high proportion of putative pathogenic microorganisms in COVID-19 patient's vaginal microbiota, i.e., Mycoplasma hominis, Gardnerella vaginalis, Ureaplasma urealyticum, Bacteroides spp., Atopobium spp., Enterococcus faecium and Acinetobacter baumannii, whilst there were significant intra-individual variations. Expression of antimicrobial resistant genes were also high in COVID-19 patients. Our reports provide further understanding of COVID-19 threats to women, and for the first time characterized its implication on women's reproductive system.

PO-1082

传染性腹泻患者中 mcr-1 阳性沙门氏菌的流行情况、基因组特征和传播动态研究

马芙蓉
广州医科大学附属第三医院

目的 本研究旨在了解 *mcr-1* 在广东省不同来源沙门氏菌中的流行情况，通过全基因组测序分析等手段探究菌株的遗传特征，并揭示其耐药传播机制。

方法 本研究收集了 2015-2017 年来源猪、猪肉及沙门氏菌感染病人样本 1701 份。通过 PCR 对 *mcr-1* 阳性沙门氏菌进行鉴定与分离。运用琼脂稀释法或肉汤稀释法检测 *mcr-1* 阳性沙门氏菌对 16 种临床常用抗生素的药物敏感性。通过质粒接合、S1-PFGE 及核酸杂交检测 *mcr-1* 的可转移性和基因定位。对 19 株 *mcr-1* 阳性沙门氏菌进行全基因测序，分析 *mcr-1* 阳性沙门氏菌的群体结构和基因组流行特点。

结果 本研究共检出 19 株 *mcr-1* 阳性沙门氏菌，在猪粪便、猪肉、临床病人感染菌株中的 *mcr-1* 阳性率分别为 0.53%（5/936），1.80%（3/167）和 1.84%（11/598）。药物敏感性实验结果发现 *mcr-1* 阳性沙门氏菌株均为多重耐药菌。*mcr-1* 基因位于 ST3-IncHI2 质粒上，其中 12 株菌株的 *mcr-1* 基因可接合转移。全基因组测序分析发现，所有沙门氏菌为 ST34 型或其相近的 ST 型。核心基因的分布与样本来源显著相关；附属基因网络图表明，不同的克隆复合体可以共享高度相似的附属基因组。

结论 本研究发现 *mcr-1* 阳性沙门氏菌呈低流行状态，菌株表现较高耐药率和多重耐药性，给抗沙门氏菌感染治疗带来了威胁。基于全基因组测序分析，克隆传播可能不是 *mcr-1* 阳性沙门氏菌传播的主要原因，而可能与 ST3-IncHI2 质粒的水平转移有关。因此，持续地监测 *mcr-1* 阳性沙门氏菌在动物、食品、社区和医院的流行趋势对 *mcr-1* 的防控至关重要。

PO-1083

Four types of ST11 novel mutations from increasing carbapenem-resistant Klebsiella pneumoniae in Guangdong, 2016-2020

Yunhu Zhao[1]、yalong liao[1]、ni zhang[1]、suling liu[1]、jiao zhang[2]、雪姣 hu[1]、dianrong zhou[1]、qianyun deng[1]、yanping shi[3]、bing gu[2]、tieying hou[1]

1. Guangdong Provincial Peoples Hospital
2. 南方医科大学皮肤病医院
3. 南方战区总医院

Objectives This study aimed to explore changes in CR-KP isolates collected in Guangdong over the period of 2016 to 2020.

Methods Antibacterial susceptibility was quantified through VITEK 2 compact and K-B method. Carbapenemase phenotypes and genotypes were characterized by mCIM, eCIM, and PCR. Molecular characteristics and evolutionary trends were analyzed by multilocus sequence typing and evolutionary tree.

Results A total of 2847 isolates of Klebsiella pneumoniae were separated in 2016-2020, and the separate rate of CR-KP increased from 5.65% to 9.90% (P=0.009). The top 3 wards were ICU (21.92%), neonatal wards (13.70%), and respiratory wards (12.33%). Serine carbapenemase was the main phenotypes and KPC-2 was the main genotypes in 146 CR-KP strains, in which 57 were contained two resistant genes, 1 was contained three resistant genes. Four polygenic strains were first found: KPC+VIM, KPC+IMP, IMP+GES, and KPC+NDM+VIM, but all the phenotypes were metalloenzyme, indicated that metalloenzyme was usually the first choice for CR-KP resistance. In addition, all the ST54 of metalloenzyme type contains IMP, and all the ST45, ST37, and ST76 contain OXA-48. ST11 was the most prevalent (42.47%), a novel type of ST11 mutation, the rpoB was mutated from sequence 1 to sequence 146, was in an independent separate branch on the evolutionary tree, and resistant to all antibacterial agents. The other 3 mutants: rpoB 1 to 15, infB 3 to 148, infB 3 to 80, also resistant to all antibacterials. Notely, all the four mutants produced serine carbapenemase and contained KPC-2, indicated that the prevalent strain, ST11, has a serious consequence of mutation, will lead to an outbreak with the fully resistant, probably. What's more, the medical burden of patients with CR-KP infection was far greater than that of CS-KP.

Conclusions The infection rate of CR-KP has increased, ICU and neonatal wards have become the key infection areas. Producing serine enzyme, KPC-2 genotype and ST11 are the predominant CR-KP. Polygenic strains and ST11 mutation made clinical treatment difficult, may become a potential threat.

PO-1084

Drug resistant mechanism and homology analysis of carbapenem-resistant Enterobacteriaceae isolated from different sites of one patient in intensive care units

Jinyi Gu 、deyao deng、wenli yuan
The Affiliated Hospital of Yunnan University

OBJECTIVE To investigate the drug resistant mechanism and homology of carbapenem-resistant Enterobacteriaceae (CRE)isolated from different sites of one patient in the intensive care unit(ICU).
METHODS The active screening of CRE in fecal or anus swabs was carried out for the patients who were hospitalized the ICU of a grade-A tertiary hosipital in Yunnan from January 1, 2017 to December 30,2018. If CRE was colonized in fecal or anus swabs ,some specimens for example, urine, sputum, drainage fluid, wound tissue, etc from other parts of the patient during the same period were collected to screen CRE. The collected CRE were identified and tested for drug sensitivity and phenotypic validation, and the clinical data and laboratory results were analyzed. Carbapenems resistance genes were detected by Polymerase chain reaction(PCR)and sequenced.The homology of CRE isolated from different sites of one patient was analyzed by Randomly amplified polymorphism DNA(RAPD) technique.
RESULT There were 1518 hospitalized patients to the ICU during the study period,and 1502 patients involved in screening, The rate of active screening of CRE was 98.95%（1502/1518）, the rectum colonization rate of active screening of CRE was 4.73%（71/1502）, The rate of CRE was detected only in rectum was 25.35%（18/71）,The rate of CRE was detected in two parts was 11.27%（8/71）, The rate of CRE was detected in three parts was 49.30%（35/71）, The rate of CRE was detected in four parts was14.08%（10/71）, Carbapenem-resistant Klebsiella pneumoniae(CRKP) strains were dominant among the pathogens,accounting for 87.32%（62/71）, All the CRE screened from two or more parts were CRKP.The results of drug sensitivity and phenotypic validation of CRE isolated from different sites of one patient were same.The positive rate of carbapenems resistance genes KPC-2,NDM-1,VIM-2 and IMP respectively were 69.83% 、 17.32% 、 8.38% and 6.70%, the gene OXA-48was not detected.The type of carbapenems resistance genes of was same（92.45%）. 161 strains of CRE isolated from two or more sites of one patient were classified into seven different clones by the RAPD technique,and the clone D was epidemic strain. CRE isolated from different sites of 94.34% patients were from same clone.
CONCLUSION Carring KPC-2 gene is the main cause leading to the drug resistance of CRE isolated from patient, and the CRE isolated from different sites of one patient have higher relatedness. It is necessary to active screening CRE and Strengthen prevention and control measure in clinic, the therapy method for the patient of CRE colonization and infection by early detection, early intervention, early treatment.

PO-1085

肺移植术后病原菌感染的分布和耐药特征及风险因素

许书琳、娄加陶
上海市胸科医院

目的 回顾性分析肺移植术后感染的病原菌的分布和耐药特征及增加感染风险的因素，为指导临床合理选择抗菌药物、调整抗感染治疗方案提供依据。

方法 分析 2007 年 9 月~2019 年 8 月行肺移植手术的 50 例患者术后病原菌分布情况、发生时间、耐药特征和增加感染的危险因素，采用 VITEK2 COMPACT 全自动微生物鉴定与药敏系统鉴定菌株和检测药物敏感性，使用 SPSS 22.0 软件系统处理数据。
结果 肺移植术后受者感染率 74%（37/50），单一病原菌感染 9 例（24.3%），两种及以上病原菌混合感染 28 例（75.7%）。引起感染的主要病原菌是革兰阴性菌（铜绿假单胞菌、鲍曼不动杆菌、嗜麦芽窄食单胞菌和肺炎克雷伯菌），铜绿假单胞菌对头孢类、氟喹诺酮类和复方新诺明耐药率 66.7%~94.1%；鲍曼不动杆菌对多种抗菌药物高耐药，耐药率 72.7%~100%；嗜麦芽窄食单胞菌对头孢他啶耐药率 50%；肺炎克雷伯菌对碳青霉烯类、β 内酰胺类、头孢类和氟喹诺酮类耐药率 44.4%~71.4%。其次是革兰阳性菌（金黄色葡萄球菌、溶血葡萄球菌和粪肠球菌），对利奈唑胺、万古霉素敏感，可作为抗感染治疗的首选药物。单因素分析结果显示性别、年龄、入住重症加强护理病房（Intensive Care Unit，ICU）、氧分压、血红蛋白水平、血清白蛋白水平、他克莫司水平、吻合口瘘/支气管狭窄、机械通气和闭塞性细支气管炎综合征是术后肺部病原菌感染的危险因素（$P < 0.05$）。
结论 移植物本身的性质、患者营养状态和外界环境因素是造成肺移植受者不同时间段感染的危险因素，以革兰阴性菌尤其是非发酵菌感染为主，对多种抗菌药物表现为高耐药，临床需根据药敏结果选择抗菌药物和剂量，以提高患者生存年限。除病原菌的识别、控制和治疗至关重要外，术后营养支持、康复护理、环境消毒隔离亦扮演重要角色，直接影响移植物的功能和免疫抑制剂的应用。

PO-1086

16 例莫拉菌属角膜炎的临床特征及分离株耐药性分析

杨媛媛、王海鸥、陈鹏飞、李亚利、郑美琴
温州医科大学附属眼视光医院

目的 探讨莫拉菌属角膜炎的临床特征及分离菌株耐药情况。
方法 回顾性研究。收集 2013 年 12 月至 2020 年 6 月于温州医科大学附属眼视光医院诊断为莫拉菌属角膜炎的 16 例患者资料，对其临床特征、风险因素、治疗效果及病原菌的分布变化、耐药性趋势进行分析。应用半自动鉴定仪 ATB Reader 与质谱检测仪 MBT 鉴定莫拉菌种。
结果 纳入研究的 16 例莫拉菌属角膜炎均为经实验室检查的确诊病例。经临床特征分析得出，最常见的局部与系统性风险因素诱分别为既往眼部手术和糖尿病/高血压，患者最常见的症状是眼痛，最常见的体征是角膜溃疡。通过实验室检查发现所有患者中腔隙莫拉菌 7 例，非液化莫拉菌 4 例，奥斯陆莫拉菌 3 例，卡他莫拉菌 1 例，亚特兰大莫拉菌 1 例。细菌药敏试验结果显示分离到的致病菌对青霉素、头孢菌素、四环素、喹诺酮类和氨基糖苷类等眼部常用药物耐药性不高。
结论 在研究的 16 例莫拉菌属角膜炎患者中，以眼痛和角膜溃疡多见；腔隙莫拉菌和非液化莫拉菌为主要感染病原菌，其分离株对药物敏感性较高，得到了有价值的结论，为以后的临床治疗与研究提供了基础。

PO-1087

Species distribution and antifungal susceptibilities of clinical isolates of Penicillium and Talaromyces species in China

Lina Guo 、shuying yu、yingchun xu
Department of Clinical Laboratory, Peking Union Medical College Hospital, Peking Union Medical College, Chinese Academy of Medical Sciences, Beijing, China

Objective Penicillium species have been found in clinical samples, however their prevalence and significance in the clinical setting are still largely unknown. Epidemiological studies provide important information about the demographic characteristics, species diversity, and susceptibility data, which are critical for the management of Penicillium-associated diseases.
Methods Morphologically identified 103 Penicillium isolates and 8 Talaromyces marneffei isolates were collected from various clinical sources between 2016 and 2017 at a medical center in Beijing, China. Identification at the species level was confirmed via sequencing of the internal transcribed spacer (ITS) region, β-tubulin (BenA), and RNA polymerase II second largest subunit (RPB2) genes. The antifungal susceptibility profiles of the Penicillium species were also evaluated by CLSI broth microdilution method.
Results The ITS region could identify 64.9% (72/111) of the isolates to the species level and 35.1% (39/111) to the genus level. Both BenA and RPB2 genes could confidently identify 100% of the isolates tested to the species level. For identification of clinical important T. marneffei isolates, the ITS, BenA and RPB2 genes worked equally well. Of the 111 isolates, 56 (50.5%) were identified as Penicillium species, and 55 (49.5%) were Talaromyces species. A total of 11 Penicillium species were detected, of which P. oxalicum was the most common, accounting for 51.8% (29/56), followed by P. rubens (10.7%, 6/56) and P. citrinum (10.7%, 6/56). Among the 55 Talaromyces isolates, nine species were identified, with T. funiculosus (36.4%, 20/55), T. stollii (27.3%, 15/55), and T. marneffei (14.5%, 8/55) being the most common. Of note, 89.3% (50/56) of Penicillium isolates and 98.2% (54/55) of Talaromyces isolates exhibited growth at 37°C. The isolates were mainly recovered from patients with pulmonary disorders (56.8%, 63/111), autoimmune disease (12.6%, 14/111), and AIDS (5.4%, 6/111). The azoles and amphotericin B exhibited potent activity against T. marneffei isolates, while various levels of activity were observed against Penicillium and other Talaromyces species. The echinocandins had the lowest MECs (MEC90 ≤ 0.12 mg/L) against most Penicillium and Talaromyces species, with the exception of T. marneffei, whose MEC90 (4 mg/L) was five or more dilutions higher than that of the other species tested.
Conclusion The ITS appears to be useful targets for identification at the genus level, while BenA can be performed for species-level identification within Penicillium and Talaromyces in clinical microbiology laboratory. RPB2 was recommended for the description of new species due to difficulties in PCR amplification and sequencing. High species diversity was observed in 111 clinical isolates, with P. oxalicum, T. funiculosus, and T. stollii being the most prevalent species. The majority of Penicillium (89.3%) and Talaromyces (98.2%) isolates were able to grow at 37°C, which might indicate an opportunistic potential to become etiological agents of systemic mycosis. These data on species distribution and antifungal susceptibility expand the current clinical knowledge of Penicillium and Talaromyces species.

PO-1088

Performance Evaluation of the Etest and disc diffusion method for ceftazidime- avibactam against Enterobacterales and P. aeruginosa, a dual center study

Jingjia Zhang、Ge Zhang、Wei Kang、Simeng Duan、Tong Wang、Jin Li、Zhiru Huangfu、Qiwen Yang、Yingchun Xu、Hongli Sun
Peking Union Medical College Hospital

Objectives Ceftazidime-avibactam is a novel synthetic β-lactamase inhibitor combination. It had been used to treat infections caused by gram-negative bacilli for only a few years. However, no commercialized product had been approved to test the drug susceptibility of ceftazidime-avibactam in clinical laboratories in China. In this study, we evaluated the performance of Etest and the disc diffusion method for the determination of ceftazidime-avibactam against *Enterobacterales* and *P. aeruginosa*.
Methods Antimicrobial susceptibility testing of 302 clinical *Enterobacterales* and *P. aeruginosa* isolates from two centers were conducted by broth microdilution (BMD), Etest, and disc diffusion method for ceftazidime-avibactam. Using BMD as a gold standard, essential agreement (EA), categorical agreement (CA), major error (ME) and very major error (VME) were determined according to CLSI guidelines. CA and EA > 90%, ME < 3%, and VME < 1.5% were considered as acceptable criteria. Polymerase chain reaction and sanger sequencing were performed to determine the carbapenem resistance genes of all the 302 isolates.
Results A total of 302 strains (228 *Enterobacterales* and 74 *P. aeruginosa*) were enrolled, among which 182 strains were from center 1 (148 *Enterobacterales* and 34 *P. aeruginosa*) and 120 strains were from center 2 (80 *Enterobacterales* and 40 *P. aeruginosa*). 18.21% (55/302) of the enrolled isolates were resistant to ceftazidime-avibactam. The categorical agreement rates of Etest for *Enterobacterales* and *P. aeruginosa* were 100% and 98.65% (73/74), respectively, and the essential agreement rates were 97.37% (222/228) and 98.65% (73/74), respectively. The categorical agreement rates of the disc diffusion method for *Enterobacterales* and *P. aeruginosa* were 100% and 95.95% (71/74), respectively. No very major errors were found by using Etest, while the major error rate was 0.40% (1/247). No major errors were found by using the disc diffusion method, but the very major error rate was 5.45% (3/55). Therefore, all the parameters of Etest were in line with acceptable criteria. For 31 blaKPC, 33 blaNDM, 7 blaIMP, and 2 blaVIM positive isolates, both of the categorical agreement rates and essential agreement rates were 100%, no major error and very major error was detected by two methods. For 15 carbapenemase-non-producing resistance isolates, the categorical agreement rate and essential agreement rate of Etest were 100%. Whereas the categorical agreement rate of the disc diffusion method was 80.00% (12/15), the very major error rate was 20.00% (3/15).
Conclusions Both Etest and the disc diffusion method can meet the needs of clinical microbiological laboratories for testing the susceptibility of ceftazidime-avibactam drugs. By comparison, the evaluation of Etest was better than that of the disc diffusion method. The detection performance of *Enterbacterales* was better than that of *P. aeruginosa*.

PO-1089

Multiplex PCR system for the rapid diagnosis of blood stream infection: systematic review and meta-analysis

Mei Yang、chuanmin Tao、zhongyi Zhao、zhonghao Wang
Department of Laboratory Medicine, West China Hospital, Sichuan University

Background Bloodstream infections (BSIs) are a leading cause of patient mortality and high health care-related costs worldwide, which are among the most common healthcare-associated infections. Traditionally, diagnosis of BSI relied solely on blood culture, which has been considered the gold standard of pathogen detection. However, there are some shortcomings with blood culture for the diagnosis of BSI, such as low sensitivity, prolonged turnaround time (>48 hours), and labor intensive or operator dependent. Recent advances have emerged for rapid and specific identification of infectious pathogen from positive blood culture bottles, which include melting curve analysis, real-time PCR and nucleic acid amplification technologies. In 2013, the Food and Drug Administration (FDA) approved a rapid and automated multiplex PCR assay, the FilmArray blood culture identification (BCID), which directly identifies common pathogens, including 8 genera/ species of Gram-positive bacteria, 11 genera/species of Gram-negative bacteria, 5 species of Candida and 3 antimicrobial resistance genes in the positive blood culture bottles. The FilmArray blood culture identification (BCID) panel is a multiplex PCR assay to detect the most commonly pathogens in bloodstream infections (BSIs) leading cause of patient mortality and high health care-related costs worldwide with increased sensitivity and specificity. However, a major problem remains that BCID panel still produce false negative or positive results, which prevents a wider adoption of this panel by laboratories.
Objectives Hence, we need to know the actual effectiveness of the method before integrating into the workflow of laboratory's diagnosis aimed to enhance the accuracy and efficiency of the disease diagnosis, allowing to accelerate the clinical decision-making. Therefore, we aim to provide a summary of evidence for the diagnostic accuracy of BCID panel, on the detection of positive blood cultures.
Methods The flow chart of our study was based on the PRISMA (Preferred Reporting Items for Systematic Review and Meta-analysis) statement and the guidelines for systematic reviews of diagnostic tests proposed by the Cochrane Collaboration. The protocol was registered with the International Prospective Register of Systematic Reviews (PROSPERO) (registration number CRD42021239176). We searched the MEDLINE, EMBASE and Cochrane databases though Mar 2021 for studies assessing the diagnostic test efficacy of the BCID panel. The number of true positives, false positives, true negatives and false negatives of the BCID panel compared with the reference standards were also extracted to calculate the sensitivities and specificities of the target assays. Last, in order to better understand the analytical accuracy of the BCID panel, we analyzed the results of confirmation methods which were performed by the investigators of the studies in all blood culture specimens with each discrepant result occurring between BCID panel and the reference identification techniques.
Results Sensitivity across the 17 included studies varied from 89% to 100% with most of the studies being from 94% to 100% for Gram-positive bacteria, it is noteworthy that in the one study with low sensitivity (89%). Sensitivity across the 17 included studies varied from 88% to 100% with most of the studies being 100% for Gram-negative bacteria, it is noteworthy that in the single study with low sensitivity (88%). Sensitivity across the 14 included studies varied from 50% to 100% with most of the studies being from 95% to 100% for fungi, it is noteworthy that in the single study with low sensitivity (50%). On the other hand, specificity across the 17 studies varied from 95% to 100% for Gram-positive bacteria, 97% to 100% for Gram-negative bacteria and 99% to 100% for fungi. Positive predictive value of the BCID panel was 42.7%, 41.6% and 96.7% for Gram-positive bacteria, Gram-negative bacteria and fungi, respectively. In other words, a positive panel result has 42.7%, 41.6% and 96.7% possibility of being correct to identify Gram-positive bacteria, Gram-negative bacteria and fungi bloodstream infection. In addition, negative predictive value of the BCID panel was 97.1%, 99.5% and 99.7% for Gram-positive bacteria, Gram-negative bacteria

and fungi, respectively. That is, a negative panel result has 97.1%, 99.5% and 99.7% possibility of being correct to identify Gram-positive bacteria, Gram-negative bacteria and fungi bloodstream infection. Summary estimates are calculated from the included studies by pooling the studies in a meta-analysis. For sensitivity analysis, goodness of fit and bivariate normality showed that random effects bivariate model is suitable. By applying a bivariate random-effects model, the pooled estimates for sensitivities were 97.0%, 99% and 99% for Gram-positive bacteria, Gram-negative bacteria and fungi, respectively. The pooled estimates for specificities were 100%, 100% and 100% for Gram-positive bacteria, Gram-negative bacteria and fungi, respectively.Overall, 83 and 104 specimens were detected as false positive and false negative, respectively, by the BCID panel compared with reference identification techniques. After confirmation methods implemented by the investigators of the included studies for the discordant results, false positive and false negative results decreased to 49 and 36, respectively. The largest number of false positive and false negative results after discrepant confirmation was showed Klebsiella pneumoniae and Staphylococcus spp.

Conclusions Based on the published studies, we conclude that the BCID panel test has higher rule-in than rule-out diagnostic value. In populations in which the prevalence of systemic bacterial or fungal infection is low, the negative BCID panel still offer useful information for clinical decision. The major limitation of the BCID panel is its suboptimal sensitivity. Before newer technology is available, we recommend clinicians combine biomarkers, clinical findings, and the BCID panel to enhance the diagnostic accuracy.

PO-1090

肠道定植碳青霉烯耐药肠杆菌目细菌的主动筛查及分子流行病

储雯雯
安徽医科大学第二附属医院

目的 筛查住院患者肠道碳青霉烯耐药肠杆菌目细菌的定植率，并分析 CRE 菌株分子的流行病学特征。

方法 采集 2019 年 3 月至 12 月安徽医科大学 第二附属医院外科重症监护病房、内科重症监护病房和血液内科（移植病房 213 例住院患者粪便、直肠拭子或肛周拭子标本，应用含碳青霉烯类药物的麦康凯平板法筛查 CRE 菌株，并进行细菌鉴定、药物敏 感试验检测，选取重点菌株进行全基因组测序，并分析其多位点序列分型、荚膜血清型、耐药基因、毒力 基因及质粒携带特征。

结果 共检出 CRE 菌株 23 株，检出率为 10.8% ；其中碳青霉烯类耐药肺炎克雷伯菌 15 株(65.2%)、大肠埃希菌和阴沟肠杆菌各 3 株(13.0%)、弗氏柠檬酸杆菌 2 株(8.7%)。单核苷酸多态性聚类分析表明，15 株 CRKP 有两种主要克隆型，均在外科重症监护病房内流行。15 株 CRKP 均属于 ST11-K64 型，均携带 β-内酰胺类耐药基因产肺炎克雷伯菌碳青霉烯酶 2 型基因；80.0% (12 株)的 CRKP 携带毒力基因黏液表型调控基因 2 型、iutABCD-iutA。

结论 住院患者中肠道定植 CRE 检出率较高，以 ST11-K64 型 CRKP 为主，CRKP 菌株兼具多重耐药性和毒力特征，有医院传播风险。

Respiratory Haemophilus influenzae infection linked to particulate air pollution

Shaocheng Zhang[1]、Xi Chen[2]、Jing Wang[2]、Chunmei Dai[2]、Yeran Gou[3]、Huanhuan Wang[4]
1. Suining Central Hospital
2. 绵阳市中心医院
3. 成都市第二人民医院
4. 汕头大学医学院

Particulate air pollution is correlated with many respiratory diseases. However, few studies have focused on the relationship between air particulate exposure and respiratory Heamophilus influenzae infection. Therefore, we detected respiratory Heamophilus influenzae infection by bacterial culture of sputum of patients, and we collected particulate air pollution data (including PM2.5 and PM10) from a national real-time urban air quality platform to analyze the relationship between particulate air pollution and respiratory Heamophilus influenzae infection. The mean concentrations of PM2.5 and PM10 were 37.58 μg/m3 and 58.44 μg/m3, respectively, showing particulate air pollution remains a severe issue in Mianyang. A total of 828 strains of Heamophilus influenzae were detected in sputum by bacterial culture. Multiple correspondence analysis suggested the heaviest particulate air pollution and the highest Heamophilus influenzae infection rates were all in winter, while the lowest particulate air pollution and the lowest Heamophilus influenzae infection rates were all in summer. In a single-pollutant model, each elevation of 10 μg/m3 of PM2.5, PM10, and PM2.5/10 (combined exposure level) increased the risk of respiratory Heamophilus influenzae infection by 34%, 23%, and 29%, respectively. Additionally, in the multiple-pollutant model, only PM2.5 was significantly associated with respiratory Heamophilus influenzae infection (B, 0.46; 95% confidence interval, 0.05–0.87), showing PM2.5 is an independent risk factor for respiratory Heamophilus influenzae infection. In summary, this study highlights air particulate exposure could increase the risk of respiratory Heamophilus influenzae infection, implying that stronger measures need to be taken to protect against respiratory infection induced by particulate air pollution.

PO-1092

17 株耐万古霉素肠球菌耐药与分子分型及同源性分析

纵帅
徐州医科大学附属医院

目的 研究万古霉素耐药肠球菌（VRE）分离株的耐药谱，并通过多位点序列分型（MLST）分型和脉冲场凝胶电泳（PFGE）分析菌株间的同源性，分析耐药谱和分子分型之间有无关联性；为临床药物治疗和预防感染暴发提供依据。
方法 对收集自北京中日友好医院的 17 株 VRE 进行鉴定和药物敏感性试验（包括微量稀释法测定其 MIC 值和 E-test 检测万古霉素和替考拉宁 MIC 值）；MLST 试验进行 ST 分型； PFGE 试验进行分子克隆分型和同源性分析。
结果 全部 17 株 VRE 万古霉素 MIC＞256μg/mL，9 株 VRE 的替考拉宁 MIC＞256μg/mL，17 株 VRE 对利奈唑胺、替加环素和奎奴普丁/达福普丁 100%敏感，对青霉素 G、氨苄西林、左氧氟沙星、环丙沙星和呋喃妥因 100%耐药，对替考拉宁、红霉素、四环素、链霉素和高水平庆大霉素的耐药率分别为 82.4%、47.1%、35.3%、23.5%和 17.6%；17 株 VRE 分为 4 个 ST 行，其中 ST78 型 14 株，为主要型别，ST343、ST192 和 ST547 型各 1 株；相同 ST 型别菌株间耐药谱和不同 ST 型别菌株间耐药谱均不完全相同；PFGE 将 17 株 VRE 共分为 10 个不同的克隆来源，PFGE 克

隆分型和 ST 分型型别未发现在严格对应关系；相同克隆来源的菌株间和不同来源的克隆株间耐药谱均不完全相同。
结论 VRE 存在严重的多药耐药特性；MLST 分型、PFGE 克隆分型和 VRE 耐药谱之间没有必然的联系；分子分型不能用于 VRE 的耐药谱及其严重程度的评估和预测；药物敏感性试验的直观结果依然是临床 VRE 治疗的主要依据。

PO-1093

A case of thoracic brucellosis misdiagnosed as malignant tumor and literature review

Fengzhen Yang
Yantai Yuhuangding Hospital

Brucellosis remains a major public health problem worldwide. It is commonly found in most developed and developing countries, such as the Mediterranean region, the Middle East, and Latin America. In China, brucellosis is mainly distributed in some of the northern provinces and is relatively rare in Shandong province. Brucellosis has a variety of clinical manifestations, with fever, sweating, fatigue, and migratory joint pain being the most common. Due to the non-specific clinical symptoms, brucellosis is often misdiagnosed as other diseases. Here, we report a rare case of brucellosis of thoracic vertebrae misdiagnosed as thoracic malignant tumor and present a review of related literature.

PO-1094

Based on transcriptome sequencing：clinicians need to pay attention to fever caused by common respiratory pathogens during the global outbreak of COVID-19

Sheng Yin、min wang、Wenlong Wang
The Second Xiangya Hospital of Central South University

Objectives During the COVID-19 pandemic, clinicians and public health decision-makers especially focus on fever patients. Other common pathogens that may cause fever are easily overlooked. We aimed to describe the pathogen infection and epidemic trend of non-SARS-CoV-2 occurring in hospitalized patients.
Methods An observational cohort study of 733 consecutive patients admitted to Hospital Clinic of the Second Xiangya Hospital for COVID-19. All samples of a pharyngeal swab from patients with fever have been tested for nucleic acid and immune antigens of SARS-CoV-2 and Influenza A/B virus. 649 fever patients have been tested for nucleic acid in ten respiratory pathogens. Macrotranscriptome sequencing was performed on 26 samples.
Results Of a total of 733 patients with fever, 2.05% patients had confirmed SARS-CoV-2 infections. Fever patients with common respiratory pathogens in fever patients was 8.78%. There is no integration phenomenon between SARS-Cov-2 and the human genome. SARS-CoV-2 positive samples will also be infected with other viruses, especially adenovirus. Macrotranscript analysis showed that there was no significant difference in the species and genus levels of pathogens between Covid-19 patients and other fever patients. The main pathways that affect human metabolism after SARS-Cov-2 infection are the Calvin-Benson-Bassham cycle, pyrimidine deoxyribonucleotides de novo biosynthesis I and D-galactose degradation V.
Conclusions Most patients have a fever caused by common respiratory pathogens. Clinicians still need to pay more attention to infections of common respiratory pathogens in addition to

SARS-CoV-2. China's public health measures to stop the spread of the epidemic have proven effective.

PO-1095

危重病科患者合并血流感染的影响因素及病原菌分析

陈凌娟、彭晓飞、李玉珍、徐令清、张中文
清远市人民医院

目的 探讨危重病科患者合并血流感染的影响因素及病原菌。
方法 选择 2020 年 1 月至 6 月我院危重病科收治的 162 例合并血流感染患者为观察组，162 例未合并血流感染患者为对照组，收集资料，分析危重病科患者合并血流感染的影响因素及病原菌。
结果 年龄≥60 岁、脑血管疾病、糖尿病、机械通气时间＞5d、入院前 30d 内使用抗菌药物是危重病科患者合并血流感染的高危因素（OR＞1 且 P＜0.05）；观察组中 162 例患者的血培养样本中分离出病原菌 251 株，其中革兰阴性菌 155 株（61.75%），革兰阳性菌 86 株（34.27%），真菌 10 株（3.98%）。
结论 危重病科患者合并血流感染与年龄、机械通气时间、使用抗菌药物和合并脑血管疾病、糖尿病有关，革兰阴性菌是其主要致病菌，临床需针对各危险因素加强护理干预，以减少血流感染发生。并根据病原菌实施药敏试验，按照试验结果合理选择抗菌药物，提高治疗效果。

PO-1096

川东某院 Gene Xpert MTB/RIF 在结核病早期诊断中的应用分析

王芬、王翠、刘家瑞、陈林
遂宁市中心医院

目的 探讨 Gene Xpert MTB/RIF 检测技术在基层医疗机构中对结核病早期诊断的应用价值，为该技术在川东地区的推广应用提供参考。
方法 收集 2020 年 3 月-2021 年 2 月遂宁市中心医院门诊及病区收治的疑似结核病患者送检标本 368 例，分别采用抗酸染色、荧光定量 PCR、Gene Xpert MTB/RIF、固体培养法进行检测，比较四种方法的阳性率。以固体培养法为金标准，分析 Gene Xpert MTB/RIF 对结核分枝杆菌的检测效能；以比例法药敏试验为金标准，分析 Gene Xpert MTB/RIF 对利福平耐药性的检测效能。
结果 抗酸染色、荧光定量 PCR、Gene Xpert MTB/RIF、固体培养法的阳性率分别为 14.13%、34.24%、49.46%和 50.82%，Gene Xpert MTB/RIF 检测的阳性率高于抗酸染色法和荧光定量 PCR 法，差异有统计学意义（P＜0.05）；固体培养法与 Gene Xpert MTB/RIF 检测阳性率差异无统计学意义（P＞0.05）。以固体培养法为金标准，Gene Xpert MTB/RIF 检测结核分枝杆菌的敏感度、特异度、阳性预测值、阴性预测值分别为 96.79%、99.45%、99.45%和 96.77%，两种方法的符合率为 98.10%，Kappa 值为 0.961；以比例法药敏试验为金标准，Gene Xpert MTB/RIF 检测利福平耐药性的敏感度、特异度、阳性预测值、阴性预测值分别为 88.89%、99.71%、96.00%和 99.13%，两种方法的符合率为 98.91%，Kappa 值为 0.884。
结论 Gene Xpert MTB/RIF 检测结核分枝杆菌和利福平耐药性的敏感度高、特异性好、对生物安全要求低，适合在川东生物安全防护薄弱的基层实验室推广使用。

PO-1097

Identification of New Peptide Biomarkers for Bacterial Bloodstream Infection

Yating Ma、Chengbin Wang
301 PLA Hospital

Background Due to a lack of effffective early diagnostic measures, new diagnostic methods for bacterial bloodstream infections (BSIs) are urgently needed. A protein–peptide profifiling approach can be used to identify novel diagnostic biomarkers of BSIs.
Methods In this study, MALDI-TOF MS and nano-LC/ESI-MS/MS are used to analyze serum peptides. In addition, GO and network analyses are conducted as a means of analyzing these potential protein markers. Finally, the potential biomarkers are verifified in independent clinical samples via ELISA.
Results m/z 1533.8, 2794.3, 3597.3, 5007.3, and 7816.7 reveal an identical trend; the intensity of m/z 1533.8, 2794.3, and 3597.3 are higher in the infection group relative to controls, whereas the intensity of m/z 5007.3 and 7816.7 are lower in the infection group. Four peaks are successfully identifified including ITIH4, KNG1, SAA2, and C3. GO and network analyses fifind these proteins to form an interaction network, which may be correlated with BSI. ELISA results indicate that ITIH4, KNG1, and SAA2 are effffective in diffffferentiating infected from normal control group and the febrile group.
Conclusions These biomarkers have the potential to offffer new insights into the signaling networks underlying the development and progression of BSI.

PO-1098

Excretory/Secretory Products From Trichinella spiralis Adult Worms Attenuated DSS-Induced Colitis in Mice by Driving PD-1-Mediated M2 Macrophage Polarization

Zixia Wang[1,2]、Chunyue Hao[2]、Qinghui Zhuang[2]、Bin Zhan[3]、Ximeng Sun[2]、Jingjing Huang[2]、Yuli Cheng[2]、Xinping Zhu[2]
1. Department of Clinical Laboratory Medicine, Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences
2. Department of Medical Microbiology and Parasitology, School of Basic Medical Sciences, Capital Medical University, Beijing, China
3. Department of Pediatrics, National School of Tropical Medicine, Baylor College of Medicine, Houston, TX, United States

Helminth-modulated macrophages contribute to attenuating inflammation in inflammatory bowel diseases. The programmed death 1 (PD-1) protein plays an important role in macrophage polarization and is essential in the maintenance of immune system homeostasis. Here, we investigated the role of PD-1-mediated polarization of M2 macrophages and the protective effects of excretory/secretory products from Trichinella spiralis adult worms (AES) on DSS-induced colitis in mice. Colitis in mice was induced by oral administration of dextran sodium sulfate (DSS) daily. Mice with DSS-induced colitis were treated with T. spiralis AES intraperitoneally and pathological manifestations were evaluated. Macrophages in mice were depleted with liposomal clodronate. Markers for M1-type (iNOS, TNF-α) and M2-type (CD206, Arg-1) macrophages were detected by qRT-PCR and flow cytometry. Macrophage expression of PD-1 was quantified by flow cytometry; RAW 264.7 cells and peritoneal macrophages were used for in vitro tests while PD-1 gene knockout mice were used for in vivo investigation of the role of PD-1 in AES-induced M2 macrophage polarization. Macrophage depletion was found to reduce DSS-induced colitis in mice. Treatment with T. spiralis AES significantly increased macrophage expression of CD206 and Arg-

1 and simultaneously attenuated colitis severity. We found T. spiralis AES to enhance M2 macrophage polarization; these findings were confirmed studying in vitro cultures of RAW264.7 cells and peritoneal macrophages from mice. Further experimentation revealed that AES up-regulated PD-1 expression, primarily on M2 macrophages expressing CD206. The AES-induced M2 polarization was found to be decreased in PD-1 deficient macrophages and the therapeutic effects of AES on colitis was reduced in PD-1 knockout mice. In conclusion, the protective effects of T. spiralis AES on DSS-induced colitis were found to associate with PD-1 up-regulation and M2 macrophage polarization. Thus, PD-1-mediated M2 macrophage polarization is a key mechanism of helminth-induced modulation of the host immune system.

PO-1099

上海市 29 所医疗机构口腔综合治疗台用水非结核分枝杆菌检测及相关因素分析

鲍容、胡必杰、高晓东、郭玮
复旦大学附属中山医院

目的 了解上海市医疗机构口腔综合治疗台治疗用水水路非结核分枝杆菌（NTM）污染现状。
方法 对医疗机构口腔综合治疗台治疗用水进行现场采样，同时通对问卷调查收集治疗台水路消毒情况等相关基础资料。采集水样用滤膜过滤法进行处理，滤膜接种 7H10 培养基培养，疑似菌落经抗酸染色确认后，通过基质辅助激光解析/电离飞行时间质谱（MALDI-TOF MS）方法进行细菌鉴定。
结果 共调查 29 所医疗机构 204 份综合治疗台治疗用水水样，包括超声用水 40 份，手机用水 53 份，三用枪用水 55 份，以及漱口水 56 份。NTM 总检出率为 15.2%（31/204），以产粘液分枝杆菌（17 株，50.0%）和龟分枝杆菌（13 株，38.2%）为主。不同部位 NTM 检出率存在统计学差异（P=0.021），三用枪用水 NTM 检出率最高，为 25.5%；超声用水 NTM 检出率最低，为 2.5%。消毒频率小于 3 个月的水管路 NTM 检出率明显低于其它频率（P＜0.001）。
结论 上海市 29 所医疗机构口腔综合治疗台用水 NTM 检出率为 15.2%。水管路消毒频率是重要影响因素。

PO-1100

评估 EDTA 改良碳青霉烯灭活试验和碳青霉烯酶抑制增强试验检测肠杆菌目细菌产碳青霉烯酶的临床价值

黄声雷、周春妹、曹锦楠、马艳、单玉璋、沈佳瑾、胡必杰、郭玮
复旦大学附属中山医院

目的 评估 EDTA 改良碳青霉烯灭活试验和碳青霉烯酶抑制增强试验检测肠杆菌目细菌产碳青霉烯酶的临床价值。
方法 收集 2020 年 1-12 月碳青霉烯类耐药的肠杆菌目细菌共 195 株，使用微量肉汤稀释法进行体外药敏试验，然后分别用 EDTA 改良碳青霉烯灭活试验和碳青霉烯酶抑制增强试验检测对碳青霉烯类耐药的肠杆菌目产生的碳青霉烯酶进行检测并分型，同时使用 PCR 方法作为金标准检测碳青霉烯酶。
结果 除了对替加环素和粘菌素的敏感率高于 95%外，耐碳青霉烯类的肠杆菌目细菌对其它常见的抗菌药物敏感率均低于 50%。和 PCR 方法比较，EDTA 改良碳青霉烯灭活试验对肠杆菌目产生的碳青霉烯酶分型的特异性和敏感度分别为 95.7%和 100%，碳青霉烯酶抑制增强试验检测的特异性和敏感度分别为 97.5%和 100%。

结论 EDTA 改良碳青霉烯灭活试验和碳青霉烯酶抑制增强试验都能较好区分不同类型的碳青霉烯酶，其中碳青霉烯酶抑制增强试验可以同时检测产 KPC 和金属酶菌株，且操作较 EDTA 改良碳青霉烯灭活试验更为简便，更适合基层微生物实验室常规开展。

PO-1101

荧光染色法与 KOH 湿片法在诊断甲真菌病中的效果比较

王有为、李雪茹、李红霞、赵薇、杨阳
电子科技大学附属医院•四川省人民医院

目的 探索甲真菌病诊断的新方法，提高诊断的准确率和阳性检出率。
方法 87 例疑似甲真菌病的病甲进行处理后分别采用真菌荧光染色法和 KOH 湿片直接镜检，并对检测结果进行比较。
结果 荧光染色法共检出 52 例真菌阳性，而 KOH 湿片法只有 44 例阳性，荧光染色法的阳性检出率明显高于 KOH 湿片法（P<0.05）。
结论 荧光染色法是一种快速、准确的真菌检测方法，值得在皮肤科对真菌感染诊断的推广使用。

PO-1102

miRNA 在革兰阴性菌相关脓毒症中的诊断价值探讨

赵卫东、谢可心、李福兴、王黎、樊玉娟
大理大学第一附属医院

目的 探究 miRNA 在革兰阴性菌(Gram negative, G-)相关脓毒症中的诊断价值，为临床诊断和治疗提供新思路。
方法 选取 2018 年 9 月-2020 年 9 月就诊于大理某医院的 7 名 G-脓毒症患者及 7 名健康体检者作为筛选队列，进行 miRNA 测序及生物信息学分析，并选取 34 名 G-脓毒症患者及 16 名健康体检者作为验证队列，对上调的 miRNA 进行 qRT-PCR 验证，探讨差异表达 miRNA 对 G-脓毒症的诊断价值；根据预后，将 G-脓毒症患者分成生存组(n=18)和死亡组(n=16)，绘制 ROC 曲线，同时与 PCT、CRP、SOFA 评分等经典感染指标做相关性分析，探讨 miRNA 对 G-脓毒症患者的预后诊断价值。
结果 筛选队列中 G-脓毒症组的 hsa-miR-1202、hsa-miR-16-5p、hsa-miR-1299、hsa-miR-486-5p 和 hsa-miR-451a 的表达显著高于对照组(P<0.05)；验证队列中 G-脓毒症患者组 hsa-miR-16-5p、hsa-miR-1202、hsa-miR-486-5p、hsa-miR-451a 水平显著高于对照组；ROC 结果表明 hsa-miR-16-5p 的 AUC 最大为 0.74。对患者预后的判断，死亡组 hsa-miR-16-5p、hsa-miR-486-5p、hsa-miR-451a 水平显著高于生存组(P<0.05)。相关性分析表明，miR-451a 和 SOFA 评分呈正相关(r=0.43, P=0.01)。
结论 血清 hsa-miR-16-5p、hsa-miR-1202、hsa-miR-486-5p、hsa-miR-451a 可能是 G-脓毒症早期诊断的生物标志物，其中 miR-16-5p 的诊断性能最佳；hsa-miR-16-5p、hsa-miR-486-5p、hsa-miR-451a 与 G-脓毒症患者的预后有关，有可能是 G-脓毒症治疗的潜在靶点。

PO-1103

PCT、hs-CRP 及血培养对布鲁氏杆菌感染临床诊断研究

张弛[1]、林国跃*[1]、何雯雯[1]、蔺志强[1]、王子璠[1]、秦莹[1]、段丽[1]、许珺[1]、高辉[1]、张蕊[1]、王钒[1]、姜海[2]
1. 新疆医科大学第八附属医院
2. 中国疾病预防控制中心传染病预防控制所，传染病预防控制国家重点实验室，感染性疾病协同诊治协同创新中心，

目的 探讨新疆地区布鲁氏杆菌感染患者体内炎症因子 PCT、hs-CRP 免疫反应水平和 RF、ESR、ASO 及血培养的临床诊断意义。
方法 采用血培养、“琥”红平板和试管凝集试验等技术对我院住院患者 191 例及正常对照人群进行实验诊断，使用流式及电化学发光法等技术检测多种炎症因子等血液指标，应用 Stata 15.0 软件进行 χ2、t 检验统计处理。
结果（1）hs-CRP、PCT 和血培养阳性率在急性组明显高于慢性组（P<0.05），并且伴有布病脊柱炎和关节炎的患病率在慢性组明显高于急性组（P=0.035）。（2）基于布病感染发病程度的抗体滴度大小与外周血炎症因子免疫反映水平关系中 PCT、hs-CRP、RF、ESR 和血培养阳性率在高滴度组明显高于低滴度表达（P<0.001）。
结论 PCT、hs-CRP 等是布鲁氏菌感染急性期的重要炎症指标，与血培养结合有助于临床早期快速明确诊断、预估病情进展分期和机体免疫状况，对牧区布鲁氏杆菌感染患者及时治疗和防疫具有重要意义。

PO-1104

Combining comparative genomic analysis with machine learning reveals some promising diagnostic markers to identify five common pathogenic nontuberculous mycobacteria

Xinmiao Jia[1]、Linfang Yang[2]、Cuidan Li[3]、Yingchun Xu[1]、Qiwen Yang[1]、Chen Fei[3]
1. Medical Research Center, Peking Union Medical College Hospital
2. 邢台市人民医院
3. 中国科学院北京基因组研究所

Objectives Nontuberculous mycobacteria (NTM) can cause various respiratory diseases and even death in severe cases, and its incidence has increased rapidly worldwide. To date, it’s difficult to use routine diagnostic methods and strain identification to precisely diagnose various types of NTM infections. Thus, it’s essential to search for new diagnostic markers to precisely identify various species of common pathogenic NTMs.
Methods We combined systematic comparative genomics with machine learning (pan-genome/random forest model/ensemble classification) to select diagnostic markers for precisely identifying five common pathogenic NTMs (Mycobacterium kansasii (Mka), Mycobacterium avium (Mav), Mycobacterium intracellular (Min), Mycobacterium chelonae (Mch), Mycobacterium abscessus (Mab)) based on 81 complete genomes (discovery set) and 548 draft genome sequences (validation set).
Results A panel including six genes and two SNPs (nikA, benM, codA, pfkA2, mpr, yjcH, rrl_C2638T, and rrl_A1173G) was selected to simultaneously identify the five pathogenic NTMs with high accuracy. Notably, the panel only containing the six genes also showed a good classification effect on the five NTMs. Additionally, the two panels could precisely differentiate the five NTMs from M. tuberculosis (accuracy > 99%). We also revealed some new marker genes/SNPs/combinations to accurately discriminate any one of the five pathogenic NTMs separately, which provided the possibility of how to diagnose one certain NTM infection precisely.

Conclusions Our research not only reveals novel promising diagnostic markers to promote the development of precision diagnosis in infectious caused by NTMs, but also provides an insight into precisely identifying various genetically close species of pathogens through comparative genomics and machine learning.

PO-1105

基于催化发夹自组装信号放大系统的 SARS-CoV-2 核酸快速检测方法

邹明园[1,2]、吴国球[1,2]
1. 东南大学附属中大医院
2. 东南大学医学院

目的 自新型冠状病毒(SARS-CoV-2)疫情爆发以来，RT-PCR 方法检测 SARS-CoV-2 核酸一直是疑似病例确诊的病原学依据之一，也是确诊病例出院标准的重要参考。然而，RT-PCR 方法在实际应用过程中也暴露出许多缺点和不足。因此，开发一种操作简单、对仪器设备依赖性低、灵敏度高、可实现即时检验的核酸检测方法对疫情防控具有重要意义。
方法 利用催化发夹型 DNA 自组装反应（catalytic hairpin assembly，CHA）与免疫侧向层析试纸条（lateral flow immunoassay strip，LFIA）联合，建立了一种等温无酶、操作简单、快速经济的 SARS-CoV-2 病毒核酸检测方法（CHA-LFIA）。CHA 是一种等温无酶核酸信号放大系统。根据已公开的 SARS-CoV-2 序列进行多序列比对，筛选出 Orf1ab 基因和 N 基因中长度为 21 个碱基的保守序列作为检测靶标，并根据靶向序列设计了两组相应的发夹型 DNA 探针(H1 和 H2)。并分别在探针 H1 的 5’端标记地高辛（Digoxin），在 H2 探针的 5’端标记生物素（Biotin）。最后，利用侧向免疫层析试纸条检测地高辛-生物素双标记的 H1-H2 双链 DNA
结果 该方法的最低检测极限（limit of detection，LoD）为 10aM（≈6000 copies/ml）。该方法对 15 例 SARS-CoV-2 阳性的咽拭子标本均报告为阳性，对 15 例健康人群的咽拭子标本均报告为阴性。与实时荧光 RT-PCR 检测结果的一致性达 100%。
结论 CHA-LFIA 方法无需对样品进行核酸提取等前处理，所需的仪器简单，仅需恒温水浴锅和荧光试纸条定量分析仪。整个检测过程（从采样到报告结果）可在 90 分钟内完成

PO-1106

临床感染患者肠球菌药物敏感性分析

王立新[1]、何正原[2]
1. 天津市天津医院
2. 天津医科大学 临床医学院

目的 了解 2009 年 1 月-2020 年 12 月两年期间临床分离的粪肠球菌和屎肠球菌对多种抗菌药物的敏感性特点及标本来源和临床分布特点，为临床肠球菌感染患者的经验性用药治疗提供依据。
方法 采自法国梅里埃公司的 vitek-2 型全自动细菌鉴定仪、身分证和药敏卡进行细菌鉴定和药敏试验。数据分析用 whonet 5 软件进行分析。
结果 共分离出粪肠球菌 164 株，其中粪肠球菌 99 株，屎肠球菌 65 株。粪肠球菌来源主要源自于肢体矫形器的第二病房和足踝创伤的第二病房。屎肠球菌标本来源主要在肢体矫形二病区和外科 ICU，其标本类型也是以尿和伤口为主。164 株菌株中没有出现对万古霉素中介或耐药的菌株，其粪肠球菌对利奈唑胺、呋喃妥因、替加环素、左氧氟沙星、氨苄西林、环丙沙星、阿莫西林、青霉素和浓度庆大霉素等抗菌药物的敏感率均大于 50%。

结论 对万古霉素和替加环素耐药的肠球菌对利奈唑胺均较敏感，对多种抗生素的耐药率均高于对屎肠球菌粪肠球菌。在临床医治肠球菌感染时，应通过肠球菌感染的结果，酌情使用抗生素，以此来减缓细菌耐药性的发展。

PO-1107

新冠病毒入侵辅助受体 SR-B1 的发现及验证

曹源
解放军第九六〇医院

高密度脂蛋白（High-density lipoprotein，HDL）是脂蛋白的一种，是由蛋白质和脂质组成的大分子复合物。借由 SR-B1 受体，HDL 能够参与胆固醇的逆向转运，将胆固醇从细胞外组织转运到细胞内。在前期的研究中，我们发现 HDL 水平在新型冠状病毒（SARS-CoV-2）感染患者中显著降低，且与疾病的严重程度相关。

在本研究中，我们对新冠病毒 S 蛋白的一级序列进行分析，发现六个可能的胆固醇结合基序。借助微量热泳动（MST）、表面等离子共振（SPR）等技术发现，S 蛋白能够与 HDL 结合。通过流式细胞术等发现 HDL 能显著增强新冠病毒的 S 蛋白与宿主细胞表面结合。当新冠病毒感染体系中加入 HDL 之后，新冠病毒能够与宿主细胞表面的 SR-B1 结合，显著促进新冠病毒与细胞的结合和入侵。此外，敲低 SR-B1 能够抑制新冠病毒对细胞的感染；而将 SR-B1 过表达之后，新冠病毒对细胞的感染显著增强。而且，SR-B1 的抑制剂能够有效抑制新冠病毒对细胞的感染。

本研究揭示了 SR-B1 是新冠病毒的辅助受体，明确了新冠病毒与脂代谢之间的联系，扩展了对新冠病毒感染细胞机制的认识，也为筛选和开发抗新冠病毒感染药物提供了理论基础。该研究成果作为封面文章在 Nature Metabolism 期刊发表。

PO-1108

前带后带现象对虎红凝集试验结果的影响分析

都基爽
吉林金域医学检验所有限公司

目的 布鲁氏菌病是布鲁氏菌侵入人体后引发的以红斑点或瘙痒性丘疹为主要症状的传染病，同时，布鲁氏菌病具有容易传染，病症缺乏特异性等特点。因此，布鲁氏菌的早期发现对于患者的及早治疗以及临床上收集布鲁氏菌病患者的流行病学资料、临床表现等提供有利帮助。以试管凝集试验和 IgG 结果作为参考，分析前带后带现象对虎红凝集试验的影响。

方法 选取 2021.01.01-2021.03.31 期间送检我公司的 1700 例标本进行检测。实验前将冷藏保存的试剂平衡至室温，将试剂充分摇匀后，在室温（18-25℃）条件下进行布鲁氏菌病抗体三项试验。选出虎红凝集试验与其他两项试验结果不相符的结果可疑标本 139 例进行虎红凝集试验复查。复查试验采用 3 种比例，即 30 微升试剂分别与 10 微升、30 微升和 50 微升血清进行凝集试验，结果不同即认为结果受到前带后带现象的干扰。

结果 挑选出的 115 例进行虎红凝集试验进行复查标本中，其中 10 微升血清与 30 微升试剂混合后结果改变的 2 例，50 微升血清与 30 微升试剂混合后结果改变的 89 例，3 种比例结果相同的 16 例，3 种比例结果不完全相同的标本占总数的 79.13%，$P<0.05$,有统计学意义。

结论 前带后带现象会引起布鲁氏菌病虎红凝集试验结果的改变，前带后带现象是免疫学中一种由于抗体或抗原过量而导致所形成的免疫复合物减少，不发生凝集反应的现象。在布鲁氏菌病虎红凝集试验中，也会因为前带后带现象而出现假阴性，故需要在虎红凝集试验结果与其他试验结果不相符时，进行血清与试剂比例的修改，避免因前带后带现象造成的假阴性。

PO-1109

An enzyme-free electrochemiluminescence biosensor for ultrasensitive assay of Group B Streptococci based on self-enhanced luminol complex functionalized CuMn-CeO2 nanospheres

Jiaji Ling
West China Second University Hospital, Sichuan University

Purpose Group B Streptococcus (GBS) is an important pathogen with a high infection rate among adults worldwide, especially pregnant women. Early neonatal infection is usually caused by GBS carried by his or her mother asymptomatically, and it is transmitted vertically to the baby during delivery. Due to the low immunity of the newborn, the infection can cause neonatal sepsis and even death. Thus, early screening of GBS is of vital importance in clinical cases. Therefore, this research is committed to establishing a sensitive and efficient method for early monitoring of GBS, so as to improve the detection rate of GBS in pregnant women and newborns.
Method Based on the self-enhanced PEI-luminol functionalized CuMn-CeO2 signal tag and MNAzyme-mediated target-recycling amplification strategy, an enzyme-free electrochemiluminescence (ECL) biosensor for ultrasensitive detection of GBS was constructed in this work. First, CuMn-CeO2 nanomaterials prepared by hydrothermal method were encapsulated with PEI to make the CuMn-CeO2 endow mass amino groups, which further cross-linked with luminol viaglutaraldehyde to obtain the self-enhanced PEI-luminol functionalized CuMn-CeO2 nanocomposites. Then the resultant CuMn-CeO2-PEI-luminol was served as tracing tag by immobilizing signal probe to obtain the CuMn-CeO2-PEI-luminol-SP. Meanwhile, the thiol-modified capture probe was assembled on the Au modified electrode through Au-thiol bond. In the presence of target DNA, the two partzymes co-recognized with target DNA to form a stable active MNAzyme which further combined with hairpin substrate for cleavage with the assistant of Mg2+ cofactor. After the cleavage reaction, the HP substrate was cleaved into two segments (trigger fragment and the other part), releasing the activated MNAzyme for next cycle. The obtained trigger fragment as a mediator hybridized with SP bioconjugates and CP, making the SP bioconjugates assembled onto the modified electrode. When the modified electrode was detected in the test solution containing H2O2, a high ECL signal was achieved, attributing to the intramolecular enhancing of efficient PEI-luminol luminophore and the intermolecular enhancing of highly catalytic CuMn-CeO2 toward H2O2 oxidation.
Result The developed enzyme-free ECL biosensor showed ultra-sensitivity for target DNA detection with detection limits of 68 aM (synthetic DNA) and 5×102 CFU mL-1 (genomic DNA extracted from GBS strain). More importantly, this biosensor was successfully applied for detection of genomic DNA of GBS extracted from clinical vaginal/anal swabs as low as 320 copies.
Conclusion This proposed strategy not only achieve highly sensitive and efficient detection of target DNA, but also provides a new practical platform for ultra-sensitive detection of GBS in clinical vaginal/anal swabs, and provides a potential universal tool for nucleic acid analysis and clinical diagnosis.

PO-1110

建立一种在碱基淬灭探针技术基础上的二维 PCR 技术检测病人粪便中 4 种微生物实现对 IBD 进展的快速、低成本动态监测

吴璇、李月颖、刘维薇
上海市第十人民医院

目的 通过结合不同荧光基团的探针序列以及多个分别扩增的微生物靶基因带标签和不带标签的引物序列进行单管检测从而实现多通量检测。通过检测梭菌ⅩⅧ等细菌可实现 IBD 患者早诊筛查或者 IBD 进展动态监测和确诊的一个潜在的检测指标，有助于提示患者及时调整饮食结构，合理安排饮食，这将极大的有助于 IBD 患者长期疾病管理和干预。
方法 建立了一种在碱基淬灭探针技术的基础上开创的二维 PCR（Two-dimensional PCR, 2D PCR）技术进行单管闭管检测病人粪便标本中的 4 种微生物，可在单管闭管的反应条件下，结合 PCR 以及熔解曲线分析方法实现同时检测五种微生物，操作简单，反应时间短，成本低，无需额外的产物鉴定仪器设备和复杂的处理过程，结果可靠稳定。
结果 2D PCR 技术实现对 IBD 患者粪便微生物梭菌 XVIII，分支梭菌，螺旋梭菌和噬糖梭菌的检测，快速、低成本动态监测 IBD 患者的菌群微生物变化。
结论 实现一个荧光通道的单管闭管试验同时检测多个靶基因，通过荧光发射波长和 TM 值对每个靶基因进行鉴定。此技术可在单管闭管的反应条件下，结合 PCR 以及熔解曲线分析方法实现同时检测梭菌 XVIII，分支梭菌，螺旋梭菌和噬糖梭菌等 4 种微生物，操作简单，反应时间短，成本低，无需额外的产物鉴定仪器设备和复杂的处理过程，结果可靠稳定。

PO-1111

Prevalence and Antifungal Susceptibility of Candida parapsilosis Species Complex in Eastern China: A 15-Year Retrospective Study by ECIFIG

Jian Guo[1]、min zhang[1]、dan qiao[2]、lingbing zeng[3]、heping xu[4]、wenjuan wu[1]
1. Department of LaboratoryMedicine,Shanghai East Hospital, Tongji University School of Medicine, Shanghai, China
2. 上海交通大学附属瑞金医院
3. 南昌大学第一附属医院
4. 厦门大学附属第一医院

Candida parapsilosis complex is one of the most common non-albicans Candida species that cause candidemia, especially invasive candidiasis. The purpose of this study was to evaluate the antifungal susceptibilities of both colonized and invasive clinical C. parapsilosis complex isolates to 10 drugs: amphotericin (AMB), anidulafungin (AFG), caspofungin (CAS), micafungin (MFG), fluconazole (FLZ), voriconazole (VRZ), itraconazole (ITZ), posaconazole (POZ), 5-flucytosine (FCY), and isaconazole (ISA). In total, 884 C. parapsilosis species complex isolates were gathered between January 2005 and December 2020. C. parapsilosis, Candida metapsilosis, and Candida orthopsilosis accounted for 86.3, 8.1, and 5.5% of the cryptic species, respectively. The resistance/non-wild-type rate of bloodstream C. parapsilosis to the drugs was 3.5%, of C. metapsilosis to AFG and CAS was 7.7%, and of C. orthopsilosis to FLZ and VRZ was 15% and to CAS, MFG, and POZ was 5%. The geometric mean (GM) minimum inhibitory concentrations (MICs) of non-bloodstream C. parapsilosis for CAS (0.555 mg/L), MFG (0.853 mg/L), FLZ (0.816 mg/L), VRZ (0.017 mg/L), ITZ (0.076 mg/L), and POZ (0.042 mg/L) were significantly higher than those of bloodstream C. parapsilosis, for which the GM MICs were 0.464, 0.745, 0.704, 0.015, 0.061, and 0.033 mg/L, respectively ($P < 0.05$). The MIC distribution of the bloodstream C.

parapsilosis strains collected from 2019 to 2020 for VRZ, POZ, and ITZ were 0.018, 0.040, and 0.073 mg/L, significantly higher than those from 2005 to 2018, which were 0.013, 0.028, and 0.052 mg/L ($P < 0.05$). Additionally, MIC distributions of C. parapsilosis with FLZ and the distributions of C. orthopsilosis with ITZ and POZ might be higher than those in Clinical and Laboratory Standards Institute studies. Furthermore, a total of 143 C. parapsilosis complex isolates showed great susceptibility to ISA. Overall, antifungal treatment of the non-bloodstream C. parapsilosis complex isolates should be managed and improved. The clinicians are suggested to pay more attention on azoles usage for the C. parapsilosis complex isolates. In addition, establishing the epidemiological cutoff values (ECVs) for azoles used in Eastern China may offer better guidance for clinical treatments. Although ISA acts on the same target as other azoles, it may be used as an alternative therapy for cases caused by FLZ- or VRZ-resistant C. parapsilosis complex strains.

Synergistic activity and biofilm formation effect of colistin combined with PFK-158 against colistin-resistant Gram-negative bacteria

Liqiong Chen[1]、Kaihang Yu[2]、Lijiang Chen[1]、Xiangkuo Zheng[1]、Na Huang[1]、Yishuai Lin[2]、Huaiyu Jia[1]、Wenli Liao[1]、Jianming Cao[2]、Tieli Zhou[1]

1. Department of Clinical Laboratory, the First Affiliated Hospital of Wenzhou Medical University, Wenzhou, Zhejiang province, China

2. 温州医科大学

Purpose The emergence of colistin resistance among Gram-negative bacteria (GNB) poses a serious public health threat. Therefore, it is necessary to enhance the antibacterial activity of colistin through the combination with other drugs. In this study, we demonstrated the synergistic activity and the possible synergy mechanism of colistin with PFK-158 against colistin-resistant GNB, including non-fermenting bacteria and *Enterobacteriaceae*.

Method 31 colistin-resistant GNB, including *Pseudomonas aeruginosa* (n = 9), *Acinetobacteri baumanni* (n = 5), *Escherichia coli* (n = 8) and *Klebsiella pneumoniae* (n = 9), were collected as the experimental strains and the minimum inhibitory concentrations (MICs) of colistin, other routine antimicrobial agents and PFK-158 against all strains were determined by the broth microdilution method. The synergistic activity of colistin with PFK-158 was assessed by the checkerboard assay and time-kill assay. The biofilm formation assay and scanning electron microscopy were used to demonstrate the biofilm formation effect of colistin with PFK-158 against colistin-resistant GNB.

Results The results of the checkerboard assay showed that when colistin was used in combination with PFK-158, synergistic activity was observed against the 31 colistin-resistant GNB. The time-kill assay presented a significant killing activity of colistin with PFK-158 against the 9 colistin-resistant GNB selected randomly, including *Pseudomonas aeruginosa* (n = 6), *Acinetobacteri baumanni* (n = 1), *Escherichia coli* (n = 1) and *Klebsiella pneumoniae* (n = 1). The biofilm formation assay and scanning electron microscopy showed that colistin with PFK-158 can effectively suppress the formations of biofilms and reduce the cell arrangement density of biofilms against most experimented strains.

Conclusion The results of the performed experiments suggest that the combination of colistin and PFK-158 may be a potential new choice as a new antibiofilm group for the treatment of infections caused by the colistin-resistant GNB.

PO-1113

Clinical Study of Innovative Antifungal susceptibility Test

Yehuan Zheng[1]、Guangyu Fu[1]、Yi Zhang[2]、Yi Li[3]
1. Zhengzhou Autobio Diagnostics Co., Ltd.
2. 郑州市中心医院
3. 河南省人民医院

Introduction With the aging of the population and the improvement of organ transplantation and anti-tumor treatment, Candida infection may become one of the main factors threatening the health of susceptible people. The non-standard application of antifungal drugs has led to an increase in drug-resistant strains.
Aim To evaluate the clinical accuracy Innovative Antifungal susceptibility Test.
Methodology A total of 218 strains of Candida were isolated from Henan Provincial People's Hospital and Zhengzhou Central Hospital from April 2019 to September 2019. Ten antifungal drugs are tested respectively by Autobio Fungal Antimicrobial Susceptibility Test and broth microdilution method. Minimum Inhibitory Concentration (MIC) value of Essential Agreement (EA) and Categorical Agreement (CA) are applied for analysis and result interpretation.
Results For 10 of antifungal drugs, Minimum Inhibitory Concentration (MIC) value of Essential Agreement (EA) between Fungal Antimicrobial Susceptibility Test and Broth Micordilution Method is 98.81% (95.41% - 99.54%). CA of Anidulafungin (ANI) is 98.10%; CA of Caspofungin (CAS) is 95.73%; CA of Micafungin (MIF) is 97.63%; CA of Amphotericin B (AMB) is 98.56%; CA of Itraconazole (ITR) is 94.71%; CA of Fluconazole (FLU) is 97.01%; CA of Voriconazole (VOR) is 99.44%; CA of Posaconazole (POS) is 97.05%.
Conclusion Autobio Fungal Antimicrobial Susceptibility Test generates accuracy and reliable Minimum Inhibitory Concentration (MIC) value and in vitro sensitivity, which can fully meet the requirements of clinical and laboratory.

PO-1114

Update on laboratory detection methods for brucellosis

Fengfeng Zhao
Department of Clinical Laboratory of Zhongda Hospital, Southeast University

Obejective The persistent worldwide prevalence of human brucellosis causes serious public health concerns and economic loss to communities. The multisystem involvement and the protean and unusual clinical presentations of the disease pose significant diagnostic challenges. The clinical features are non-specific and can overlap with a wide spectrum of other infectious and non-infectious diseases, leading to brucellosis being labelled the 'disease of mistakes'. Protracted chronicity and serious complications can result and mislead physicians onto a path of costly laboratory and radiological investigations.
Medthod To reach a diagnosis clinicians must use a wide range of non-specific routine haematological and biochemical tests in addition to Brucella-specific assays. The latter are microbiological (culture), serological (e.g. slide or tube agglutination, Coombs test, immunocapture agglutination, Brucellacapt, immunochromatographic lateral flow, enzyme-linked immunosorbent assays and the indirect fluorescent antibody test) and molecular (e.g. polymerase chain reaction (PCR) and real-time PCR).
Results Each of these tests has advantages and limitations, and thus requires careful interpretation. Since brucellosis can have several presentations and phases(acute, subacute, chronic, relapsed, active and inactive), the search for reliable, discriminatory diagnostic and prognostic markers, especially for monitoring disease evolution, are ongoing.
Conclusion Although much progress has been made, further challenges remain to the accurate diagnosis of this historic but still common global zoonotic disease.

PO-1115

Alifax HB&L 微生物培养联合质谱技术快速鉴定血培养阳性菌的方法学研究

李晓杰
中山大学附属第三医院

目的 建立 Alifax HB&L 微生物培养联合质谱技术（MALDI-TOF MS）达到快速增菌鉴定血培养阳性菌的方法并评估其符合率。
方法 收集 2019 年 8 月～2020 年 1 月中山大学附属第三医院 Versa TREK 全自动快速微生物培养系统报阳性的血培养标本 101 例，从血培养瓶中提取内容物到 Alifax HB&L 微生物培养仪配套的体液培养基中，放进 Alifax HB&L 微生物培养仪中进行增菌培养。Alifax HB&L 微生物培养仪报阳，采用 MALDI-TOF MS 技术对待测菌株进行快速鉴定；同时采用常规实验室鉴定流程对待测菌进行转种培养及鉴定，比较两者之间的鉴定符合率。
结果 101 例血培养标本中，有 98 例单菌株血液感染，其中有 84 例（85.7%）鉴定正确，无准确鉴定结果的有 6 例（6.1%），鉴定不出的有 7 例（7.1%），错误鉴定的有 1 例。1 例两种菌株混合感染，两种菌株均鉴定至“种”水平。有 2 例鉴定结果与镜检结果不相符；Alifax HB&L 微生物培养联合 MALDI-TOF MS 较常规法用时缩短约 629 分钟，其中革兰阴性菌采用该方法鉴定菌种更具有优势，能缩短的培养鉴定时间更多。
结论 血培养阳性菌快速培养鉴定技术较常规培养方法快速、操作步骤简单，单一菌种鉴定结果准确，对革兰阴性菌的鉴定符合率高，可大幅缩短培养鉴定时间。

PO-1116

耐碳青霉烯类肺炎克雷伯菌的耐药基因及消毒剂的研究

谢屿平、曹颖平
福建医科大学附属协和医院

目的 分析福建医科大学附属协和医院 2014 年-2015 年收集的耐碳青霉烯类肺炎克雷伯菌（CR-KP）的耐药基因及消毒剂基因，为 CR-KP 的流行与传播提供实验室依据，并指导临床科学用药与消毒。
方法 通过 PCR 及测序法检测 CR-KP 碳青霉烯酶基因，并进行多位点序列分型（MLST），采用 PCR 扩增耐消毒剂基因，采用微量肉汤稀释法检测常用耐消毒剂的最低抑菌浓度（MIC）。
结果 对 101 株耐碳青霉烯类肺炎克雷伯菌进行碳青霉烯酶基因的检测发现，KPC-2 检出率最高，阳性率为 67.3%（68/101）；其次为 IMP-4 基因占 5.0%（5/101）；NDM-1 阳性率为 1.0%（1/101），其中有 1 株 CR-KP 同时携带 KPC-2 和 NDM-1 基因。101 株 CR-KP 中未发现 SME、GES、IMI、VIM、SIM、GIM、SPM 和 OXA-48。在 MLST 的检测结果中，68 株产 KPC-2 酶的肺炎克雷伯菌均为 ST11；在 5 株产 IMP-4 的肺炎克雷伯菌中，3 株为 ST26，2[1]株为 ST334。耐消毒剂基因检测结果中，检出 qacE△1 95 株(94.1%)， qacF/H/I 53 株（52.5%）,qacC 34 株（33.7%）,qacE 2 株（2.0%）。
结论 本院临床分离的 CR-KP 耐药基因主要是 KPC-2 和 IMP-4 基因。耐消毒剂基因的高检出率可能使菌株对消毒剂产生抗性，需引起临床重视。

PO-1117

2016-2019 年南疆三地州铜绿假单胞菌耐药性监测

热那古·艾山、玛依拉·阿布都热依木、党楠
喀什地区第二人民医院

目的 了解 2016 年 2019 年南疆三地州临床上铜绿假单胞菌的分布及耐药变迁，为临床合理使用抗生素提供依据。
方法 通过全自动细菌鉴定分析仪 VITEK-2 compact 和 VITEK-MS 对临床分离株进行菌株鉴定并进行药敏试验，K-B 纸片法做补充。
结果 4 年间共检出铜绿假单胞菌 2131 株，占全部标本检测总阳性率的 5%（2131/39767），占革兰阴性杆菌的 7.9% (2131/26964)。4 年来铜绿假单胞菌分离率位于革兰阴性菌的第四位，以痰标本为主，约占 61.9%，其次为尿标本，约为 11.4%。对铜绿假单胞菌有较高活性的抗生素包括头孢哌酮/舒巴坦、哌拉西林/他唑巴坦、头孢他啶、头孢吡肟、阿米卡星、庆大霉素 、环丙沙星、左旋氧氟沙星敏感率均大于 82%。
结论 铜绿假单胞菌已成为临床最常见的致病菌之一， 南疆三地州检出的铜绿假单胞菌耐药情况十分严峻，为了提高抗菌药物的治疗效果，应连续监测本地区的抗菌药物的耐药情况，根据药敏结果合理选用抗菌药物。

PO-1118

A Real-time Duplex Reverse Transcription Multienzyme Isothermal Rapid Amplification Assay for Detecting Severe Acute Respiratory Syndrome Coronavirus2 (SARS-CoV-2)

Jin Li
Department of Clinical Laboratory Medicine, Institute of Surgery Research, Daping Hospital, Army Medical University

Until now, there is still no effective cure for coronavirus disease 2019 (COVID-19) caused by severe acute respiratory syndrome coronavirus2 (SARS-CoV-2). A rapid and simple method is necessary for testing suspected specimens and screening population. In order to better monitor sample effectiveness, this study describes a method to detect nucleocapsid protein gene (N gene) of SARS-CoV-2 and human ACTB gene employing a real-time duplex reverse transcription multienzyme isothermal rapid amplification (RT-MIRA) assay. Cross-reactions were not observed to other pathogens and the detection limit was 100 copies/reaction. Using simulated clinical samples to further test established assay and the amplification process can be completed within 20 min at 42℃. The above results showed that the real-time duplex RT-MIRA assay is expected to be further optimized and evaluated in the detection of SARS-CoV-2 confirmed cases.

PO-1119

MALDI-TOF MS 快速检测耐甲氧西林金黄色葡萄球菌的方法研究

唐克文、汤冬玲、汪倩钰、李从荣
武汉大学人民医院

目的 评价基质辅助激光解吸电离飞行时间质谱（Matrix-assisted laser desorption ionization time-of-flight mass spectrometry，MALDI-TOF MS）快速检测 MRSA 的应用价值，寻找辨别 MRSA 和 MSSA 的质谱特征峰。

方法 收集 2018 年 4 月至 2019 年 6 月自武汉大学人民医院临床患者分离的 214 株金黄色葡萄球菌作为实验菌株，采用头孢西丁纸片扩散法和 mecA 基因检测法区分 MRSA 和 MSSA 菌株。利用 MALDI-TOF MS 采集菌株蛋白指纹图谱，采用三种分组方式分别结合 ClinProTool 软件中遗传算法（Genetic Algorithm，GA）、监督神经网络算法（Supervised Neural Network algorithm，SNN）和快速分类算法（Quick Classification algorithm，QC）建立 MRSA 快速检测模型，利用软件进行峰值统计和计算，获得辨别 MRSA 和 MSSA 的特征峰并优化模型，同时验证模型对 MRSA 的检测效果。

结果 三种分组方式分别结合三种机器学习算法共获得九个基于 MALDI-TOF MS 的 MRSA 检测模型，其中 GA 算法获得最高交叉验证值和识别能力值，分别为 95.82%、98.13%。分析九个基础模型共获得 3 056m/z、4 322m/z 等九个特征峰，采用九个特征峰结合 GA 算法优化模型，最终优化模型交叉验证值由 95.82％增加为 96.68％。经验证，最终优化模型的特异性由 90.00％提高到 98.33％，准确性由 88.89％提高到 91.98％。

结论 MALDI-TOF MS 与机器学习算法的结合是一种高效而客观的分类工具，可应用于 MRSA 的快速筛查且具有很高的检测性能，与常规药物敏感实验相比具有快速、低成本等明显优势。

PO-1120

某院 4 年引起血流感染的念珠菌分布与阳性报警时间的应用分析

曹敬荣、王岩、陈典典、谢威、李文军、段园园、刘云屹、闵嵘、王培昌
首都医科大学宣武医院

目的 了解引起血流感染的念珠菌的分布及阳性报警时间（TTP）特点，为临床及早抗真菌治疗提供依据。

方法 Whonet5.6 软件回顾性分析某院 4 年血培养分离的念珠菌的菌种分布等临床资料，分析不同念珠菌的 TTP 特点。

结果 4 年间共收到血培养 45466 瓶，真菌阳性报警 226 瓶，阳性检出率为 0.51%，其中单一菌阳性 218 瓶，复数菌 8 瓶；患者年龄 26-92 岁（平均 64.67±16.03 岁），≥60 岁者占 70.33%（64/91），男女比例 2.6:1；共分离出念珠菌 234 株，以白念珠菌（39.74%，93/234）、热带念珠菌（26.50%,62/234）、近平滑念珠菌（22.22%，52/234）和光滑念珠菌（8.97%,21/234）为主。所有念珠菌的平均 TTP 为 36.9±18.04h，其中热带念珠菌 TTP 最短（25.85±12.00h），显著短于近平滑念珠菌（34.27±13.50h）、白念珠菌（41.14±17.80h）和光滑念珠菌的 TTP 53.26±24.90h（t=3.76，p=0.025）；不同念珠菌在性别、年龄及各科室的构成比均有显著差异，在外科和外科 ICU 的分离率显著高于内科和内科 ICU（x2=19.14、4.66，p=0.03,0.025）；4 年中各念珠菌构成比由白念珠菌为主变迁为非白念珠菌为主；热带念珠菌在 24h 内报警阳性占 50.0%，其 TTP 明显短于其它念珠菌（x2=16.80，p=0.03），近平滑念珠菌和热带念珠菌＞90%菌株在 48h 内报警阳性，而光滑念珠菌则在≥72h 报警阳性占 33.33%，TTP 显著长于其它念珠菌（x2=6.42，p=0.02）。

结论 我院念珠菌血流感染病原菌构成比中非白念珠菌增加，TTP 对初步判断血培养念珠菌菌种有一定的提示意义，对及早正确的抗真菌治疗尤为重要。

The response of PD-1–based immunotherapy for non-small cell lung cancer altering by gut microbiome

Daqiang He[1]、Xing Li[2]、Rui An[1]、Lihong Wang[2]、Yun Wang[2]、Mingfeng Jiang[2]、Xueqin Chen[2]、Xianjun Wang[1]
1. Affiliated Hangzhou First People's Hospital, Zhejiang University School of Medicine
2. 浙江大学医学院附属杭州市肿瘤医院

Purpose To identify a group that has specific effects of gut microbiome on PD-1 based immunotherapy for non-small cell lung cancer (NSCLC).
Methods We performed a study on patients with advanced NSCLC who received PD-1 mAb 6 months after one or several prior therapies, and we combined blood immune-related factors of the participants and fecal 16s rRNA sequencing at baseline to investigate the diversity and composition of the gut microbiota. We also compare the differences in relative abundancies at the genus level of gut microbiome, and we used spearman rank correlation coefficient analysis of genus abundance in relation to blood immune-related factors.
Results 16s rRNA sequencing showed that a clear difference between the bacterial community diversity and compositions of stable disease (SD) and disease progression (PD) patients. Comparison of the differences in relative abundances at the genus level showed that Escberichia-Shlgella, Akermansia and Olsenella in SD groups were significantly higher compared to the PD group. SD groups had significantly higher IL-12 and INF-γ than those in the PD groups. Interestingly, numbers of white blood cells as well as sorted cells in SD groups were higher than those in the PD groups. Spearman rank correlation coefficient analysis showed that Escberichia-Shlgella was positively correlated with IL-12，INF-γ and BASO. Akermansia was positively correlated with monocytes.
Conclusions The response of PD-1–based immunotherapy for NSCLC altering by gut microbiome diversity and composition. Escberichia-Shlgella and Akermansia may have specific effects on PD-1 inhibitory immunotherapy for NSCLC.

PO-1122

基质辅助激光解吸电离飞行时间质谱技术对分枝杆菌液体培养系统菌种鉴定的临床研究

杜岩青
天津市海河医院

目的 应用基质辅助激光解吸电离飞行时间质谱(matrix assisted laser desorption ionization time of flight mass spectrometry，MALDI-TOF MS)对 BactecTM MGITTM 960 液体培养出的阳性培养物进行高通量、快速、准确的菌种鉴定，为临床早期、精准治疗提供病原学依据。
方法 选取我院 BactecTM MGITTM 960 分枝杆菌快速液体培养的阳性培养物为研究对象，通过不同的孵育时间、不同大小的研磨珠处理、不同的破壁方式摸索出 MALDI-TOF MS 对 BactecTM MGITTM 960 阳性培养物鉴定的“最优处理方法”，并将所有结果与基因芯片法菌种鉴定做参照进行比对，鉴定不一致的结果通过基因测序确认。
结果 BactecTM MGITTM 960 液体培养报阳性后增加孵育时间可提高检出率及鉴定分值，同时使用 0.5mm 的氧化锆珠研磨，使用超声震荡混匀处理，鉴定效果最佳。鉴定结果方面，液体系统报阳

的 420 份阳性标本，基因芯片法鉴定结果为结核分枝杆菌占 69.05%(290/420)，非结核菌占 28.81%(121/420)，9 例未鉴定出，未鉴定占 2.14%（9/420），错误鉴定占 0.95%（4/420），总鉴定率为 97.86%（411/420）；采用 MALDI-TOF MS 质谱鉴定 420 份阳性标本中鉴定出 419 例，其中结核分枝杆菌占 69.05%(290/420)，非结核占 30.00%(126/420)，星型奴卡菌 0.48%（2/420），巴西奴卡菌占 0.24%（1/420），1 例未鉴定出，总鉴定率为 99.76%。两种方法比较 p 值>0.05 没有统计学意义。

结论 质谱做为高通量的微生物鉴定手段对实验室工作起到了一个巨大的推动作用，广泛应用能助力结核病的快速诊断。

PO-1123

MALDI-TOF MS 自建数据库对丝状真菌临床分离株鉴定能力的评估

李颖、曹敬荣、王培昌
首都医科大学宣武医院

目的 评估 MALDI-TOF MS 自建数据库对丝状真菌临床分离株的鉴定能力。

方法 分子测序技术明确 41 株拟建库丝状真菌的种属信息；采用标准提取法分别对拟建库菌株幼稚菌落和成熟菌落进行 MALDI-TOF MS 自建数据库处理；另采用 236 株丝状真菌临床分离株评估该自建数据库的鉴定能力。

结果 41 株建库丝状真菌分属于 10 属 25 种；自建数据库包含 82 张参考质谱峰图。采用 MALDI-TOF MS 自建数据库可将评估菌株种水平鉴定率由商业数据库的 29.2% (69/236) 提升至 67.5% (159/236) ；将自建数据库与商业数据库联合后，评估菌株种水平鉴定率为 76.3% (180/236) 且无错误鉴定情况。与形态学方法相比，MALDI-TOF MS 自建数据库对临床常见曲霉分离株的鉴定无优势，对于曲霉少见种和非曲霉丝状真菌，其种水平鉴定率为 61.8% (34/55)，显著优于形态学方法 (16.4%，9/55)。

结论 MALDI-TOF MS 自建数据库有助于提高实验室丝状真菌鉴定能力，在形态学方法鉴定困难的少见丝状真菌鉴定方面其作用更为显著。

PO-1124

分枝杆菌快速诊断实验室方案-大数据回顾性研究

彭静、汪峰、孙自镛
华中科技大学同济医学院附属同济医院

背景 肺结核（PTB）的及时准确诊断仍是临床实践的一大难题。本研究旨在建立一种在真实环境下优化的 PTB 快速诊断策略。

方法 回顾性分析同济医学院附属同济医院 28171 例疑似 PTB 的成人住院患者的病历资料。支气管肺泡灌洗液（BALF）和/或痰用于抗酸杆菌（AFB）涂片、Xpert MTB/RIF（Xpert）检测和培养，外周血单个核细胞（PBMC）用于 T-SPOT.TB 检测。以分枝杆菌培养阳性作为参考标准，我们分析了标本类型对检测结果的影响，分析了诊断 PTB 所需的涂片次数，并评价上述检测方法单独或联合检测诊断 PTB 和非结核分枝杆菌（NTM）感染的能力。

结果 痰和 BALF 在 AFB 涂片或 Xpert 检测中具有中等至较高的一致性，BALF 的阳性检出率较高。3-4 次涂片的敏感性高于 1-2 次涂片。同时联合应用 AFB 和 Xpert 可将 44/51 例 AFB+/Xpert+和 6/7 例 AFB+/Xpert-分别正确诊断为 PTB 和 NTM 感染。当与 AFB/Xpert 序贯联合使用时，T-Spot 在 AFB+或 Xpert+的患者中作用有限。对于 AFB-/Xpert-患者，T-SPOTMDC（厂家给定的阳性判断值）显示高的阴性预测值（99.1%）和次佳敏感性（74.4%），而 TBAg/PHA（结核分枝杆菌特

异性抗原与植物血凝素斑点形成细胞的比值，一种改进的计算 T-SPOT.TB 检测结果的方法）≥0.3 显示高的特异性高（95.7%）和相对较低的敏感性（16.3%）。
结论 在结核高负担的真实环境中，同时对痰和/或 BALF 进行 AFB 涂片（至少 3 次）和 Xpert 检测有助于快速诊断 PTB 和 NTM 感染。如果可以，BALF 是 AFB 涂片和 Xpert 检测的首选样本类型。此外，PBMC T-SPOTMDC 和 TBAg/PHA 比值对 AFB-/Xpert-患者的 PTB 诊断具有辅助作用（分别具有中度排除 PTB 和判定 PTB 的作用）。

PO-1125

Comprehensive pathogen identification, antibiotic resistance and virulence genes prediction directly from simulated blood samples and positive blood cultures by Nanopore metagenomic sequencing

Menglan Zhou、Qiwen Yang、Yingchun Xu
Peking Union Medical College Hospital

Bloodstream infection is a major cause of morbidity and mortality worldwide. We explored whether MinION Nanopore sequencing could accelerate diagnosis, resistance and virulence profiling prediction in simulated blood samples and blood cultures. One milliliter of healthy blood samples from direct spike (sample 1), anaerobic (sample 2) and aerobic (sample 3) blood culture with initial inoculation of ~30 CFU/ml of a clinically isolated Klebsiella pneumoniae strain, were subjected to DNA extraction and Nanopore sequencing. Hybrid assembly of Illumina and Nanopore reads from pure colonies of the isolate (sample 4) was used as a reference for comparison. Hybrid assembly of the reference genome identified a total of 39 antibiotic resistance genes and 77 virulence genes through alignment with the CARD and VFDB database. Nanopore correctly detected K. pneumoniae in all three blood samples. Fastest identification was achieved within 8h from specimen to result in sample 1 without blood culture. However, direct sequencing in sample 1 only identified seven resistance genes (20.6%) but 28 genes in sample 2-4 (82.4%) compared to reference within 2h sequencing time. Similarly, 11 (14.3%) and 74 (96.1%) of the virulence genes were detected in sample 1 and sample 2-4 within 2h sequencing time, respectively. Direct Nanopore sequencing from positive blood cultures allowed comprehensive pathogen identification, resistance and virulence genes prediction within 2h which is promising to be used in point-of-care clinical settings.

PO-1126

临床常见四种曲霉菌的分子检测方法的建立及其临床验证

许婉怡、杨洋、张磊、陈敬贤
广州金域医学检验中心

各种曲霉菌一直是免疫低下病人出现致死性感染的重要病原体。 高危人群包括长期粒细胞减少、造血干细胞移植、实体器官移植、先天或后天免疫缺陷、糖皮质激素使用者等。曲霉感染主要有侵袭性曲霉病、多种慢性曲霉病以及过敏性曲霉病三种临床类型，它们的实验诊断方法包括真菌培养、抗原检测（G 试验）、分子诊断、组织病理。由于侵袭性曲霉病病情进展快，给诊断只留取狭窄的时间窗。因此快速、准确、敏感的分子检测方法为临床所需要。不同曲霉菌对抗真菌药物的敏感性不尽相同，譬如临床最常见的烟曲霉近年来对唑类抗真菌药物耐药的报道不断增加，而土曲霉对各种二性霉素制剂均不敏感。因此我们在建立了能够检出各种曲霉菌的泛曲霉分子检测法以后，进一步研发了临床常见的四种曲霉菌（烟曲霉、黄曲霉、黑曲霉和土曲霉）各自的分子检测方法。

它们均为基于 Taqman 探针的实时荧光 PCR 方法，反应条件一致，因此可以选择几种同时应用，以便一次采样一次鉴定到菌种。泛曲霉检测法的线性范围 10^3～10^8 拷贝/微升（最小检测浓度 1000 拷贝/微升）。烟曲霉，黄曲霉，黑曲霉，土曲霉分子检测方法的线性范围在 10^2～10^8 拷贝/微升（最小检测浓度 100～1000 拷贝/微升）。干扰实验表明，B 族链球菌、肺炎链球菌、化脓链球菌、卡他链球菌、表皮葡萄球菌、金葡、肺炎克雷伯菌、铜绿假单胞菌、百日咳杆菌、D 群沙门氏菌、白念、光滑念、近平滑念、结核杆菌、烟曲霉、黄曲霉、黑曲霉、土曲霉，以及腺病毒、鼻病毒、副流感病毒、呼吸道合胞病毒对这几个曲霉菌的实时荧光 PCR 都没有干扰。这些检测方法的临床验证正在进行之中。

PO-1127

1976 例 β-半乳甘露聚糖和 2012 例曲霉菌抗原结果分析

陈振朋、张维
西安金域医学检验所有限公司

目的 β-半乳甘露聚糖（G 试验）和曲霉菌抗原（GM 试验）作为真菌早期感染的血清学标志，在真菌早期感染的筛查中，有着重要的应用价值。
方法 统计了陕西省的 2012 例曲霉菌抗原和 1976 例 β-半乳甘露聚糖的病人检测结果。曲霉菌抗原使用竞争法检测，β-半乳甘露聚糖使用显色法检测，所用试剂由丹娜生物提供。并对以上统计结果进行分类分析。
结果 2012 例曲霉菌抗原结果，阳性结果为 408 例，占比为 20.3%；1976 例 β-半乳甘露聚糖，阳性结果 304 例，占比 15.4%。同时送检曲霉菌抗原和 β-半乳甘露聚糖的病人为 508 例，曲霉菌抗原结果阳性、β-半乳甘露聚糖阴性者 72 例，占比 14.2%，曲霉菌抗原结果阴性、β-半乳甘露聚糖阳性者 56 例，占比 11%，两项试验均阳性者 32 例，占比 6.3%。
结论 血清中的 β-半乳甘露聚糖在某些侵袭性真菌感染时升高，尤其是对念珠菌血症，是首选的筛查指标；半乳甘露聚糖（GM）从薄弱的菌丝顶端释放，曲霉菌感染的患者血液内存在 GM，而且常于临床症状和影像学出现异常之前数日出现。因此，GM 试验可用于曲霉菌感染的早期诊断的筛查指标。两个相试验同时进行，有助于进一步明确感染类型：G 试验阳性、GM 试验阳性：曲霉菌和青霉感染；G 试验阳性、GM 试验阴性：排除 GM 假阴性后，念珠菌，镰刀菌属；G 试验阴性、GM 试验阳性：排除 G 试验假阴性后，隐球菌属感染。

PO-1128

Multilocus Sequence Typing Reveals Clonality of Fluconazole-Nonsusceptible Candida tropicalis: A Study From Wuhan to the Global

Qianyu Wang
Renmin Hospital of Wuhan University

Candida tropicalis is a globally distributed human pathogenic yeast, and its increasing resistance to azoles makes clinical treatment difficult. In this study, we investigated the clinical features, azole resistance and genetic relatedness of 87 C. tropicalis isolates from central China and combined with the global database to explore the relationship between genetic information and fluconazole susceptibility. Of the 55 diploid sequence types (DSTs) identified by multilocus sequence typing (MLST), 27 DSTs were new to the C. tropicalis MLST database. Fluconazole-nonsusceptible (FNS) isolates were genetically closely related. goeBURST analysis showed that DST225, DST376, DST506, and DST546 formed a distinct and unique FNS clonal complex (CC) in Wuhan. The local FNS CC belongs to the large FNS CC (CC2) in China, in which the putative

founder DST225 has been reported from the environment. The three most prevalent types (DST506, DST525, and DST546) in Wuhan had high minimum inhibitory concentrations (MICs) for antifungal azoles, and the six possible nosocomial transmissions we captured were all FNS strains, most of which were from CC2. Unique FNS CCs have been found in Singapore (CC8) and India (CC17) and are close to China's CC2 in the minimum spanning tree. There were no FNS CCs outside Asia. This study is the first to reveal a significant correlation between genetic information and fluconazole susceptibility worldwide and to trace geographical locations, which is of great value for molecular epidemiological surveillance and azole-resistance study of C. tropicalis globally.

PO-1129

三叶青提取物 TH-w3 对金黄色葡萄球菌微生物膜的抑制和清除作用

孙丹[1]、翁远珍[2,3]、祝宇翀[2]、刘军权[2,3]、单宇[2]
1. 乔司街道社区卫生服务中心
2. 杭州金域医学检验所有限公司
3. 杭州下城区中西医结合医院

探究三叶青提取物 TH-w3 对金黄色葡萄球菌微生物膜形成的抑制和清除作用。**方法** 从本实验室临床分离培养并保存的 300 株金黄色葡萄球菌中选取各 20 株成膜能力阳性的 MRSA 和 MSSA 菌株，菌落计数法绘制金黄色葡萄球菌生物膜形成曲线，二倍稀释法肉眼观察加吸光度检测测定最小抑菌浓度，结晶紫法研究三叶青提取物 TH-w3 对金黄色葡萄球菌生物膜的抑制及清除作用。**结果** 有 MRSA 菌株 202 株（67.3%），MRSA 菌株成膜阳性率 60.9%，有 MSSA 菌株 98 株（32.7%），MSSA 菌株成膜阳性率 20.4%，两者差异比较有统计学意义；三叶青提取物 TH-w3 对"MRSA(+)组"和"MSSA(+)组"菌株的 MIC 均为 8.00μg/mL；三叶青提取物 TH-w3 对"MRSA(+)组"和"MSSA(+)组"菌株生物膜的抑制和清除作用均具有浓度依赖性，在 2MIC 浓度下抑制率和清除率最高，可达 90%以上。**结论** 三叶青提取物 TH-w3 对金黄色葡萄球菌微生物膜有一定的抑制和清除作用，有重要的研究开发和临床应用价值。

PO-1130

恶性肿瘤患者合并胆道感染的病原菌分布和耐药性分析

张秀色
天津医科大学肿瘤医院

目的 分析 2010-2017 年恶性肿瘤患者胆汁中分离病原菌的分布及耐药性，为临床合理应用抗生素提供帮助。
方法 细菌、真菌鉴定及细菌药敏试验均采用 Vitek2-Compact 系统，真菌药敏试验采用 ATB FUNGUS 试剂盒，采用 Whonet 5.6 软件对数据进行统计分析。
结果 2010-2017 年 678 份胆汁培养阳性标本共分离出 80 种 1079 株病原菌。胆道感染患者主要分布于肝胆肿瘤科（223，47.1%）、胰腺肿瘤科（103，21.8%）、介入治疗科（73，15.4%）、生物治疗科（22，4.7%）和消化肿瘤内科（17，3.6%）。革兰阴性菌、革兰阳性菌和酵母菌的构成比为 48.6%（524/1079）、44.5%（480/1079）、6.9%（75/1079）。革兰阳性菌对万古霉素、替加环素、利奈唑胺高度敏感。凝固酶阴性葡萄球菌（CNS）和金黄色葡萄球菌耐甲氧西林（MRCNS 和 MRSA）分别占 47.6%和 33.3%。大肠埃希菌和肺炎克雷伯菌产 ESBLs 率分别为 46%和 24.8%。革兰阴性菌对碳青霉烯类、阿米卡星及哌拉西林/他唑巴坦高度敏感。所有真菌对常用抗真菌药物的耐药率均较低。

结论 恶性肿瘤患者胆汁中分离的病原菌种类复杂，定期进行耐药性分析能够为临床合理使用抗生素提供帮助。

PO-1131

中国西部人群 7p21.3 基因座的遗传多态性与肺结核合并肺外结核的进展相关性分析

刘国烨[1]、梁渊[3]、王茜[1]、董惠霞[1]、汪强虎[3]、严虹[2]
1. 南京医科大学附属脑科医院
2. 南京医科大学第二附属医院
3. 南京医科大学

背景 结核病（TB）仍然是主要的公共卫生问题。众所周知，肺结核合并肺外结核（PTB＆EPTB）会增加临床诊疗的难度。在这项研究中，我们探索了新的遗传基因位点促进 PTB＆EPTB 的易感。
方法 本研究纳入了中国西部汉族人群的 900 TB 患者和 1,534 名健康个体。在 900 例 TB 中，有 657 例仅肺结核（PTB），93 例仅肺外结核（EPTB）和 150 例 PTB 合并 EPTB（PTB＆EPTB）。在我们的研究中还收集了实验室指标。总共通过数据库 1000 Genomes Project 和软件 Haploview V4.2 选择了三个单核苷酸多态性（SNP）（rs12333784，rs6463794 和 rs720964），并通过定制的 2×48-Plex SNPscan™试剂盒进行了基因分型。
结果 我们观察到 rs12333784 的次要等位基因型（G 携带者）使 PTB 和 EPTB 发生的风险增加（pBonferroni = 0.03878），并且在显性模型分析下观察到了类似但更显着的影响（pBonferroni = 0.013，OR = 1.349），95％CI = 1.065-1.709）。我们发现具有 rs12333784 GG + GA 基因型（在显性模型中）的患者与葡萄糖（GLU）（P = 0.03），γ-谷氨酰转移酶（GGT）相关（p = 0.05 ）和红细胞沉降率（ESR）（P = 0.05）实验室指标显著相关。
结论 我们的发现初步探究了一个新的 7p21.3 基因座，该基因座可促进 PTB 和 EPTB 的进展，并提示 AC007128.1 基因是 7p21.3 基因座的功能靶标。

PO-1132

二氧化碳嗜纤维菌引起的血流感染两例

许晶晶
徐州医科大学附属医院

二氧化碳嗜纤维菌引起血流感染的相关报道国内比较少见。它属隶属于黄杆菌科，为兼性厌氧无动力的革兰阴性杆菌。它也是人口腔里的正常菌群，经常分离自成人牙周病患者。二氧化碳嗜纤维菌已经被报道可引起免疫功能正常或低下（尤指中性粒细胞缺乏）患者败血症及其他内源性的感染（心内膜炎、子宫内膜炎，腹膜炎，骨髓炎等等）。该类菌能够抑制中性粒细胞趋化和淋巴细胞增殖。2020 年 11 月份，我院微生物室从两位血液病患者血培养中分别分离出两株二氧化碳嗜纤维菌。

二氧化碳嗜纤维菌属的细菌通常对广谱头孢菌素类。碳青霉烯类、克林霉素、大环内酯类、四环素和氟喹诺酮类抗菌药物敏感，但是对氨基糖苷类耐药，有时候可检出多重耐药菌株。虽然二氧化碳嗜纤维菌为人类口腔正常菌群，一般不致病，但分离自无菌体液和血液时可能有临床意义，临床医生可结合患者情况和临床资料综合分析，合理选择抗生素。

PO-1133

mNGS 在沙门氏菌感染中的临床应用研究

赵倩雯
南方医科大学珠江医院

背景 临床上常用的传统的检测沙门氏菌感染的检测技术多是进行粪便或血液的培养，培养出可疑病原体后再进行细菌鉴定的药敏检测，至少需要花费 2-3 天的时间。而且血培养的阳性率还很低，对于一些疑难危重症病人来说，时间就是生命，较长的检测时间会贻误患者的病情和临床诊疗，也不一定能得到相应的阳性结果。现如今 mNGS 已经逐渐在临床上广泛应用，其检测时间短，敏感性高，有较高的阳性率，具有广泛的临床应用前景。本研究的目的就是为了探索 mNGS 在沙门菌感染中的临床应用价值。
方法 对粪便和血液中沙门氏菌临床检测阳性的患者，收集其血浆标本，观察是否可以利用 mNGS 技术快速检测出其血浆标本中的沙门氏菌序列，提高沙门氏菌患者的诊疗效率。同时分析粪便标本沙门氏菌阳性的患者血浆标本中的阳性率。
结果 在本研究收集得到的粪便和血液标本沙门氏菌阳性患者的血浆标本中，血液培养沙门氏菌阳性的患者标本中经过 mNGS 的检测得到沙门氏菌序列的阳性率可达 85%以上。而粪便标本阳性患者的血浆标本经过 mNGS 的检测得到沙门氏菌序列的阳性率也可达 67%以上。
结论 mNGS 可成功地从沙门氏菌感染患者的标本中快速检出沙门氏菌序列，且检出阳性率较高，有望应用于急危重症和疑难感染患者中沙门氏菌感染的检测和诊断。

PO-1134

MALDI-TOF MS 鉴定马尔尼菲篮状菌的实验条件优化

刘俞谷、王艳芳
南方医科大学珠江医院

目的 构建用于质谱鉴定的马尔尼菲篮状菌数据库，并探索用于马尔尼菲篮状菌质谱鉴定的最佳培养条件和前处理方案。
方法 利用 8 株马尔尼菲篮状菌构建自建质谱库，比较不同培养基（SDA、SDB）、培养温度（28℃、35℃）、培养时间、前处理方法（甲酸乙腈法、直涂法）对谱图质量及鉴定结果准确度的影响。
结果 在 VITEK MS RUO 模式中成功构建马尔尼菲篮状菌质谱自建库。SDA 平板较 SDB 液体培养基更适合马尔尼菲篮状菌质谱鉴定，后者采集谱图中干扰峰较多。两种温度培养采集谱图的特征峰相似，但 35℃菌落的鉴定准确率略高。培养 3-5 天时的菌落鉴定准确率高于 71.4%，其中 5 天时鉴定准确率最高，为 100%。甲酸乙腈法的提取效果优于直涂法。以上最优培养条件和前处理方案，对于形态不典型的马尔尼菲篮状菌，同样适用。
结论 为提高 VITEK MS RUO 模式鉴定马尔尼菲篮状菌的准确率，较优的条件为：SDA 平板 35℃培养 3-5 天内，经甲酸乙腈法前处理可得到较高的准确率，需要更多的菌株进一步扩大数据库及评价。

PO-1135

粪便标本溶组织内阿米巴原虫 Real-Time PCR 检测方法的建立及初步评价

张春莹[1]、孟妍明[1]、刘成玉[2]、马莹[1]
1. 四川大学华西医院
2. 成都市妇女儿童中心医院

建立粪便标本溶组织内阿米巴原虫 Real-Time PCR 检测方法，并评价该方法在临床粪便标本中检测溶组织内阿米巴原虫的应用价值。基于溶组织内阿米巴原虫小亚基核糖体 RNA（SSU rRNA）基因设计特异性引物，使用 Real-Time PCR 方法对溶组织内阿米巴原虫标准株 DNA 进行扩增，建立溶组织内阿米巴原虫感染的 Real-Time PCR 技术；同时收集临床腹泻病人粪便标本 221 例，分别采用镜检法检测病原体、ELISA 方法检测原虫抗原、Real-Time PCR 法扩增粪便标本中的溶组织内阿米巴原虫 DNA，以临床诊断为判断阳性的依据，比较三种方法的检测性能。本研究成功建立粪便溶组织内阿米巴原虫 Real-Time PCR 检测方法，模板 DNA 最低检测限为 0.05 fg/uL，可用于临床腹泻患者粪便标本溶组织内阿米巴原虫检测，检测灵敏性和特异性好，而镜检法易漏检，不同方法检测临床粪便标本的结果比较中，PCR 方法最优，镜检法易漏检，本研究使用的 ELISA 试剂盒在检测我国西部地区肠道溶组织内阿米巴原虫感染时特异性低于 PCR 方法。本研究为建立临床溶组织内阿米巴原虫感染的 Real-Time PCR 检测方法提供了可靠的实验基础，同时也为临床检测其他致腹泻原虫的分子生物学检测方法提供参考。

PO-1136

Novel long noncoding RNA and LASSO prediction model to better identify pulmonary tuberculosis: A case-control study in China

Zirui Meng
West China campus of sichuan university

Introduction The insufficient understanding and misdiagnosis of clinically diagnosed pulmonary tuberculosis (PTB) without an aetiological evidence is a major problem in the diagnosis of tuberculosis (TB). This study aims to confirm the value of lncRNA n344917 in the diagnosis of PTB and construct a rapid, accurate and universal prediction model.
Methods A total of 536 patients were prospectively and consecutively recruited, including clinically diagnosed PTB, PTB with an aetiological evidence and non-TB disease controls, who were admitted to West China hospital from Dec 2014 to Dec 2017. The expression levels of lncRNA n344917 of all patients were analyzed using reverse transcriptase quantitative real-time PCR. Then, the laboratory findings, electronic health record (EHR) information and expression levels of n344917 were used to construct a prediction model though the Least Absolute Shrinkage and Selection Operator (LASSO) algorithm and multivariate logistic regression.
Results The factors of n344917, age, CT calcification, cough, TBIGRA, low-grade fever and weight loss were included in the prediction model. It had good discrimination (AUC = 0.88, cutoff = 0.657, sensitivity = 88.98%, specificity = 86.43%, positive predictive value = 85.61%, negative predictive value = 89.63%), consistency and clinical availability. It also showed a good replicability in the validation cohort. Finally, it was encapsulated as an open-source and free web-based application for clinical use and is available online at https://ziruinptb.shinyapps.io/shiny/.
Conclusions Combining the novel potential molecular biomarker n344917, laboratory and EHR variables, this web-based prediction model could serve as a user-friendly, accurate platform to improve the clinical diagnosis of PTB.

PO-1137

2014-2015 年广州 759 例儿童肠道病毒感染病原谱调查

赵崇泉
南方医科大学珠江医院

目的 调查 2014-2015 年我院 759 例儿童感染肠道病毒血清型的分布，了解广州地区肠道病毒（enterovirus, EV）病原谱。
方法 采集手足口病等疑似肠道病毒感染患儿肛拭子标本，采用荧光逆转录多聚酶联反应法(reverse transcriptase polymerase chain reaction, RT-PCR)检测通用型、EV71 型、CA16 型核酸，巢式 PCR 法扩增 VP1 基因测序分型。
结果 1 060 例疑似感染者检出 759 例 EV 阳性（检出率 71.6%）；两年均检出 11 种血清型，2014 年科萨奇病毒 A 组 16 型(Coxsackie virus A group 16，CA16)、肠道病毒 71 型（enterovirus 71, EV71）、科萨奇病毒 A 组 4 型(Coxsackie virus A group 4，CA4)、科萨奇病毒 A 组 10 型（Coxsackie virus A group 10，CA10）和科萨奇病毒 B 组 5 型（Coxsackie virus B group 5，CB5）列前五位，CA16 和 EV71 占 77.1%；2015 年科萨奇病毒 A 组 6 型（Coxsackie virus A group 6，CA6）、EV71、CA10、CA16 和科萨奇病毒 A 组 2 型（Coxsackie virus A group 2，CA2）列前五位，CA6 占 51.7%；性别比 1.8～5.3；感染以<3 岁儿童为主（60.1%，456/759）；全年均可检出，4～7 月达高峰，5 月 CA16、EV71、CA10 和 CA2 达高峰，7 月 CA6 达高峰。由于病原谱不同，2015 年病情普遍较 2014 年轻，两年均无死亡病例。EV71 感染重症病例比率最高（12.7%），CA16、CA10、CA4 和 CA6 偶见重症病例。
结论 广州主要流行十余种肠道病毒，两年病原谱不同，大部分病情较轻感染引起疾病较轻。

PO-1138

ST5-t2460-SCCmecII 型耐甲氧西林金黄色葡萄球菌与高死亡率相关

李雪寒
郑州大学第五附属医院

目的 自 2013 年以来，ST5-t2460-SCCmecII MRSA 在中国大量出现并迅速增加，而关于该型别菌株的特征及其与感染者临床预后的关系的研究也非常有限。因此，我们收集了 ST5-t2460-SCCmecII MRSA 感染者的部分临床特征，研究 ST5-t2460-SCCmecII MRSA 对感染者临床预后的影响。
方法 91 株 MRSA 来源于 2018 年 1 月至 2019 年 12 月期间于武汉大学中南医院住院患者的不同临床标本。提取菌株染色体 DNA 进行 spa，MLST 和 SCCmec 分型。收集感染者的年龄、性别、基础疾病、血常规指标、PCT 水平、药敏试验结果、感染 30 天后的结局、感染来源、感染前 1 个月内进行的侵入性操作等资料，采用 SPSS 22.0 进行统计分析。
结果 筛选出 34 株 ST5-t2460-SCCmecII MRSA 和 57 株非 ST5-t2460-SCCmecII MRSA 菌株。与非 ST5-t2460-SCCmecII MRSA 相比，ST5-t2460-SCCmecII MRSA 是一种小菌落突变体，其生长速度慢、菌落小、无色素沉着、在血琼脂平板上溶血环较弱。ST5-t2460-SCCmecII MRSA 对大多数抗生素的耐药率明显高于非 ST5-t2460-SCCmecII MRSA。感染 ST5-t2460-SCCmecII MRSA 和感染非 ST5-t2460-SCCmecII MRSA 的患者其性别、年龄、基础疾病和感染源无显著差异，但感染 ST5-t2460-SCCmecII MRSA 的患者白细胞计数、PCT 水平及 30 天死亡率较高，且感染者入住 ICU 的频率更高，一个月内接受侵入性手术的频率也更高。
结论 ST5-t2460-SCCmecII MRSA 是一种金葡菌小菌落突变体，在医院环境内可能具有更大的竞争优势，预示着严重的感染，其感染者通常预后较差。

PO-1139

由产 ESBLs 肠杆菌引起的术后脑膜炎的表型、分子特征和危险因素分析：一项为期六年的多中心队列研究

郑光辉
首都医科大学附属北京天坛医院

背景 为了解我国产超广谱 β-内酰胺酶 (Extended-spectrum β-lactamase，ESBL) 肠杆菌科 (ESBL-producing Enterobacteriaceae，EPE) 术后脑膜炎的表型、分子特征及危险因素。
方法 2014 年 1 月至 2019 年 12 月，我们对中国 4 个神经外科感染中心的肠杆菌感染引发的术后脑膜炎患者进行的多中心队列研究。对分离菌株的表型和分子特征进行了分析，并用 logistic 回归分析了 EPE 脑膜炎的独立危险因素。
结果 本研究中，共检出肠杆菌 220 株，包括 EPE 78 株。其中有 85.6% (67/78) 的菌株中检测到 ESBL 相关基因，包括 blaSHV (14.9%) 和 blaSHV+blaTEM+blaCTX-M-9 (20.9%) 是肠杆菌感染最常见的单基因和复合基因。logistic 分析显示，开颅术 (OR. 2.583，95%C.I. 1.274-5.235，P=0.008) 和恶性肿瘤 (OR. 2.406，95%C.I. 1.299-4.456，P=0.005) 为 EPE 诱发脑膜炎的独立危险因素。
结论 据我们所知，这是迄今为止我国开展的最大的与 EPE 脑膜炎相关的危险因素分析研究。开颅手术和恶性肿瘤是 EPE 脑膜炎的独立危险因素。危险因素的鉴别可进一步应用于临床实践和研究中，以降低感染患者的死亡率。

PO-1140

Listeria monocytogenes infections: Analysis of 59 patients

Xingbing Lu
west china hospital

Objective Various conditions increase the risk of meningitis caused by Listeria monocytogenes. However, the relative importance of these risk factors has not been well established. We describe and analyze the demographics and clinical features of 59 cases of L. monocytogenes to determine the predisposing conditions for severe meningitis infections.
Methods A retrospective study was conducted to use positive isolated L. monocytogenes from blood, cerebrospinal fluid（CSF）, and other organic fluids. Electronic medical record data were used to determine the epidemiological and clinical characteristics of L. monocytogenes infection. Multiple logistic regression analysis was used to predict the risk factors for Listeria meningitis.
Results A total of 59 cases and 133 controls were enrolled. Three major groups were identified: minors (3.39%), pregnant women (3.39%), and adults (93.22%). The outbreak was mainly concentrated in the spring and summer, and the indices of cerebrospinal fluid and blood increased in varying degrees. Twenty-five patients (42.37%) developed a neuroinvasive infection. In univariate and multivariate analyses, the use of hormonal drugs (odds ratio =3.207) and use of immunosuppressive agents (odds ratio=3.058) were associated predictors of severe meningitis, and the presence of headache (odds ratio=7.296) and pain symptoms (odds ratio=3.898) were the major independent risk factors for the occurrence of severe nervous system infection with L. monocytogenes. The 47 patients (79.66%) were treated with ampicillin (27.12%), carbapenems (18.64%), quinolones (11.86%), and β amidase inhibitors (11.86%) as the main target of antimicrobial treatment. Thirty-four patients (57.63%) improved clinically, five patients (8.47%) had a poor prognosis, and two patients (3.39%) died.
Conclusion In addition to pregnancy and foodborne factors, long-term use of immunosuppressants and hormones is the main risk factor for severe adult forms of Listeria-related infections. The headache and pain are independent risk factors for severe neurological

infections. In the early empirical treatment of L. monocytogenes, sensitive antibiotics such as penicillins and carbapenem should be added or replaced.

PO-1141

云南省抗病毒治疗后死亡 HIV/AIDS 患者基因型耐药情况调查

李健健
云南省传染病医院

目的 调查云南省 2011-2019 年间接受抗病毒治疗后死亡 HIV/AIDS 患者基因型耐药率、耐药程度、突变位点分布及其与非死亡患者的耐药差异。
方法 采用横断面研究方法，收集患者耐药相关流行病学信息。通过 In house 方法，运用 RT -PCR 扩增患者 HIV-1 pol 基因序列，测序后进行比对分析，阐明和对比两组患者耐药率及三类抗病毒药物耐药情况。
结果 纳入全省 HIV/AIDS 致死亡患者 415 人，扩增阳性 345 例，发生耐药突变 221 例（64.1%），在抗病毒治疗失败的死亡患者中耐药率较非死亡患者 73.5%（169/230）低，粗略估计 HIV-1 在死亡人群中总体耐药率为 1.5%（221/14603）。死亡患者耐药发生的影响因素包括性别、年龄、感染途径、初始 CD4+细胞计数和治疗方案（P<0.05）,死亡患者核苷类抑制剂（NRTIs）、非核苷类抑制剂（NNRTIs）以及蛋白酶抑制剂（PIs）的耐药率分别为 64.2%(142/221)、85.5%（189/221）、5.0%（11/221）；三类药物出现频率最高的突变位点依次为 NRTIs -M184V（59.1%），NNRTIs-K103N/S（28.7%），PIs-L23I（1.3%）。
结论 云南省死亡 HIV/AIDS 患者耐药呈现低流行水平，耐药率相对较低与患者发现较晚、治疗时间短、病毒在药物压力作用下变异程度小有关，三类药物中，各种药物耐药率和突变位点出现频率与非死亡组患者略有差异。我们应加强对 HIV/AIDS 危重症患者抗病毒治疗的管理和基因型耐药的检测，控制耐药毒株的产生，进一步降低患者死亡率。

PO-1142

脑脊液 MyD88L265P 基因突变在原发性中枢神经系统淋巴瘤预后影响分析

陈锟[1,2]、关明[1]、陈波斌[1]
1. 复旦大学附属华山医院
2. 复旦大学附属华山医院北院

目的 原发性中枢神经系统淋巴瘤（PCNSL）是一种预后较差的侵袭性结外淋巴瘤，常规检测诊断价值不高，脑脊液的液体活检成为首选。本文拟探讨脑脊液髓样分化因子 88L265P 突变（MyD88L265P）和白细胞介素 10（IL-10）在 PCNSL 预后的关系，为临床治疗提供依据。
方法 收集 39 例 PCNSL 患者的病例资料、脑脊液检测（包括细胞学、细胞计数、蛋白及 IL-10）及治疗经过进行回顾性分析。采用数字 PCR 检测 39 例石蜡组织和 35 例脑脊液标本中 MyD88L265P 基因突变，分析与 PCNSL 相关的预后因素，应用 Log-rank 检验进行单因素分析和 Cox 回归进行多因素分析。
结果 39 例 PCNSL 患者中位年龄 59 岁，30.1%的患者在初诊及治疗过程中出现眼内受累。组织 MyD88L265P 突变率为 74.4%（29/39），脑脊液 MyD88L265P 突变率为 40.0%（14/35），组织、脑脊液同时检测到该突变率为 51.9%（14/27），单因素分析显示眼内累及、脑脊液高 IL-10（≥45pg/mL）及脑脊液 MyD88L265P 突变中位无进展生存期（mPFS）均有明显统计学差异（p＜0.05）。多因素分析显示：眼内累及（HR=2.4，95%CI 1.3～7.8，p＜0.05）和脑脊液 MyD88L265P 突变（HR=2.1，95%CI 1.1～5.7，p＜0.05）均是影响患者 PFS 的独立预后因素。

结论 PCNSL 患者中出现眼内累及和脑脊液 MyD88L265P 突变是预后不良的因素，检测脑脊液 MyD88L265P 突变有希望成为肿瘤微残留的监测指标。

PO-1143

LGALS3 异常剪接体及空腹血糖水平与 CML 疾病进展的相关性研究

赵翠、李书琪、刘静、姚芳苡、徐颜美、张静、林晋、秦婷玉、钟芳敏、李美勇、黄波、王小中
南昌大学第二附属医院

研究背景及目的 慢性髓系白血病(Chronic myelogenous leukemia, CML)是一种与费城染色体 t(9;22)相关的造血干细胞恶性肿瘤。CML 分为慢性期（CP）、加速期(AP)及急变期（BP)三个不同的临床阶段。尽管伊马替尼（IM）的引入使 CML 患者的疗效及预后得到了极大改善，但是 IM 原发性或继发性耐药和不耐受的情况出现导致急变期，其预后极差，故而探究 CML 疾病进展相关机制意义重大。观察发现 CML 急变期（Blastic phase-CML, BP-CML）患者易出现高糖现象。同时，课题组 CML 转录组测序结果表明，CML 患者 LGALS3 基因存在 3 号内含子保留（LGALS3 intron 3 retention, LGALS3-R）的异常选择性剪接。因此，本研究拟探索 LGALS3 异常剪接体表达水平、空腹血糖（Fasting blood glucose, FBG）水平与 CML 疾病进展的相关性，旨在为 CML 疾病进展预测、治疗提供新的思路。
方法 在这项回顾性研究中，我们根据纳入和排除标准最终纳入 CML 慢性期（Chronic phase-CML, CP-CML）患者 304 名和 BP-CML 患者 117 名。采用受试者工作特征(ROC)曲线分析、倾向得分匹配法(PSM)分析和实时荧光定量 PCR (qPCR)检测的方法，比较 BP-CML 组和 CP-CML 组患者的 FBG 水平和 LGALS3 基因及其异常剪接体的表达水平，并使用相关性分析变量之间的相关性。
结果 FBG 水平在 CP-CML 组和 BP-CML 组分别为 3.74 ± 1.52mmol/L 和 5.81 ± 1.94 mmol/L。BP-CML 组 FBG 水平明显高于 CP-CML 组($P < 0.001$)。经 PSM 分析，未经靶向治疗的 BP-CML 组的 FBG 水平高于 CP-CML 组($P < 0.001$)。FBG 诊断 BP-CML 的曲线下面积（Area under the curve, AUC）为 0.785，FBG 的最佳临界值为 5.08 mmol/L，敏感性为 61.9%，特异性为 83.3%。LGALS3 基因 BP-CML 组表达量较 CP-CML 组表达量低($P < 0.001$)，与 FBG 水平呈负相关性($R = -0.552$, $P < 0.001$)。进一步分析显示与 CP-CML 组相比，BP-CML 组中异常剪接体 LGALS3-R 表达显著下调($P < 0.001$)。
结论 本研究结果表明，FBG 高水平和 LGALS3-R 低表达水平可能是 CML 疾病进展的潜在标志，对 BP-CML 和 CP-CML 的鉴别诊断具有较高的临床价值。

PO-1144

γδT 细胞、Th17 细胞和 IL-17 在慢性乙型肝炎患者外周血中表达的意义

王雅姝[1]、晋红梅[2]、王克强[2]
1. 泰安市中心医院
2. 山东第一医科大学第二附属医院检验科

目的 了解 γδT 细胞、Th17 细胞和 IL-17 在慢性乙型肝炎（CHB）患者外周血中的表达情况，探讨 γδT 细胞、Th17 细胞和 IL-17 在 CHB 发病机制中可能的作用。
方法 用流式细胞仪检测 20 例健康人、20 例 CHB 无症状携带者（AsC）、20 例 CHB 轻度患者和 20 例 CHB 中、重度患者外周血中 γδT 细胞和 Th17 细胞的数量，用 ELISA 法检测各组血清中 IL-17 细胞因子的含量。

结果 健康人、AsC、CHB 轻度患者和 CHB 中、重度患者，γδT 细胞的表达量分别为 1.258±0.1348、2.178±0.1946、4.160±0.0693、7.058±0.9699，差异具有统计学意义（F＝498.35, P＝0.000）；Th17 细胞的表达量分别为 1.252±0.1545，1.714±0.1031、2.338±0.2337、3.826±0.4884，差异具有统计学意义（F＝310.65, P＝0.000）；IL-17 的浓度（pg/ml）分别为 16.307±19.25、92.706±16.85、147.635±6.32、391.787±28.52，差异具有统计学意义（F=349.41，P＝0.000）。Pearson 相关性分析显示，CHB 患者外周血中 γδT 细胞和 Th17 细胞的百分率存在正相关（r=0.978，P=0.000）；γδT 细胞的百分率和 IL-17 存在正相关（r=0.959，P=0.000）；Th17 细胞的百分率和 IL-17 存在正相关（r=0.954，P=0.000）。
结论 随着 CHB 病情程度的加深，外周血 γδT 细胞、Th17 细胞和 IL-17 表达也随之升高，表明 γδT 细胞和 Th17 细胞可能参与了机体感染病毒后引起的免疫反应和组织损伤过程；γδT 细胞和 Th17 细胞表达呈正相关，提示 γδT 细胞可能对 Th17 细胞具有调节功能，并在免疫系统的发病机制中可能起着关键的作用。

PO-1145

外周血异常红细胞形态联合血常规红细胞参数在缺铁性贫血和地中海贫血诊断中的价值探讨

吴昊
电子科技大学附属医院·四川省人民医院

目的 探讨外周血异常红细胞形态联合血常规红细胞参数在缺铁性贫血和地中海贫血鉴别诊断中的价值。
方法 选取 2018 年 1 月至 3 月本院收治的 40 例地中海贫血患者，58 例缺铁性贫血患者，54 例健康体检者作为研究对象。对各组入选样本进行血常规检测，并制作血涂片分类计数 1000 个红细胞。将各组红细胞参数 HGB、MCV、MCH、MCHC，10 种异常红细胞（靶形红细胞、球形红细胞、椭圆形红细胞、泪滴形红细胞、低色素性红细胞、盔形红细胞、红细胞碎片、嗜多色性红细胞、嗜碱性点彩红细胞、其它异常红细胞）检出率共计 14 项指标进行比较分析。
结果 与对照组相比，缺铁贫组除嗜碱性点彩红细胞检出率无统计学差异外，其余 13 项指标均有统计学差异；与对照组相比，地贫组 14 项指标均有统计学差异；与缺铁贫组相比，地贫组除 MCH、低色素性红细胞检出率、嗜多色性红细胞检出率 3 项指标外，其余 11 项指标均有统计学差异。
结论 外周血异常红细胞形态联合血常规红细胞参数在缺铁性贫血和地中海贫血的鉴别诊断中具有一定的价值，提高检验人员外周血红细胞形态识别能力有助于向医生和患者提供更多有意义的信息。

PO-1146

红细胞体积分布宽度新型计算公式对地中海贫血和缺铁性贫血鉴别诊断的价值

杨卓、甘勇、吴洁、伊洁、陈雨、陈倩、王斐、吴卫
中国医学科学院北京协和医院

目的 初步探讨利用血常规中红细胞参数的新型运算公式【（MCV2×RDW-CV）/Hb*10】对缺铁性贫血与地中海贫血进行鉴别诊断的实用价值。
方法 使用全自动血细胞分析仪 Advia 2120 对 68 例缺铁性贫血和 62 例地中海贫血样本的红细胞参数进行检测，α-地中海贫血缺失型采用 GAP-PCR 法确诊，α-地中海贫血点突变和 β-地中海贫血采用 PCR-反向点杂交法确诊，排除其他合并疾病。缺铁性贫血诊断标准：

小细胞低色素贫血：男性 Hb<120g/L, 女性 Hb<110g/L, MCV<80 fl， MCH<26pg，MCHC<300g/L，有明确的缺铁病因和临床表现，血清铁蛋白<12μg/L。统计数据采用 SPSS 软件进行 t 检验分析。
结果 地中海贫血组红细胞数值为(5.06±1.07)×1012/L，包含 α-地中海贫血标本 12 例，β-地中海贫血标本 48 例，α-地中海贫血复合 β-地中海贫血 2 例。缺铁性贫血组红细胞数值为(4.19±0.57)×1012/L，地中海贫血组的 RBC 数值高于缺铁性贫血组，两者具有统计学差异（p=0.000）。采用两组变异差别较大的红细胞体积分布宽度百分比（RDW-CV,单位%）、平均红细胞体积（MCV，单位 fL）和血红蛋白(Hb,单位 g/L)参数，组合多种公式进行分析，结果发现采用公式【（MCV2×RDW-CV）/Hb*10】，地中海贫血组数值为 86.02±39.87,缺铁性贫血组数值为 109.41±26.81,地中海贫血组明显低于缺铁性贫血组，两者具有统计学差异（P=0.015）。
结论 利用常规红细胞参数进行组合运算，有助于初步推导低色素小细胞性贫血的类型，对疾病的鉴别诊断和进一步临床处理具有重要的参考价值。

PO-1147

利用 CD38/CD58 的 MFI 比率可以在 B-ALL 诊断样本中更容易区分出白血病细胞

王清晨
北京大学第一医院（北京大学第一临床医学院）

目的 急性 B 淋巴细胞白血病（B-ALL）是儿童常见的血液系统肿瘤。微小残留病（minimal residual disease；MRD）是儿童 B-ALL 的独立预后标志，对于预测预后和选择进一步治疗策略的强度至关重要。目前 MRD 的测量方法主要包括流式细胞术及 PCR 技术。本研究目的是通过流式细胞术分析我院儿童 B-ALL 初诊免疫表型，探讨在儿童急性 B 淋巴细胞白血病(B-ALL)诊断中最具鉴别能力的抗原组合。
方法 病例组为 22 例初诊 B-ALL 患者骨髓细胞，对照组选取 6 例患有血液系统疾病但已达到完全缓解患儿的骨髓细胞。采用多参数流式细胞术分析八种标记物的平均荧光强度(MFI):CD45、CD19、CD10、CD34、CD38、CD20、CD58、CD117，并在白血病细胞和正常 B 祖细胞上获得的 MFI 进行对比。利用 ROC 曲线的 AUC 值分析标记抗原组合的敏感性和特异性。
结果 抗原的定性表达模式显示,相比较正常 B 祖细胞，CD58、CD34、CD10 在白血病淋巴细胞上过度表达，而 CD45、CD38 表达不足。使用 ROC 曲线分析，相比较 CD38 与 CD58 单独进行免疫表型分析（CD38 AUC：0.61；CD58 AUC：0.665），CD38/CD58 的抗原平均荧光强度比率在 0.32 时，ROC 曲线下面积达到最大，此时灵敏度为 0.824，特异度为 0.8。
结论 CD38/CD58 的 MFI 抗原比率可以更好区分白血病细胞和正常的未成熟 B 祖细胞。

ABCB1 和 CES1 基因多态性对 达比加群酯治疗脑卒中患者抗凝效果的影响

张琳、郑绪雅、张俊峰、许军秀
郑州大学第五附属医院

目的 探究 ABCB1 SNP（rs1045642）与 CES1 SNP（rs2244613）基因位点多态性对服用达比加群酯的脑卒中患者的抗凝疗效的影响，以进一步推进达比加群酯的个体化治疗，改善抗凝效果。
方法 选取 2020 年 11 月至 2021 年 6 月在郑州大学第五附属医院住院治理的脑卒中患者 60 例作为研究对象。利用 Taqman®荧光探针法检测患者全血标本中 ABCB1 SNP（rs1045642）与 CES1 SNP（rs2244613）的基因型，HTI 凝血分析法来测定患者服用达比加群后的血浆浓度谷峰值，凝

血分析仪检测患者服药后的凝血指标，包括活化部分凝血活酶时间(APTT)、凝血酶时间(TT) 、凝血酶原时间（PT）和国际标准化比值（INR），并在患者治疗期间观察记录出血事件。统计分析基因多态性对服用达比加群的患者血浆浓度、凝血指标和出血风险的影响。
结果 ABCB1 SNP（rs1045642），CES1 SNP（rs2244613）两个位点的基因型和基因频率均无显著性差异（P>0.05）。rs1045642 多态性与达比加群血浆浓度、凝血指标均无显著关联；此位点上不同基因型的房颤患者在治疗期间的出血事件发生率，差异无统计学意义（P>0.05）。rs2244613 位点多态性与达比加群浓度峰值无显著关联，但等位基因(A)携带者较非携带者有更高的达比加群血药浓度谷值(AA 与 CC 基因型，P<0.05；CA 与 CC 基因型，P<0.05)；不同基因型间峰值水平的凝血指标均无统计学意义，在谷值水平测得的凝血指标中，只有 APTT 值差异有统计学意义，两两比较显示 CC 基因型患者的 APTT 值高于 CA 基因型患者与 AA 基因型患者；等位基因携带者与非携带者相比，具有轻微出血的危险性。
结论 ABCB1 SNP（rs1045642）基因位点可能不会影响脑卒中患者口服达比加群酯后的抗凝疗效。CES1 SNP（rs2244613）上的次要等位基因可以使接受达比加群治疗的脑卒中患者的血药浓度谷值增高，并且增加轻微出血风险。

PO-1149

CircPVT1 promotes acute myeloid leukemia cell proliferation, migration and invasion via the miR-455-3p/MCL1 axis

Kun Wu 、Yuntao Li、Bo Nie、Yun Zeng、Mingxia Shi
First Affiliated Hospital of Kunming Medical University

Background Circular RNAs (circRNAs) play a crucial role in acute myeloid leukemia (AML) progression. Recently, accumulatingstudies have confirmed that circPVT1 participates in diverse pathological processes, especially tumorigenesis. However, the function and mechanism of circPVT1 in AML remain unclear.
Methods The mRNA expression levels of circPVT1, miR-455-3p and MCL1 in 42 adult AML patients andhealthy subjects were determined by RT-qPCR. Cell Counting Kit-8 (CCK-8)andTranswell assays were conducted to identify the roles of circPVT1 in the growth and migration/invasion, respectively, of NB4 and HL-60 cells. Bioinformatic analysis and in vitro experiments were conducted to clarify the mechanism of circPVT1-mediated gene regulation in NB4 and HL-60 cells.
Results CircPVT1 expression was significantly increased in primary AML samples and cell lines. CircPVT1knockdown significantly reduced the proliferation, migration and invasion of NB4 and HL-60 cells and impaired tumor growth in vivo. Bioinformatic analysis and luciferase reporter assays demonstrated that circpvt1 promoted MCL1 expression by interacting with miR-455-3p. Moreover, the inhibitory effects of MCL1 knockdown on AML progression were partially reversed by decreasing miR-455-3p levels or enhancing circPVT1 expression.
Conclusions In summary, our findings suggested that circPVT1 might be a therapeutic target for the treatment of patients with AML since targeting circPVT1 suppressed AML progressionin vitroand in vivo.

PO-1150

The important clinical role of minimal residual disease detection by flow cytometry in childhood acute lymphoblastic leukemia and its prognostic significance

Kun Wu 、Shenju Cheng、Yanhong Li
First Affiliated Hospital of Kunming Medical University

B cell acute lymphoblastic leukemia (B-ALL) is a malignant neoplastic disease which causing great burden to children's health and family life. Aiming to explore possible risk factors for B-ALL relapse, we conducted a retrospective cohort study from October 2016 to March 2018. Flow cytometry was used to minimal residual disease (MRD) detection. 192 children with B-ALL were divided into groups according to the level of MRD (MRD≥0.01% and MRD<0.01%) and different periods (end of the induction remission period and maintenance treatment period). Each group was followed-up in different times. The results showed that the cumulative recurrence rate of children with MRD+ was significantly higher than MRD- (P=0.0293) during the maintenance treatment period, while the cumulative recurrence rate was not statistically different at the end of the induction remission period (P=0.419). With Cox risk proportional regression model, we found that prednisone insensitive, bone marrow characteristics on day 15 and the MRD level after remission (≥0.01%) may be high-risk factors for the B-ALL recurrence. Our 4-color fluorescent labeled B lymphocyte antibody combination template for flow cytometry could well distinguish B-ALL children with MRD+ and MRD- and negative after chemotherapy. Our present study confirmed the important clinical role of MRD in B-ALL in Chinese population and provided the 4-color fluorescent labeled B lymphocyte antibody combination template for other researchers.

PO-1151

多发性骨髓瘤患者外周血肿瘤教育血小板的研究

张娟[2]、蒋黎[1]
1. 电子科技大学医学院·四川省人民医院
2. 电子科技大学医学院·四川省人民医院

目的 肿瘤教育血小板（Tumor-Educated-Platelete,TEP）是指血小板吞噬了肿瘤来源的 RNA 而形成的特殊的血小板。本研究主要探讨多发性骨髓瘤(Multiple Myeloma, MM)患者外周血是否存在肿瘤教育血小板及其形态特征和机制研究。

方法 收集 2020 年 10 月-12 月在四川省人民院确诊的多发性骨髓瘤患者 50 例和 50 例正常人外周血血小板进行了密度梯度离心分离纯化，并按试剂说明书提取了血小板中的 RNA，进行了二代测序。同时对提取出的血小板进行透射电镜和扫描电镜观察。对多发性骨髓瘤患者和正常人外周血进行血涂片瑞氏染色观察。

结果 测序结果显示，MM 患者与正常人外周血血小板中 RNA 表达是有差异的，即 MM 具有特异的 TEP RNA。扫描电镜结果显示，MM 患者外周血血小板形态较不规则，形态变化较大，而正常对照组血小板相对较为规则。透射电镜结果显示，MM 患者血小板多呈不规则形，胞浆中可见线粒体、粗面内质网和颗粒结构，部分线粒体有轻度肿胀，偶见少量脂滴。正常对照组血小板形态结构多呈规则形，胞浆中可见线粒体、粗面内质网和颗粒结构。瑞氏染色结果显示，与正常人对照相比，MM 患者外周血易见大血小板，部分血小板胞浆边缘可见长短不一绒毛状的突起，部分血小板胞浆边缘可见明显"环状"结构。可能与 MM 患者外周血血小板被激活，伸出伪足有关。"环状"结构可能与血小板中微管与驱动蛋白有关。

结论 MM 患者外周血肿瘤教育血小板可能与 MM 的发生有关，其具体机制有待进一步深入研究。

PO-1152

基于柔性等离子活性琼脂糖薄膜的便携 SERS 平台用于血清中尿酸的快速检测

陈嘉明[1,2]、洪国焌[1,2]
1. 厦门大学附属第一医院 检验科
2. 厦门市基因检测重点实验室

目的 复杂体液样品的检测中容易受到其他生物大分子的干扰，影响检测结果。如何快速分离样品和实现目标物的快速检测成为目前的研究热点。我们针对这一问题，利用表面增强拉曼散射（SERS）技术的高灵敏、无损快速检测的优势，并结合琼脂糖凝胶的筛分能力，构建了基于柔性等离子活性琼脂糖薄膜的便携 SERS 平台并用于体液样品的即时诊断。

方法 采用贵金属纳米粒子和琼脂糖水凝胶溶液作为前驱体，调控温度和湿度，大规模制备等离子活性琼脂糖薄膜。整个制备过程温和、简单而且低廉。通过琼脂糖凝胶的微纳米孔道，对样品中生物大分子进行初步分离，再结合便携拉曼光谱仪进行指纹图谱的识别、分析。

结果 首先，对该 SERS 薄膜的多项 SERS 性能进行考察。实验结果表明，该 SERS 薄膜具有极高的 SERS 灵敏度和均一性。以罗丹明 6G 作为模型探针，得到检测限可以达到 10 fM，检测线性范围 1.0 pM 至 10 nM。然后，该等离子凝胶珠作为 SERS 基底被用于对尿酸进行定量检测，其线性检测范围为 1.0 μM∽1000 μM，检测限为 0.1 μM，并成功应用于人血清中的尿酸检测。

结论 基于柔性等离子活性琼脂糖薄膜的便携 SERS 平台方法具有制备温和简单，大批量制备的优点。并且，可以利用琼脂糖特点分离生物大分子快速、灵敏地检测复杂生物样品中目标分子，配合便携拉曼光谱仪有望应用于即时检验等领域。

PO-1153

Falsely elevated platelet count in a ITP infant with unusual finding of megakaryocytes in peripheral blood

Qingzhou Chen
The First Affiliated Hospital of Zhengzhou University

An 11-month-old infant had the platelet count of 63×10^9/L. After Wright-Giemsa stain, we almost could not see platelets in the peripheral blood by smear microscopy (panel A&B, black arrow, original magnification×1000). Apart from that, mature erythrocytes were of varying sizes, the cells were mainly small and hypochromic, and the central portion of the cells was lightly stained, and target cells were visible (panel A&B, red arrow, original magnification ×1000). After correction with Mindray BC-6800Plus instrument, the final platelet count was 5×10^9/L, the number of erythrocytes increased from 4.8×10^12/L to 4.86×10^12/L. The number of increased erythrocytes (60×10^9/L) was almost equal to the decreased platelets (58×10^9/L) via calculation. Considering of the value (57.0fL) of erythrocyte mean corpuscular volume (MCV), we considered that the cause of false increase of platelet count was the interference of small erythrocytes. The peripheral venous blood was collected by a routine venipuncture procedure. Peripheral smear showed above is consistent with clinical history of ITP and hypochromic microcytic anemia. So we need to take microscopic examination as the gold standard, and make full use of various scientific and technological means to solve the difficult problems.

Immune thrombocytopenia (ITP), an autoimmune disorder characterized by autoantibody production which can inhibit proplatelet formation by megakaryocytes and impair platelet production in vitro. Because of low platelet, the majority of patients have the risk of haemorrhage and require treatment. The etiology of ITP is complex. Of note, we found two typical granular megakaryocytes at the end of the slide(panel C&E, arrow, original magnification×40, panel D&F,

original magnification×1000). Such accidental discovery has been rarely reported in literature. Generally speaking, megakaryocytes appearing in peripheral blood are common in diseases including chronic lymphoblastic cytic leukemia (CLL), chronicmyelomonocyticleukemia (CMML), myelodysplastic syndromes (MDS), myeloproliferative (MPN), primary myelofibrosis (PMF) and acute megakaryocytic leukaemia (AMeL). Clinical significance of this finding is unknown, the mechanism may be the increased gap of sinus wall after treatment of the infant, then megakaryocytes enter peripheral blood from bone marrow. In addition, a manifestation of ITP is the maturation disorder of megakaryocytes in bone marrow,

we speculate that megakaryocytes appearing in peripheral blood smears are almost immature, so the granular megakaryocytes we found is consistent with the explanation. What's more, this case teaches us an inspiration to use the end of the slide as an significant area for finding large cells of diagnostic importance such as tumor cells, atypical lymphocytes, or in this case granular megakaryocytes can be found.

PO-1154

Performance evaluation of PA-990, a novel automated Lifotronic specific protein analyzer, in detecting C-reactive protein

Fan Zhang 、Mianyang Li 、Chengbin Wang
Chinese People's Liberation Army General Hospital

Background PA-990 is a new automated Lifotronic specific protein analyzer that can detect C-reactive protein (CRP). The aim of this study was to investigate the analytical performance of PA-990.
Methods The analytical performance of PA-990 was evaluated on the basis of the following parameters, including the limit of blank (LoB), carryover, precision, accuracy, linearity, and reference interval. Additionally, channel comparison and method comparisons were performed.
Results LoBs satisfy the manufacturer's statement (≤0.5 mg/L). No significant carryover (≤0.5%) was observed in this study. The precision and accuracy for all parameters fell within acceptable criteria. The channel comparison analysis and reference interval fell within acceptable criteria. The method comparison analysis demonstrated strong agreement between PA-990 results and those of PA-990, and those of Siemens–BN-II automated specific protein analyzer. Excellent measurements were observed in the dilution linearity (coefficient of determination, r2≥0.95).
Conclusion The analytical and clinical performance characteristics of PA-990 were demonstrated satisfactory, which made it well suited for routine use in clinical laboratories and emergency departments.

PO-1155

2 例 X 染色体非随机灭活导致女性血友病 A 的机制

徐扬
上海交通大学医学院附属瑞金医院

目的 X 染色体非随机灭活是女性血友病 A 的主要发病机制之一，但 X 染色体非随机灭活机制不清，本文主要研究了 X 染色体非随机灭活导致女性血友病的分子发生机制。
方法 检测相关凝血指标；进行基因相关检测，包括 PCR 扩增及测序分析 FVIII 和 XIST 基因的各外显子及其侧翼序列、拷贝数检测、FVIII 基因内含子 1 和 22 倒位检测；针对 HUMARA 基因和 RP2 基因进行 X 染色体灭活率的检测；采用 G 显带法分析外周血细胞核型。

结果 诊断 2 名女性为血友病 A 患者，检测发现患者 1 FVIII 基因存在第 22 内含子远端倒位，患者 2 FVIII 基因存在 c.592T>A:p.Cys198Ser 杂合突变；HUMARA 检测发现两名患者 X 染色体为非随机灭活；XIST 基因分析显 2 名女性血友病 A 患者存在相同位点的 XIST 突变，但该突变与患者的 X 染色体非随机灭活无关；G 显带核型分析显示先证者染色体核型未见明显异常。
结论 这 2 名患者均携带单 FVIII 基因杂合突变，且均由 X 染色体非随机灭活导致的女性血友病 A；排除了 XIST 基因 11150 位 A 到 G 的突变对 X 染色体非随机灭活的影响。X 染色体非随机灭活与细胞选择有关，推测存在 X 染色体大片段缺失导致细胞生存劣势，从而造成 X 染色体非随机灭活现象的产生；也可能存在另外未知的 X 染色体突变，而且该突变不利于接下来的细胞的繁殖，造成该 X 染色体灭活。这也将是后续深入研究的方向。

PO-1156

乳腺粘液癌的针吸细胞学形态分析

朱玉秋
徐州医科大学附属医院

目的 乳腺粘液癌是一种发生于乳腺导管的少见浸润性特殊型乳腺癌，发生率仅占乳腺肿瘤的 1-6%。肿块多呈膨胀性生长，生长缓慢，境界清楚，质地较软，因此，容易被临床体格检查、超声等影像学检查误诊为纤维腺瘤。针吸取细胞学检查是术前早期鉴别诊断乳腺肿瘤良恶性的重要方法之一。但由于乳腺黏液癌的发病率低、肿瘤细胞形态异型性不明显、针吸细胞学文献报道少、缺乏诊断标准等原因，给术前诊断带来了困难和挑战。本文旨在探讨乳腺粘液癌的针吸细胞学的形态学特征，提高对乳腺粘液癌针吸细胞学的诊断率。
方法 对乳房肿块进行针吸细胞学检查，结合组织病理学结果，分析乳腺粘液癌的细胞形态学诊断特征。
结果 以病理学结果为金标准，5 例乳腺黏液癌针吸细胞学诊断结果与病理组织学结果一致，准确率为 100%。5 例乳腺黏液癌针吸物均为半透明胶冻样粘稠物，镜下形态学特点：1.中等至大量的透明、半透明黏液物质背景；2.肿瘤细胞体积略增大、轻度异型；3.紧密排列呈乳头状或三维立体球团样，如同小岛漂浮在粘液湖中，亦可与黏液交织存在；4.未见或极少见肌上皮细胞。
结论 乳腺黏液癌针吸细胞形态学特征较鲜明，可以作为乳腺粘液癌术前诊断的一种常规检查方法。

PO-1157

Quantitative proteomic analysis of plasma exosomes to identify the candidate biomarker of Imatinib Resistance in Chronic Myeloid Leukemia patients

Meiyong Li、Bo Huang、Xiaozhong Wang、Cui Zhao、Fangmin Zhong、Ying Cheng、Shuai Xu、Fangyi Yao、Junyao Jiang、Yulin Yang
The Second Affiliated Hospital of Nanchang University

Background Imatinib (IM), a tyrosine kinase inhibitors (TKIs), has markedly improved the survival and life quality of chronic myeloid leukemia (CML) patients. However, IM resistance and lack of specific biomarkers remain a serious clinical challenge for a subset of patients. Recently, growing evidence has suggested that exosomes-harbored proteins were involved in tumor resistance and could be novel biomarkers for the diagnosis and prediction of cancer. Therefore, we aimed to investigate the proteomic profile of plasma exosomes derived from CML patients to identify ideal biomarkers for IM resistance.
Methods We extracted exosomes from pooled plasma samples of 9 imatinib-resistant CML and 9 imatinib-sensitive CML by Total Exosome Isolation Reagent. Then, we identified the expression

levels of exosomal proteins by liquid chromatograph-mass spectrometer (LC-MS/MS) based label free quantification, and bioinformatic analyses were used to analyze the proteomic data. Finally, the western immunoblotting (WB) and Parallel reaction monitoring (PRM) analyses were applied to validate the candidate proteins in an independent cohort.
Results A total of 2812 proteins were identified in plasma exosomes from imatinib-resistant and imatinib-sensitive CML patients, including 279 differentially expressed proteins (DEPs) with restricted criteria ($p<0.05$, fold change>1.5). Compared with imatinib-sensitive CML, 151 proteins were up-regulated and 128 proteins were down-regulated. Bioinformatics analyses revealed that the main function of upregulated proteins was to participate in the protein synthesis, while the downregulated proteins were mainly involved in lipid metabolism. The top 20 hub genes were obtained using STRING and Cytoscape, most of which are the components of ribosomes. Moreover, we found that RPL13 and RPLP2 exhibited especially marked differences between imatinib-resistant and imatinib-sensitive CML patients, which were further confirmed by WB and PRM in respective independent cohorts.
Conclusion Proteomic analysis of plasma exosomes provides new ideas and important information for the study of imatinib resistance in CML. Especially the exosomal proteins (RPL13 and RPLP2), which may have great potential as biomarkers of imatinib resistance.

PO-1158

达比加群酯在非瓣膜性房颤抗凝治疗中基因多态性的研究进展

张帆、王成彬
解放军总医院第一医学中心检验科

房颤是临床上最常见的快速心律失常，致死率高，非瓣膜性房颤已成为心血管病中最常见的疾病之一。房颤易发生血栓栓塞事件，尤其是脑动脉栓塞和外周动脉栓塞。因此，房颤患者为预防脑卒中，抗凝剂的应用是最重要的治疗方案。如今传统抗凝剂、新型口服抗凝剂等常规剂量的应用仍面临着出血与栓塞的问题。为了实现个体化治疗，减少出血风险，对基因多态性研究显得尤为重要，本研究主要针对此方面做一综述。

达比加群酯作为新型口服抗凝药，其疗效与安全性较为肯定，与华法林相比具有诸多优势，预防脑卒中的效果明显优于华法林; 目前临床上使用的达比加群酯普遍存在个体差异，基因的多态性对于达比加群酯的影响主要包括药物代谢及药物动力学方面。国外研究普遍接受 CES1 和 ABCB1 基因可以作为接受达比加群酯治疗的非瓣膜性房颤患者发生不良心脑血管事件的独立预测因子，对于携带等位基因 CES1 SNP rs2244613 而导致出血不良事件，可以选用低剂量达比加群酯; ABCB1 与 CES1 SNP rs8192935 可能会有小概率缺血性事件的发生，可适当予以提高剂量; 杂合子 143G/E 基因型对于达比加群酯的激活、活化速率有影响，如今并没有确切相关试验表明会引起不良事件的发生。

基于 CES1、ABCB1 基因多态性的指导更好地提高药物的疗效与安全性。然而现在相关临床研究主要集中在西方人群中，由于基因多态性的差异，在不同人种及个体中达比加群酯的药代动力学及药效动力学存在较大差异。因此，尚需进一步在亚洲人群中开展相关研究，并推动中国基因多态性检测指导临床工作，提升抗凝药物使用的安全有效性，减少不必要的不良事件发生，有助于临床进一步权衡达比加群剂量，使抗凝治疗更合理安全，从而实现个体化治疗。

PO-1159

结合机器学习和血常规分析揭示中性粒细胞过度激活在 SARS-CoV-2 感染重症化中的作用

秦士杰、夏欣一
中国人民解放军东部战区总医院

目的 目前已知有 7 种冠状病毒可感染人类：四种只引起轻度呼吸道疾病（HCoV-229E、HCoV-OC43、HCoV-NL63 和 HCoV-HKU1），而另外三种（SARS-CoV、MERS-CoV、SARS-CoV-2）可引起严重呼吸道疾病甚至死亡。重型冠状病毒相较于轻型冠状病毒具有更强的促进细胞因子风暴的能力，导致严重的呼吸系统疾病、多器官衰竭等。系统构建人体内的信号转导网络对揭示 COVID-19 的病因学和传播特点十分必要。
方法 检索获得 7 种冠状病毒的基因组、基因和蛋白序列。病毒感染后的人类基因表达数据来自 GEO 数据库。2979 例 COVID-19 患者血液中性粒细胞及临床资料来源于武汉火神山医院。使用 edgeR R 包计算病毒感染后转录组差异表达基因。利用 GEO 数据库计算芯片表达差异基因。用 BLAST 软件比较并计算 7 种病毒的蛋白质编码基因相似性。所有患者均在实验室采用咽拭子进行 RT-qPCR 方法确诊。全自动血细胞分析仪检测所有患者血细胞比率和计数。
结果 核衣壳磷酸化蛋白在重型冠状病毒中表现出显著的保守性，但在不同的轻型冠状病毒中存在差异，表明核衣壳磷酸化蛋白参与致病反应。感染 SARS-CoV-2 后，宿主应答基因（HRG）、HRG 富集以及富集后 KEGG 通路的生物学过程与 SARS-CoV 和 MERS-CoV 略有重叠，但与四种轻型冠状病毒不同，并且 HRGs 对中性粒细胞过度激活的富集只在重型冠状病毒感染中常见，轻型冠状病毒中则没有。此外，临床数据表明，重症患者中性粒细胞的过度激活可能是 SARS-CoV-2 感染与其他两种严重冠状病毒（SARSCoV 和 MERS-CoV）感染相似临床症状的一个主要因素。
结论 本文揭示了 SARS-CoV-2 编码蛋白的特征和宿主对其感染的反应，为 SARS-CoV-2 的致病机制提供了开创性见解，强调了中性粒细胞失调在 SARS-CoV-2 致病的关键作用，揭示了宿主对 SARS-CoV-2 感染反应的信号转导网络和关键转录因子，揭示了为 SARS-CoV-2 可能的致病机制。（本文部分内容已发表于 Bioinformatics，IF=5.61）

PO-1160

恢复期血浆治疗 COVID-19 患者的安全性与有效性研究: 来自匹配病例对照研究和荟萃分析的证据

蒋卫军、夏欣一
中国人民解放军东部战区总医院

目的 新型冠状病毒（COVID-19）自大流行以来，已造成全球数千万人的感染。鉴于 COVID-19 快速传播，目前没有针对 COVID-19 的特定治疗制剂或疫苗。一些临床治疗方法，如托珠单抗疗法和恢复期血浆疗法(CPT)，正在研究中。CPT 是较有前景的治疗方法之一，受到越来越多国家研究人员青睐。但 CPT 在 COVID-19 中的临床疗效和安全性尚不清楚。
方法 本病例对照研究所有被纳入患者均经 qRT-PCR 确诊为新冠肺炎病例，所有患者都接受了其他标准治疗，实验组还接受恢复期血浆治疗。我们对 2020 年 8 月 31 日之前发表的研究进行关键词检索，检索数据库包括 PubMed，Web of science 和 MedRxiv，并手动检索纳入文章的参考文献以获取其他相关文章。
结果 我们纳入共 326 例患者研究（CPT 组 163 例和对照组 163 例）。发现 CPT 组患者住院天数明显高于对照组(P < 0.0001)。CPT 组与对照组在年龄、病情严重程度、出院情况、基础疾病、ICU 人数等方面无显著差异。我们荟萃分析 498 例 CPT 治疗患者和 557 例标准治疗患者，评估 CPT 在 COVID-19 患者中临床疗效和安全性。发现与标准治疗对照组相比，接受 CPT 治疗患者组

死亡率显著降低 (OR= 0.496, 95%CI= 0.342-0.719, P< 0.0001)，序贯性分析也发现这是真阳性结果。在不良事件方面，虽然荟萃分析发现，相比于对照组，CPT 治疗患者不良事件发生率显著增加，序贯性分析发现其是假阳性结果。而在住院时长，临床症状改善和出院率方面，未发现两组之间差异性。

讨论 CPT 作为较有前景的治疗方法之一，其临床疗效和风险仍不清楚。John Mair-Jenkins 等人分析 CPT 治疗 SARS 冠状病毒感染的研究发现 CPT 能显著降低死亡率，特别是在症状出现后早期给予 CPT 治疗。我们也发现 CPT 能显著降低 COVID-19 患者死亡率(4.91% vs. 9.20%)。本文首次在最大样本量系统回顾和荟萃分析 CPT 治疗 COVID-19 患者的有效性和安全性研究。表明 CPT 可以显著降低 COVID-19 患者死亡率，且不良事件发生率无明显增加。这为 CPT 治疗 COVID-19 患者的有效性和安全性提供了证据。（本文部分内容已发表于 Blood, IF=17.543，ESI 高被引和 Clin Transl Med，IF=7.919 上）

PO-1161

Clinical values of combined analyses of blood routine ratio parameters in patients with acute ischemic stroke

Jia Wu、Junjun Wang
Department of Clinical Laboratory, Jinling Hospital, Medical School of Nanjing University, Nanjing 210002, Jiangsu, China

Objective To analyze the blood routine ratio parameters, systemic immune inflammation index (SII), neutrophil to lymphocyte ratio (NLR) and platelet to lymphocyte ratio (PLR) of patients with acute ischemic stroke (AIS), and assess its severity with AIS and explore its value in predicting the prognosis of AIS.

Methods A total of 116 AIS patients and 57 healthy controls were selected, Albumin (ALB), platelet count (PLT), neutrophil percentage [N(%)] and lymphocyte percentage [L(%)] were detected in AIS patients and healthy controls, respectively. SII, NLR, PLR were calculated and analyzed the level of other blood lipids and coagulation parameters at the same time as well as assessed the National Institutes of Health Stroke Scale (NIHSS) on admission and the modified Rankin Scale (mRS) and modified Barthel Index (mBI) on discharge of AIS patients.

Results Compared with the control group，Patients with AIS had a significantly increased SII (Z=-2.740, P=0.006)、NLR (Z=-3.752, P<0.001)、PLR (Z=-8.076, P<0.001). Correlation analysis showed that in AIS patients, SII were significantly positively correlated with NLR (r=0.932, P<0.001) ; SII and NLR were both significantly positively correlated with NIHSS(SII: r=0.364, P<0.001; NLR: r=0.395, P<0.001)、mRS(SII: r=0.228, P=0.019; NLR: r=0.236, P=0.015), but both were significantly negatively correlated with mBI(SII: r=-0.318, P<0.001; NLR: r=-0.375, P<0.001). multiple stepwise regression analysis showed that after correcting for the effects of age, sex, blood lipids, and coagulation parameters, SII (corrected R2=0.228, β=0.526, P=0.030) remained significantly independent of the NIHSS score. According to ROC curve analysis, the area under the ROC curve AUC of the combined SII, NLR, and PLR three parameters to distinguish the AIS group and the control group was 0.903(95% CI: 0.858 ~0.948, P<0.001). Logistic regression analysis showed that SII(OR=2.287, 95%CI: 1.120~4.670, P=0.023) 、PLR(OR=2.090, 95%CI: 1.118~3.905, P=0.021) can still be used as independent predictors of AIS after adjusting for the effects of age, gender, and blood lipid , coagulation parameters; During the follow-up of 2 years, 24 patients with AIS developed cerebrovascular diseases, their SII (Z=-3.455, P=0.001) and NLR (Z=-3.262, P=0.001) were significantly higher than those without occurrence. Multivariate Cox regression analysis showed that after adjusting for the effects of age, gender, blood lipids and coagulation parameters, SII(HR=1.284, 95%CI: 1.105~1.493, P=0.001) can still be used as an independent predictor of AIS.

Conclusion The levels of blood routine ratio parameters NLR, PLR and SII in AIS patients are significantly increased; Combined analysis of SII, NLR and PLR can be used as a new indicator for evaluating the severity and prognosis of acute ischemic stroke.

PO-1162

建立和验证预测非小细胞肺癌患者接受 PD-1 单抗治疗疗效和预后的列线图

夏艳、袁世进、谢鑫友、张钧
浙江大学医学院附属邵逸夫医院

背景 程序性细胞死亡蛋白-1（PD-1）单抗显著改善晚期非小细胞肺癌（NSCLC）患者的预后。但是缺乏简便可靠的预测标志物。本研究旨在探究 NSCLC 患者的临床特征和外周血实验室指标与 PD-1 单抗治疗疗效及生存的相关性，并建立相应的预测模型。
方法 纳入浙江省内 8 家医院共 203 例接受 PD-1 单抗单药治疗的 NSCLC 患者，其中 92 例作为训练队列，111 例作为验证队列。此外，纳入 124 名接受化疗的患者作为对照队列。收集患者治疗前的临床资料和实验室指标。在训练队列中，多因素 Logistic 和 Cox 模型分别确定与疗效和生存显著相关的因素，并在对照队列中探索这些因素与化疗疗效和生存的相关性。以训练队列中的显著因素为基础，构建列线图预测治疗有效、疾病无进展和生存的概率。C 指数、曲线下面积（AUC）和校准曲线评估列线图的预测效能，并在验证队列中进行验证。
结果 训练队列中，多因素 Logistic 模型确定吸烟和淋巴细胞高与 PD-1 单抗治疗有效显著相关；多因素 Cox 回归模型确定女性、年龄＞65 岁和乳酸脱氢酶高与无进展生存期较短显著相关；乳酸脱氢酶高和衍生中性淋巴比率高与总体生存期较短显著相关。在对照队列中，这些相应的因素与化疗的疗效和生存均无相关性。基于上述训练队列中明确的显著相关的因素，构建了三个列线图分别用于预测患者 PD-1 单抗第 6 周治疗有效的概率（列线图 1）、第 6、12 和 18 个月疾病无进展的概率（列线图 2）以及第 6、12 和 18 个月生存的概率（列线图 3）。列线图 1 的 C 指数和 AUC 均为 0.706；列线图 2 的 C 指数为 0.728，第 6、12、18 个月的 AUC 分别为 0.782、0.702 和 0.661；列线图 3 的 C 指数为 0.741，第 6、12、18 个月的 AUC 分别为 0.836、0.717 和 0.691；提示三个列线图均具有良好的预测效能。在验证队列中，列线图 1 的 C 指数和 AUC 均为 0.701（95%CI 0.613-0.722）；列线图 2 的 C 指数为 0.701（95%CI 0.638-0.764），第 6、12、18 个月的 AUC 分别为 0.767、0.680 和 0.634；列线图 3 的 C 指数为 0.709（95%CI 0.612-0.806），第 6、12、18 个月的 AUC 分别为 0.818、0.700 和 0.667；提示三个列线图在验证队列中依然保持良好的预测效能。同时，校准曲线展示出了每个列线图的预测概率和实际结果有良好的一致性。
结论 基于 NSCLC 患者临床特征和外周血中简便可靠的标志物建立三个列线图来预测 PD-1 单抗治疗的疗效和生存，可以帮助临床医生早期评估患者的治疗效果和预后。

PO-1163

一种血细胞形态学室间质评新方式的探索

宋颖
上海市临床检验中心

目的 采用全自动细胞图像采集设备将血涂片数字化，通过网络服务器和专用软件实现网络化阅片。改变传统的形态学室间质评单张图片识别的考核方式，用数字化血细胞图片进行检测人员阅片能力考核。
方法 此新方式使用莱卡 Aperio CS2 扫片机在油镜下选取目标识别区域进行区域扫描。得到区域细胞数字图像后，用箭头指出待考核的所有细胞。后台随机配置一定数量的考核血细胞，参加考核的

人员通过网络打开电子图片，并点击目标箭头，进行细胞识别。2019 年至 2020 年共进行 5 次调查。调查所选用的图片来源为正常体检人员的血涂片样本。
结果 调查所选取的形态识别类型包括：中性粒细胞、嗜酸性粒细胞、嗜碱性粒细胞、小淋巴细胞、大淋巴细胞、异形淋巴细胞、单核细胞、红细胞、血小板、杂质。其中，识别率较高的细胞为中性粒细胞、嗜酸性粒细胞、小淋巴细胞和杂质。交易混淆的细胞为淋巴细胞有假核仁、反应性淋巴细胞/大淋巴细胞/单核细胞、正常红细胞/小红细胞/球形红细胞、镰状红细胞/泪滴红细胞/裂红细胞、巨大血小板/小血小板。同年形态学室间质评新方式考核回报结果为 70 至 80%，而传统考核回报结果为 98%。传统考核方式照片和照片之间的联系不够，和细胞形态学的实际检验工作相距甚远，无法使用量化指标对参与者进行考核。新方式的好处在于细胞形态的室间质评和细胞形态的实际检验工作相一致，并且能够采取量化指标对参与者进行考核。
结论 运用此新方式，参加者可以随时比较箭头所指细胞与整张片子中其他细胞的形态差异，结合所给图片信息作出正确的判断。此方式为随机抽取考核，参加室间质评的各实验室考核内容各有所异，不同于旧方式次序不同但内容相同。血细胞形态学室间质评新方式改变了传统的形态学室间质评考核模式，室间质评结果更加公平公正，具有说服力。若被应用在细胞形态学的室间质评中，可提供较为一致的质评，且更能体现公平和公正原则。

PO-1164

不明原因血细胞减少症中 MDS 的早期鉴别诊断模型的初步建立

常青
中国人民解放军总医院第一医学中心

目的 血细胞减少症（blood cytopenia）是指血液中红细胞、白细胞及血小板一系或多系减少，其原因包括营养性、免疫性、理化因素、肿瘤性等。在不明原因血细胞减少症中，临床最关注的是一类是骨髓增生异常综合征（myelodysplastic syndrome，MDS），MDS 是一组克隆性造血干细胞肿瘤，其特征是造血细胞存在不同程度的病态造血（dysplasia），外周血呈一系或多系的血细胞减少。约 60%以上的患者，因骨髓或外周血中髓系原始细胞并未明显升高，又缺乏特异性诊断标志物，多数病例混于不明原因血细胞减少症中，其早期鉴别诊断一直是个难题，且对于该病的及时治疗干预至关重要。本研究旨在将 MDS 从不明原因血细胞减少症中更准确地鉴别出来，为临床尽早进行血液专科治疗提供依据。
方法 对该实验入选的患者信息收集，进行单因素和多因素分析。包括性别、年龄、症状与体征、病史，临床常规检查结果；进行血液专科检查及数据收集，包括血液常规、血细胞形态、生化指标（铁代谢、叶酸/B12）、骨髓细胞形态、骨髓活检病理、免疫分型、染色体核型，38 种髓系肿瘤相关基因突变（包含了 WHO 2016 诊断标准列出所有髓系肿瘤相关基因突变）。
预期结果和结论 综合利用患者的临床信息、血液指标、骨髓细胞形态学与骨髓活检病理、流式免疫分型 CD 分子、染色体核型，以及 38 种髓系肿瘤相关基因突变。建立不明原因血细胞减少症早期鉴别诊断指标和参数的数据库，用于进一步模型建立与疾病诊断分析。以期实现对不明原因血细胞减少症中 MDS 的早期精准鉴别诊断，并进一步优化 MDS 诊断指标和诊断模式。

PO-1165

血小板活化功能异常性疾病发病机制探究

张驰昊、戴菁
上海交通大学医学院附属瑞金医院

目的 对 3 名血小板功能障碍的患者及其家系成员进行深入研究，明确患者的临床表型，并结合基因检测结果，尝试对患者的发病机制进行探究。

方法 采用血小板聚集试验观察血小板在多种刺激剂作用下的聚集反应；采用流式细胞术检测血小板表面功能受体的表达水平，以及经凝血酶刺激后活化标记（CD62p）的阳性率；采用血块收缩试验与血小板铺展试验评估血小板表面受体与细胞骨架蛋白的功能；同时对患者进行全外显子组基因测序，初步筛选其基因组中具有潜在致病可能的突变，并使用 Sanger 测序对可疑突变进行验证。
结果 患者 1 血小板对多种刺激剂诱导的聚集减低，其血块收缩率与血小板平均铺展面积均低于正常对照。患者 2 血小板对 ADP（2μM）诱导的聚集减低，血块收缩率低于正常对照，流式分析显示经凝血酶（0.05U/mL）活化后其血小板表面 CD62p 阳性率低于正常对照；患者 2 及其父亲均在 HPS5 基因上存在一个杂合的错义突变（c.3122C>T, p.Thr1041Met）。患者 3 血小板对 ADP（2μM）诱导的聚集减低，流式分析显示经凝血酶（0.05U/mL）活化后其血小板表面 CD62p 阳性率低于正常对照；患者 3 及其母亲、外祖父均在 ITGA2B 基因上存在一个杂合的错义突变（c.1212C>A, p.Asp404Glu）。
结论 血小板功能通常受到多种因素的影响，故血小板相关疾病的临床表型和发病机制往往较为复杂。本文对 3 名血小板功能障碍的患者进行了研究与分析，后续可进一步探究患者存在的可疑突变对蛋白功能的影响，这将有助于阐明疾病的发病机制，为血小板相关疾病的诊断与研究提供新的参考。

miR-181c 增加可调节 GATA2 缺陷细胞的存活率

陈锐[1]、王文新[2]
1. 首都医科大学附属北京同仁医院
2. 美国国立卫生研究院

GATA deficiency is caused by germline mutations in GATA, leading to loss of function or haploinsufficiency of the GATA transcription factor. GATA deficiency is manifested by severe cytopenias of multiple cell lineages, susceptibility to opportunistic infections and strong propensity to develop myelodysplastic syndrome (MDS) and acute myeloid leukemia. In this study, miRNA profiles were evaluated and eight miRNAs were found to be differentially expressed ($p \leq 0.05$) in patient derived GATA deficiency cell lines in comparison to controls. Cell death assays indicated that miR-181c potently induces cell death. GATA expression led to significant repression of miR-181c expression in transfection experiments. Conversely, knock-down of GATA by RNA interference led to increased miR-181c expression. These findings indicate that miR-181c expression is increased in GATA deficiency cells, and that GATA represses miR-181c transcription. Increased miR-181c may contribute to elevated cell death, in GATA deficient cells.

PO-1167

Development of an ultrasensitive fluorescent immunochromatographic assay based on multilayer quantum dot nanobead for simultaneous detection of SARS-CoV-2 antigen and influenza A virus

Wanzhu Shen、Chongwen Wang、Rui Xiao
Beijing Institute of Radiation Medicine

Background The ongoing coronavirus disease 2019 (COVID-19) pandemic, which is caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), has rapidly spread to over 214 countries since December 2019 and resulted in more than 104 million infected individuals and over 2.27 million deaths. The early symptoms (mainly cough and fever) of SARS-CoV-2 infection

mimic those of common respiratory viruses, such as influenza A virus (FluA); as such, controlling the epidemic spread and guiding clinical treatment are difficult. Thus, methods for accurate and rapid diagnosis of FluA/SARS-CoV-2 are urgently needed.
Methods Here, we developed a two-channel fluorescent immunochromatographic assay (ICA) for ultrasensitive and simultaneous qualification of the two viruses in biological samples. A high-performance quantum dot nanobead (QB) was fabricated by adsorption of multilayers of dense quantum dots (QDs) onto the SiO2 surface and used as the highly luminescent label of the ICA system to ensure the high-sensitivity and stability of the assay. The combination of monodispersed SiO2 core (~180 nm) and numerous carboxylated QDs formed a hierarchical shell, which ensured that the QBs possessed excellent stability, superior fluorescence signal, and convenient surface functionalization. The fluorescence signals of SiTQD labels on the two T lines could be easily observed using a UV light source for qualitative detection and quickly measured by a commercial fluorescent reader for quantitative analysis of SARS-CoV-2 and FluA.
Results Under the optimal conditions, the SiTQD-ICA simultaneously detected SARS-CoV-2 NP and FluA H1N1 in throat swab samples with LOD values of 5 pg/mL and 50 pfu/mL, respectively. The compared test results verified that the sensitivity of SiTQD-ICA was improved by about 100 times than that of traditional AuNP-based ICA method and over 20 times than that of ELISA kits. Moreover, our method showed high accuracy and specificity in throat swab samples.
Conclusions To the best of our knowledge, this work is the first to develop a two-channel ICA for simultaneous detection of SARS-CoV-2 and FluA. The proposed method is a promising and convenient tool for detection of respiratory viruses.

PO-1168

红细胞碎片参数在不同基因型地贫中诊断价值的探讨

李轶勋、武坤、郭翀、斯南卓玛、陈睿
昆明医科大学第一 附属医院

目的 探讨红细胞碎片参数（Fragmented red blood cells FRC）针对不同基因型的地中海贫血，其诊断价值的大小。
方法 收集 2018 年 2 月至 2021 年 2 月间到院就诊的地中海贫血疑似病例 724 例，采集其样本进行血液细胞分析及地中海贫血基因检测，记录红细胞碎片及常规红细胞参数结果，地贫基因分析结果。通过构建受试者工作特征曲线(Receiver operating curve ROC) ，分析比较红细胞碎片参数以及常规的 HGB、HCT、MCV、MCH、MCHC、RDW 等参数针对不同基因型地贫的诊断运用价值。
结果 （1）724 例疑似病例中，野生型 473 例（65.33%），非野生型 251 例（34.37%）。地贫基因阳性病例中，占比较高的基因型如下：aa/--SEA 基因型共 64 例（25.50%），aa/-3.7a 基因型 48 例（19.12%），βO 型 CD41-42(-TCTT)共 28 例（11.16%），βO 型 CD17 A>T 共 25 例（9.96%），β+型 CD26 G>A 共 27 例（10.76%），β+型 IVS II-654 C>T 共 23 例（9.16%）。（2）野生型和非野生型 FRC 参数均值比较 P＜0.05，差异有统计学意义。（3）在 aa/--SEA 型、βO 型 CD41-42(-TCTT)型、βO 型 CD17 A>T 型三种亚型中，FRC 绝对值 ROC 曲线下面积（AUC）分别为 0.916、0.916、0.915，FRC 百分比 AUC 分别为 0.908、0.929、0.917；在 β+型 IVS II-654 C>T 型、β+型 CD26 G>A 型、aa/-3.7a 型三种亚型中，FRC 绝对值 AUC 分别为 0.897、0.704、0.579，FRC 百分比 AUC 分别为 0.910、0.740、0.579。常规血液细胞分析参数（HGB、HCT、MCV、MCH、MCHC、RDW）AUC 均未超过 0.5。（4）若 FRC 参数联合 MCV、MCH，在 β+型 IVS II-654 C>T 型、βO 型 CD41-42(-TCTT)型、aa/--SEA 型、βO 型 CD17 A>T 型四种亚型中，AUC 可达 0.972、0.959、0.947、0.939，在 β+型 CD26 G>A 型、aa/-3.7a 型两种亚型中，AUC 可提升至 0.913、0.807。
结论 FRC 参数在本地区常见的地中海贫血基因型中的诊断价值明显优于 MCV、MCH、MCHC 等常规血液分析的筛查指标，且针对不同基因型其诊断效用不同。若将 FRC 参数与 MCV、MCH 联合运用，可提高地中海贫血筛查的效用，为地贫筛查拓展了新思路，新方法。

PO-1169

Isolation of circulating tumor cells in patients undergoing surgery for esophageal cancer and a specific confirmation method

Yingjie Chen
Department of Clinical Laboratory, Second Hospital of Shandong University

The clinical significance of circulating tumor cells (CTCs) in patients with esophageal squamous cell carcinoma (ESCC) who have undergone radical surgery was investigated. A novel confirmation method for identifying CTCs or circulating tumor microemboli (CTM) in ESCC was also investigated. Blood samples from 55 patients with ESCC were collected 1-3 days prior to surgery and 7 days post-surgery. All patients underwent curative thoracic esophagectomy and lymphadenectomy. Blood samples from 20 healthy volunteers were obtained as controls. Isolation by size of epithelial tumor cells was also performed. The overall CTC detection rate was 52.7% preoperatively and 49.1% postoperatively. The presence of CTCs correlated with the Tumor-Node-Metastasis stage and the Log odds of positive lymph nodes. No significant difference in perioperative CTC transformation was discovered between the thoracoscopic and laparoscopic approach, and the open approach. The P40+/cluster of differentiation (CD)45- phenotype was confirmed in the CTCs and CTM. The isolation by size of epithelial tumor cells method appeared to have high sensitivity for detecting CTCs within ESCC patients. Immunofluorescence staining for CD45 and P40 was a specific, accurate and conve_x0002_nient method for confirming the presence of CTCs or CTM in patients with ESCC, and is strongly recommended as a supple_x0002_ment to morphological analysis.

PO-1170

The significance of coagulation and fibrinolysis-related indexes in predicting venous thrombosis after breast cancer surgery

Lijie Su
The Second Hospital of Jilin University

Background We aimed to explore the expression level of coagulation and fibrinolysis-related indexes in the plasma of breast cancer patients after surgery, and analysis their predictive value for deep venous thrombosis (DVT).
Methods From May 2016 to May 2019, 65 patients with lower extremity DVT after radical mastectomy in our hospital were selected as the thrombus group, and 74 patients without venous thrombosis after radical mastectomy were selected as the control group. The levels of D-dimer (D-D) and fibrinolytic product (FDP) were measured by latex enhanced immunoturbidimetry, Fibrinogen (FIB) levels were measured using the von Clauss method, thrombin antithrombin complex (TAT) levels were measured by enzyme-linked immunosorbent assay (ELISA), and the evaluation value of coagulation markers on tumor thrombosis was analyzed by receiver operating characteristic curve (ROC) curve analysis.
Results There were significant differences in blood pressure, platelet count (PLT) level, and tumor metastasis between the two groups ($P<0.05$). The levels of PT, D-D, FDP, and TAT in the thrombus group were significantly higher than those in control group ($P<0.05$). The area under the curve (AUC) of D-D, FDP, and TAT were 0.790, 0.881, and 0.672, respectively and there was a marked difference among the indexes ($P<0.05$). The AUC of FDP was the largest, and the sensitivity and diagnostic value of FDP were the highest.

Conclusions The plasma levels of FDP, D-D, and TAT in breast cancer patients with DVT after radical mastectomy were significantly increased, which is related to imbalanced coagulation and fibrinolysis functioning in patients. FDP had the highest predictive value for DVT after radical mastectomy.

PO-1171

Clinical applications of monitoring immune status with 90 immune cell subsets in human whole blood by 10-color flow cytometry

Weiwei Wang[1]、Haibo Li[2]、Lihua Zhang[1]、Wenli Jiang[1]、Lisong Shen[1]、Guang Fan[2]
1. Clinical laboratory, Xinhua hospital, Shanghai Jiaotong University of Medicine School, Shanghai,200092,China
2. Department of Pathology, Oregon Health and Science University, Portland, Oregon, USA.

Introduction The immune system may involve and predict the different prognosis and therapy consequences. So, it's important to monitor and evaluate the immune status before and after treatments.
Methods Flow cytometry is the best technology to perform immune monitoring, because it can detect immune cells using small amount of sample in a short time. The whole blood is the ideal sample for immune status monitoring, since it includes almost all the immune cells and it's relatively easy to obtain and less invasive than bone marrow or lymph node.
Results Here we developed and validated a 10-color panel with only four tubes containing 29 antibodies to monitor 90 immune cell subsets in 2 ml whole blood samples. The major immune cell populations detected by our panel included T cell subsets (CD3+total T, Th, Tc, Treg, CD8hi, CD8low, αβTCR, γδTCR, naïve, and memory T), T cell activation markers (CD25, CD69, and HLA-DR) and one immune checkpoint PD1, B cell subsets (B1, switched memory, non-switched,naïve B, and CD27-IgD B cells),neutrophils, basophils, four monocytic cell subsets, dendritic cells (pDCs and mDCs),and four NK cell subsets. These panels of antibodies had been applied to monitor immune status (percentage and absolute number) in total 303 cases with various diseases, such as leukemia (AML, CML, MM, and ALL), lymphoma (B cells and NK/T cells), cancers (colon, lung, prostate, and breast), immune deficiencies, and autoimmune diseases.
Conclusion We provided proof of feasibility for clinical monitoring immune status and guiding immunotherapy by multicolor flow cytometry testing.

PO-1172

Perioperative change in neutrophil count predicts worse survival in esophageal squamous cell carcinoma

宋倩
中国科学院大学附属肿瘤医院（浙江省肿瘤医院）

Background This study aimed to investigate the relationship between perioperative change in neutrophil count and survival of patients with esophageal squamous cell carcinoma (ESCC).
Methods Neutrophil change (Nc) (Nc=Post-Neutrophil–Pre-Neutrophil) was counted according to data within one week before surgery and two weeks after surgery. All patients were divided into two groups (Nc≥2.60 and Nc<2.60) according to the median of Nc.
Results Multivariate analysis revealed that neutrophil change(Nc)(≥2.60 vs.<2.60) was an independent prognostic marker for overall survival (OS). Subgroup analysis suggested that OS of male patients, age≤60 patients, patients without vessel invasive and patients without nerve infiltration were dramatically worse for those with neutrophil change(Nc)(<2.60).

Conclusions Perioperative change in neutrophil count predicts worse survival in ESCC after the operation.

PO-1173

Impairment of proliferation and hematopoietic support function in bone marrow mesenchymal cells derived from myelodysplastic syndrome patients

Juan Wu[1]、Jiadi Chen[2]、Xuchun He[3]、Yanfang Lin[2]、Huifang Huang[2]
1. Fujian Medical University
2. 福建医科大学附属协和医院
3. 福建省卫生职业技术学院

Myelodysplastic syndrome (MDS) is characterized by a group of heterogeneous clonal disease derived from hematopoietic stem cells (HSC) and a high risk of transforming to leukemia. Bone mesenchymal stromal cells (BMSCs), as an important component of bone marrow microenvironment, play a pivotal role in the pathogenesis of MDS. Some previous studies have shown that the BMSCs derived from patients with MDS (MDS-BMSCs) exhibited the genetic abnormalities, biological and functional alterations. However, the knowledge of MDS-BMSCs is still limited and controversial. In the present study, we investigated the genetic, biological and functional characteristic of MDS-BMSCs. Although we failed to found the chromosome abnormalities which was reported in some previous literature, we found MDS-BMSCs exhibited defective proliferation and more prone to senescence partly due to the activation of p53/p21 pathway. Moreover, our study suggested MDS-BMSCs displayed significantly diminished ability to support hematopoiesis and dysregulation of some key hematopoietic cytokines gene expression including IL-6, TGF-β, GM-CSF and G-CSF. Taken together, our data showed that defective proliferation and dysfunctional hematopoietic support capacity of MDS-BMSCs.

PO-1174

Single-cell multi-omics analysis reveals the Leydig cells developmental obstacles and related mechanisms in non-obstructive azoospermia patients

Haihong He、Fan Yu、Yiwen Zhou
Clinical Laboratory Medical Center, Shenzhen Hospital, Southern Medical University

Non-obstructive azoospermia is an important factor that prevents couples from acquiring offspring naturally. We constructed a single-cell multi-omics map of NOA and normal people and found that testicular cells of NOA patients are mainly composed of somatic cells. MYC and TSSK6 were identified as hub genes among the 301 differentially expressed genes. We further focused our research on LCs and identified ACTA2, CDKN1A, SOD2 and TNFAIP3 as key genes. The pseudo-chronological analysis showed that ACTA2 increased rapidly in the later stages of cell development, while the developmental trajectories of the other 3 genes were basically the same. For the first time, we found transitional LCs between the NOA group and the normal group and the most important marker genes are CDH1, GREM1 and ABCG1. Gene Set Enrichment Analysis showed that the male gamete generation gene set was highly expressed in transitional LCs. Transcription factor analysis showed that EGR1 (975g) and JUND (156g) play an important role in the development of LCs. Gene set variation analysis showed that the NGF and Wnt signaling pathways are the key pathways that affect the development of LCs. Further analysis of the interaction between testicular cells showed that the NGF signaling pathway has

close interactions in LCs and other testicular cells, especially the NGF-NGFR ligand receptor pair. Our research reveals that LCs has developmental obstacles in NOA and further reveals the key genes, transcription factors and key signaling pathways that affect the development of LCs, filling the related knowledge and mechanism of LCs and NOA.

PO-1175

一个遗传性蛋白 C 缺陷症家系的表型与基因型分析

丁红香、 李姗姗、 朱丽丹 、徐晓杰 、倪莉 、 江明华
温州医科大学附属第二医院

目的 探讨 1 个遗传性蛋白 C 缺陷症家系的分子致病机制。
方法 对先证者及家系成员（共 3 代 7 人）进行血浆蛋白 C 活性（PC:A）、蛋白 C 抗原（PC:Ag）含量及其他凝血指标检测。用 PCR 法对先证者蛋白 C 基因（PROC）9 个外显子及侧翼序列进行扩增，PCR 产物纯化后进行直接测序；对可疑的突变用反向测序进行验证，并对家系其他成员相同突变位点进行检测。分别用生物信息学软件 MutationTaster、PolyPhen-2、PROVEAN 及 FATHMM 和 ClustalX-2.1-win 分析突变的致病性和保守性；用 Swiss-PdbViewer 软件分析蛋白质三维模型和突变氨基酸之间的相互作用。
结果 先证者及其祖母、父亲和哥哥 PC:A 和 PC:Ag 分别降至 55%、52%、48%、51%和 53%、55%、50%、56%，均明显降低。基因分析显示，上述 4 名成员 PROC 第 9 号外显子均存在 c.1318C>T（p.Arg398Cys）杂合错义突变。有三个生物信息学软件对该突变的预测评分结果一致：MutationTaster 为 0.991 分，PROVEAN 为-3.72 分，FATHMM 为-2.49 分，均显示为有害的突变；保守性分析显示，Arg398 在同源物种间高度保守。蛋白质模型分析显示，在野生型 PC 蛋白质中，极性带正电的 Arg398 与 Glu341 和 Lys395 各形成 1 个氢键；当突变为极性不带电的 Cys398 后，其链变短，与 Glu341 的氢键消失，与 Lys395 增加了 1 个氢键，使蛋白质的空间结构发生了改变。
结论 c.1318C>T 杂合错义突变是该家系遗传性蛋白 C 缺陷症的分子致病机制。

PO-1176

两种不同采血方式的临床应用价值对比分析

杨丽思、尹利民、潘永圣
昆明市第一人民医院

目的 探讨不同采血方式的临床应用价值对比分析。
方法 选取昆明市第一人民医院检验科 2017 年、2018 年、2019 年至 2020 年门诊采血患者共 751421 例为研究对象，比较 2017 年、2018 年、2019 年、2020 年的检验科门诊患者采血数据、采血等待时间、采血速度和针刺伤风险率的情况。
结果 2017 年均采用蝶翼针采血，全年采血量为：152873 例，2018 年开始采用直针采血技术以后，2018 年至 2020 年门诊采血量分别为 186554 人次、220668 人次、191146 人次，采血量的增长率分别为 22%、18.2%、44%。我科 2017 年、2018 年每天平均 6 名采血人员在工作，2019 年减少到平均每天 5 名采血人员，2020 年平均每天 4 名采血人员即可完成采血工作，使用直针技术后提高了采血速度，同比 2017 年蝶翼针采血数据每人日采血量分别增加了 22%、73.2%、86.7%；同比 2017 年的碟翼针针刺伤数据，2018 年直针采血针刺伤率风险率下降 33%，2019 年下降 50%，2020 年下降 66.7%。
结论 直针采血技术的运用提高了采血人员的采血速度，缩短了患者采血等待时间，提高了工作效率，显著降低了针刺伤风险。

PO-1177

ADAMTS13 基因突变所致低活性与血栓事件发生风险的关联

陈俊捷、李蕾、梁茜、陆晔玲
上海交通大学医学院附属瑞金医院

目的 探讨发生血栓疾病的人群中 ADAMTS13 基因突变所导致 ADAMTS13 低活性之间的关联，以及临床检测 ADAMTS13 是否具有一定的诊断价值。
方法 收集来自上海交通大学医学院附属瑞金医院的 24 例血栓病人血浆标本以及 40 例正常对照血浆标本，对病人的血浆标本进行 ADAMTS13 活性及抗原检测，以及 ADAMTS13 基因测序，筛选出 ADAMTS13 基因上存在突变的患者，以 ELISA 法检测 ADAMTS13 的抗原，FRET 法检测 ADAMTS13 的活性。
结果 对携带 ADAMTS13 基因突变患者的血浆进行 ADAMTS13 活性及抗原分析，发现较正常人群差异不大，但对 14 个 ADAMTS13 活性检测低值的标本分析后，发现除 ADAMTS13 活性降低，同时也存在 VWF 抗原升高，而 VWF 活性无明显升高，进一步检测发现这些样本的 ADAMTS13 突变位点多集中在 ADAMTS13 的 Disintegrin 结构域和 tsp1-5 结构域。
结论 本次对 24 例血栓病人进行 ADAMTS13 基因分析及 ADAMTS13 活性及抗原分析显示，携带 ADAMTS13 基因中位于 Disintegrin 结构域和 tsp1-5 结构域中的突变可导致 ADAMTS13 活性降低及 VWF 抗原水平升高，可能是与 Disintegrin 结构域包含的外泌体能够增强 MP 结构域的蛋白水解功能以及 tsp1-5 结构域能够调节 ADAMTS13 蛋白结合 VWF 的能力有关。因此，若患者携带了 ADAMTS13 该结构域的突变，其发生血栓性疾病的风险升高。而在 tsp1-8 结构域、tsp1-3 结构域、富半胱氨酸结构域和 cub-2 结构域存在突变的患者血浆的 ADAMTS13 活性及抗原水平与正常对照相比未见明显异常，其血栓发生与 ADAMTS13 突变的关系有待进一步探究。本研究显示检测 ADAMTS13 活性较检测 ADAMTS13 抗原更有意义，对临床更具有诊断价值。

PO-1178

缺血性脑卒中患者凝血和纤溶系统标志物的临床意义

宋佩佩[1]、李伟[2]、赵灵芝[1]、尤崇革[1]
1. 兰州大学第二医院
2. 中南大学湘雅医院

目的 探讨新型血栓标志物血栓调节蛋白（TM）、凝血酶-抗凝血酶复合物（TAT）、纤溶酶-α2 抗纤溶酶复合物（PIC）、组织型纤溶酶原激活物-纤溶酶原激活物抑制剂-1 复合物（t-PAI-C）在缺血性脑卒中患者中的临床意义。
方法 采用化学发光酶免疫法检测 176 例确诊的缺血性脑卒中患者初次入院时血浆 TM、TAT、PIC、t-PAI-C 水平，比较缺血性脑卒中患者与 60 名健康对照组之间的差异，同时分析这些标志物在动脉粥样硬化型卒中与腔隙型卒中之间的表达差异；短期随访三个月，记录 mRS 量表评分、卒中复发和死亡率。
结果 缺血性脑卒中患者组血浆 TM（9.83±3.14 vs 8.29±2.30 TU/ml）、TAT（3.70±3.48 vs 1.39±0.77 ng/ml）、PIC（0.70±0.56 vs 0.48±0.17 ug/ml）和 t-PAI-C（8.10±3.07 vs 6.14±2.71ng/ml）水平均明显高于正常对照组，且差异均存在统计学意义（$P < 0.01$）。动脉粥样硬化型卒中相比腔隙型卒中患者有更高的 TAT（4.07±3.12 vs 2.55±1.65 ng/ml，$P < 0.05$）和 PIC（0.75±0.53 vs 0.59±0.20 ug/ml，$P < 0.05$），TAT 的 ROC 曲线下面积为 0.649，敏感度 56.9%，特异度 76.1%。三个月有效随访患者 168 例，无死亡事件，预后不良的患者复发率更高（13/72 vs 5/96）；短期预后不良（mRS > 2）较预后良好患者血浆 TAT（5.58±4.81 vs 2.37±1.47 ng/ml，$P < 0.05$）和 PIC（0.86±0.57 vs 0.56±0.25 ug/ml，$P < 0.05$）更高，而 TM 和 t-PAI-C 在卒中亚型和预后中无明显差异。

结论 缺血性脑卒中患者存在血管内皮损伤及凝血和纤溶系统功能紊乱，初次血浆 TAT 和 PIC 水平与卒中亚型和患者预后相关，可作为缺血性卒中鉴别诊断及预后判断的辅助指标。

PO-1179

NAGL 和 IL-8 用于儿童早期尿路感染快速诊断的实验研究

余抒、李如飞
重庆市重钢总医院

目的 探讨尿液中 IL-8 和 NAGL 的表达变化与尿路感染 (urinary tract infection, UTI)以及在早期肾损伤的关系。POCT 具有“快速、便携、操作简单”等优势，突破了诸多限制，在医院检验科、急诊科、社区门诊、家庭健康管理、疫情控制等多个领域得到充分应用和推广，解决了传统大型医疗设备的使用局限，尤其是在医院资源相对落后的地区实现检验指标的快速实施。
方法 选取 6 周龄以下儿童 150 例，根据 UTI 临床诊断分为 3 组：A 组为初次诊断为尿路感染未实施临床治疗的患儿 50 例；B 组为既往尿路感染实施治疗后复发的患儿 50 例；C 组为未发生急慢性感染的儿童 50 例。为了进一步研究 NGAL 在肾损伤中的表达变化，将 UTI 标本分为 D 和 E 组，其中 D 组为 UTI 且包含合并症 44 例；E 组为单纯性 UTI 56 例。采用干化学技术分别检测入组标本尿液中 IL-8 和 NAGL 的浓度，分析两者在不同临床分组中的表达变化，结果进行统计学分析。
结果 通过对 IL-8 和 NAGL 的检测分析，IL-8 在尿路感染中呈现显著性高表达，p 值分别为 0.007 和 0.0015，并且初次感染表达明显高于再次感染；NAGL 不仅在尿路感染中呈现高表达(*p=0.008)，同时在伴有合并症的尿路感染中表达显著性升高(#p=0.005)。通过 Mann-Whitney U 检验分析得出：UTI 组中 IL-8 表达显著高于正常对照(*p=0.007)，差异显著；同时复发组中 IL-8 表达也高于对照(#p=0.0015)，差异显著，说明 IL-8 可以作为初次以及复发性尿路感染的重要提示(如图 1A 所示)。尿液 NAGL 在 UTI、复发性 UTI 均呈现高表达，且与正常对照差异显著(p 值分别为 0.008，0.005)，说明 NAGL 在尿路感染的不同阶段均具有指示性作用。
结论 本研究通过对 IL-8、NGAL 在 UTI 诊断中的分析，探讨两种指标在尿路感染发生以及合并症出现时 IL-8 和 NGAL 的表达变化。以便辅助临床快速筛查 UTI 患儿，为及时诊断治疗儿童 UTI 提供简便、准确、可靠的实验依据，减少或避免 UTI 迁延不愈、肾脏瘢痕结局的发生，达到快速诊断儿童早期尿路感染的实验目的。

PO-1180

Value of TAT, PIC with D-dimer for Cancer Patients with Metastasis

juan Cui
Chinese Academy of Medical Sciences and Peking Union Medical College

Introduction The hypercoagulability of blood is related to the development and metastasis of cancer. High levels of D-dimer have been reported to be associated with the metastasis and poor prognoses of cancer. Here, we investigated the performance of biomarkers—TAT, PIC, TM, and tPAI·C by new method—for monitoring cancer patients with metastasis.
Methods A total of 197 cancer patients were enrolled. TM, TAT, PIC, and tPAI·C were detected by the chemiluminescence immunoassay.
Results Results showed that the levels of TAT and PIC were higher in the metastasis group than those in the nonmetastasis group (P < .01). In the nonmetastasis group, there were 16 patients with elevated levels of D-dimer. But, TAT and PIC in these 16 patients were all at normal level (<0.55 mg/L FEU). After dilution, D-dimer was also decreased to normal levels in these 16 patients. The ROC was used to show the performance of D-dimer, TAT, and PIC on indicating cancer with metastasis. The AUC of PIC was higher than that of D-dimer (0.825 vs. 0.770). The

specificity and PPV of TAT and PIC were higher than those of D-dimer. Serial test of TAT, PIC, and D-dimer improved the specificity and positive predictive value to 90.91% [80.61%, 96.25%] and 89.29% [77.45%, 95.57%], respectively.
Conclusion Combining TAT and PIC with D-dimer could be useful surveillance biomarkers for cancer with metastasis.

PO-1181

细菌、真菌及 EB 病毒感染性疾病中外周血单核细胞亚群和 HLA-DR 活性的研究

刘基铎[1]、林浩颐[2]
1. 广州中医药大学第一附属医院
2. 广州中医药大学

目的 探讨不同感染性疾病的患者外周血中单核细胞及其亚群的占比和相应 HLA-DR 活性的表达是否具有统计学差异以及是否可以为相应的感染性疾病的诊断、鉴别诊断、疗效监测及预后评估提供实验室依据。
方法 收集 2020 年 8 月至 2021 年 2 月本院感染性疾病病例共 230 例，其中革兰氏阳性菌感染 47 例，革兰氏阴性菌感染 42 例，真菌性感染 46 例，EB 病毒感染 43 例，健康对照 52 例，做流式细胞学检查。
结果 实验组指标分别两两比较之后：①G+组：与对照组比较得出在总单核活性、经典型占比及其活性中表达下降，在中间型占比中表达升高；与 EB 病毒组比较得出在总单核活性、经典型活性中表达下降；与 G-组比较得出在总单核占比中表达升高，以上均具有统计学差异（P<0.05）。②G-组：与对照组比较得出在总单核活性、总单核占比、经典型占比及其活性中表达下降，在非经典型占比、中间型占比中表达上升；与 EB 病毒组比较得出在总单核活性、总单核占比、经典型活性和非经典型活性中表达下降，以上指标具有统计学差异（P<0.05）。③真菌组：与对照组比较得出在总单核活性、经典型占比及其活性、中间型活性中表达下降；与 EB 病毒组比较得出在总单核活性、经典型活性、非经典型活性、中间型活性中表达下降，具有统计学差异（P<0.05）。其余实验指标没有得出具有统计学意义的结果。
结论 不同感染性疾病的患者外周血中总单核细胞的占比和 HLA-DR 活性以及经典型、中间型、非经典型的单核细胞亚群占比和 HLA-DR 活性等的表达是不同的。分析不同感染性疾病的单核细胞及其亚群的占比和 HLA-DR 活性变化可以为相应的感染性疾病的诊断、鉴别诊断、疗效监测、预后评估提供实验室依据。

PO-1182

三种心脏病患者的外周血单核细胞亚群及 HLA-DR 的表达水平研究

刘基铎[1]、张雨欢[2]
1. 广州中医药大学第一附属医院
2. 广州中医药大学

目的 探讨三种心脏病（冠状动脉粥样硬化性心脏病 CHD、慢性肺源性心脏病 CPHD、高血压性心脏病 HHD）中单核细胞及其亚群比例和表面 HLA-DR 活性表达的差异，为临床进一步诊断、指导治疗心血管疾病提供良好的依据。

方法 收集 2020 年 7 月至 2021 年 3 月本院收治的确诊为 CHD 患者 30 例、CPHD 患者 28 例和 HHD 患者 30 例以及健康人 43 例，通过流式细胞术分别检测外周血单核细胞及其亚群的比例和表面 HLA-DR 活性。

结果 与对照组相比，HHD 组和 CHD 组外周血单核细胞比例明显升高（P<0.05），HHD 组、CHD 组、CPHD 组外周血单核细胞、CD14++CD16-单核细胞、CD14++CD16+单核细胞表面 HLA－DR 活性表达均明显降低（P<0.05），CHD 组外周血 CD14+CD16++单核细胞表面 HLA－DR 活性表达明显降低（P<0.001），。HHD 组外周血 CD14+CD16++单核细胞表面 HLA－DR 活性表达明显高于 CHD 组（P<0.001）。CHD 组外周血 CD14++CD16-单核细胞比例与对照组、HHD 组和 CPHD 组相比明显降低（P<0.001），而外周血 CD14+CD16++单核细胞比例明显升高（P<0.001）。CHD 组外周血 CD14++CD16+单核细胞比例高于 CPHD 组（P<0.05）。

结论 HHD、CHD 及 CPHD 的外周血单核细胞及其亚群比例和表面 HLA-DR 活性表达的差异与心血管疾病的疾病进程、炎症发展机制相关。

PO-1183

应用凝血酶生成试验评估胰腺癌患者高凝状态风险的研究

赵一晨[1,2]、陆晔玲[1]
1. 上海交通大学医学院附属瑞金医院
2. 上海交通大学医学院检验系

目的 评估凝血酶生成试验(thrombin generation test, TGT)在预测胰腺癌(Pancreatic cancer)患者高凝状态中的应用价值。

方法 选取 2021 年 1 月至 2021 年 3 月就诊于上海交通大学医学院附属瑞金医院的胰腺癌患者 38 例，并将胰腺癌患者的标本根据常规凝血功能试验（Routine coagulation test，RCT）结果分为 RCT 高值组[纤维蛋白原（Fibrinogen，FIB）、纤维蛋白原降解产物（Fibrin degradation products，FDP）、D 二聚体（D Dimer，DD）中至少一项高于正常值]和 RCT 正常组（FIB、FDP、DD 各项结果均正常）。另选同期相同年龄段的 60 名健康体检者作为正常对照组。在患者知情同意的情况下，采集患者乏血小板血浆，首先进行常规凝血功能试验各项检测，同时检测患者与正常对照者在 5 pmol/L TF（tissue factor, TF）试剂激活下的凝血酶生成能力的差异。分析患者 RCT 高值组与患者 RCT 正常组、患者 RCT 高值组与正常对照组、以及患者 RCT 正常组与正常对照组之间 TGT 各参数[凝血酶生成峰值(Peak)、凝血酶生成潜力（endogenous thrombin potential, ETP）、达峰时间（time to peak, ttPeak）]的差异。

结果 在 5 pmol/L TF 激活下，RCT 高值组的 Peak、ETP 显著高于正常对照组（P<0.01）；LT、ttPeak 在 RCT 高值组与正常对照组之间无统计学意义（P>0.05）。RCT 正常组的 Peak、ETP 显著高于正常对照组（P<0.01）；LT 在 RCT 正常组与正常对照组之间无统计学意义（P>0.05）。ETP、ttPeak、Peak 在 RCT 高值组与 RCT 正常组之间差异均无统计学意义（P>0.05）。

结论 胰腺癌患者中，在 5pmol/L TF 激活下，Peak 和 ETP 是 TGT 的 4 个参数指标中评估胰腺癌患者高凝状态风险的最佳指标；且 TGT 能够在常规凝血功能试验各参数结果正常的情况下，提示胰腺癌患者存在高凝状态的风险，有助于为患者制定合理的抗凝方案提供参考。此外，研究发现 TGT 中 LT 与常规凝血实验项目（PT、TT、INR、DD、FDP、FIB）具有相关性。

PO-1184

外周血白细胞绿色包涵体合并疟色素的临床和实验室检查回顾分析

郭平
上海交通大学医学院附属瑞金医院

目的 本文旨在回顾分析一例外周血白细胞绿色包涵体合并疟色素病例的临床和实验室检查，以加深广大医务工作者对该现象的认识。
方法 研究对象为尼日利亚归国务工人员，因反复高热伴关节酸痛就诊，经确诊为恶性疟感染，后因多脏器衰竭、感染性休克等并发症，经全力救治不幸逝世。实验室检查包括血常规、C 反应蛋白、生化肝肾功能检查、免疫胶体金疟原虫抗原检测、外周血细胞形态学观察。疟原虫厚、薄血膜制备与染色，油红 O 染色。
结果 入院时血常规及生化检查结果示血小板严重减少，中性粒细胞百分比升高；C 反应蛋白升高；肝、肾功能异常，胆红素升高。入院时外周血涂片见疟原虫环状体，虫体密度高。免疫胶体金抗原检测提示恶性疟感染。治疗期间疟原虫虫体密度逐渐下降，但至治疗后期仍未完全消失，外周血及脑脊液均可见虫体残留。患者病情恶化后外周血涂片中性粒细胞出现中毒颗粒，在大约 16%的中性粒细胞以及少数单核中观察到绿色包涵体及疟色素，油红 O 染色后包涵体呈橘红色，疟色素未染色。
结论 外周血白细胞的绿色包涵体及疟色素对重症疟疾预后不佳患者病情的发展具有重要提示作用。

PO-1185

急性炎症患者联合检测 CRP 和 SAA 结果分析

王白石
天津医科大学中新生态城医院

目的 急性炎症一般起病急，持续时间短，早期症状不明显。通常是由于细菌感染、病毒感染所引起。严重的细菌感染会导致脓毒血症或脓毒性休克，容易导致儿童死亡。若能在细菌感染发病早期使用抗生素，能够明显降低死亡率；而病毒感染时，不需服用抗生素。
方法 通过分组对临床标本急性炎症期 C-反应蛋白（CRP）、血清淀粉样蛋白 A（SAA）水平和正常人群水平进行动态分析比较。
结果 各组研究对象与正常对照组 CRP、SAA 水平检测结果及 SAA/CRP 的比值比较细菌感染组患者急性期的 CRP、SAA 水平明显高于病毒感染组和正常对照组，而 SAA/CRP 比值明显低于正常对照组，差异具有统计学意义（$P<0.05$）。病毒感染组患者急性期的 SAA 水平及 SAA/CRP 比值明显高于正常对照组，差异具有统计学意义($P<0.05$)，但 CRP 水平与正常对照组相比无明显变化（$P>0.05$），差异无统计学意义。
结论 1.CRP 及 SAA 均可作为细菌感染的早期诊断指标，CRP 的特异度高于 SAA，SAA 的敏感度高于 CRP。2.SAA 在判断病毒感染方面的敏感性高于 CRP，可作为病毒感染的诊断指标。3.计算 SAA/CRP 的比值，对于病毒感染早期诊断的敏感性高于单独检测 SAA，因此 SAA/CRP 的比值对于病毒感染更具有研究价值。4.CRP 与 SAA 两种感染性标记物联合检测，有利于提高早期诊断急性炎症病因的准确性，为疾病的治疗及预后提供准确有效的实验室参考指标。

PO-1186

光镜下的凋亡细胞、胀亡细胞和焦亡细胞形态学研究

沈兴娅、赵广明、李德来、杨立顺
天津市北辰区中医医院

目的 ：用显微照片形式描述和分析光镜下凋亡细胞、胀亡细胞、焦亡细胞形态，以利于临床检验操作及临床应用。

方法 将工作中收集的复检血涂片、精液涂片、脑脊液涂片及阴道/宫颈细胞涂片经瑞-姬氏染色在光镜、油镜下拍照的显微照片，利用文献中描述的细胞程序性死亡形态学理论进行分类，对不同疾病组进行分析和总结。

结果 1.凋亡细胞形态：细胞体缩小，细胞核固缩、核碎裂、核丝断裂、核融合、凋亡小体形成；①在少精子症或畸形精子症患者精液中常可检到凋亡精子细胞和凋亡初级精母细胞，②在炎性脑脊液中常可检到凋亡中性粒细胞；③在健康体检者血涂片中凋亡中性粒细胞比例较高；④在绝经期以后妇女阴道/宫颈脱落细胞涂片中常可检到凋亡鳞状上皮细胞；⑤在含有阴道毛滴虫的阴道分泌物中，可检出凋亡的阴道毛滴虫；2.胀亡细胞形态：细胞体及细胞核胀大，细胞核边聚并胀出胞体外，核染色质分散，常出现核染色质均质化溶解和不全均质化溶解，细胞膜通透性增强，可见胞浆内有泡状物，并可见胞浆内容物渗透到胞体外；①在少精症患者精液中可检到胀亡生精细胞；②在围产期妇女血涂片中常可检到较多胀亡淋巴细胞；③在 IM 组病例中，胀亡淋巴细胞检出率达（45.7%）；3.焦亡细胞形态：细胞核类似于凋亡细胞的核固缩、核碎裂，细胞质类似于胀亡细胞的细胞质胀大，细胞膜通透性增强。

结论 凋亡细胞、胀亡细胞、焦亡细胞均属于程序性死亡，是临床检验中比较常见细胞，凋亡细胞最终被巨噬细胞吞噬，不会引起周边组织炎症，属于静默性死亡；而胀亡细胞和焦亡细胞最终会出现细胞解体，将细胞内容物等炎性因子释放，引起周边组织炎症。

PO-1187

中国表观健康老年人群外周血白细胞随龄变化趋势研究

王双、陈思、江虹
四川大学华西医院

目的 探讨外周血白细胞参数及中性粒细胞淋巴细胞比(Neutrophil to lymphocyte ratio，NLR)、血小板淋巴细胞比(Platelet to lymphocyte ratio, PLR)、淋巴细胞单核细胞比（Lymphocyte to monocyte ratio ，LMR)在中国老年人群中的性别、年龄分布特征，以了解外周血白细胞的随龄变化趋势；

方法 2018 年 4 月至 12 月，对不同地区 9 家医院招募的 14331 例健康受试者进行血液常规检测，其中 40-49 岁组 3941 例（男 2012 例，女 1929 例)、50-59 岁组 3346 例（男 1947 例，女 1399 例) 、60-69 岁组 3808 例（男 2103 例，女 1705 例) 、70-79 岁组 2222 例（男 1376 例，女 846 例)、80-89 岁组 1014 例（男 677 例，女 337 例)，对各组受试者外周血白细胞参数及血细胞比值结果进行组间比较，分析不同性别及年龄组白细胞参数与血细胞比值差异，探索年龄与 NLR、PLR 及 LMR 的相关性及其随龄变化趋势；

结果 各年龄组组间比较显示淋巴细胞计数、单核细胞计数、NLR 及 PLR 四项参数结果组间比较差异具有统计学意义（P＜0.05）；通过 Pearson 相关分析显示， NLR 与年龄呈正相关、LMR 与年龄呈负相关（P＜0.01）；NLR 随受试者年龄增加缓慢上升，LMR 随受试者年龄增长缓慢下降，PLR 无明显的随龄变化趋势；各年龄组男性白细胞、中性粒细胞、嗜酸性粒细胞计数和 NLR 均高于女性，淋巴细胞计数、PLR 和 LMR 均低于女性，差异具有统计学意义（P＜0.05）。

结论 老年人群白细胞参数及全血 NLR、PLR、LMR 结果可随受试者性别、年龄发生变化，将其应用于疾病诊断或预后评估时应充分考虑年龄及性别的影响。

PO-1188

应用外周血细胞相关指标构建重症感染评分进行感染预测研究

王双、陈思、江虹
四川大学华西医院

目的 探讨外周血细胞检测参数在感染性疾病中的变化，构建重症感染评（Intensive Care Infection Score，ICIS），应用 ICIS 进行感染早期预测评估。
方法 选取脓毒症患者 140 例，纳入脓毒症病例组；单纯感染患者 160 例，纳入感染病例组；随机选取健康体检者 100 例，纳入对照组。对研究纳入者进行血常规检测，获得外周血细胞参数结果，进行非参数分析组间比较，选取指标构建 ICIS，应用受试者工作曲线（ROC）评估 ICIS 预测感染的诊断效能。
结果 组间比较可见中性粒细胞计数（NEUT）、幼稚粒细胞计数 (IG)、高荧光强度大细胞计数（HFLC）、平均中性粒细胞侧向荧光强度(NE-SFL)、成熟红细胞与新合成红细胞间血红蛋白差异（Delta-He）五项参数结果具有明显统计学差异（P＜0.001), 脓毒症与单纯感染组 NEUT、IG、HFLC、NE-SFL 结果明显高于健康组，Delta-He 结果则低于健康组，绘制感染预测 ROC 曲线，NEUT、IG、HFLC、NE-SFL、Delta-He 曲线下面积分别为 0.830、0.872、0.630、0.837、0.804；应用 NEUT、IG、HFLC、NE-SFL、Delta-He 五项参数构建 ICIS（0-5 分），感染预测临界值为 3 分，用于感染早期预测时灵敏度为 83.6%，特异度为 72.1%。
结论 由外周血细胞参数构建的 ICIS 可作为一种简易方法预测患者感染情况，将 ICIS 与外周血炎性因子等其他感染预测指标结合使用可辅助提高临床对感染性疾病的诊断效能。

PO-1189

危重症慢性呼吸衰竭患者淋巴细胞免疫分型变化研究的临床价值

张文佳
重庆市人民医院三院院区

目的 探讨外周血淋巴细胞免疫分型在危重症慢性呼吸衰竭患者中的变化及临床价值。
方法 选取本院 64 例危重症慢性呼吸衰竭患者，根据病因将其分为肺实质炎症组、肺间质炎症组、慢性阻塞性肺疾病组和其它疾病组，同时选取 30 例健康人作为正常对照组，采用流式细胞法检测外周血 CD3+、CD3+CD4+、CD3+CD8+T 淋巴细胞绝对计数及其百分比，同时计算 CD3+CD4+/CD3+CD8+比值，比较各亚组间淋巴细胞绝对计数及其百分比差异，同时与对照组比较分析。
结果 危重症慢性呼吸衰竭患者较正常人外周血 CD3+、CD3+CD4+、CD3+CD8+T 淋巴细胞绝对计数均极显著降低（P≤0.01），当肺部疾病与其它疾病比较时，前者 CD3+CD4+/CD3+CD8+淋巴细胞比值明显升高（P≤0.05），后者明显降低（P≤0.05），其中肺实质炎症组 CD3+CD8+%极显著降低（P≤0.01），肺间质炎症组 CD3+CD8+T 淋巴细胞绝对计数明显降低（P≤0.05），慢性阻塞性肺疾病组 CD3+CD4+%明显降低（P≤0.05）和 CD3+CD4+/CD3+CD8+淋巴细胞比值明显升高（P≤0.05）；当与正常对照组的外周血淋巴细胞免疫分型比较时，肺实质炎症组和肺间质炎症组变化一致，即 CD3+、CD3+CD4+、CD3+CD8+T 淋巴细胞绝对计数极显著降低（P≤0.01），CD3+%、CD3+CD8+%明显降低（P≤0.05），CD3+CD4+/CD3+CD8+淋巴细胞比值明显升高（P≤0.05），慢性阻塞性肺疾病组无 CD3+%显著升高；三组肺部疾病之间外周血淋巴细胞免疫分型变化均无明显差异（P≥0.05）。

结论 危重症慢性呼吸衰竭患者淋巴细胞数量均较低，存在明显的细胞免疫功能紊乱，对比其他严重病因，CD3+CD4+T 淋巴细胞数量的升高，可用于鉴别诊断肺部炎症和慢性阻塞性肺疾病。但是相较于正常人，引起危重症慢性呼吸衰竭的各种肺部疾病之间的差异，有待进一步研究。

PO-1190

数字 PCR 检测血流感染病原菌的临床应用研究

吕琳婷、刘芳瑞
上海交通大学医学院附属仁济医院(东院)

背景 血流感染是指细菌、真菌等病原微生物入侵血循环，在血液中繁殖,释放毒素和代谢产物,并诱导细胞因子释放,引起全身感染性疾病。目前血流感染的主流病原菌有大肠埃希菌、肺炎克雷伯菌、鲍曼不动杆菌、铜绿假单胞菌以及各类葡萄球菌。大多入侵为呼吸道感染、泌尿系统感染以及腹腔感染。近些年由于抗生素和介入治疗的使用，血流感染的发病率呈持续增高趋势。目前检测血流感染最重要的检查手段是血培养。但血培养周期时间长、用血量大、且无法定量，早期诊断及准确的抗菌治疗对降低疾病死亡率至关重要。
目的 运用领航数字 PCR 系统检测临床血浆样本中的病原菌，以测评该技术的临床应用价值。
方法 采用领航基因五色荧光数字 PCR 系统检测 169 份临床血浆样本，并与传统血培养方法进行比较，计算数字 PCR 技术检测血流感染的敏感度、特异性和符合率。
结果 本次实验检测的 169 份样本中，血培养阳性 27 例，阴性 142 例，阳性率 16%；数字 PCR 阳性 15 例，阴性 154 例，阳性率 8.9%。与传统血培养鉴定技术相比，领航五色荧光数字 PCR 系统检测血流感染样本的敏感度为 24%，特异性为 97.2%，阳性预测值为 60%，阴性预测值为 88%，总体符合率为 88.8%。数字 PCR 系统鉴定阳性的病原菌包括绿假单胞菌（1 例）、大肠埃希菌（5 例）、肺炎克雷伯菌（4 例）、鲍曼不动杆菌（2 例）、屎肠球菌（3 例）、粪肠球菌、嗜麦芽窄食单胞菌（5 例）、表皮葡萄球菌（3 例）。但由于血培养阴性而数字 PCR 检测阳性的病原菌主要集中在嗜麦芽假单胞菌和表面葡萄球菌，所以不能排除污染的可能性。
结论 数字 PCR 技术是一种新型血流感染的检测技术，检测时间短，具有较好的特异性，但敏感性还有待提高，未来或许可以成为临床早期诊断与优化感染治疗的新方法。

PO-1191

117 例多发性骨髓瘤流式细胞术免疫表型分析

陈雪
吉林金域医学检验所有限公司

目的 探讨多发性骨髓瘤(MM)免疫表型的特点和临床意义。
方法 选取 2020 年 1 月至 2020 年 12 月送检我公司的多发性骨髓瘤分型样本 117 例，使用十色流式细胞仪,按照多发性骨髓瘤分型十色方案添加抗体,对样本进行免疫分型检测,并分析抗原表达情况。
结果 117 例样本中，浆细胞呈单克隆性共 83 例,占 70.9%,胞内免疫球蛋白 Kappa 轻链限制性表达的为 38 例(45.7%),胞内免疫球蛋白 Lambda 轻链限制性表达的为 45 例(54.3%),各类抗原的表达情况依次为 CD38 强阳性 33 例(39.7%),阳性 50 例(60.2%);CD138 阳性 59 例(71.0%),部分阳性 23 例(27.7%),少量阳性 1 例(1.2%);CD19 阳性 17 例(20.4%),部分阳性 13 例(15.6%),少量阳性 1 例(1.2%),阴性 52 例(62.6%);CD56 阳性 47 例(56.6%),部分阳性 1 例(1.2%),阴性 35 例(42.1%);CD20 阳性 15 例(18.0%),阴性 68 例(81.9%);CD27 阳性 7 例(8.4%),部分阳性 14 例(16.8%),阴性 62 例(74.6%);CD81 阳性 16 例(19.2%),部分阳性 3 例(3.6%),少量阳性 1 例(1.2%),阴性 63 例(75.9%);CD28 阳性 10 例(12.0%),部分阳性 5 例(6.0%),少量阳性 3 例(3.6%),阴性 65 例(78.3%)。浆细胞呈多克隆性共 27 例,占 23.0%,各类抗原的表达率依次为 CD38 阳性 27 例(100%);CD138 阳

性 19 例(70.3%),部分阳性 8 例(29.6%);CD19 阳性 27 例(100%);CD56 阴性 27 例(100%);CD20 阳性 3 例(11.1%),阴性 24 例(88.8%);CD27 阳性 15 例(55.5%),部分阳性 7 例(25.9%),阴性 5 例(18.5%);CD81 阳性 24 例(88.8%),阴性 3 例(11.1%);CD28 阴性 27 例(100%)。无浆细胞共 7 例,占 5.9%。

结论 流式细胞术免疫分型能快速、多参数、客观地测定细胞膜和胞浆中多种抗原的表达,准确地判断多发性骨髓瘤的类别,结果重复性好,从而能够更加准确的判断出多发性骨髓瘤,为多发性骨髓瘤的预后和治疗方案的选择提供了科学的依据。

PO-1192

尿液分析中如何快速解决携带污染问题的探讨

何秋阳、马顺高、钟国梁
大理州人民医院（云南省大理白族自治州）

目的 探讨日常工作中如何快速解决尿液分析中携带污染问题。

方法 将 200 名我院 2020 年 1 月-2020 年 12 月期间住院患者的肉眼血尿标本和当天健康体检尿液标本作为研究对象，研究对象分为 2 组，即肉眼血尿组 100 例和健康体检组 100 例。采用希森美康 UF5000 和 UF3500 分别对其连号（即 1 号为肉眼血尿，2 号为健康体检）和隔号（1 号为肉眼血尿，2 号为生理盐水，3 号为健康体检）进行分析。

结果 相同标本的隔号分析结果和连号分析结果做比对，肉眼血尿标本无显著差异、健康体检标本隔号检查结果与连号检查结果有显著差异。

结论 隔号检测可以有效避免高浓度标本给低浓度标本带来的携带污染问题。此方法在标本量大且时间紧迫的三甲医院日常工作中非常实用，既可以保证检验结果的准确性，又可以按时出具报告。

PO-1193

CRP/ALB 联合 ALB/PLT、NLR 和 PLR 对克罗恩病的辅助诊断价值

江烊州
中国人民解放军陆军军医大学第二附属医院

目的 探讨血清 C-反应蛋白 / 白蛋白值（CRP/ALB）、白蛋白 / 血小板值（ALB/PLT）、中性粒细胞与淋巴细胞比值（NLR）及血小板与淋巴细胞比值（PLR）联合指标对克罗恩病(Crohn disease，CD)的辅助诊断价值。

方法 收集来源于陆军军医大学第二附属医院的 218 例样本，其中健康组：健康者 68 例；疾病组（CD 组）：克罗恩病患者 86 例；鉴别对照组（UC 组）：溃疡性结肠炎患者 64 例进行回顾性分析。比较各组中 CRP/ALB、ALB/PLT、NLR 和 PLR 的变化，采用受试者工作特征(ROC) 曲线评价单项及联合分析对 CD 的诊断及鉴别诊断价值。

结果 与健康组相比，疾病组 CRP/ALB、NLR 和 PLR 水平均显著升高，而 ALB/PLT 水平显著性降低，差异均有统计学意义（P<0.05）。与鉴别对照组相比，疾病组 CRP/ALB、ALB/PLT、NLR 和 PLR 水平显著升高且差异具有统计学意义（P<0.05）；四项指标联合检测 CD 的 ROC 曲线下面积（AUC）为 0.867，明显高于单项检测（AUC 分别为 0.703、0.718、0.791、0.839）。联合检验的灵敏度为 79.1%，特异度为 86.6%；CRP/ALB、ALB/PLT、NLR 和 PLR 四项指标单独检测鉴别诊断 CD 和 UC 的 AUC 分别为 0.575、0.527、0.658、0.659。联合检测下鉴别诊断的 AUC 为 0.716。

结论 CRP/ALB、ALB/PLT、NLR 和 PLR 联合指标对 CD 的辅助诊断有较高价值，可用于 CD 的辅助诊断和鉴别诊断。

PO-1194

男性患者精液分析及疾病分布探讨

陶亚
中南大学湘雅医院

目的 通过分析男性患者精液常规检测结果，探讨临床上导致精液异常的疾病分布以及男性不育症患者的精液质量现状，为临床上男性不育等男科疾病的诊疗提供依据。
方法 对 2020 年 7 月 1 日-2021 年 2 月 28 日在中南大学湘雅医院首次进行精液常规检测的 1280 例患者，利用 SQA-V 自动化精子质量分析系统进行精液常规检测。
结果 1280 例患者中，精液检测各项参数完全正常患者 479 例，一项或多项参数异常患者 801 例。精液异常患者主要表现在精子总活动力、前向活动精子率及形态正常精子率异常，分别占 63.4%、78.5%、41.1%；其中 532 例患者已被确诊为男性不育症，188 例存在前列腺炎，147 例有精索静脉曲张，140 例罹患泌尿生殖系统感染，51 例存在性功能障碍，28 例存在生殖系统炎症，18 例存在泌尿生殖系统器质性病变，7 例有内分泌系统疾病，12 例为其他疾病患者。对 814 例临床已诊断明确的男性不育患者的精液进行常规分析，其中完全正常者 283 例(34.8%)，异常者 531 例(65.2%)。各参数分析显示：精子总活动力异常 343 例(占 42.1%)；前向活动精子率异常 430 例(占 52.8%)；形态正常精子率异常 244 例(占 30.0%)。
结论 男性患者的精液异常主要表现在精子活力的下降及精子畸形率高，与男性不育症患者精液异常表现一致。精索静脉曲张，前列腺炎及泌尿系统感染对男性生育有较大的影响，临床上应及时采取有效的治疗措施。

PO-1195

snoRD4A 作为肾透明细胞癌新型标志物及调控其生物学行为的研究

张倩茹、宋兴国、尚晓玲、宋现让
山东省肿瘤医院

肾细胞癌（Renal Cell Carcinoma，RCC，简称肾癌）是起源于肾小管上皮的恶性肿瘤，占肾脏恶性肿瘤的 80%-90%，其最常见的病理类型为透明细胞癌，近年来肾癌的全球发病率以每年 2%-3%的速度持续增长，已经成为全球男性第六大常见癌症。 多项研究表明 snoRNAs 的异常表达直接影响着肿瘤的发生、发展及预后。在多种肿瘤中普遍存在有 snoRNAs 异常表达，但在特定肿瘤中只有特定 snoRNAs 表达异常，这表明 snoRNAs 表达却具有肿瘤类型特异性。
目的 验证尿沉渣中 snoRD4A 作为肾透明细胞癌（Clear cell renal cancer cell, ccRCC）新型标志物能力，并探索 snoRD4A 对 ccRCC 发生发展的驱动作用。
研究方法（1）通过肾癌组织 TCGA 数据，筛选出与肾癌发生发展效密切相关的 snoRNAs，RT-PCR 验证肾癌患者和健康志愿者之间血浆、尿沉渣 snoRNAs 分子表达差异情况，计算诊断效能；（2）进行肾癌恶性生物学行为体外功能实验，包括 CCK8 实验，克隆形成实验，细胞凋亡实验等；（3）慢病毒构建过表达或沉默表达 snoRD4 稳筛细胞株，进行裸鼠皮下成瘤实验；（4）蛋白质谱分析差异蛋白，WB 验证差异蛋白表达。
结果 （1）snoRD4A 在肾癌石蜡组织、血浆以及尿沉渣中表达升高。（2）在肾癌细胞中沉默 snoRD4A 表达，细胞的增殖、克隆形成能力减弱，凋亡能力增强；在肾癌细胞中过表达 snoRD4A，细胞的增殖和克隆形成能力增强，凋亡能力减弱；（3）在动物体内沉默 snoRD4A 的表达，肿瘤体积明显减小；（4）蛋白质谱实验、western blot 实验以及拯救实验表明 snoRD4A 可能通过 Wnt 信号通路调控肾癌恶性生物学行为。

结论 尿沉渣 snoRD4A 可作为 ccRCC 的一种无创性诊断标志物。且 snoRD4A 通过 Wnt 信号通路调控 ccRCC 恶性生物学行为。

PO-1196

血小板活化及功能评估参数在静脉血栓栓塞性疾病诊断中的价值

肖贺欣、吕晓艳、王言
吉林大学第二医院

目的 血小板在静脉血栓栓塞（VTE）中的角色和参与程度目前仍未明确。本研究的目的是评估 VTE 患者血小板活化和功能状态。通过对 VTE 患者外周血中不同血小板参数，包括未成熟血小板分数（IPF）、未成熟血小板计数（IPC）、P-选择素、血小板计数（PLT）及血小板聚集（PA）参数的检测，探索未成熟血小板以及血小板的活化和功能在静脉血栓栓塞疾病中的作用及对疾病进程的影响。
方法 选取超声检查显示有特发性深静脉血栓形成（DVT）和/或因固定引起的肺栓塞（PE）或 VTE 的 46 位 VTE 入院患者为观察组。选取 50 名健康体检者作为对照组。IPF、IPC、PLT 计数由 Sysmex XN-2000 分析仪检测，P-选择素由 Beckman 流式分析仪检测，PA 使用血小板聚集分析仪检测。
结果 与对照组相比，VTE 组 IPF、IPC 均无明显差异(P>0.05)。PLT 计数和诱导剂刺激下 PA 与对照组相比均有不同程度的下降(P<0.05)，且 ADP、胶原及 AA 诱导的 PA 降低与血小板计数之间呈正相关。血小板 CD62p 与对照组相比呈显著增高（P<0.01）。
结论 VTE 患者血小板绝对计数及聚集功能显著降低，且二者呈相关性，这可能与 VTE 中血小板的消耗相关。但血小板活化程度明显增高，提示血小板的活化在 VTE 疾病发生中发挥重要作用。

PO-1197

冠心病患者同型半胱氨酸水平与血小板聚集功能的相关性探讨

李洁、张云平
哈尔滨医科大学附属第一医院

目的 探讨冠心患者同型半胱氨酸水平(Homocysteine，HCY)与血小板聚集功能之间的关系。
方法 检测 112 例冠心死患者及正常的健康体检者 91 例的 HCY 及以二磷酸腺苷（ADP）和花生四烯酸（AA）为诱导剂的血小板聚集功能，进行统计对比分析。
结果 冠心病组的 HCY 水平、血小板聚集功能与对照组比较有显著差异(P<0.05)；高 HCY 患者组的血小板聚集功能与正常 HCY 患者组比较有显著差异(P<0.05)。
结论 HCY 水平增高可引起血小板聚集功能增强，是冠心病反复发作的高危因素。

PO-1198

骨髓间充质干细胞来源的外泌体 miR-10a 通过 RPRD1A 激活的 Wnt 信号通路保护急性髓系白血病细胞免受化疗

张雅琴[1]、吴娟[2]、李小玉[1]、陈玲[2]、陈加弟[1]、黄慧芳[1]、曹颖平[1]
1. 福建医科大学附属协和医院
2. 福建医科大学医学技术与工程学院

Exosomes derived from acute myeloid leukemia(AML)-bone mesenchymal stem cells(AML-BMSCs-Exos) has been proposed as one of the important factors for promoting tumor development and drug resistance on AML. However, the molecular mechanism remains unclear. In this study, We found that the level of miR-10a in AML-BMSCs-Exos was increased compared with that of healthy donor BMSCs exosomes(HD-BMSCs-Exos), and miR-10a can protect AML cells from chemotherapy. MiR-10a derived from AML-BMSCs-Exos can down-regulate RPRD1A expression, which can activate Wnt signaling pathway and mediated AML cells drug resistance.

PO-1199

房颤患者 CRP、D-2 聚体水平与脑血管病认知障碍的相关性分析

朱冉
资阳市第一人民医院

目的 研究房颤患者 CRP、D-2 聚体水平与脑血管病认知障碍的相关性。
方法 选取我院 90 例房颤患者，根据出现脑血管病及认知功能障碍，分为研究组（N=30）和观察组（N=30）以及参考组（N=30），对三组都进行 CRP、D-2 聚体水平的检测，分析房颤患者 CRP、D-2 聚体水平与脑血管病的相关性分析。
结果 研究组以及观察组均出现不同程度的脑血管病并伴一定程度认知功能障碍，CRP、D-2 聚体升高率明显高于参照组（P<0.05），分析其相关性发现，CRP、D-2 聚体水平与脑血管病认知障碍呈负相关（r=-0.621，-0.51，p<0.01）。
结论 房颤患者 CRP、D-2 聚体水平与脑血管病认知障碍呈负相关，对于房颤患伴 CRP、D-2 聚体水平升高的患者具有早期预防诊断作用。

PO-1200

妊娠合并血小板减少的病因分析及产后母儿影响

袁秋艳
资阳市第一人民医院

目的 观察和分析妊娠合并血小板减少的病因及不同程度血小板减少对母婴结局的影响。
方法 回顾性分析 2010 年 1 月 1 日至 2020 年 12 月 31 日本院收治的妊娠合并血小板减少病例 X 例,分析血小板减少的不同病因和血小板降低的不同程度对母儿结局的影响。
结果 妊娠合并血小板减少的病因主要为妊娠期血小板减少症(GT)、免疫性血小板减少性紫癜(ITP)、先兆子痫(PE)、HELLP 综合征及弥散性血管内凝血(DIC).五组患者的早产率、胎死宫内发生率、产后出血发生率等妊娠结局存在组间差异(P<0.05).依血小板降低程度分为轻 PLT(50～100)×109/L、中 PLT(30～50)×109/L、重,PLT＜30× 109/L 三组,随血小板减少程度的增加,三组间剖宫产率、早产率、死产率、产后出血率均存在统计学差异(P<0.05).
结论 不同程度血小板减少对母婴结局均有不良影响..血小板计数<50×109/L 对不良妊娠结局有重要的提示作用.

PO-1201

血 NLR、β2-MG 和 Cys-C 对初诊多发性骨髓瘤患者合并肾损伤预测价值的探讨

厉吉霞
烟台市烟台山医院

目的 探讨血中性粒细胞/淋巴细胞比值（NLR）、β2-微球蛋白(β2-MG）及胱抑素 C（Cys-C）对初诊多发性骨髓瘤（MM）患者合并肾损伤的预测价值。
方法 回顾性分析 2013 年 1 月至 2020 年 12 月烟台市烟台山医院收治的初诊为 MM 的患者 97 例，按照血肌酐水平将 MM 患者分为肾损伤组 22 例（血肌酐＞176.8mmol/L）及非肾损伤组 75 例（血肌酐≤176.8mmol/L）。比较肾损伤组和非肾损伤组的性别、年龄、临床分型及实验室指标。采用二元 Logistic 回归法单因素及多因素分析 MM 发生肾损伤的危险因素，应用受试者工作特征曲线（ROC），评估各危险因素对 MM 患者发生肾损伤的预测价值。
结果 97 例初诊 MM 患者发生肾损伤者占 22.70%。MM 肾损伤组与非肾损伤组比较性别、年龄，红细胞分布宽度（RDW）、血浆纤维蛋白原含量（FIB）、血清白蛋白（ALB）检测水平差异不具有统计学意义（P 值均＞0.05）；临床分型 IgG-λ 型，IgA-κ 型、IgA-λ 型、不分泌型差异不具有统计学意义（P 值均＞0.05），临床分型轻链型、IgG-κ 型差别具有统计学意义（P 值均＜0.001）。MM 肾损伤组外周血白细胞（WBC）、中性粒细胞/淋巴细胞比值（neutrophil to lymphocyte ratio,NLR），单核细胞与淋巴细胞比值(mtolymphocyte ratio,MLR)、血清碱性磷酸酶（ALP）、血清唾液酸（SA）、血清胱抑素 C(CysC)、血清 β2-微球蛋白(β2-MG）水平高于非肾损伤组，红细胞（RBC）、血红蛋白（HB）含量低于非肾损伤组。差别均有统计学意义（P 值均＜0.05）。WBC、NLR、MLR、ALP、HB、RBC、β2-微球蛋白、Cys-C 是多发性骨髓瘤肾损伤的危险因素。NLR≥1.92，β2-MG≥6.66mg/L，Cys-C≥1.66mg/L 是多发性骨髓瘤肾损伤的独立危险因素，P 值均＜0.05。ROC 曲线分析显示，NLR、β2-MG、Cys-C 曲线下面积（area under the curve,AUC）分别为 0.758、0.929、0.921；NLR、β2-MG 和 Cys-C 联合检测预测价值更高，曲线下面积 AUC 值为 0.968。
结论 NLR≥1.92，β2-MG≥6.66mg/L，CYS-C≥1.66mg/L 是多发性骨髓瘤肾损伤的独立危险因素。提示临床联合检测 NLR、β2-MG、Cys-C 可提高 MM 患者肾功能损伤的早期检出率。

PO-1202

妊娠期贫血患者的血常规检验结果分析

王菊
资阳市第一人民医院

目的 结合临床意义，对妊娠期妇女的血常规检验结果进行回顾性分析。
方法 选取 2019 年 1 月至 2021 年 1 月到资阳市第一人民医院就诊的 150 例妊娠期贫血患者，另收集同期就诊的 150 例非贫血孕妇，对两种人群的血常规检验结果进行分析比较。
结果 孕中期及孕早期小细胞性贫血发生的几率较高，分别为 35.53%和 39.47%，孕晚期大细胞性贫血发生率较高，为 60.29%，组间差异有统计学意义（P<0.05）。小细胞贫血孕妇的 MCV、MCH、MCHC 等指标均低于对照组，大细胞贫血孕妇的 MCV、MCH 等指标均高于对照组，而 RBC 低于对照组，组间差异有统计学意义（P<0.05）。
结论 孕妇贫血的几率较高，应加强对孕妇生理健康的定期体检和长期管理，避免影响到胎儿出生后的健康状态。

PO-1203

行人工全髋关节置换术后高凝状态患者凝血因子活性变化及D-二聚体水平相关分析

唐笛娇
重庆医科大学附属第一医院

目的 凝血因子活性是临床凝血项报告中最常见的一种参数，反映了参与血液凝固过程中各种蛋白质组分的活性。已有研究表明，凝血因子活性检测可能对有效评估出血风险等有积极作用。D-二聚体可作为血栓的排除指标。本研究旨在探讨行人工全髋关节置换术后呈高凝状态患者的凝血因子活性变化情况以及与术后 D-二聚体水平是否存在一定关系。
方法 本研究共收集了 2019 年 1 月至 2020 年 1 月重医附一院骨科的 63 例人工髋关节置换术患者的相关临床资料并进行了相关分析。利用血栓弹力图数据判断术后高凝状态的患者。
结果 通过配对样本 t 检验发现，手术前后活性变化有统计学意义的有凝血因子Ⅱ、凝血因子Ⅷ和凝血因子 XⅡ，并通过 Spearman 相关性分析得到，在 D-二聚体≤3.4mg/L 时，凝血因子 XⅡ与 D-二聚体有显著相关（P＜0.05）。以 TEG 指标作为高凝状态的诊断标准做 ROC 分析，凝血因子Ⅱ(AUC=0.507,P=0.954), 凝血因子 XI（AUC=0.447，P=0.643）、FXII（AUC=0.414，P=0.451）。
结论 在 D-二聚体较低时，凝血因子 XⅡ与 D-二聚体有显著相关。术后单独 FⅡ、FXI、FXII 活性对高凝状态的预测作用并不显著，可以选择联合应用提高预测效果。

PO-1204

AKA、CCP、MCV、RF 和 CRP 联合诊断在类风湿关节炎中的临床价值

张彬、李智洋
南京鼓楼医院

目的 探究抗环瓜氨酸肽抗体（ anti-CCP ）、抗角蛋白抗体（ AKA ）、C 反应蛋白(CRP)、抗突变型瓜氨酸波形蛋白抗体（ anti-MCV ）联合类风湿因子(RF)在类风湿关节炎(RA)诊断中的价值。
方法 选择 2018 年 10 月- 2019 年 11 月南京鼓楼医院纳入类风湿关节炎（ RA ）临床确诊病例 173 例，归为 RA 组；另外选取同期非类风湿关节炎病例 99 例，为非 RA 组。抗 CCP 抗体和抗 MCV 抗体采用 ELISA 法检测，抗角蛋白抗体（ AKA ）采用间接免疫荧光法，(RF)和(CRP)采用速率散射比浊法检测。采用 t 检验及 ROC 曲线等统计方法，分析两组结果差异及其相关性。比较两组之间抗 CCP 、AKA 、CRP 、抗 MCV 、 RF 单独检测与联合检的阳性率；比较抗 CCP 、CRP 、抗 MCV 、 RF 检测的灵敏度、特异性。
结果 RA 组患者抗 CCP 、抗 AKA、 CRP 、抗 MCV 和 RF 的阳性率明显高于非 RA 组的阳性率，差异均有统计学意义（P<0.05）；联合检测的阳性率明显高于单一检测的阳性率，差异有统计学意义（P<0.05）。血清抗 CCP、抗 MCV 和 RF 诊断 RA 的曲线下面积（ AUC ）分别为 0.7827、0.7904 和 0.7372；在最佳诊断临界条件时，敏感度分别为 65.32％、65.90％和 58.72％；特异度分别为 89.90％、89.90％和 87.88％。 RA 组患者血清 RF 与 CRP 呈正相关（ y = 4.170 x + 174.2， r = 0.2482， P = 0.0010 ）。抗 CCP 和抗 MCV 与 CRP 均无相关性（均 P > 0.05）。
结论 抗 CCP 、抗 AKA 、 CRP 、抗 MCV 及 RF 对 RA 均具有一定的辅助诊断价值，5 项联合检测可提高 RA 的检出率，有助于风湿科临床医师对 RA 患者采取及时有效的治疗、干预措施。

PO-1205

Lymphocyte-Monocyte-Neutrophil index: a Predictor of Severity of Coronavirus Disease 2019 Patients Produced by Sparse Principal Component Analysis

Jianan Jia
The 901th Hospital of Joint Logistics Support Force of Chinese People's Liberation Army

Background It is important to recognize severe ill coronavirus disease 2019 (COVID-19) patients from moderate ones and more effective predictors should be developed.
Methods Clinical indicators of COVID-19 patients from two independent cohorts (Training data: Hefei Cohort, 82 patients;Validation data: Nanchang Cohort, 169 patients) were retrospected. Sparse principal component analysis (SPCA) using Hefei Cohort was performed and prediction models were deduced. Prediction models were evaluated by receiver operator characteristic curve and decision curve analysis (DCA) in above two cohorts.
Results SPCA using Hefei Cohort revealed that the first 13 principal components (PCs) accounted for 80.8% of the total variance of the original data. The PC1 and PC12 were significantly associated with disease severity with odds ratio of 4.049 and 3.318 respectively and were used to construct predication model, named Model-A. In disease severity prediction, Model-A gave the best prediction efficiency with area under curve (AUC) of 0.867 and 0.835 in Hefei and Nanchang Cohort respectively. Model-A's simplified version, named as LMN index, gave comparable prediction efficiency as classical clinical markers with AUC of 0.837 and 0.800 in training and validation cohort respectively. In DCA, Model-A gave slightly better performance than others and LMN index showed similar performance as albumin or neutrophil-to-lymphocyte ratio.
Conclusions Prediction models produced by SPCA showed robust disease severity prediction efficiency of COVID-19 patients and have the potential for clinical application.

PO-1206

罗湖区孕期 D-二聚体、FDP 参考区间的建立及在产后出血的应用

唐丽姣
深圳市罗湖区妇幼保健院

目的 初步建立深圳市罗湖区孕妇不同孕期 D-二聚体、FDP 的参考区间，并探讨动态检测 D-二聚体、FDP 对产后出血早期预测价值。
方法 收集研究组孕妇 1138 例，按孕期分为早孕（386 例）、中孕（351 例）、晚孕组（401 例），对照组健康体检非孕妇 300 例；疾病组：选取产后出血 84 例。采用免疫比浊法检测 D-二聚体、FDP 的含量。不同孕期 D-二聚体、FDP 之间比较采用 Kruskal-Wallis 检验，$P < 0.05$ 为差异有统计学意义；不同孕期组之间 D-二聚体、FDP 的两两比较同样采用非参数 Kruskal -Wallis 检验，并应 Bonferroni 方法进行 P 值的校正。D-二聚体、FDP 参考区间均采用 95%作为参考区间上限，采用单侧百分位数法，计算 95%参考区间。
结果 D-二聚体、FDP 水平随孕期增加有上升趋势，呈正相关（$r = 0.80$、$r = 0.77$，$P < 0.05$），且明显高于对照组 （$P<0.05$）。孕早期妇女血浆 D-二聚体、FDP 的参考区间分别为<1.5μg /ml、<4.45μg /ml，孕中期 D-二聚体、FDP 的参考区间为<2.53μg /ml、<8.75 mg/ml，孕晚期孕妇血浆 D-二聚体、FDP 的参考区间分别 为<4.35μg /ml、<13.6μg /ml。疾病组明显高于参考区间（$P<0.05$）

结论 本研究通过初步建立罗湖区孕妇 D- 二聚体、FDP 参考区间，提高凝血功能在产后出血的应用价值。

PO-1207

外周血中性粒细胞膜碱性磷酸酶在骨髓增生异常综合征分型中的应用价值

朱立梅、王然、张丽
连云港市第一人民医院

目的 本研究应用流式细胞术检测骨髓增生异常综合征(myelodysplastic syndrome，MDS)患者外周血中性粒细胞膜碱性磷酸酶(Alkaline phosphatase expression on the membrane of neutrophils，mNAP)的表达，探讨其在 MDS 分型中的价值。
方法 收集 2018 年 8 月至 2019 年 12 月连云港市第一人民医院收治初诊 MDS 患者 32 例,通过骨髓细胞形态学诊断，入选患者符合 2016 版 WHO-MDS 分型标准。以同期医院体检中心 50 名健康体检者作为对照组。 采用流式细胞术检测 MDS 患者和对照组外周血 mNAP 水平。
结果 32 例 MDS 患者中，MDS 伴单系发育异常（MDS-SLD）15 例，MDS 伴多系发育异常（MDS-MLD）8 例，MDS 伴环状铁粒幼红细胞（MDS-RS）3 例，MDS 伴有原始细胞过多（MDS-EB）2 例，MDS 不能分类（MDS-U）4 例，其中 15 例 MDS-SLD 患者 mNAP 水平显著升高，最低值为 11650AB/c, 最高值为 18687AB/c，均值 13937 AB/c，高于健康对照组 1831 AB/c（1371-2411 AB/c）和 MDS 其他组 1851 AB/c（1124-3001 AB/c），差异有统计学意义(P<0.01）。其他型 MDS 患者中，除 2 例 MDS-EB 结果为 634AB/c、910AB/c，低于正常参考均值 1831AB/c 外，其他组 mNAP 水平均在正常参考值范围内，与健康对照组比较，差异无统计学意义(P>0.05）。
结论 mNAP 在 MDS-SLD 中的高水平表达，对 MDS 的分型有提示作用，可通过检测外周血 mNAP 水平对 MDS-SLD 的分型起到诊断价值。

PO-1208

Autophagy regulates glycolytic metabolism of acute myeloid leukemia cells in bone marrow stroma

min huang
Shandong Provincial Hospital Affiliated to Shandong First Medical University

To investigate the relationship between glycolytic activity and autophagy in acute myeloid leukemia (AML), and the changes of autophagy when co-culture AML cells with bone marrow-derived mesenchymal stromal cells (BMSCs), we detected the expression of Autophagy-related E1 ligase 7 (ATG7), hexokinase II (HKII), glucose transporter 1(GLUT1) and lactate dehydrogenase A (LDHA) in bone marrow from healthy samples and AML patients. In this study, we further detected the changes of glycolysis and chemosensitivity in AML cells after ATG7 knockdown. We co-culture AML cells with BMSCs, then research the level of glycolysis and autophagy. The data suggests that over expression of ATG7 is associated with the prognosis of AML, the decrease of glycolysis followed autophagy inhibition due to the decrease of HK-II, GLUT1 and LDH. ATG7 knockdown sensitizes AML cells to cytarabine (Ara-C). Co-culture with BMSCs enhanced autophagy in AML cells, this effect can be partially reversed the decrease of glycolysis in ATG7 knockdown cells and protects AML cells from Ara-C induced cytotoxicity. These results indicate autophagy plays a role in regulating glycolysis, and the inhibition of autophagy could improve outcomes in AML therapy.

PO-1209

质谱流式临床应用——17 markers 淋巴细胞精细分群方案

王世佳
上海宸安生物科技有限公司

背景 流式细胞术是临床样本检测的重要技术手段。通用的 TBNK 分型一般采用 6 色或 8 色方案。荧光流式技术可选的检测通道有限，且存在通道间信号干扰，难以满足日益增长的临床检测需求。质谱流式技术结合了荧光流式高效的单细胞研究能力和飞行时间质谱的全谱高分辨率优势，采用金属标记抗体对样本进行染色，可以实现单个样本 50+指标检测，并且克服了荧光基团光谱重叠的问题。
目的 为开发下一代单细胞诊断技术，完善质谱流式临床应用，上海宸安生物科技有限公司自主研发了 17 markers 质谱流式淋巴细胞精细分群检测方案。
方法 将人外周血单个核细胞与含有金属标记抗体的冻干微芯混合；经孵育、洗涤、DNA 染色、洗涤、重悬后上样；收集 8 万个细胞后分析淋巴细胞的分群情况。
结果 在本方案中，去除碎片和死细胞后，我们对 CD45 阳性的细胞进行分析：采用 CD3 和 TCRγδ 标记 γδT 细胞；采用 CD25 和 CD127 标记 Treg 细胞；采用 CD3, CD4, CD8, CD45RO, CD45RA, CCR7 区分不同 T 细胞亚群；采用 CD19, CD27, IgD, CD24, CD38 区分不同 B 细胞亚群；采用 CD16 和 CD56 区分 NK 细胞和 NKT 细胞（图 1）。
结论 宸安生物自主研发的质谱流式淋巴细胞精细分群检测方案，可以实现单份样本 17 个生物标志物检测，超越了荧光流式相同样本量下的检测能力，获取更加精确的诊断信息。

PO-1210

应用骨髓涂片 FISH 技术回顾性鉴别诊断 ALL 与 CML 急淋变一例

熊克梅
四川金域医学检验中心有限公司

目的 探讨一例 3 年前诊断为急性淋巴细胞白血病(Acute lymphoblastic leukemia，ALL)患者初诊时的骨髓涂片进行荧光原位杂交（fluorescence in situ hybridization，FISH）检测，回顾性鉴别诊断 ALL 与 CML 急性变。
方法 对陈旧的骨髓涂片进行去油、褪色，再在新鲜配置的固定液（甲醇：冰乙酸=3:1）中固定 10 分钟，胃蛋白酶消化 15 分钟,用磷酸缓冲盐溶液（phosphate buffer saline，PBS）处理三次，每次 10 分钟，依次在 70%、85%、100%的无水乙醇中脱水各 3 分钟，然后加 BCR/ABL1 双色融合探针进行荧光原位杂交，最后荧光显微镜下分析结果。
结果 对进行荧光原位杂交的骨髓涂片进行计数，计数 200 个细胞，检测到 BCR/ABL1 融合细胞占 52.0%（104/200），其中淋巴细胞和粒细胞均出现阳性。细胞信号模式为：1G1R2F 26.0%,1GIR1F 14.0%,2G1R2F 8.0%,1G2F 2.0%,1G1R3F 2.0%,2G2R 44.5%,3G2R 1.5%,3G3R 2.0%。
结论 特殊情况下可以应用骨髓涂片直接进行荧光原位杂交检测，并可以基于形态学鉴别诊断急性淋巴细胞白血病与慢性粒细胞白血病急淋变。

PO-1211

髓系肿瘤浸润浆膜腔积液的临床和实验室特征研究

龚旭波
浙江大学医学院附属第二医院

背景 髓系肿瘤浸润浆膜腔积液的研究报告在国内外少见，本研究旨为研究此类患者的临床与实验室特征。
方法 回顾性分析 2004 年 1 月 1 日至 2021 年 1 月 1 日之间，在浙江大学附属第二医院收治的髓系肿瘤浸润浆膜腔积液的患者临床资料。疾病诊断参照 2016 年《WHO 造血与淋巴组织肿瘤》的标准，浆膜腔积液中检出髓系原始细胞（>3.0%），即判为髓系肿瘤累及。
结果 在此期间，检出髓系血液肿瘤浸润胸水 8 例（8/4637，0.1725%），浸润腹水 2 例（2/2096，0.0954%），未检出浸润心包积液病例(0/372)。这 10 例标本中，以 CGL 急变为主（n=4，40%），M5 次之（n=2，20%），另有 M2、M4、MDS-EB2、髓系肉瘤各一例。对于 8 例浸润胸水的病例，自发现胸水累及时计算，中位生存时间仅 3.5 月，而对照组（n=25）中位生存时间为 21 个月，两组比较具有统计学差异（P = 0.03）。
结论 髓系肿瘤浸润浆膜腔积液的占比极低，疾病类型以 CGL 急变为主，几乎均累及双侧胸腔，且预后较差。

PO-1212

登革热患者 NLR、d-NLR、白细胞值测定的临床意义

严建新
温岭市第一人民医院

目的 探讨登革热患者血常规相关参数的变化特点，为登革热的诊断与鉴别诊断提供参考。
方法 收集 2019 年 4 月至 11 月在本院住院治疗的登革热患者 38 例，收集同期甲型流感抗原筛查阳性患者 102 例作为甲型流感病毒感染组，，收集 2020 年 1 月-2 月在本院就诊的新型冠状病毒核酸 RNA 阳性患者 54 例作为新型冠状病毒感染组，并收集 2019 年 9 月-10 月在本院健康体检者 69 例作为对照组，分别做血常规检测。
结果 登革热病毒感染组与健康对照组相比，白细胞、淋巴细胞、血小板计数下降，单核细胞、中性粒细胞/淋巴细胞比值（NLR）、血小板/淋巴细胞比值、衍生中性粒细胞/淋巴细胞比值（d-NLR）升高；与甲型流感病毒感染组相比，白细胞、中性粒细胞、血小板、平均红细胞体积、中性粒细胞/淋巴细胞比值、SⅡ、CRP 下降，淋巴细胞/单核细胞比值、淋巴细胞/CRP 比值升高；与新型冠状病毒感染组相比，淋巴细胞、淋巴细胞/单核细胞比值、衍生中性粒细胞/淋巴细胞比值下降。
结论 NLR、d-NLR、白细胞、血小板、淋巴细胞等感染性指标的组合，不仅可以减少个体差异和不稳定，而且反映了机体炎症反应和免疫状态之间的平衡关系，为登革热病毒感染的早期诊断与鉴别诊断提供参考。

PO-1213

The expression of SWI/SNF subunits BRG1 is increased in clinical acute myeloid leukemia patients and associated with Wnt/β-catenin pathway

Shuo Gao[1]、Xuejing Xu[1]、Wanqing Zhou[1]、Junhao Chen[1]、Jun Han[2]、Han Shen[1]
1. Nanjing Drum Tower Hospital, the Affiliated Hospital of Nanjing University Medical School
2. Children's Hospital of Nanjing Medical University

SMARCA4/BRG1, a core component of the SWI/SNF ATP-dependent chromatin-remodelling complex, plays an important role in cell cycle regulation, DNA repair and tumor development. Unlike the evidences as tumor suppressor genes in the past reports, latest researches show that BRG1 plays an important role in sustaining the growth of leukemia cells in acute myeloid leukemia (AML). Here we observed the expression of BRG1 in clinical AML patients and investigate the relationship between BRG1 and β-catenin, an important protenin in Wnt/β-catenin pathway. The expression level of BRG1 was increased in 50 of 70 AML patients（71.43%）, with the positive rate was only 36.73% in other hematological diseases detected by qRT-PCR and Western blot. Clinical data analysis showed that the expression of BRG1 was highly correlated with the myeloblast proportion in bone marrow of AML patients (P=0.0329), but had no relevance with other clinical pathological factors, including age, gender, FBA types and fusion genes. Moreover, there was a positive correlation between BRG1 and β-catenin expression，and the two genes were decreased significantly in patents in complete remission after clinical treatment. Our results showed that the expression of BRG1 is increased in clinical AML patients and associated with Wnt/β-catenin pathway, which indicates BRG1 as a biomarker or therapeutic target of AML.

PO-1214

Establishment of APTT critical value based on coagulation factor deficiency

莫喜明[1]、屈天吉[1,2]
1. 中南大学湘雅二医院
2. 中南大学医学检验系

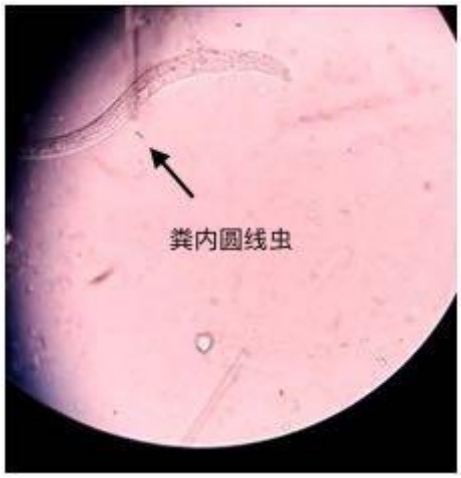
Purpose To evaluate the sensitivity of different APTT reagents in the laboratory to endogenous coagulation factors, and to provide a scientific basis for the establishment of the APTT critical value in the laboratory.
Methods According to the critical value of endogenous coagulation factor recommended by the guidelines, an in vitro single coagulation factor deficiency model was established. APTT values were measured in Sysmex FSL, Sysmex Actin, Stago PTTA and Wolfen HenosIL SynthAsil, respectively .
Results In the in vitro model established by using Stago deficiency single factor plasma, The 95% confidence intervals of APTT critical value obtained by Sysmex FSL, Sysmex Actin, StagoPTTA and Wolfen HenosIL SynthAsil detection systems respectively are: 43.8-47.2s, 62.7-72.7s, 54-60.3s, 74.3-75.0s.
Conclusion Different APTT detection systems have huge differences in factor sensitivity, and it is necessary to set the APTT critical value according to different instruments and reagents in clinical practice.

PO-1215

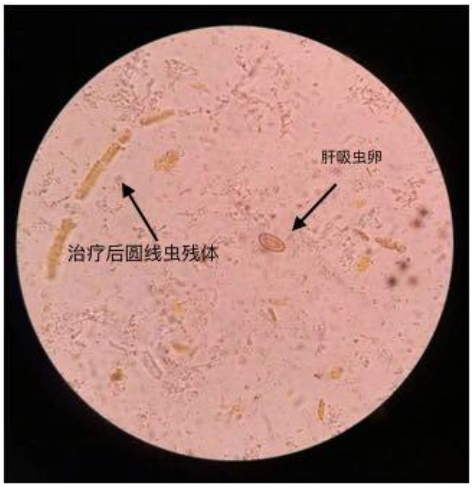
双虫混合感染（粪类圆线虫+肝吸虫）

兰萌
南方医科大学珠江医院

佛山市南海区的李阿伯（化名）因全身浮肿一个月，发热 10 天在当地医院治疗无缓解后被家人送往我院就医。初进院时李阿伯情况危急，精神差，食欲差，睡眠差，小便少，全身浮肿加重，面色苍白，重度贫血貌，并出现发热，不喜言语，还有现感染性休克。初进院的第 1 天，李阿伯的抽血检测项目肿瘤指标高，呼吸科邓教授查房指示不排除胃肠道及肺部肿瘤的可能，并于床边在局麻下行右锁骨下深静脉穿刺置管术，手术顺利。第 2 天李阿伯全身水肿减轻，但仍有发热，精神很差，睡眠差。第 3 天李阿伯留取粪便送检，粪便涂片于显微镜观察发现有活动的虫体，虫体细长，大小约为 0.6-0.7mm，咽管呈柱状，尾端尖而分叉。于当天粪检结果报查见粪类圆线虫，如下图：



继给予肠虫清治疗。余继续抗感染，营养支持，纠正贫血对症处理。第 4 日李阿伯水肿消退，发热状况有所好转，睡眠一般。继又留取粪便复检，接到此标本时是我当班，引起了我的好奇。我想看看有没有虫子排卵的可能。于是我往试管中加大粪量，用吸管吸取最底层的液体涂片，小心仔细的查看每个视野，生怕漏掉任何蛛丝马迹，圆线虫依旧还有，忽然，低倍镜下见到一个似曾相识淡黄色透亮的东西，内心无比的激动，转到高倍镜下，确认是肝吸虫卵，如下图：



于是报**结果** 查见粪类圆线虫、查见肝吸虫卵。并致电临床医生并了解到患者喜欢去河塘下水捞鱼和吃鱼生的习惯。这次的粪便检查又有了重大发现除了发现粪类圆线虫，又查见了肝吸虫卵。这一检查结果让呼吸科的医务人员振奋人心，夏教授查房听取病史汇报后，认为这是一例较少见的两种寄生虫同时感染。 增加抗寄生虫药物，继续肠虫清治疗，余治疗继续营养支持，纠正贫血处理。一直到了第 13 天，李阿伯无水肿，无发热，意识清楚，小便正常，感染休克已纠正。抽血检测结果大部分正常。面色较前红润，中度贫血貌。且粪便检查结果均未查见圆线虫和肝吸虫卵。李阿伯经历了两周的住院治疗症状好转后，家属满意签字出院。

心得体会：想起一位形态学专家说过：找到一个异常细胞容易，寻找第二个异常细胞有时需要 5 分钟或者几十分钟，粪便常规亦是如此。我们不担心找不到虫卵，我们只害怕找到一个虫卵，因为这样，你需要花费比其他标本多几倍的时间才能放心的发出报告。

PO-1216

凝血因子XII缺乏合并狼疮抗凝物阳性一例并文献复习

黄珣钡、刘超男、凌莉琴、廖娟、周静
四川大学华西医院

目的 通过分享 1 例凝血因子XII缺乏合并狼疮抗凝物阳性病例并复习相关文献，提高对该疾病的诊断及治疗水平。
方法 结合该患者的临床诊治过程及相关文献报道，对该疾病临床表现、实验室鉴别诊断及治疗特点进行讨论。
结果 分析实验室指标及临床表现，患者诊断为凝血因子XII缺乏合并狼疮抗凝物阳性。
结论 当患者凝血因子严重缺乏的时候，1:1APTT 纠正试验会掩盖低滴度抑制物的存在，合理选择 4:1 纠正试验有助于低滴度抑制物的识别。

PO-1217

尿液细胞学巴黎报告系统在泌尿系统肿瘤中的应用价值

朱立强
徐州医科大学附属医院

目的 探讨尿液细胞学巴黎报告系统对泌尿系统肿瘤的诊断价值。
方法 收集徐州医科大学附属医院泌尿外科 2017 年 5 月至 2019 年 2 月间疑似膀胱癌的住院患者 224 例。所有患者均在膀胱镜检查操作前，留取晨起第二次新鲜尿标本至少 30ml，制作液基细胞学薄片，分别用传统报告模式和更新的巴黎报告系统进行诊断。根据外科病理活检诊断结果这一“金标准”，分别计算传统模式与巴黎报告系统诊断的敏感性、特异性等评估诊断效能的指标，以 $P<0.05$ 为差异有统计学意义，以确定哪种诊断范式与病理活检诊断有更强的相关性。
结果 根据 224 例患者的最终病理结果和细胞学检查结果，我们的研究得到泌尿细胞学巴黎报告系统对尿路上皮细胞肿瘤诊断的敏感性(55.6％)和正确率(71.0％)均要明显优于传统细胞学的敏感性(24.7％)和正确率(58.0％)，而两者的特异性、阳性预测值和阴性预测值则没有显著差异;在不同级别尿路上皮癌中，泌尿细胞学巴黎报告系统对低级别尿路上皮癌的敏感性(84.6％)要显著高于传统细胞学的敏感性(19.4％);在高级别尿路上皮细胞癌的诊断中，2 者没有显著差异。
结论 泌尿细胞学巴黎报告系统通过规范性的诊断标准和术语提高了细胞学在尿路上皮细胞肿瘤的诊断效能，在膀胱癌的诊断中值得推广。

PO-1218

超声引导下经皮细针穿刺细胞学对肝脏占位性病变的诊断价值 --67 例细胞/组织病理分析

朱立强
徐州医科大学附属医院

目的 评估超声引导下经皮细针穿刺细胞学(FNAC)诊断可疑肝脏肿块的敏感性、特异性和准确性。
方法 结合临床及组织病理学资料，回顾性检索分析 2019 年 12 月至 2020 年 12 月接受超声引导下经皮 FNAC 联合肝肿块病理组织活检患者的细胞学和组织病理学数据库。所有患者均有一个或多个影像学检查出的肝脏占位性疾病。以肝活检组织病理学诊断为金标准，确定 FNAC 诊断肝病变的敏感性、特异性和准确性。

结果 67 例患者中，细胞学诊断为非肿瘤性的 8 例，怀疑肿瘤的 12 例，恶性的 47 例。在 8 例(11.9%)细胞学诊断为非肿瘤性患者中，最终病理诊断为非肿瘤性 4 例，恶性 4 例(50.0%)；在细胞学怀疑肿瘤的 12 例患者中，最终病理全部诊断为恶性(100.0%)；47 例细胞学诊断为恶性肿瘤患者中，15 例(31.9%)肝细胞癌(HCC)，6 例(12.8%)胆管细胞癌，21 例（44.7%)为转移性肿瘤，为转移性肿瘤，其余 5 例(10.6%)为其他原发性肝脏恶性肿瘤。总体而言，FNAC 诊断肿瘤性病变的敏感性为 93.7%，特异性为 100%，准确性为 94.0%，阳性预测值为 100%，阴性预测值为 50.0%。
结论 肝肿块 FNAC 是一种高准确性的技术，可用于鉴别大多数肝肿瘤的良恶性，具有较高的特异性。联合超声、细胞、组织病理学方法在肝肿瘤的诊断方面提供了更高的准确性，这可能会影响治疗决定。

PO-1219

Distinguishing patients presenting prolonged activated partial thromboplastin time with/without bleeding diathesis by comparison of immediate and post incubation mixing test

Yu Liu、Chao Zhu、Guanqun Xu、Fang Wu、Xuefeng Wang
Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objectives To establish laboratory differentiation diagnosis of acquired hemophilia A (AHA) in patients presenting prolonged activated partial thromboplastin time (APTT) with and without bleeding diathesis by comparing the outcome of mixing test performed immediately and post incubation.
Methods The coagulation function profile of 186 patients from March 2013 through November 2019 with prolonged APTT, including 42 AHA patients and 144 asymptomatic individuals, was retrospectively investigated. The association of bleeding manifestation and outcome of mixing tests, both immediate and post-incubation as represented by Rosner index (RI 1,2), were analyzed. Novel parameter, Rosner index 3 and 4, calculated by minus or dividing RI 2 with RI 1 was adopted and its performance in laboratory differentiation diagnosis of AHA was also evaluated.
Results The correction immediately after mixture was more prominent in AHA patients as represented by RI 1 ($p<0.001$). The magnitude of correction was similar in AHA patients and asymptomatic individuals when the clotting assay was performed after incubation as shown by RI 2 ($p=0.277$). Both RI 3 and 4 had excellent performance (Youden Index>0.9).
Conclusion The blood coagulation interferences of AHA and asymptomatic individuals can be better characterized by RI 3 and 4 concerning outcome of both immediate and post-incubation mixing test.

PO-1220

外周血单个核细胞 DNA 甲基化标志物对乳腺癌和乳腺良性病变的鉴别诊断价值

张莹
山东大学第二医院

背景 到 2020 年，女性乳腺癌已成为全球癌症发病率最高的恶性肿瘤。同时，乳腺癌也是全球死亡率第 5 的恶性肿瘤。在女性中，乳腺癌占癌症病例的 1/4，占癌症死亡人数的 1/6，成为绝大多数国家女性发病率和死亡率最高的恶性肿瘤。在我国，由于经济增长带来的生活方式、社会文化的巨

大变化以及工业劳动力中女性比例的增加对乳腺癌发病率产生了影响——推迟生育和少生孩子，更大程度的超重和缺乏体力活动，乳腺癌发病率逐年缓慢升高。乳腺癌目前诊断方法（细针穿刺活检、影像学检查及血清标志物）各有其局限性。探索乳腺腺癌发生的机制，并寻找无创的兼具灵敏度和特异度的诊断乳腺癌的新型肿瘤标志物，是当前研究的焦点。

方法 通过密度梯度离心法分离乳腺癌和乳腺良性病变患者外周血 PBMC 通过 850K 芯片获得、乳腺癌 DMPs 差异表达谱，先后在 2 个独立样本集中验证筛选得到的的特异性 DMPs 和诊断模型，并研究其临床应用价值。

结果 对照组和肿瘤组差异 DMPs 建立的诊断模型检测 BC 具有较高的敏感性、特异性和总体准确性。

结论 PBMC 差异甲基化位点具有较好的鉴别能力。

PO-1221

mIPS 评分联合 T 淋巴细胞亚群对恶性血液病化疗粒细胞缺乏期并发血流感染的预测价值

武坤、罗珊、聂波
昆明医科大学第一附属医院

目的 探究 mIPS 评分联合 T 淋巴细胞亚群对恶性血液病化疗粒细胞缺乏期并发血流感染预测价值。

方法 选取 2015 年 4 月~2020 年 11 月我院血液科收治的 100 例首发恶性血液病成年（≥18 岁）化疗患者作为研究对象，根据血流感染结局分为感染组（n=33）和非感染组（n=67）。收集患者一般资料及化疗前、粒细胞缺乏期时感染可能性评分（IPS）及 T 淋巴细胞亚群（CD3+、CD4+、CD4+/CD8+）等指标并分析其变化。采用受试者工作特征曲线（ROC）评估血流感染的预测价值，logistic 进行多因素回归分析。

结果 粒细胞缺乏期 mIPS 评分与化疗前比较显著增加，且粒细胞缺乏期感染组高于非感染组；粒细胞缺乏期 CD3+、CD4+、CD4+/CD8+与化疗前比较显著降低，且感染组低于非感染组，差异均具有统计学意义（P<0.05）。mIPS 联合 T 淋巴细胞亚群对粒细胞缺乏期并发血流感染的预测能力最强（AUC=0.898），mIPS、CD 3+、CD4+、CD4+/CD8+单项指标 AUC 面积依次为 0.820、0.697、0.694、0.748，且多因素 logistic 回归分析 mIPS 为独立危险因素，CD3+、CD4+、CD4+/CD8+为保护因素。

结论 mIPS 评分联合 T 淋巴细胞亚群对恶性血液病化疗粒细胞缺乏期并发血流感染有较好的预测价值，可为后续血流感染预防用药提供依据。

PO-1222

Detection of pancreatic cancer-specific exosomes based on surface-enhanced Raman spectrum

yanru li
The Second Hospital of Shandong University

Exosomes have been proven to be important biomarkers for non-invasive diagnosis of cancer. However, the laborious process of separation and enrichment of exosomes hinders accurate quantification of exosomes. Here, we propose a simple method to capture and analyze GPC1-positive exosomes directly from the serum. First, connect streptavidin magnetic beads and biotinylated antibodies to construct functionalized exosomes capture magnetic beads, and use CD63 functionalized magnetic beads to enrich exosomes based on the antigen-antibody reaction. Secondly, an Ag@MBA SERS tag modified with anti-GPC1 antibody was added to label exosomes GPC1 for quantification. In addition, this method was used for quantification of GPC1

positive exosomes by using 20 μL of clinical serum samples.The system can quickly enrich and separate exosomes from the solution, with a separation efficiency of 60%~80%. Due to the specific signal amplification effect of the surface-enhanced Raman scattering substrate, the detection limit of exosomes is up to 10 particles/ml. Based on SERS signal analysis, it is possible to easily distinguish pancreatic cancer patients from healthy controls. More importantly, clarifying the amount of GPC1 positive exosomes will help distinguish patients with benign pancreatic disease and pancreatic cancer.

PO-1223

血小板相关参数与甲状腺肿瘤的相关性研究

朱莹、吴惠玲、高晓玲、乔焱源
玉溪市人民医院医学检验科（昆明医科大学第六附属医院医学检验科）

目的 研究外周血血小板相关参数对甲状腺肿瘤的临床病例特征关系及诊断与预后价值。
方法 回顾性分析 2019 年 12 月—2020 年 12 月在我院初次行手术治疗的甲状腺乳头状癌及良性肿瘤患者临床检验病理资料，分别讨论 PLR、PLT、PDW、MPV、PCT 及 P-LCR 与甲状腺乳头状癌患者临床病理特征的关系。
结果 与健康对照组相比，观察组 PLR、MPV、PCT 及 P-LCR 均升高，差异有统计学意义(P<0.05)。此外，PLR 最大曲线下面积(AUC)为 0.857，MPV 最大曲线下面积(AUC)为 0.845, PCT 最大曲线下面积(AUC)为 0.761, P-LCR 最大曲线下面积(AUC)为 0.809，联合预测因子最大曲线下面积(AUC)为 0.961，敏感度为 87.1%，特异度为 95.2%。
结论 术前检测血小板相关参数可辅助诊断甲状腺癌，对病情评估具有一定临床预测价值。

PO-1224

西南地区血红蛋白 H 病筛查分析

张玲、潘建华
广州金域医学检验中心

目的 回顾性分析西南地区筛查血红蛋白 H（HbH）病阳性类别占比情况。
方法 分析来自金域医学检验中心西南三省（昆明金域、贵州金域、四川金域）2020 年 1 月至 2020 年 10 月期间进行血红蛋白病筛查的孕前，产前，婚检、体检样本共 180624 例，其中，昆明金域 81633 例、贵州金域 50543 例，四川金域 48448 例。三个中心人群筛查年龄从 0 岁到 88 岁，平均年龄 29 岁。所有样本经 COULTER-DXH800 全自动血球分析仪进行血液学分析、四川和贵州金域采用美国 Helena 全自动电泳仪（SPIFE3000）和昆明金域采用法国 Sebia Capillarys3 进行血红蛋白电泳、Beckman AU680 全自动生化仪检测红细胞渗透脆性分析。对筛查出 HbH 病的所有样本均在报告中加建议进一步做地贫基因确诊试验证实，并从 LIS 系统查与该阳性患者相关联的 α 地贫基因缺失或点突变的类型。对少见或罕见类型的 α 地贫进行测序鉴定。同时取来自各子金域体检中心的健康人群作为正常对照组 100 例，平均年龄 35 岁，排除贫血或其他相关疾病。
结果 从 180624 例电泳筛查出 200 例 HbH 病患者，其中，昆明金域筛查出 HbH 病 130 例（HbH 型：130 例，HbBart's 型：0 例），阳性率为 0.16%（130/81633）；贵州金域筛查出 HbH 病 48 例（HbH 型：16 例，HbBart's 型：32 例），阳性率为 0.09%（48/50543）；四川金域筛查出 HbH 病 22 例（HbH 型：9 例，HbBart's 型：13 例），阳性率为 0.05%（22/48448）；昆明金域筛查出的 HbH 病患者阳性率明显高于贵州金域和四川金域人群，西南三省的金域实验室筛查 HbH 病的阳性率比较存在差异，具有统计学意义（P＜0.05);西南三省的金域实验室筛查出的 HbH 病阳性类型存在差异,昆明金域筛查的 HbH 病类型主要是 HbH 型为主，贵阳和四川金域筛查出的 HbH 病类型主要以 HbBart's 型为主，具有统计学意义（P＜0.05)。

结论 西南三省 HbH 病筛查出的阳性率不同地区存在差异，以云南发病相对较高，应加强优生优育的普检和健康人群血红蛋白电泳的体检，早发现早预防。

PO-1225

206 例各类贫血患者网织红细胞参数结果分析

吴惠玲、高晓玲、朱江贤
玉溪市人民医院医学检验科（昆明医科大学第六附属医院医学检验科）

目的 探讨网织红细胞参数在贫血性疾病鉴别诊断中的价值。
方法 采用 Sysmex XN-9000 血细胞分析仪对 206 例七类贫血患者及 50 例健康体检者的网织红细胞百分率（RET%）、网织红细胞绝对值（RET#）、未成熟网织红细胞比率（IRF%）、低荧光网织红细胞比率（LFR%）、中荧光网织红细胞比率（MFR%）、高荧光网织红细胞比率（HFR%）及网织红细胞血红蛋白含量（RET-He）进行检测。
结果 七类贫血患者 RET%、RET#、IRF%、LFR%、MFR%、HFR%及 RET-He 与健康对照组比较，肾性贫血 RET%不增高（P>0.05)，RET#轻度降低，LFR%降低，IRF%、MFR%、HFR%增高（P<0.05)；溶血性贫血和失血性贫血 RET%、RET#、IRF%、MFR%、HFR%显著或明显增高，LFR%显著降低（P<0.05）；巨幼细胞性贫血和缺铁性贫血 RET%轻度增高，IRF%、MFR%及 HFR%明显增高，LFR%明显降低（P<0.05)，RET#不增高（P>0.05)；再生障碍性贫血 RET%、RET#明显降低（P<0.05)，LFR%略降低、IRF%、MFR%及 HFR%略增高(P>0.05)；白血病贫血 RET%、RET#、LFR%降低，IRF%、MFR%及 HFR%增高(P<0.05)。与健康组比较，肾性贫血、溶血性贫血和白血病贫血的 RET-He 差异无统计学意义(P>0.05)；缺铁性贫血和失血性贫血 RET-He 降低，巨幼细胞性贫血和再生障碍性贫血 RET-He 增高(P<0.05)。
结论 网织红细胞参数检测在贫血性疾病的诊断、鉴别诊断等方面具有重要价值。

PO-1226

Cysteine depletion induces ferroptosis in myeloid leukemia cells

Shuhan Liu、Qiaoqian Chen、Zhiyuan Zheng、Xiandong Jiang、Wei Wu、Donghong Lin
Fujian Medical University

Objective This study aimed to explore the effect of cysteine depletion on the induction of ferroptosis in different types of myeloid leukemia cells, and preliminarily explore its potential molecular mechanism.
Method We used 6 myeloid leukemia cells as experimental cell lines, including HL-60, Kasumi-1, U937, THP-1, K562, K562/G01. Firstly, experimental cell lines were cultured in the cysteine-free medium, and we detected the proliferation capacity of cells by MTS after 24 hours. Next, cells were treated with four cell death inhibitors such as apoptosis, necrosis, ferroptosis, and autophagy to determine the form of cell death. Meanwhile, we used transmission electron microscopy, micro-method, flow cytometry to detect cell mitochondrial morphology, MDA content, ROS level, respectively. Finally, we used qPCR and Western blot to detect the mRNA and protein expression levels of the cystine/glutamate reverse carrier (System XC-) subunits SLC7A11 and SLC3A2 of the corresponding cells.
Results In the absence of cysteine, the proliferation ability of HL-60, THP-1, K562 had no significant change, while the proliferation ability of Kasumi-1, U937, K562/G01 decreased significantly(P<0.001). Among them, only K562/G01 cells can be observed the changes of ferroptosis indicators: As to the four inhibitors, only ferroptosis inhibitors can reverse the cell proliferation inhibition of K562/G01 (P<0.001). After cysteine depletion, K562/G01 cells showed

characteristic ultrastructural changes of ferroptosis, such as the disappearance of mitochondrial cristae, incomplete mitochondrial membranes, and large numbers of lipid droplets in the cytoplasm under the transmission electron microscopy. Moreover, MDA and ROS levels of K562/G01 cells were also significantly increased(P<0.001). qPCR and Western blot results showed that the mRNA and protein expression levels of SLC7A11 and SLC3A2 in K562/G01 cells increased significantly(P<0.01) after cysteine depletion.
Conclusion Cysteine depletion can induce the death of K562/G01 in the form of ferroptosis. The underlying mechanism may be related to the redox metabolism regulated by SLC7A11 and SLC3A2. This study suggests that targeting cysteine metabolism to induce ferroptosis may become a new treatment for myeloid leukemia and it deserves further study.

PO-1227

联合检测 WBC、CRP、IL-6、PCT，SAA 及血培养在小儿败血症诊断中的临床价值

陈剑、张良艳、张大莲、周利、黄奕然、冯磊
玉溪市人民医院医学检验科（昆明医科大学第六附属医院医学检验科）

目的 探讨联合检测 WBC、CRP、IL-6、PCT，SAA 及血培养在小儿败血症中的诊断价值。
方法 分析 2020 年 5 月-2020 年 8 月在我院接受诊疗的 47 例小二败血症患者的临床基本资料，作为试验组；再选取 50 例在本院同期健康体检者作为对照组。分析比较两组患者 WBC、CRP、IL-6、PCT、IL-6、SAA 水平。
结果 试验组患者 WBC、CRP、IL-6、PCT，SAA 水平均显著高于对照组，且差异均具有统计学意义（P<0.05）。试验组 47 例患者共分离出 45 株致病菌，其中 28 株革兰阳性菌（62.22%），主要为 16 株表皮葡萄球菌（35.56%）和 10 株溶血性链球菌（22.22%），2 株肠球菌（4.44%）；以及 17 株革兰阴性菌（37.78%），主要为 11 株大肠埃希菌（24.44%）和 5 株肺炎克雷伯菌（11.11%）,1 株鲍曼不动杆菌（2.22%）。
结论 WBC、CRP、IL-6、PCT，SAA 检测可以早期诊断小儿败血症而且可以提示疾病的严重程度，联合血培养观察患儿致病菌分布对患者的诊断和治疗具有重要的临床意义。

PO-1228

标本未离心放置对 D-二聚体(DD)及血浆纤维蛋白原降解产物(FDP)检测结果影响分析

曾超、陈佳益、刘寒、凌昉钦
上海市第一人民医院嘉定分院

目的 探讨标本未离心放置时间对 D-二聚体(DD)及血浆纤维蛋白原降解产物(FDP)检测结果影响，为规范分析前过程提供实验依据。
方法 随机选取我院 2021 年 6 月门诊采集的 100 份枸橼酸钠抗凝的外周血标本，所有标本均无溶血、脂血以及黄疸情况，采集之后分成 4 份，分别在室温下放置 0h、2h、4h、24h，在 3000r/min，持续离心 10min，使乏血小板血浆分离。离心之后立即检测，在室温条件下于分别对 D-二聚体(DD)及血浆纤维蛋白原降解产物(FDP)这两个指标进行测定。使用ＳＡＳ统计软件包对上述两项指标在放置 2h、4h、24h 后离心所得到的检测结果与 0h 后离心检测的结果进行配对ｔ检验。
分析 与 0h 后离心检测的结果相比，2h D-二聚体(DD)及血浆纤维蛋白原降解产物(FDP)无明显差异（P>0.05）； 4h 、24h D-二聚体(DD)及血浆纤维蛋白原降解产物(FDP)均明显升高（P＜0.05）；

结论 DD 是交联纤维蛋白在纤溶酶(Plasmin)作用下所产生的一种特异性纤维蛋白降解产物,是证实体内存在继发性纤溶的特异指标。FDP 是在机体发生纤溶亢进时纤溶酶作用于血浆中的纤维蛋白或纤维蛋白原产生的降解产物的总称,FDP 反映的是机体纤溶活性的总水平,原发性纤溶亢进或者继发性纤溶亢进时都为阳性。为了保证这两项检验结果的准确性，本实验说明 D-二聚体(DD)及血浆纤维蛋白原降解产物(FDP)的标本未离心的情况下，在室温存放一段时间后,对 D-二聚体(DD)及血浆纤维蛋白原降解产物(FDP)两项指标均造成一定影响，为保证凝血功能指标的检测结果更为精准，标本从采集到检测的整个过程必须控制在采血后 2h 内。超过 2h 未送检或者未完成检测的标本，均需重新采集后检测。

PO-1229

Identification of a serum lncRNA panel for the diagnosis and recurrence prediction of bladder cancer.

Weili Duan、chuanxin wang
The Second Hospital of Shandong University

Purpose The involvement of circulating lncRNAs in cancer and their potential as biomakers of diagnosis and prognosis biomakers are becoming increasingly appreciated. However, little is known about dys-regulated circulating lncRNAs in bladder cancer (BC). The purpose of present study was to identify a panel of circulating lncRNAs capable of differentiating BC patients from controls, and determining their clinical applications in BC recurrence prediction.
Methods We examined the expression of 13 candidate lncRNAs in 80 BC and matched adjacent normal tissues via quantitative real-time PCR. Eleven dys-regulated lncRNAs were evaluated in serum from 120 BC
patients and 120 controls (training set). A three-lncRNA panel was established based on logistic regression model using training set date. Then, the panel was validated in an independent cohort of 100 BC patients and 100 controls
(validation set). Meanwhile, the relationship between lncRNAs and BC recurrence was further assessed in the validation set.
Results We identified a three-lncRNA panel (MEG3, SNHG16 and MALAT1) that provided a high diagnostic accuracy of BC in training and validation set. The satisfactory diagnostic performance of lncRNA panel persisted regardless of disease status. Furthermore, Kaplan-Meier analysis was applied for BC patients and identified that non muscle invasive BC (NMIBC) patients with low MEG3 level had worse recurrence-free survival. Univariate and multivariate Cox analysis indicated that MEG3 was an independent predictor for the recurrence of NMIBC.
Conclusion This study indicated that a three-lncRNA panel can act as a novel blood-based biomarker for the diagnosis of BC. Furthermore, MEG3 was identified as an independent factor for BC recurrence.

PO-1230

凝血功能指标在热射病中的临床应用

邢丽丽
西安医学院第一附属医院

目的 中暑是指人体在高温环境下，由于水和电解质丢失过多，散热功能障碍引起的以中枢神经系统和心血管功能障碍为主要表现的热损伤性疾病。其中热射病是中暑中最为严重的类型。出凝血功能障碍在中暑发病后最早出现并对患者的预后起决定性作用，继发的其他器官功能损害也与凝血功能的异常有密切的联系。热射病合并凝血功能异常的发病机制，目前研究认为可能的发病机制，其一血液浓缩学说：高温使机体失水增加，血液浓缩，血液黏滞度变高，这些因素增加了血栓形成的

风险； 其二炎性反应因子学说：高温导致的热应激可以直接激活炎性反应系统，诱导大量中性粒细胞、巨噬细胞及单核细胞的活化，释放多重炎性反应介质和氧自由基，而诱导炎性反应级联反应的产生。在缺氧、应激时，激发“瀑布样”炎性反应可以促发凝血反应，反之凝血反应也会加重炎性反应；其三内皮细胞损伤学说：即高温产生的细胞高代谢、缺氧等一系列因素导致血管内皮细胞的损伤，使原本带有抗凝因子的血管内皮细胞表面变成促凝因素；凝血异常作为许多疾病的急性时相反应，包括急性感染、创伤等因素引起的 MODS。此类患者中普遍存在着凝血功能的异常，同时凝血异常会加重已发生的 MODS。因此本论文评价凝血功能指标在热射病中的临床应用的研究。

方法 一般资料选取 2015 年 7 月到 2018 年 7 月在本院急诊科接受治疗的 30 例热射病患者，其中男性 22 例，女性 8 例。年龄 28-55 岁，平均（43±7.5）岁。入院患者均排除其他疾病导致的凝血功能损害。30 例患者中存活组（24 例）及死亡组（6 例）。方法两组患者均进行血液检查，在入院后立即进行肘前静脉血的抽取，抽取量为 2.7ml，将其放于 3.2%柠檬酸钠抗凝的负压溶液试管中，轻摇试管，将血液与抗凝剂充分的混合，之后采用 3000r / min 进行离心，时间 10min。采用全自动血凝分析仪进行凝血功能指标的检测，将测试结果进行记录.同时采集 2ml 前肘静脉血放于 EDTA-K2 抗凝真空管中，采用全自动血细胞分析仪进行 PLT 计数，将测试结果进行记录。观察指标对比 DD、FDP、PT、APTT、FIB、PLT 各项指标之间的差异。

结果 观察生存组和死亡组患者血小板、纤维蛋白原比较差异无统计学意义，但死亡组患者 PT 和 APTT 明显高于生存组（P=0.021）；DD、FDP 亦明显高于生存组（P=0.035），差异有统计学意义。

结论 本研究结果显示，死亡组 PT、APTT、DD、FDP 均显著高于生存组，证实凝血功能障碍是热射病患者死亡的高危因素,证明凝血功能相关指标可以作为热射病预后判断因子，为热射病临床干预提供指导。

PO-1231

中性粒细胞和单核细胞 VCS 参数在早期诊断细菌感染中的临床价值初探

简子娟、梁湘辉、刘文恩
中南大学湘雅医院

目的 探讨中性粒细胞和单核细胞 VCS 参数在早期诊断细菌感染中的临床应用价值。

方法 利用 Beckman Coulter DxH800 血液分析仪分析 40 例血流感染患者、47 例局部感染患者和 69 例健康对照者的 WBC、NE%（中性粒细胞百分比）和中性粒细胞、单核细胞的 VCS 参数，对以上参数进行组间差异比较。绘制差异有统计学意义指标的 ROC 曲线，计算灵敏度、特异性和 AUC 值。

结果 血流感染组和局部感染组与对照组比较时，MNV（中性粒细胞平均体积）、MNV-SD（中性粒细胞平均体积的标准差）和 MMV（单核细胞的平均体积）的差异均有统计学意义（P＜0.01）。中性粒细胞的光散射值只有 UMALS（高中位角光散射）、UMALS-SD 和 LMALS（低中位角光散射）的差异有统计学意义（P＜0.05）。单核细胞的光散射值只有 MALS（中位角光散射）、LMALS 和 UMALS 的差异有统计学意义（P＜0.05）。血流感染组的 MNV、MNV-SD 和 MMV 值显著高于局部感染组（P＜0.01），可用于鉴别诊断。MNV 用于鉴别血流感染与局部感染的临界值为 155.5 时，灵敏度和特异性分别为 0.85 和 0.723；MNV-SD 的临界值为 21.35 时，灵敏度和特异性分别为 0.9 和 0.681；MMV 的临界值为 185.5 时，灵敏度和特异性分别为 0.6 和 0.745。

结论 监测 MNV、MNV-SD 和 MMV 有利于细菌感染性疾病的早期诊断，较 WBC 和 NE%有更高的灵敏度和特异性，且可为临床鉴别血流感染和局部感染提供实验室指标。

PO-1232

Investigation on Reference Intervals of Complete Blood Count for Children Aged 0-6 Years Old in Shenzhen of China

Xiaoliu Liu
Medical Laboratory of Shenzhen Luohu Hospital Group

Objective To establish the RIs of CBC for healthy children aged 0-6 years old in Shenzhen city, China.
Methods The peripheral blood of 101797 healthy children aged 0-6 years old who underwent physical examinations from January 2016 to April 2019 were collected. Blood samples were grouped by genders and ages for CBC.
Results The 24 RIs of CBC for healthy children from 0 to 6 years old in Shenzhen city were provided, including 8 items in red blood cells, 11 items in white blood cells and 5 items in platelets. The 24 test items in different age or gender groups were all non-normal distributions. The developing trends of 24 items of CBC with age were clarified by comparing the differences between neighboring age groups of the same indicators. Besides that, the gender differences in 24 test items of CBC were provided.
Conclusions The RIs of CBC for healthy children aged 0-6 years old were established. The RIs can be utilized as a reference index of CBC for children from Shenzhen city

PO-1233

To detect roapoptotic effects of the novel proteasome inhibitor b-AP15 on multiple myeloma cells and natural killer cells

Xiaoli Feng
Clinical laboratory center of the second hospital of Shandong university

we show that b-AP15 triggers time- and dose-dependent apoptosis of the human multiple myeloma (MM) cell lines RPMI8226 and U266, as determined by phosphatidylserine exposure. Apoptosis was dependent on caspase activation and was partially dependent on cathepsin D. Furthermore, b-AP15 triggered processing of pro-caspase-3 and cleavage of poly (ADP-ribose) polymerase in MM cells. b-AP15 also induced caspase-independent apoptosis in primary human natural killer cells. We also demonstrate that b-AP15 induces activation of the mitochondrial apoptosis pathway in MM cells, with activation of the proap optotic protein Bax and a pronounced loss of the mitochondrial transmembrane potential.The latter events, however, appeared largely independent of caspase activation.

PO-1234

A Rapid and Fully Automated Mixing Test for Screening of FVIII Inhibitors in Hemophilia A Patients

Qiang Li
Department of Laboratory Medicine, Nanfang Hospital, Southern Medical University

BACKGROUND Coagulation factor VIII (FVIII) inhibitors are the most significant complication in the treatment of hemophilia A. Activated Partial Thromboplastin Time (APTT) correction test is commonly used as a screening method, which is manual, time-consuming and laborious. The purpose of this study is to develop a rapid and automated method for screening of FVIII inhibitors.
METHODS Protocols of immediate APTT correction test (APTT-I) and post-incubation APTT correction test (APTT-P) were set on the SYSMEX CA1500 analyzer. A total of 360 patients with hemophilia A and 94 patients with lupus anticoagulant were detected by the automated method and Bethesda method. A positive inhibitors value for Bethesda was defined as ≥0.6 BU/mL. The APTT difference (APTT-D) and APTT correction index (APTT-CI) were calculated to evaluate the diagnostic efficiency of the automated method in this study and the anti-interference ability of lupus anticoagulant.
RESULTS The positive rates of Bethesda, APTT-D, APTT-CI and APTT-D combined APTT-CI were 20.29%, 22.35%, 22.65% and 21.76%, respectively. The sensitivities of APTT-D, APTT-CI and APTT-D combined APTT-CI were 97.10%, 98.55% and 97.10, 96.68%, 96.68% and 97.42% for specificity, 99.24%, 99.62% and 99.25% for negative predictive values (NPV), 88.16%, 88.31% and 90.54% for positive predictive values (PPV), 96.76%, 97.06% and 97.35% for diagnose accordance rates (DAR), respectively. The positive rates of APTT-D, APTT-CI and APTT-D combined APTT-CI were not significantly different from that of the Bethesda.
CONCLUSIONS The fully method automated established and verified by this study is a simple, rapid and accurate method for screening of FVIII inhibitors, which can be widely used in medical laboratories.

PO-1235

2 型糖尿病患者血小板聚集功能水平的研究

黎海生、邱潇林、徐敏、蒋金梅、戚南昌、朱莹泉、赵晓丽
昆明市第一人民医院

目的 通过研究 2 型糖尿病（T2DM）患者的血小板聚集功能水平，为 2 型糖尿病患者血栓（及出血）防治提供客观的依据。
方法 入选 231 例该院住院的 T2DM 患者作为研究对象（研究组），以健康体检者 222 例作为对照组，利用 PL-12 型全自动血小板功能分析仪分别检测花生四烯酸（AA）和二磷酸腺苷（ADP）诱导的血小板聚集率。对研究组和对照组的血小板聚集率进行比较，收集并分析研究组血小板聚集率与糖化血红蛋白（HbA1c）、平均血小板体积（MPV）、病程之间的相关性，比较研究组有并发症和无并发症患者的血小板聚集率差异。
结果 研究组 AA 和 ADP 诱导的血小板聚集率均明显高于对照组，差异均有统计学意义（P<0.05）。研究组 AA 和 ADP 诱导的血小板聚集率与 HbA1c 水平和病程均无相关性（P>0.05，r>0）；研究组 ADP 诱导的血小板聚集率与 MPV 呈负相关（P<0.05，r<0），AA 诱导的血小板聚集率与 MPV 无相关性（P>0.05,r<0）。研究组 AA 和 ADP 诱导的无并发症患者的血小板聚集率与有并发症患者差异均无统计学意义（p>0.05）。
结论 T2DM 患者的血小板聚集功能水平与 HbA1c、MPV、病程和并发症无明显关联。动态监测 T2DM 患者的血小板聚集功能水平在预防血栓（及出血）事件中具有一定的临床应用价值。

Homozygous prothrombin-Tyr510Asn mutation causes severe dysprothrombinemia with no abnormal bleeding due to antithrombin resistance

Yeling Lu 、Xi Wu、Qiulan Ding、Xuefeng Wang
Ruijin Hospital,Shanghai Jiaotong University School of Medicine

A patient with hematuria referred to our clinic was diagnosed with urolithiasis. Analysis of the patient's plasma clotting time indicated that both APTT (52.6 s) and PT (19.4 s) are prolonged and the prothrombin activity is reduced to 12.4% of normal, though the patient exhibited no abnormal bleeding phenotype. Genetic analysis revealed the patient is homozygous for prothrombin Tyr510Asn mutation. We expressed and characterized the prothrombin-Y510N variant in appropriate coagulation assays and found that the specificity constant for the activation of the mutant zymogen by factor Xa is impaired ~5-fold. Thrombin generation in the prothrombin-deficient plasma supplemented with either wild-type or prothrombin-Y510N revealed that the mutation has decreased the peak height and time to peak of thrombin generation without affecting the endogenous thrombin generation potential of the mutant prothrombin. Further analysis indicated that the thrombin mutant exhibits resistance to antithrombin and is inhibited by the serpin with ~12-fold slower rate constant. Protein C activation by thrombin-Y510N was also decreased ~10-fold, however, thrombomodulin overcame the catalytic defect. The Na+-concentration-dependence of the amidolytic activities revealed that the dissociation constant for the interaction of Na+ with the mutant has been elevated ~20-fold. These results suggest that Tyr510 (Y184a in chymotrypsin numbering) belongs to network of residues involved in binding Na+. A normal protein C activation by thrombin-Y510N suggests that thrombomodulin modulates the conformation of the Na+-binding loop of thrombin. The clotting defect of thrombin-Y510N appears to be compensated by its markedly lower reactivity with antithrombin, explaining patient's normal hemostatic phenotype.

PO-1237

降钙素原在急性淋巴细胞白血病化疗后感染中的应用价值

周泽杰
南方医科大学珠江医院

目的 研究降钙素原（PCT）在急性淋巴细胞白血病化疗后感染的诊断价值。
方法 选取在南方医科大学珠江医院出院诊断为急性淋巴细胞白血病（ALL）113 例，分为 3 组，分别为重症细菌感染组 27 例、局部细菌感染组 69 例，非细菌感染组 17 例为对照组。采用固相免疫层析技术测定各组降钙素原（PCT）水平。
结果 重症细菌感染组、局部细菌感染组及非细菌感染组之间患者降钙素原不全相等，具有统计学意义（P<0.05）。根据尤登指数， PCT>0.19 时为早期细菌感染的最佳诊断阈值，敏感度 62.5%, 特异度 100%。
结论 在急性淋巴细胞白血病化疗后细菌感染诊断中，降钙素原较 CRP 特异度高，是一种具有较高特异性新型诊断指标；严重细菌感染时，降钙素原水平异常升高，且与感染的严重程度及预后有关。

PO-1238

老年肺炎患者中 D-二聚体与降钙素原及中性粒细胞的相关性及临床意义

吕士玉
山东第一医科大学第一附属医院（山东省千佛山医院）

目的 探讨老年肺炎患者外周血中 D-二聚体、中性粒细胞比例和降钙素原水平变化及临床意义。
方法 收集 2015 年 10 月至 2017 年 2 月在我院进行治疗的老年肺炎患者 56 例作为观察组，选取同期健康体检的健康老人 100 例作为对照组。两组研究对象，采集空腹静脉血，检测 D-二聚体（D-D）、降钙素原（PCT）水平、白细胞计数（WBC）和中性粒细胞比例（N%），比较两组间这些指标的变化情况。
结果 ①老年肺炎组与健康对照组相比，D-D、PCT、WBC 和 N%均升高（P<0.01）；②老年肺炎组中，D-D 与 PCT、N%之间均存在显著正相关性；
结论 在老年肺炎患者，随着炎症程度升高（炎症生物标志：降钙素原水平、白细胞计数及中性粒细胞比例），血栓风险增加（D-二聚体增高），及时检测 D-二聚体，采取预防和治疗措施，有助于减少血栓发生。

PO-1239

RBC、RET 系统参数在闽东地区地中海贫血和缺铁性贫血的鉴别诊断应用

陈丹丹
宁德市闽东医院

目的 探讨红细胞 3 项系统参数：红细胞计数（RBC）、平均红细胞体积（MCV）、平均红细胞血红蛋白量（MCH）；网织红细胞 6 项系统参数：网织红细胞百分率（RET％）、网织红细胞绝对值（RET＃）未成熟网织红细胞比率（IRF%）、低荧光强度网织红细胞百分率（LFR％）、中荧光强度网织红细胞百分率（MFR％）、高荧光强度网织红细胞百分率（HFR％）在地中海贫血（thalassemia trait，TT）和缺铁性贫血（iron deficiency anemia，IDA）的鉴别诊断中的应用。
方法 将 100 例 TT 患者设为地贫组，100 例 IDA 患者设为缺铁贫组，100 例健康人设为对照组，用希森美康 XN9000 系列全自动血液分析仪检测红细胞参数及网织红细胞参数，用 SPSS 23.0 统计软件分析各组参数间的差异，多组间数据采用单因素方差（one-way ANOVA）分析，多组间比较采用 Tukey 校正，同时采用受试者工作特征曲线（ROC）分析各参数曲线下面积（AUC）,评价各项指标的在鉴别 TT 和 IDA 中的诊断效能。
结果 TT 组和 IDA 组 RBC、MCV、MCH、RET%、RET#、IRF%、LFR%、MFR%、HFR%与对照组比较，其差异均有统计学意义（P＜0.05）；地中海贫血组 RBC、MCV、RET%、RET#、IRF%、LFR%、MFR%、HFR%与缺铁贫组比较，其差异均有统计学意义（P＜0.05）。α 地中海贫血与 β 地中海贫血在这些参数上进行比较，差异无统计学意义（P＞0.05）。用 ROC 分析各项指标时，HFR%的曲线下面积（AUC）=0.862，在各项指标中 AUC 下面积最大，在鉴别 TT 和 IDA 中 HFR%的 cut-off 值为<2.680。
结论 在 TT 和 IDA 的鉴别诊断中 HFR%的诊断效能最大，有望作为两者鉴别诊断重要的实验室指标。

PO-1240

红细胞分布宽度联合血清 D-二聚体水平对急性心肌梗死患者 PCI 术后心脏不良事件的预测价值

李宁
西安市第一医院

目的 探讨红细胞分布宽度联合血清 D-二聚体水平对急性心肌梗死患者 PCI 术后心脏不良事件的预测价值。
方法 选取 2016 年 10 月-2017 年 4 月期间入我院进行 PCI 术的急性心肌梗死患者 100 例，根据红细胞分布宽度是否≥16.0%分为高 RDW 组和低 RDW 组，根据 D-二聚体的水平是否＜1.0μg 分为低 D-二聚体组和高 D-二聚体组。
结果 高 RDW 组患者的 LVEF 明显低于低 RDW 组，LVEDD 和 LVESD 明显高于低 RDW 组（P＜0.05）；高 RDW 组的院内死亡、心力衰竭、再发性急性心肌梗死和恶性心律失常发生率明显高于低 RDW 组（P＜0.05）；低 D-二聚体组的死亡率明显低于高 D-二聚体组（P＜0.05）。
结论 红细胞分布宽度和血清 D-二聚体水平能够对急性心肌梗死患者 PCI 术后的心脏不良事件进行有效的预测，可以对预后效果进行一定程度的提示。

PO-1241

肾综合征出血热患者凝血及纤溶相关指标检测结果分析

李锐成、董轲
空军军医大学唐都医院检验科

目的 分析不同临床分期和不同严重程度肾综合征出血热（hemorrhagic fever with renal syndrome, HFRS）患者凝血指标和纤溶指标的检测结果，探讨 HFRS 在病情变化时凝血纤溶指标的改变规律。
方法 选取 2010 年 1 月至 2020 年 7 月期间在我院就诊的有明确分期和严重程度的 HFRS 患者 552 例，对其进行凝血、纤溶功能指标的检测，包括活化部分凝血活酶时间（APTT）、凝血酶原时间（PT）、纤维蛋白原含量（FIB）、凝血酶时间（TT）、纤维蛋白原降解产物（FDP）和 D-二聚体（D-D），对各项指标在临床分期和不同严重程度时的检测结果进行分析比较。
结果 PT、APTT、FIB 和 TT 四项凝血指标在低血压休克期时异常幅度最为明显，而 FDP 和 D-D 两项纤溶指标则在少尿期时最为明显。六项指标随着疾病的严重程度出现了异常率和异常水平的明显上升，差异均具有统计学意义(P 均<0.05)。
结论 六项凝血指标及纤溶指标在 HFRS 患者中出现明显异常，尤其处在低血压休克期和危重型。在低血压休克期前和重症时做到早期干预以纠正凝血和纤溶系统紊乱意义重大。

PO-1242

Hsa_circ_0006834 在非小细胞肺癌中的作用及机制研究

丁小鸽
江苏大学

目的 研究表明 CircRNA 在人非小细胞肺癌（non-small cell lung cancer, NSCLC）发生发展中起着重要作用。本文拟探究 Circ6834 在 NSCLC 中的表达模式及生物学功能，并探讨其潜在的作用机制。
方法 采用 qRT-PCR 检测 NSCLC 患者肿瘤组织及细胞系中 Circ6834 的表达水平。采用过表达及敲减 Circ6834 质粒转染 NSCLC 细胞，通过克隆形成、生长曲线、transwell 细胞迁移侵袭实验分

别观察过表达和敲减 Circ6834 对 NSCLC 细胞生物学功能的影响，采用荧光素酶报告基因实验、RNA 免疫共沉淀（RIP）及质谱分析探究 Circ6834 在 NSCLC 中的潜在作用机制。
结果 Circ6834 在 NSCLC 患者肿瘤组织中低表达。体外实验发现 Circ6834 过表达后能明显抑制 NSCLC 细胞增殖、迁移和侵袭能力，促进细胞凋亡；敲减 Circ6834 具有相反效果。同时，Circ6834 应答 NSCLC 细胞内转化生长因子 β（transforming growth factor-β,TGF-β）刺激，TGF-β 刺激后，Circ6834 在 NSCLC 细胞中表达下调且 TGF-β 可以部分逆转过表达 Circ6834 引起的 NSCLC 细胞的功能学改变；而过表达 Circ6834 可以抑制 TGF-β/Smad 信号通路的激活。荧光素酶报告基因实验发现 miR-873-5p 具有较强抑制 Circ6834 荧光素酶报告基因活性的作用，过表达 miR-873-5p 可以逆转 Circ6834 的抑癌作用。RIP 及质谱分析表明 Circ6834 可能通过与 AHNAK 蛋白结合调控 AHNAK 的表达从而抑制 NSCLC 的转移。
结论 Circ6834 在 NSCLC 中低表达，具有抑制 NSCLC 生长和转移的重要作用，可能作为一个潜在的生物标志物，为 NSCLC 的早期诊断及治疗提供新靶点。

PO-1243

初步探讨血浆 vWF 和 ADAMTS-13 在 VSD 患儿术后血管内皮损伤评估及预后的应用价值

王欣怡[1,2]、张琼文[1,2]、沈永明[3]、刘军锋[1]、李文正[1]、贾克刚[1,2]
1. 泰达国际心血管病医院
2. 天津医科大学心血管病临床学院
3. 天津市儿童医院

目的 动态观察先天性心脏病室间隔缺损（VSD）患儿围手术期血浆血管性血友病因子（vWF）、血管性血友病因子裂解蛋白酶（ADAMTS-13）的水平和活性变化，探讨 VSD 患儿术后血浆 vWF 浓度（vWF:Ag）和 ADAMTS-13 活性（ADAMTS-13:AC）反应内皮细胞损伤及预后的影响。
方法 收集泰达国际心血管病医院 2018 年 10 月至 2019 年 3 月期间行手术治疗的 VSD 患儿 74 例为实验组(单纯 VSD 组 28 例、VSD 合并肺动脉高压组 32 例、VSD 合并心脏瓣膜病组 14 例)。收集同期天津市儿童医院健康儿童 31 例为对照组。分别留取患儿入院时、心脏手术后当天、术后一天的外周静脉血血浆，记录入院时各项生化指标。进行 vWF 活性（vWF:AC）、vWF:Ag、ADAMTS-13 抗原(ADAMTS-13:Ag)、ADAMTS-13:AC 检测。
结果 ①实验组患儿血浆 vWF:Ag、vWF:AC 术前含量明显低于对照组（P<0.001），术后当天、术后 1 天均持续明显升高（P<0.001）；②实验组患儿血浆 ADAMTS-13:Ag 术前含量明显高于对照组（P<0.001），术后当天、术后 1 天较术前明显下降，但两者之间无显著差异（p=0.777）；③实验组患儿血浆 ADAMTS-13:AC 水平明显低于对照组（P<0.001），术后当天、术后 1 天均无明显变化（p=0.054，p=0.926）；④VSD 合并瓣膜病组术前 vWF 水平与对照组无明显差异，三亚组术后 vWF、ADAMTS-13 水平与实验组变化趋势相同；⑤vWF:Ag/ADAMTS-13:AC 比值曲线面积（AUC=0.798）高于 vWF:Ag 和 vWF:AC；术后 1 天 vWF:Ag/ADAMTS-13:AC 比值在反映血管内皮损伤中的敏感性及特异性最高。
结论 术后 vWF:Ag、vWF:AC 明显上升,ADAMTS-13:Ag 明显下降，呈明显相反的动

PO-1244

肝病发展阶段凝血六项的变化趋势研究

刘飞、徐运
陆军军医大学第二附属医院检验科

目的 探讨凝血六项联合检测在肝病的诊治、病情监测及指导用药中的临床价值。
方法 （1）样本选取 2010 年至 2020 年新桥医院消化内科 210 例不同病程的肝病患者（慢性肝炎 70 例、肝硬化 70 例，肝癌 70 例）及健康体检者 70 例；采用静脉全血检测，枸橼酸钠抗凝。（2）采用 ACL TOP 700 LAS 全自动凝血分析仪及其配套试剂检测患者凝血六项各指标水平,研究肝病发展进程与凝血六项的相关性。（3） 组间比较采用 t 检验或非参数 Wilcoxon 秩和检验，多组间比较采用单因素方差分析或非参数 Kruskal-Wallis H 秩和检验。P＜0.05，差异有统计学意义。
结果 1）不同发展阶段的肝病患者 PT、APTT、TT 较对照组均有不同程度的延长（P＜0.05）；FIB 含量较对照组均有不同程度的下降（P＜0.05）；AT-III 活性较对照组均有不同程度的下降（P＜0.05）；D-二聚体含量较对照组均有不同程度的上升（P＜0.05）。2）各型肝脏疾病 PT、APTT 呈现慢性肝炎组＜肝硬化组、肝癌组（P＜0.05）而肝硬化组和肝癌组相比差异无统计学意义（P＞0.05）；TT 呈现慢性肝炎组＜肝硬化组（P＜0.05），而慢性肝炎组与肝癌组、肝硬化组与肝癌组相比差异无统计学意义（P＞0.05）；FIB 含量呈现肝癌组＞慢性肝炎组＞肝硬化组（P＜0.05）；AT-III 活性呈现慢性肝炎组＞肝硬化组、肝癌组（P＜0.05），而肝硬化组和肝癌组相比差异无统计学意义（P＞0.05）；D-二聚体含量呈现慢性肝炎组、肝硬化组＜肝癌组（P＜0.05），而肝硬化组和慢性肝炎组相比差异无统计学意义（P＞0.05）。
结论 凝血六项的水平可客观地评价肝病患者的凝血纤溶状况，并且与肝病的严重程度一致。对临床肝脏疾病的诊断、治疗、动态检测和指导临床用药提供依据，具有重要的临床指导意义。

PO-1245

基于沃芬凝血系统的常规凝血项目结果自动审核规则建立与验证的多中心研究

苗林子[1]、李传宝[2]、戴菊华[3]、屈晨雪[1]、续薇[4]、曲林琳[4]、范庆坤[5]、汪润[1]、叶辉铭[6]、张晶[6]、王海[7]、芦慧霞[8]、赵艳丽[9]、李小侠[10]、沈阳[11]、伍佰清[12]、夏立娇[13]、朱传金[14]
1. 北京大学第一医院
2. 北京医院
3. 北京大学国际医院
4. 吉林大学白求恩第一医院
5. 武汉亚洲心脏病医院
6. 厦门市妇幼保健院
7. 吉林大学中日联谊医院
8. 东南大学附属中大医院
9. 吉林大学第二医院
10. 陕西省人民医院
11. 沃芬医疗器械商贸（北京）有限公司
12. 江西省人民医院
13. 民航总医院
14. 山东省肿瘤医院

目的 建立能够满足临床需要的基于沃芬凝血系统的凝血项目自动审核规则，在保证检验报告准确性的同时，减轻人工审核的人员支出，有效缩短实验室内周转时间。
方法 通过来自 9 个中心的包括凝血酶原时间(PT)，活化部分凝血活酶时间(APTT)，凝血酶时间(TT)、纤维蛋白原(FIB)、纤维蛋白原降解产物（FDP）以及 D 二聚体（D-D）6 项的凝血数据建立

了自动审核规则。自动审核规则包括质控检查、核对与医嘱一致性和结果的数字形式、标本性状检查、报警信息检查，危急值检查、历史结果查询及差值检验、限制范围判定、放宽条件判定以及逻辑关系判定，将自动审核规则设入模拟验证软件、仪器中间件中，进行了初步验证、一期验证及二期验证。规则验证通过自动审核通过率、真阳性率、真阴性率、假阳性率、假阴性率、敏感性和特异性进行评估；用实验室周转时间(TAT)评估自动审核规则的效率。
结果 收集 2020 年 1 月至 2020 年 3 月 9 家医院凝血检测样本 22072 份进行自动审核规则的建立。初步验证采用规则建立组数据，自动审核通过率为 68.83%，其中 6281 例假阳性病例，无假阴性病例。 在 2020 年 6 月进行了 32743 份样本的一期模拟验证，自动审核的总体率为 66.73%，其中 4650 例假阳性病例，无假阴性病例，敏感性为 100%，特异性为 85.80%。 在 2020 年 10-11 月将自动审核规则设入中间件和 LIS 系统，进行了 10176 例样本的二期验证。自动审核总体通过率为 69.50%，各家中心检验后平均实验室内周转时间（TAT）由 91min 降至 72min，差异具有统计学意义(P=0.006)。
结论 基于沃芬凝血系统的自动审核系统可以在保证医疗安全的同时，对大部分无异常的结果进行自动审核，减轻人工审核的负担，缩短 TAT，提高工作效率。

PO-1246

健康成人白细胞表面 CD64 和 HLA-DR 指标参考区间建立及其影响因素探讨

苗林子、陆遥、屈晨雪、由然、龚岩
北京大学第一医院

目的 建立健康成人白细胞表面 CD64 和 HLA-DR 及相关指标的参考区间，探讨其影响因素。
材料和方法 选取北京大学第一医院体检中心 126 例 22-60 岁的健康成人，分别采用抗 CD64、抗 HLA-DR 单克隆抗体标记白细胞表面 CD64 和 HLA-DR，采用流式细胞术检测二者的表达情况，计算白细胞表面 CD64 和 HLA-DR 相关指标并建立相应的参考区间，分析年龄、性别对白细胞表面 CD64 和 HLA-DR 相关指标的影响。
结果 健康成人白细胞表面多个 CD64 和 HLA-DR 相关指标检测结果显示，数据均呈偏态分布。CD64 相关指标在各年龄组间无统计学差异。单核细胞 HLA-DR 平均荧光强度、单核细胞 HLA-DR 荧光强度中位数、单核细胞与中性粒细胞 HLA-DR 比值(平均荧光强度）随年龄增加有逐渐上升趋势。18-29 岁组的单核细胞 HLA-DR 平均荧光强度低于 40-49 岁组和 50-59 岁组（P=0.023，P=0.007）；18-29 岁组的单核细胞 HLA-DR 荧光强度中位数低于 50-59 岁组（P=0.034），上述差异均具有统计学意义。男性与女性白细胞表面 CD64 和 HLA-DR 相关指标均无显著差异（P 均>0.05）。
结论 本研究首次建立了健康成人白细胞表面 CD64 和 HLA-DR 相关的多个指标的参考区间，对这些指标的临床应用提供了依据。年龄会影响健康成人白细胞表面 HLA-DR 相关指标检测结果。

PO-1247

XN9000 血细胞分析系统自动审核规则验证

刘中路
临沂市人民医院

目的 在血液分析中联合应用多项规则进行检验结果的自动审核，来验证多规则联合应用的有效性。
方法 利用临沂市人民医院检科 2020 年 8 月至 11 月期间的 EDTA-K2 抗凝的血常标本共 50659 例，联合应用标本性状检查、复检规则、多中心审核规则、IP 报警检查、Positive 检查等多项规则，对

XN9000 血液水线结果自动审核。对所选择验证的标本全部推片镜检，镜检阳性结果录入Labman6.0 系统，统计自动审核通过率、假阳性率、假阴性率、复检率及镜检率。
结果 自动审核验证通过率 68.78%（34845/50659）、假阳性率 15.58%（7982/50659）、假阴率 1.51%（765/50659）、复检率 18.51%（9379/50659）、镜检率 15.71%（7959/50659）。使用自动审核规则后，平均 TAT 缩短 3 分钟。
结论 使用 XN9000 配套的 Labman6.0 系统，联合应用多项规则进行血常规结果的自动审核，在满足假阴性要求的前提下，提高结果自动审核率（70%左右），保证工作人员集中精力复检异常标本，提高血常规的检验质量。

PO-1248

Establishment and Bleeding Assessment in Subarachnoid Hemorrhage Mice Model Based on Aggregation- Induced Emission Probe

Maliang Tao
Sourthern medical unniversity NanFang hospital

Background & Objective Subarachnoid hemorrhage (SAH) is a serious disease caused by the rupture of diseased blood vessels at the bottom of the brain or on the surface of the brain, with blood flowing directly into the subarachnoid space. The pathophysiological mechanisms involved in SAH brain damage, such as brain injury and cerebral vasospasm, is still unclear. As is considered to the closest imitation of human SAH, the endovascular perforation method for inducing SAH is frequently used in rodents for exploring the mechanisms involved in SAH brain damage and developing effective therapeutic strategies. However, the assessment of SAH severity by radiological technology is greatly limited, due to the difficulty on bleeding quantification, especially the micro bleeding (less than 40 μL) and diffuse bleeding in SAH rodents.
In order to overcoming these above shortcomings, we demonstrated a near-infrared (NIR) aggregation-induced emission (AIE)-active probes for in vivo bleeding indication, through binding blood to switch the fluorescence state from off to on. Based on the fluorescence signal in the subarachnoid space, we hope to identify the induction of SAH without euthanasia and establish a new grading system for the quantification of bleeding and the evaluation of SAH severity, providing a new visual bleeding quantitative tool and new animal model for the study of the pathological mechanism of SAH.
Methods 1. AIE-active fluorescent probe TTVP that can specifically respond to blood was obtained by constructing and screening the AIE molecular library. Its photophysical properties were studied by UV-absorption spectrum analysis, photoluminescence (PL) analysis, and other methods. Stability detection, selective-specificity experiment, tissue penetration experiment, and CCK8 assay were performed to determine the capacity of TTVP to work as an in vivo bleeding indicator.
2. To bring TTVP into the subarachnoid space of mice during the induction of SAH, a new injectable cannula was connected by the insulin needle and the ultra-fine capillary tube, which was used to replace the traditional No. 3 fishing line for puncturing the intracranial blood vessel and injecting TTVP.
3. The brain fluorescent signal of SAH mice with different levels of hemorrhage was detected by an In-Vivo FX PRO imaging system, and a new in vivo identification method and quantitative hemorrhage grading system were established. To evaluate the superiority and reliability of the fluorescent grading system, mouse brain anatomy and MRI were assessed at the same time.
Results 1. TTVP showed an absorption maximum at 480 nm and emitted red fluorescence with emission peak at 645 nm in THF, with maximum tissue penetration depth exceeding 0.75 cm. TTVP was completely unaffected with pH changes ranging from 3 to 12 and showed excellent stability in fresh cerebrospinal fluid over 24 h.

2. TTVP can specifically light up the blood through binding to albumin and hemoglobin in the blood and had a good linear response relationship with the blood volume in the range of 2-20 μL, with the lowest detection limit of 2 μL.
3. The new injectable device successfully brought TTVP into the subarachnoid space of mice and obtained the SAH mice model;
4. The brain fluorescent signal in the occipital region was used to determine the induction of SAH, and its intensity difference was proportional to the bleeding degree and severity of SAH in the mice, which could be divided into 5 levels from light to severe. The signal of the fluorescence imaging system based on TTVP was not only consistent with the brain anatomy and MRI results, but also far superior to MRI for the quantitative detection of bleeding, especially in diffuse bleeding and minor bleeding.
Conclusion In this study, we constructed and screened a near-infrared (NIR) aggregation-induced emission (AIE)-active probe TTVP for in vivo bleeding indication, through binding with albumin and hemoglobin in the blood to switch the fluorescence state from off to on. It has the advantages of near-infrared luminescence, high biological stability, and high tissue penetration. Based on the fluorescence signal in the subarachnoid space, we successfully identified the induction of SAH without euthanasia. Furthermore, a new fluorescence grading system based on TTVP has also been established for the quantification of bleeding and the evaluation of SAH severity. This fluorescence evaluation system provides a new visual bleeding quantitative tool and new animal model for the study of the pathological mechanism and novel therapeutic therapies of SAH.

PO-1249

不同检验原理血凝仪器检测结果可比性讨论

靳强强
山东大学第二医院

目的 探讨不同检测原理血凝仪器凝血常规四项检测结果可比性。
方法 收集 20 份检验结果覆盖线性范围的病人样本，离心获得乏血小板血浆后，均分成两份，并编成 A、B 两组。A 组为对照组：实验组检测仪器为沃分 TOP 700；B 组为检测仪器为思塔高 STAR Max。分别上机检测项目为 PT、APTT、TT、FiB，4h 之内检测完毕，并对检验结果进行比较分析。
结果 两台仪器检测原理：思塔高 STAR Max 为磁珠法，沃分 TOP 700 为光学凝固法。通过对 A、B 两组数据 20 份样本进行数据分析，利用数据一致性、相关性、符合性三个方面对检测结果进行分析。根据 WS/T406-2012 凝血检验批内精密度的检测要求推导得来，系统间比对偏倚应<1/2Tea，PT 正常标本允许偏差≤6.0%，异常标本≤16.0%；APPT 正常标本允许偏差≤8.0%，异常标本≤16.0%；TT 正常标本允许偏差≤10.0%，异常标本≤10.0%；FiB 正常标本允许偏差≤12.0%，异常标本≤24.0%。由于不同品牌仪器间试剂及检测原理差异，若比对结果不能满足相对偏差要求，则应对数据进行回归分析，计算 r2 满足 1±0.05 即可。若不满足相关性要求，则降级按照定性检验地要求进行结果符合率验证，符合率>80%即可通过。本次比对结果中，PT 检测结果具有符合性，符合率为 85%；APTT 检测结果具有相关性，APTT 回归方程 $y = 1.224x + 1.5505$，$r^2=0.9814$；TT 检测结果具有符合性，符合率为 100%；FiB 检测结果具有一致性。
结论 PT 检测结果具有符合性；APTT 检测结果具有相关性；TT 检测结果具有符合性；FiB 检测结果具有一致性。

PO-1250

探究布加综合征患者血小板活化情况

刘云
徐州医科大学附属医院

目的 探究布加综合征患者血小板活化百分比，为疾病的早诊断早治疗提供新思路。
方法 收集 BCS 患者外周血 10 例，同时采集正常人外周血 10 例作为对照，采用流式检测 CD62P、PAC-1 百分比以及 CD41a、AK2 的表达情况。
结果 BCS 患者 CD62P、PAC-1 以及 CD41a 与正常对照相比差异有统计学意义（1.236±0.14vs0.340±0.02，P=0.0004；1.946±0.42vs0.309±0.03，P=0.001；9305±436.1vs7604±500.6，P=0.025）。
结论 BCS 患者外周血血小板活化指标 CD62P、PAC-1 相对于正常对照均升高，提示在疾病诊断中具有较大临床应用价值。

PO-1251

新型尿液分析仪在疑似尿路感染病人中快速筛查应用研究

李江
湖南省人民医院

尿路感染（Urinary Tract Infections，UTI）是门诊和住院患者最常见的感染之一。如不能及时准确地诊断，延误治疗，可能导致患者逐渐发展为复发性难治性尿路感染，严重降低患者生活质量。在疑似尿路感染的病人中，大部分定量尿细菌培养的结果为阴性，阴性率可以高达 60%，甚至更高。此外，尿细菌培养程序至少需要 24 小时，并且需要临床实验室工作人员的大量手工操作。在临床诊断操作中，临床实验室无法快速提供尿细菌培养的病原体信息，临床医生基于其自身的技术和经验，采用经验性抗生素用药方法，可引起抗生素的过度使用，增加尿路感染细菌的耐药性风险。希森美康 UF-5000 尿有形成分分析仪采用 488nm 波长新型蓝色半导体激光器，同样基于荧光流式细胞术的检测原理，快速准确计数并分类尿液中有形成分如红细胞、白细胞、上皮细胞、管型及微生物等的全自动化尿液分析仪。UF-5000 能够更精准识别和鉴定细菌的特征。采用流式细胞术原理，基于革兰氏阳性菌和阴性菌细胞壁肽聚糖的含量差异，二者的前向散射光强度和荧光染色特性均有差异，从而区分出革兰氏阳性菌和革兰氏阴性菌，从而提供极其有价值的尿细菌学信息，为指导尿路感染患者抗生素的使用提供重要依据。最新研究表明，UF-5000 在检测尿有形成分颗粒计数、分类方面展现出良好的性能，但用于评估其在筛查疑似尿路感染患者的性能方面鲜有报道。

PO-1252

定量比值法测新生儿脐血 G6PD 临界值设定的探讨

刘均如
广东省人民医院

目的 通过高铁血红蛋白还原实验结合双酶定量比值法检测脐血 G6PD，探讨新生儿脐血双酶比值法测定 G6PD 的临界范围设定。
方法 用广州米基公司 G6PD 定量比值法试剂盒对本院产科 2018 年 7 月-2021 年 4 月共 2065 例女性新生儿脐血进行 G6PD 定量检测，同时进行高铁血红蛋白还原试验（肉眼观察呈明显棕红色、棕色或黑色为阳性）。

结果 2065 例女性新生儿中， G6PD 比值<1.10 有 52 例（双酶比值法脐血正常参考范围 1.10-2.50），高铁血红蛋白还原实验阳性 141 例，其中 52 例 G6PD 比值<1.10 新生儿脐血，两种方法符合率为 100%。另 89 例 G6PD 比值>1.10 而高铁血红蛋白还原试验阳性的脐血样本，结合父母亲 G6PD 缺陷情况，判定 87 例为 G6PD 杂合子。
结论 比值法测 G6PD 杂合子容易漏检，参照试剂说明书正常参考范围，脐血女性新生儿 G6PD 缺陷检出率为 2.5%；而根据本研究，比值法测脐血 G6PD 对女性杂合子的漏检率约为 4.2%，若比值法检测 G6PD 设定脐血临界参考范围在 1.05-1.40，则脐血女性新生儿 G6PD 缺陷检出率可达 6.7%，可大大降低新生儿脐血筛查 G6PD 女性杂合子漏检率。

PO-1253

The effects of storage on platelet proteome assessed by protein expression changes and lysine modification changes using TMT isobaric labeling

Li Wang、Zhicheng Wang
Department of Laboratory Medicine, Huashan hospital, Fudan University

Objective To provide the first insight into the proteomic dynamics during platelet storage.
Experiment design In this study, based on TMT-labeled LC-MS/MS analysis, combined with antibody-affinity enrichment and purification for acetylated and succinylated peptides, we performed quantification of global proteomics, acetylome and succinylome. Simultaneously, dynamic molecular changes and functional transformation of platelet were also characterized under proper conditions stored for 1, 3, 5, 7 days, respectively.
Results 3,100 proteins are quantified from a total of 3,609 proteins identified from platelets. Out of 1,308 acetylated sites identified in 648 proteins, 790 sites in 396 proteins are quantifiable. There are 1,947 succinylated sites in 959 proteins in which 1,279 sites in 661 proteins are quantifiable. We screened the differential expression changes of global proteins, acetyl- and succinyl- proteins, and systematically interpreted their molecular functions, biological processes, cellular components, pathways and motif characters to fully investigate the molecular dynamics and biological functions of platelets.
Conclusions This paper is the first systematic exploration of proteomes and modified proteomes of platelet dynamics during storage in the aim to improve our understanding of platelet biology, which may be a valuable reference for further research and clinical application.

PO-1254

OSA 患者血浆外泌体在促心肌细胞纤维化和肥大作用中机制研究

吕星、龚辉、张湘瑜
中南大学湘雅二医院

目的 研究阻塞性睡眠呼吸暂停（OSA）血浆外泌体在心肌细胞纤维化和肥大中的作用机制，为进一步研发新的无创诊断方法、新的诊断标记物和有效治疗的方法提供理论依据。
方法 将未经治疗的 OSA 患者(OSA-exos)和健康对照(非 OSA-exos)空腹血浆样本中提取的外泌体作用于心肌细胞 H9C2。采用 Western blotting、PCR 和免疫荧光染色观察 Col1A1、ANP、BNP 等纤维化和肥厚性标志的表达变化，此外，在 H9C2 中加入等量的 OSA-Exos,观察自噬和 Akt/mTOR 表达变化以及在其中的作用机制。

结果 与对照组相比，未经治疗的 OSA 外泌体导致 Col1A1、ANP 和 BNP 显著升高。并且自噬指标 LC3B 和 beclin1 在 OSA-Exos 组表达下降。OSA-Exos 处理组 p-Akt/Akt、p-mTOR/mTOR 水平高于对照组。
结论 OSA 血浆外泌体可能通过 Akt/mTOR 信号通路抑制自噬从而调控心肌细胞纤维化和肥大。

PO-1255

遗传性异常纤维蛋白原血症一家系纤维蛋白原含量及功能分析

吴雪莲、李孟韩、谢依杉、卢谊、潘娟、王逍遥、吴斯玮、邓昆
重庆医科大学附属第三医院

目的 对 1 个遗传性异常纤维蛋白原血症家系进行表型和基因型分析，阐述该家系成员的纤维蛋白原含量、纤维蛋白原功能之间的联系，探讨该家系分子发病机制。
方法 应用 ACL TOP 700 全自动凝血分析仪检测先证者及其家系成员三代 20 人的血浆活化部分凝血活酶时间（activated partial thromboplastin time, APTT）、凝血酶原时间（prothrombin time，PT）、凝血酶时间（thrombin time，TT）、纤维蛋白原（fibrinogen，Fg），分别采用 von-Clauss 法、PT 衍算法检测纤维蛋白原活性（Fg：C）；用贝克曼 AU 5800 全自动生化分析仪检测纤维蛋白原抗原水平（Fg：Ag）。应用血栓弹力图仪检测 9 名凝血功能异常家系成员的反应时间（R）、凝血形成时间（K）、最大振幅（MA）、弹力图最大切角（α-Angle），评估纤维蛋白原功能以及血小板功能。应用 BGISEQ-500RS 基因测序仪对先证者、先证者父母及先证者儿子 4 人进行全外显子测序，进行基因分析。
结果 凝血功能检测结果显示先证者以及包括先证者母亲和儿子在内的 10 名家系成员均存在凝血酶时间（TT）明显延长、Fg 活性（von-clauss 法）明显减低；血栓弹力图检测结果显示先证者弟弟 K 值延长， α-Angle 减低，先证者弟弟的儿子凝血 R 值缩短， α-Angle 减低；二代测序结果显示先证者、先证者母亲以及先证者儿子存在 FGA 基因 c.103C＞T 杂合突变。
结论 基于 FGA 基因的 c.103C＞T 突变是导致先证者、先证者母亲以及先证者儿子异常纤维蛋白原血症的分子发病机制；该突变所致异常纤维蛋白原的功能正常。

PO-1256

线粒体转移促进肿瘤发展的研究进展

张娟[1]、张柳芸[2]、向云会[2]
1. 电子科技大学附属医院·四川省人民医院
2. 电子科技大学医学院

细胞间线粒体转移（Mitochondria transfer）在多种血液系统肿瘤和实体瘤的发生、转移、侵袭力改变、化疗耐药等过程中都发挥了重要的作用。肿瘤细胞与其微环境中细胞之间的线粒体转移对肿瘤的发展至关重要，微环境中的细胞，如间充质干细胞、内皮细胞等，可以将线粒体转移至肿瘤细胞中，恢复肿瘤细胞的有氧呼吸，并为快速增殖的肿瘤细胞提供能量，从而促进肿瘤发展。不仅如此，肿瘤细胞也可以将线粒体转移至微环境中的细胞，从而降低自身线粒体的数量，避免线粒体氧化磷酸化中，呼吸复合物 I 和 III 产生过多的线粒体活性氧(Reactive Oxygen Species，ROS) 损伤肿瘤细胞。此外，肿瘤细胞之间有时也会发生线粒体转移。本综述主要讨论了截至目前研究报道的有关细胞间线粒体转移对肿瘤细胞增殖、化疗耐药和诱导凋亡等方面的影响，为将线粒体作为肿瘤治疗中的潜在靶标奠定理论基础。

PO-1257

新型冠状病毒感染的重症和非重症患者实验室指标的对比分析

李佳珊
哈尔滨医科大学附属第一医院

背景 2019 冠状病毒病(COVID-19)已威胁全球健康。冠状病毒的实验室特征对临床诊断和治疗具有重要意义。我们发现了可能最有效地预测非重症 COVID-19 患者发展为重症患者的指标。
方法 我们对检索的文献中 COVID-19 重症患者与非重症患者的实验室检查结果进行 meta 分析。
结果 通过分析 35 篇文献(5912 例)中 COVID-19 患者的实验室检查资料，我们发现重症病例具有更高的白细胞(1.20 倍)、中性粒细胞(1.33 倍)、CRP(3.04 倍)、PCT(2.00 倍)、ESR(1.44 倍)、AST(1.40 倍)、ALT(1.34 倍)、LDH(1.54 倍)、CK(1.44 倍)、CK-MB(1.39 倍)，总胆红素(1.14 倍)，尿素(1.28 倍)，肌酸(1.09 倍)，PT(1.03 倍)，d -二聚体(2.74 倍)，淋巴细胞(1.44 倍)，嗜酸性粒细胞(2.00 倍)，单核细胞(1.08 倍)，血红蛋白(1.53 倍)，PLT(1.15 倍)，白蛋白(1.15 倍)，APTT(1.02 倍)，与非重症相比较。重症组与非重症组的淋巴细胞亚群和炎性细胞因子序列也有所不同，在重症组中 CD4 T 细胞较低(2.10 倍)、CD8 T 细胞较低(2.00 倍)，而 IL-1β(1.02 倍)、IL-6(1.93 倍)、IL-10(1.55 倍)较高。
结论 部分实验室检查指标可预测 COVID-19 变化的进展，特别是淋巴细胞、CRP、PCT、ALT、AST、LDH、D -二聚体、CD4 T 细胞和 IL6，这些指标可能为预防疾病恶化提供有价值的信号。

PO-1258

贫血鉴别诊断中的血液检验效果观察

吕艳丽
南方医科大学珠江医院

目的 研究贫血鉴别诊断中血液检验的应用价值与有效性，为临床诊断提供必要指导。
方法 随机将 2017 年 3 月～2019 年 3 月本院 25 例贫血患者作为实验组，同期选择 25 例健康体检者作为对照组，对比两组参与者血液检验结果。
结果 实验组 MCV 为（74.79±0.48）、RBC 为（3.71±0.44）、MCH 为（10.11±1.32）、Hb 为（86.61±4.48）、RDW 为（22.46±1.57），前四项指标均比对照组高，最后一项指标高于对照组，差异具备统计学研究意义（P＜0.05）。
结论 诊断贫血的过程中，选择血液检验方式，可有效提高诊断结果的准确性，临床应用相对广泛。

PO-1259

血浆 D-二聚体诊断肺癌合并肺栓塞的最佳临界值研究

刘胜男、廖建枫、李广华、黄革、顾兵
广东省人民医院

目的 探讨血浆 D-二聚体诊断肺癌合并肺栓塞的最佳临界值。
方法 2010 年-2019 年广东省人民医院收治肺癌合并肺栓塞患者 158 例，随机选取 2010 年-2019 年广东省人民医院收治肺癌患者并肺栓塞阴性 158 例作为对照组。目前临床上普遍采用螺旋 CT 增强扫描作为肺栓塞的确诊依据[1]，因此以影像学诊断为主，结合临床医生诊断，收集患者诊断当天的 D-二聚体数值以拟合 ROC 曲线，确定其最佳临界值。

结果 经 ROC 曲线分析，D-二聚体诊断肺癌合并肺栓塞的灵敏度为 72.2%，特异度为 75.9%，阳性预测值为 79%，阴性预测值为 78.2%，Youden 指数为 0.481，AUC 值为 0.810，有较高的诊断价值；D-二聚体诊断肺癌合并肺栓塞的最佳临界值为 1950μg/L。
结论 肺癌患者体内 D-二聚体升高，临床上目前使用 500μg/L 作为肺栓塞阴性排查值并不适用于肺癌人群， D-二聚体取 1950μg/L 作为肺癌合并肺栓塞的最佳诊断值,有利于肺栓塞的早期诊断和治疗,对改善肺栓塞患者预后有重要意义。

PO-1260

Outcome of adolescent and adult T-cell acute leukemia and the prognostic significance of early T-cell precursor leukemia subtype

Hongyan Liao [1]、Qin Zheng[2]
1. Department of Laboratory Medicine, West China Hospital, Sichuan University
2. 四川大学华西医院实验医学科

Objective To evaluate the clinical characteristics of T-cell acute leukemia/lymphoma and explore the prognosis significance of early T-cell precursor leukemia/lymphoma.
Methods 160 patients diagnosed of T-ALL from 2008 to 2016 in West China Hospital, Sichuan University were enrolled in this study. They were further categorized by immunophenotype according to the expression of T-cell lineage markers CD1a, CD8, CD5 and one or more stem cell or myeloid markers. The laboratory indicators and prognosis factors were also statistically analyzed.
Results Of all patients, the ratio of male to female was 2.2:1, with the median age 26 years old (range 10 to 77). The percentage of ETP-ALL was as high as 44.4%. T-ALL patients showed higher ratio in first clinical remission rate (CR1) than T-LBL patients (64.4% vs 30.8%, P = 0.03). Group with WBC count higher than 50×109/L at presentation showed higher ration of achieving CR1 than those lower than 50×109/L (78.4% vs 50.9%, P = 0.009). In comparison with the Non-ETP-ALL, ETP-ALL patients had older age of onset (P < 0.001), lower WBC count (P < 0.001), lower risk of CNS involvement (11.3% vs 25.4%，P = 0.049) and slightly inferior overall survival (P = 0.053).Results between positive and negative expression of T-cell lineage markers CD1a-, CD8- ,CD4- and myeloid lineage markers CD33-, CD56-, there is no statistical significance of prognosis.
Conclusion Flow cytometry and associated markers for immunophenotyping is of significance in the diagnosis and prognosis monitoring of T-ALL/LBL. The percentage of ETP-ALL/LBL subtype is high in Chinese adolescent and adult T-ALL patients. ETP/ALL/LBL is a high risk subtype, which needs more precise standard for diagnosis and advanced therapies for better outcome.

PO-1261

一例少见异常 HbQ 的家系分析

葛艳芬
广东省人民医院（广东省医学科学院）

目的 报道一例异常 Hb Q 的家系分析结果。
方法 采集患者一家三口的外周血标本，进行常规血液学检测、血红蛋白电泳、变性珠蛋白小体（Heinz 小体）实验。
结果 先证者（新生儿）的血红蛋白电泳发现在 S 区含有 19.2%的区带,Hb Barts：0.5%，Hb A：21.0%，Hb F：59.3%。其父为异常 Hb Q 含量：29.0%，Hb A：68.6%,Hb A2：2.4%（偏低）。

其母 Hb A：97.1%,Hb A2：2.9%，未发现异常血红蛋白区带。其父 RBC:5.31*1012/L,Hb:136g/L,MCV:76.1fl,MCH:25.6pg，RDW-CV:0.14。其母血液学参数均正常。一家三口变性珠蛋白小体均阴性。

结论 根据家系遗传分析，推断先证者及其父的异常血红蛋白均为 α 链变异的 Hb Q。此异常血红蛋白是我国少见的一种异常血红蛋白变异体，且与 aa / -a4.2 缺失型的 α 地中海贫血连锁携带 。此家系的报道丰富了医务工作者对异常血红蛋白复合 α 地中海贫血的认知，对于优生优育、指导遗传咨询具有重要的意义。

PO-1262

侵袭性 NK 细胞白血病的实验室和临床特点分析

廖红艳[1]、金咏梅[2]、蒋能刚[2]
1. 四川大学华西医院
2. 四川大学华西医院实验医学科

目的 探讨侵袭性 NK 细胞白血病（Aggressive NK Cell Leukemia, ANKL）患者的临床病理特点。

方法 回顾性分析 2016 年 1 月-2016 年 12 月在我院确诊的 12 例 ANKL 患者的临床病理资料，包括骨髓细胞形态学、免疫表型及病理结果。

结果 12 例骨髓涂片中可见大颗粒淋巴细胞。流式细胞学示 ANKL 的免疫表型均为 CD2(+)sCD3(-)CD5(-)CD56(+)，6 例 CD7(+)，3 例 CDl6(+)。6 例行免疫组化检测，结果均为：EBER1/2 (+)、粒酶 B（+）。

结论 骨髓细胞形态学、免疫表型和免疫组化对于 ANKL 的及时诊断和鉴别诊断具有重要意义。

PO-1263

毛细管电泳技术在非缺失 α-地中海贫血中的筛查价值

葛艳芬
广东省人民医院（广东省医学科学院）

目的 分析毛细管电泳技术的电泳结果,评价其在非缺失 α-地中海贫血中的应用价值并对非缺失型 α-地中海贫血的基因型和表型进行分析。

方法 收集标本检测血常规，Hb 电泳以及地贫基因结果。设为 A 组非缺失 α-地贫杂合子（包括 HbCS、HbQS、HbWS），B 组 α-地贫 2（-α3.7/αα 或-α4.2/αα），C 组 α-地贫 1（--αSEA /αα），D 组为非缺失型复合 α-地贫 2，E 组为非缺失型复合 β-地贫，F 组为非缺失型复合 α-地贫 1。进行统计学分析。

结果 381 个病例：A 组 22 例，临床表现为静止型一轻型;B 组 116 例，临床表现为静止型;C 组 239 例，临床表现为轻型；D 组：2 例（-αWS/-α3.7），临床表现为轻型；E 组 2 例（ ααCS/αα 合并 β-28 杂合子），临床表现为轻型；F 组 1 例（ααWS/--SEA），临床表现为轻型一中间型。

结论 初步阐明非缺失 α-地贫杂合子表型比缺失型的 α-地贫 2 明显，毛细管电泳技术对筛查非缺失 α-地中海贫血具有较大的应用价值，提高了 α-地贫的检出率。

PO-1264

Optimization of pretreatment methods for cerebrospinal fluid metabolomics based on Ultrahigh Performance Liquid Chromatography/Mass Spectrometry

Zhiqiang Song[1,2]、Mian Wang[1]、Zhenyu Zhu[2]、Gusheng Tang[1]、Yue Liu[2]、Yifeng Chai[2]
1. Changhai Hospital
2. 第二军医大学药学系

Sample pretreatment of cerebrospinal fluid (CSF) in metabolomics plays an important role in metabolic profiling study, especially for samples related to central nervous system diseases. However, there is few study about optimization of CSF metabolomics pretreatment. Therefore, it is an urgent need to optimize CSF pretreatment in order to promote the extraction efficiency of metabolites. In this study, CSF samples were separately subjected to nine different protein precipitation solvents and five different reconstitution solvents to establish the most effective pretreatment method before hydrophilic interaction (HILIC) and reverse-phase (RP) ultrahigh performance liquid chromatography mass spectrometry (UPLC/MS) analysis. The optimal conditions for different sample pretreatment methods were analyzed based on coverage (number of detected potential metabolites), stability (the relative standard deviation (RSD) distribution of metabolites) and the reproducibility of the data. Our results suggested that using EtOH or MeOH-EtOH-ACN (1:1:1, v/v/v) as the protein precipitation solvents and H2O-MeOH-ACN (2:1:1, v/v/v) as the reconstitution solvent were optimal methods for T3 column analysis. For HILIC column analysis, using EtOH to precipitate protein and H2O-MeOH-ACN (2:1:1, v/v/v) to reconstitute or MeOH to precipitate and 5%ACN to reconstitute performed best. This developed UPLC/MS pretreatment method could provide better protein precipitation solvents and reconstitution solvents for global CSF metabolic analysis, potentially facilitating the comprehensive understanding of many central nervous system diseases.

PO-1265

Significance of plasma fibrinogen assay in risk assessment of retinopathy in patients with type 2 diabetes

Qinghua Huang[1,2]、Mingyi Wo[1,2]、Fan Han[1,2]、Yiran Wang[1,2]、Chaonan Li[1,2]、Xianming Fei[1,2]
1. Zhejiang Provincial People's Hospital
2. 杭州医学院附属人民医院

Objective To explore the clinical significance of plasma fibrinogen (Fbg) measurement in risk assessment of diabetic retinopathy (DR).
Methods The coagulation parameters of 307 patients with type 2 diabetes (T2D) was measured, the association of Fbg and DR was assessed, the risk factors of DR was analyzed by Logistic regression, and the ROC curve was used to evaluate the predicting power of risk factor for DR.
Results The level of Fbg in DR group was significantly higher than that in T2D group (P<0.001), and patients in DR with proliferative stage had a significantly higher Fbg level than that in non-proliferative stage (P<0.01). The area under ROC curve of Fbg predicting DR risk was 0.835 (95% CI:0.775-0.896, P <0.001)， and the sensitivity and specificity were 86% and 83%, respectively according to cutoff value of 2.95g/L. Moreover, the area under ROC curve for discriminating between was 0.778 (95% CI: 0.729-0.828, P <0.001), and the sensitivity and specificity were 82% and 75%, respectively, when the cutoff value was 3.23 g/L. Multivariate regression analysis revealed that Fbg was an independent risk factor for occurrence and progression of DR with OR values of (4.121, 95% CI: 2.332–8.430) and (8.516, 95% CI: 4.886–16.655) (P <0.01).

Conclusion Plasma fibrinogen can be used as an independent predictor of retinopathy and its progression in type 2 diabetes.

PO-1266

mir-155 与冠心病患者阿司匹林抵抗的相关性研究

徐成伟
山东大学第二医院

目的 研究 mir-155 与冠心病患者阿司匹林抵抗的相关性，统计分析 AR 的其他危险因素。
方法 入选 2016 年 3 月至 2017 年 1 月因冠心病入住山东大学第二医院心内科和干部保健科的患者 58 例，采用血栓弹力图的方法检测静脉血花生四烯酸(amchidonic acid，AA)诱导的血小板抑制率，将 AA 诱导的血小板抑制率≤50%，定义为阿司匹林抵抗（AR），血小板抑制率＞50%，定义为阿司匹林敏感（AS），收集临床资料分析。根据 TEG 结果分为 AR 组和 AS 组，利用患者血样提取 RNA，通过实时荧光定量 PCR（QRT-PCR）检测两组患者中 mir-155 的表达水平,利用多因素 logistic 回归分析 mir-155 与 AR 的相关性。
结果 所有患者中，20 例（34.5%）存在阿司匹林低反应，两组间性别、吸烟、高血压、糖尿病史、血清总胆固醇、甘油三脂、糖化血红蛋白、外周血小板计数差异无统计学意义，AR 组低密度脂蛋白水平均高于 AS 组，差异具有统计学意义。AR 组 mir-155 表达明显低于 AS 组，通过 logistic 回归分析得出 mir-155 表达水平下调可能是 AR 的危险因素。
结论 mir-155 在冠心病血小板低反应患者中的表达下调，是 AR 的危险因素。Mir-155 可能成为抗血小板药物个体反应的差异性新标志物，为临床医师治疗血小板低反应提供新的导向。

PO-1267

血清轻链和游离轻链在多发性骨髓瘤和淋巴瘤患者中的差异性表达研究

张娟、王加强、王智斌、蒋黎
电子科技大学附属医院·四川省人民医院

目的 探讨多发性骨髓瘤 MM 和淋巴瘤 LYM 患者血清单克隆免疫球蛋白轻链、游离轻链 FLC 与免疫球蛋白 IgG 及其亚类的表达水平差异，为辅助诊断及探讨疾病机理提供可靠依据。
方法 收集 2019 年 1 月-12 月在四川省人民院确诊的 MM 患者 229 例，LYM 患者 231 例，分别进行轻链、游离轻链和总 IgG 及其亚类的回顾性分析。各变量的组间比较采用非参数 Mann-Whitney U 检验。IgG 亚类与轻链的相关性采用 Spearman 相关分析。轻链在不同年龄段的分布采用独立样本克鲁斯卡尔-沃利斯检验。
结果 MM 患者轻链 κ 显著低于 LYM 患者(P=0.000)，而 FLCκ、FLCλ 显著高于 LYM 患者(P 分别等于 0.001，0.000)。血清轻链及亚型定性结果显示，MM 患者 κ、λ、IgGκ、IgGλ、IgAκ、IgAλ 阳性率显著高于 LYM 患者，而 IgMκ、IgMλ 显著低于 LYM 患者(P 分别为 0.001，0.000)。IgG 亚类分析显示，MM 患者 IgG3 显著低于 LYM 患者(P=0.024)，而 IgG1、IgG2、IgG4 差异没有显著性。不同性别、不同年龄组轻链、游离轻链的分布显示，男性 LYM 患者 FLCλ 含量明显高于女性患者，差异有统计学意义(P=0.045)，MM 患者的年龄显著高于 LYM 患者(P=0.000)，IgG 亚类含量与血清轻链、游离轻链的相关分析显示，随着 MM 总 IgG、IgG1 含量的增高，患者 λ 有增高的趋势，随着 IgG2、IgG3、IgG4 的升高，患者 κ 有增高的趋势。LYM 患者中，随着 IgG、IgG1、IgG2、IgG4 含量的增高，患者 λ 有增高的趋势，随着 IgG、IgG1 升高，患者 κ 有增高的趋势。
结论 血清轻链、游离轻链与 IgG 亚类结果在 MM 患者和淋巴瘤患者中存在差异，Ig 亚类与轻链的表达具有一定相关性，需要进一步的研究明确其在辅助诊断及发病机理的价值。

PO-1268

三种血凝分析仪检测 D-二聚体结果的比对分析

亓春玲
泰安市中心医院

目的 比较 3 种全自动血凝分析仪检测 D-二聚体结果的一致性。
方法 随机选取本院患者 219 例，其中包括门诊体检者 45 例和住院患者 174 例，分别用 Sysmex CS-5100 全自动血凝分析仪(CS5100), 日本积水 SEKISUI CP2000 全自动血凝分析仪(CP2000)、)、Biomerieux VIDAS 酶联免疫荧光分析仪及其配套试剂，检测患者血浆 D-二聚体水平并进行统计学分析。
结果 CS5100，CP2000、VIDAS 3 种仪器检测 D-二聚体的阳性率分别为 94.1%、91.3%、92.5%, 差异无统计学意义(P＞0.05)。3 种仪器检测 D-二聚体结果比较差异有统计学意义(P＜0.05)，CP2000 与 CS5100 检测 D-二聚体结果比较差异有统计学意义(χ2=8.89,P<0.05)；CP2000 与 VIDAS 检测 D-二聚体结果差异有统计学意义(χ2=9.3,P<0.05)；CS5100 与 VIDAS 检测 D-二聚体结果差异有统计学意义(χ2= 4 .33,P<0.05)，CS5100 与 VIDAS 检测 D-二聚体结果相关性比 CP2000 与 VIDAS 检测 D-二聚体结果相关性较好些。
结论 不同仪器检测 D-二聚体结果阳性率基本相同,但由于检测原理和检测试剂等的不同导致同一患者检验结果的可比性较差,难以进行方法间的比对。因此,在同一实验室内,建议连续对患者 D-二聚体水平进行检测时,尽可能使用同一机型及配套试剂进行检测，以便更好地动态观察病人病情变化。

PO-1269

Plasma miR-1273g-3p acts as a potential biomarker for early Breast Ductal Cancer diagnosis

苏海翔
甘肃省医学科学研究院，甘肃省肿瘤医院

Circulating miRNAs presenting in plasma in a stable manner have been demonstrated their potential role as a promising biomarkers in many human diseases, such as Alzheimer's disease, melanoma and ovarian carcinoma. However, few circulating miRNAs could be used for breast ductal cancer diagnosis. Here, we identified miR-1273g-3p as a biomarker for detecting breast ductal cancer. We detected miR-1273g-3p levels in the plasma. The results showed the plasma miR-1273g-3p level were significantly up-regulated in breast ductal cancer patients compared with healthy donors (p=0.0139). Taken together, miR-1273g-3p could represent as a potential biomarker for early breast ductal cancer diagnosis

PO-1270

极易误诊为母细胞性浆细胞样树突细胞肿瘤的以皮肤为首发表现的急性髓系白血病一例

杨利群[1]、唐梅[1]、潘建华[2]
1. 四川金域医学检验中心有限公司
2. 广州金域医学检验中心有限公司

目的 探讨极易误诊为母细胞性浆细胞样树突细胞肿瘤以皮肤为首发表现的急性髓系白血病一例。
方法 对 1 例急性髓系白血病的临床资料分析、皮肤活检组织形态学、免疫组化及骨髓流式细胞免疫表型特点进行分析。

结果 患者，女，25 岁，全身皮疹 8 月余，最大者直径 3CM，左后腰皮疹活检示：真皮内见原始/幼稚细胞呈弥漫性分布，易见嗜表皮性；免疫组化(IHC)示：原始/幼稚细胞 CD4（+）、CD56（+）、CD123（+）、TdT（+）、Ki-67（+、约 80%）、CD3（-）、CD5（-）、CD15（-）、CD30（-）、ALK（-）、CD20（-）、CD10（-）、CD117（-）、GrB（-）、MPO（-） 。骨髓流式细胞免疫表型（FCM)示：检测到异常细胞占有核细胞总数约 13.5%，表达 CD4，CD56，CD123，cMPO，CD13+33，HLA-DR，不表达 BDCA-2/CD303，BDCA-4/CD304，CD14，CD64，CD36，CD19，CD20，CD10，cCD79a，cCD3，CD61，CD38，CD138，CD200，CD117，CD34，CD2，CD3，CD5，CD7，CD8，综合骨髓 FCM、皮肤组织活检形态学及 IHC 综合诊断为急性髓系白血病（AML），倾向单核细胞来源。

结论 AML 累及皮肤与母细胞性浆细胞样树突细胞肿瘤（BPDCN） 具有相同的形态学和免疫表型特征（尤其是单核细胞分化的 AML，可共表达 CD4、CD56 和 CD123），鉴别诊断具有挑战性，因此在诊断 BPDCN 之前需要进行广泛的 IHC，并且一定要注意年龄及病史，CD303、CD304 为 BPDCN 的特异性标记，成为鉴别诊断要点之一，因 FCM 检测的是活体细胞，部分抗体表达保存更加完好，此例流式表达 cMPO，而免疫组化 MPO 阴性，FCM 在两者的鉴别诊断中发挥了关键作用。

PO-1271

细胞外囊泡与肿瘤发生发展的关系及其检测方法进展

黄蓉蓉
南京鼓楼医院

目的 了解细胞外囊泡在肿瘤发生发展中的作用及其检测方法

方法 在 web of science、springer、ACS 等数据库及杂志社检索相关文章并综述

结果 大量研究证实，肿瘤细胞分泌的细胞外囊泡数量相较正常细胞更多，这些细胞外囊泡是将肿瘤细胞产生的核酸、蛋白质等多种重要的生物活性分子运输到靶细胞的载体，是连接肿瘤原发部位和转移部位的桥梁，细胞外囊泡作为细胞间的通讯载体，能将来源于肿瘤细胞或肿瘤相关细胞和病毒的重要生物分子如蛋白质（包括酶类、粘附分子、转录因子、受体和膜转运蛋白等）、DNA、miRNA 以及长非编码 RNA 等进行细胞间转移，细胞外囊泡既能调控靶细胞的增殖、分化和凋亡，也能调节肿瘤细胞微环境，与肿瘤的获得性耐药、肿瘤细胞上皮-间质转化、肿瘤细胞侵袭力上升、血管渗漏性提高、肿瘤细胞免疫逃逸等息息相关。研究人员逐年开发出了越来越多的细胞外囊泡定量方法。基于细胞外囊泡物理性质进行定量的方法有动态光散射（Dynamic light scattering，DLS）、可调电阻脉冲传感（Tunable Resistive Pulse Sensing，TRPS）以及 Nanoparticle tracking analysis（NTA）。除去这些传统的方法，还有各种基于电化学、荧光、SPR 等检测原理的新型检测方法。

结论 细胞外囊泡是连接肿瘤原发部位和转移部位的桥梁，在作为肿瘤诊断和预后指标方面有着巨大的潜力，以细胞外囊泡作为肿瘤生物标志物有利于提高癌症诊断的精确性和便利性。深入探索与癌症发生和发展的过程密切相关的细胞外囊泡所特异性表达的蛋白和核酸等标志物，并将该类标志物作为检测靶标，有助于实现特定细胞来源细胞外囊泡的特异性分离和检测，为临床应用带来便利。

PO-1272

qSOFA 评分联合中性粒细胞 CD64 指数对恶性血液病患者血流感染早期诊断价值分析

武坤、祝艳翠、李艳红、聂波
昆明医科大学第一附属医院

目的 探讨 qSOFA 评分联合中性粒细胞 CD64 指数在恶性血液病患者血流感染的早期诊断价值。
方法 选择我院 2019 年 6 月-2020 年 6 月收治的 45 例恶性血液病血流感染患者为研究对象（血流感染组），另选择同期恶性血液病住院无感染患者 45 例（非感染组）作为对照。流式细胞仪测定中性粒细胞 CD64 指数及 TNF-α 水平，对患者进行 qSOFA 评分，并进行统计学分析。
结果 血流感染组患者 qSOFA 评分、中性粒细胞 CD64 指数明显高于非感染组（P＜0.05），血流感染组中死亡患者 qSOFA 评分、中性粒细胞 CD64 指数明显高于非死亡患者（P＜0.05）；血流感染患者 qSOFA 评分（r=0.410，P=0.005）、中性粒细胞 CD64 指数（r=0.380，P=0.010）与 TNF-α 呈显著正相关；qSOFA 评分诊断血流感染曲线下面积为：0.706（95%CI：0.682-0.755），P=0.037，中性粒细胞 CD64 指数诊断血流感染曲线下面积为：0.749（95%CI：0.695-0.813），P=0.028；qSOFA 评分联合 CD64 细胞指数诊断恶性血液病患者血流感染的曲线下面积为 0.874（95%CI：0.831-0.926），P=0.015。
结论 qSOFA 评分、中性粒细胞 CD64 指数联合应用对恶性血液病血流感染的早期诊断具有一定价值。

PO-1273

粪便钙卫蛋白在炎症性肠病诊断中的价值

熊志刚
四川省医学科学院·四川省人民医院

目的 探讨定性与定量粪钙卫蛋白检测在炎症性肠病诊断中的价值。
方法 选取 43 例正常体检患者作为对照组，114 例经临床检查诊断的消化内科及儿科的肠病患者作为炎症性肠病组。检查内容包括隐血，轮状病毒，血常规，CRP 检测等。本实验采用 SPSS 23.0 分析两组患者粪钙卫蛋白水平，因数据不满足正态分布，采用百分位数表示。
结果 炎症性肠病患者组与对照组的粪钙卫蛋白检测值【中位值（四分位数间距）】分别为 65.64（49.33-159.73）ug/g、56.27（43.83-102.04）ug/g，炎症性肠病组患者的粪钙卫蛋白水平明显高于对照组（P＜0.05）。根据 Kappa 一致性检验结果，可以认为定性与定量两种试验结果一致。
结论 定性与定量粪钙卫蛋白检测在炎症性肠病的诊断中具有重要意义。

PO-1274

SysmexXN-10 与迈瑞 BC-6900 全自动血细胞分析仪在有核红细胞干扰下相关研究

熊志刚
四川省医学科学院·四川省人民医院

目的 探讨外周血出现有核红细胞时,Sysmex XN-10 全自动血细胞分析仪与迈瑞 BC-6900 全自动血细胞分析仪的白细胞数是否存在相关关联.

方法 应用 Sysmex XN-10 全自动血细胞分析仪筛查有核红细胞阳性的 104 例标本,分别用迈瑞 BC-6900 和人工显微镜计数,分析显微镜检与两台仪器计数之间有无统计学差异,以及当出现 NRBC 情况下,两台仪器之间计数白细胞存在的关联.
结果 分别校正前后,显微镜检与迈瑞 BC-6900 计数外周血白细胞数量均有极好的相关性 (r=0.990), 2 种方法计数结果的差异无统计学意义 (P> 0.05).显微镜检与 XN-10 计数有极好的相关性(r= 0.988), 显微镜检（校正前）与 XN-10 计数差异有统计学差异（P＜0.05），而校正后与 XN-10 计数差异无统计学意义（P>0.05 ）.XN-10 与 BC-6900(校正前)白细胞计数差异有统计学差异（P＜0.05）, 两者存在线性关系（Peason 相关系数 r=0.992）,建立线性回归模型有极显著的统计学意义，线性回归方程:Y=1.044X-0.092，r^2=0.984，P＜0.05.
结论 当外周血出现 NRBC 时,根据一元线性回归方程,可由迈瑞 BC-6900 全自动血细胞分析仪 WBC 计数预测 Sysmex XN-10 全自动血细胞分析仪的 WBC 数值，有一定的实际实用价值.

PO-1275

PDCA 信息化闭环管理对血常规部分质量指标的影响

陈光意
河南省肿瘤医院检验科

目的 分析 PDCA 信息化闭环管理模式后对血常规部分质量指标的影响。
方法 选取我院 2020 年 10-12 月血常规非急诊门诊和住院患者标本检验前及实验室内 TAT 的中位数与实行 PDCA 信息化闭环管理模式后 2021 年 1-3 月份的数据作比较。
结果 前者非急诊血常规门诊标本检验前及实验室内 TAT 中位数分别为 25min 和 23min，住院患者非急诊标本检验前及实验室内 TAT 中位分别为 83min 和 75min，；后者血常规门诊非急诊标本检验前及实验室内 TAT 中位分别为 13min 和 14min，效率分别提高 48%和 39.2%,住院患者非急诊标本检验前及实验室内 TAT 中位分别为 60min 和 57min，效率分别提高了 27.8%和 24%。
结论 从 2021 年年初开始科室配合医院对血常规标本采用 PDCA 信息化闭环管理模式，严格标本每个环节的 TAT 时间，制定详细的实施计划，检查计划，及时反馈到院周会，按完成情况进行奖惩处罚，根据 2021 年第一季度与 2020 年最后一季度统计结果来看，非急诊的门诊和住院患者血常规标本检查时间 TAT 均有明显缩减，达到预期的目标，显著提高了检验工作效率。

PO-1276

低血红蛋白密度在缺铁性贫血疗效观察中的应用

师传帅
吉林大学第一医院

目的 通过观察口服铁剂后低血红蛋白密度（low haemoglobin density, LHD）的变化情况，动态监测缺铁性贫血患者对铁剂治疗后的疗效反应，为临床缺铁性贫血的诊治提供新的参考依据。
方法 动态观察 28 例缺铁性贫血患者口服铁剂治疗后 1 周、4 周、8 周、12 周的 LHD、RBC、HGB、血清铁、铁蛋白的变化情况。
结果 28 例缺铁性贫血患者口服铁剂治疗前 LHD 为 87.8%±12.8%，口服铁剂 4 周后降低至 67.1%±20.4%，差异有统计学意义。12 周基本降至正常水平 14.2%±7.2%。同时，血清铁水平升高、铁蛋白升高、RBC 和 HGB 亦恢复正常。
结论 缺铁性贫血患者口服铁剂后 LHD 恢复时间较晚，连续动态监测 LHD 可有效评估病情变化和铁剂治疗效果。

PO-1277

免疫细胞、细胞因子、凝血指标及血脂水平在肺癌分期中的应用价值

李丹、赵辰昊、何春燕
苏州大学附属第二医院

目的 探讨外周血免疫细胞、细胞因子、凝血指标及血脂水平与肺癌肿瘤分期的相关性，为临床诊断和治疗提供依据。
方法 选择 2020 年 6 月至 2021 年 5 月在苏州大学附属第二医院就诊的肺癌患者共 96 例。根据患者的临床表征，依据传统肿瘤分期方法（I/II/III/IV 期）进行分组。采用流式细胞术检测处于不同病程阶段的肺癌患者免疫细胞（CD4、CD8、NK、B 细胞，CD4/CD8 比值）及细胞因子（IL-2、IL-4、IL-6、IL-10、IL-17A、TNF-α、IFN-γ、IL-12）水平，同时对患者凝血指标（凝血酶原时间、活化部分凝血活酶时间、纤维蛋白原、抗凝血酶 III、D-二聚体）和血脂水平（总胆固醇、甘油三酯、总胆汁酸）的结果进行回顾性分析。
结果 随着病情的进展，肺癌患者血清中的细胞因子 IL-6、IL-17A 和 IFN-γ 水平明显上升（P<0.05）；晚期肺癌患者血清中抗凝血酶 III 和纤维蛋白原水平显著增加（P<0.01）；免疫细胞和血脂相关指标则与肺癌病程无关（P>0.05）。
结论 在肺癌诊断和治疗过程中，细胞因子 IL-6、IL-17A、IFN-γ 和凝血指标 ATIII、FIB 可以辅助临床对肺癌进行分期，有助于后续治疗。

PO-1278

中医气血虚证与丙种球蛋白及血红蛋白的相关性

唐芸
昆明市中医医院

目的 探讨 中医气虚、血虚患者的丙种球蛋白，血红蛋白值之间的相关性。
方法 选择 203 例中医辨证为气虚，血虚，气血双虚症患者为研究对象，采用证素辨证方法以其检查的丙种球蛋白及血红蛋白指标进行研究。
结果 气虚、血虚，气血双虚与丙种球蛋白、血红蛋白值之间均存在着相关性 (P <0.05)；而虚症病理改变程度之间无显著性差异(P >0.05)。
结论 不能单纯依靠丙种球蛋白及血红蛋白值来诊断气虚、血虚证的病理改变。

PO-1279

探讨ＥＤＴＡ依赖性血小板减少的最佳处理方法

张明珍
山东第一医科大学第一附属医院

目的 探讨ＥＤＴＡ依赖性血小板减少的处理方法，纠正血小板计数。
方法 用Ｓｙｓｍｅｘ XN-10 血液分析仪对标本进行检测、使用配套试剂及质控品仪器状态良好，每天均检测质控，且均在控。收集本院门诊就诊及住院的患者 20 例，仪器结果均显示血小板减少，同时报警提示血小板聚集，血小板直方图曲折不平滑，有翘尾现象；血涂片染色镜下见有大量血小板紧密聚集，一般为 10 个左右血小板聚集成堆，甚至出现大片聚集现象，散在的血小板少见。对这种血小板凝集的标本，采取两种方法进行复检：方法 1、用不加抗凝剂的采血管抽血后立即上机

检测。方法 2、使用含有枸橼酸钠抗凝剂蓝帽采血管抽血后上机检测，以人工显微镜检计数血小板为参考，寻找的最佳处理方法

结果 对于 EDTA 依赖性血小板减少的标本，采取方法 1 在仪器准备妥当的情况下，通知患者来门急诊化验室重新采血立即上机检测，结果是可靠的。采取方法 2 使用含有枸橼酸钠抗凝剂蓝帽采血管进行重新抽血上机检测，并记录 1 小时内不同时间段的检测结果，其结果可靠。

结论 使用含有枸橼酸钠抗凝剂蓝帽采血管的方法对于解决 EDTA 依赖性血小板减少的现象是非常有效可靠的，方便患者，防止因走动影响到患者的病情，也为临床诊治患者节约时间，是最佳处理方法。

PO-1280

一例伴免疫组化 BCL2 阴性的滤泡性淋巴瘤的诊断及鉴别诊断分析

姜山、杨利群、唐梅
四川金域医学检验中心有限公司

目的 探讨一例免疫组化 BCL2 阴性的滤泡性淋巴瘤的实验室检查结果分析并文献复习

方法 对一例免疫组化 BCL2 阴性的滤泡性淋巴瘤的临床资料、淋巴结活检、免疫组化、分子生物学检查的结果分析并鉴别诊断。

结果 患者，68 岁，女性，全身淋巴结肿大 2 年余，双侧颈部、腋窝、腹股沟区均可触及数个肿大淋巴结，最大者位于腹股沟，约 3*2cm，左腋窝淋巴结切除活检示淋巴结结构破坏，滤泡明显增生，套区变薄，呈现“背靠背”现象，符合滤泡性淋巴瘤病理形态特征；免疫组化结果提示：肿瘤性滤泡 CD20（+），CD79α（+），CD10（+），BCL2（-），Ki67（+，30%），MUM-1（-），IgD（+），Lambda（+），Kappa（-）；滤泡间区 CD3（+），CD5（+）；C-MYC（-），CyclinD1（-），CD30（-）；CD23 FDC 网（+）。B 细胞克隆性分析提示 IGK 的 Vk-Kde+intron-Kde 区间 267.76/280.60bp 处检测到单克隆重排；二代测序淋巴造血相关 175 基因中检测到 NOTCH2、BCL6、KMT2C、KMT2D、BTG1、CREBBP、BCL2、PHF6 基因突变；荧光原位杂交 IGH/BCL2 重排探针阳性，信号模式为 1G1R1F 21%,2G1F 8%,1G1F 15%,1R1F 6%,1G1R2F 3%,2G1R 10%,1G2R 2%,2G2R 35%；结合临床表现及病理诊断、免疫组化、分子生物学检测，综合诊断为滤泡性淋巴瘤(FL)，2 级。

结论 BCL2 蛋白阴性 FL 与反应性淋巴滤泡性增生鉴别诊断困难，BCL2 阴性仍不能除外滤泡性淋巴瘤，BCL2 蛋白在 1 级和 2 级 FL 约 85%-90%病例中表达，FL 缺乏 BCL2 表达可能是由 BCL2 基因突变引起的，应及时行荧光原位杂交、基因重排及相关基因突变检测，因为荧光原位杂交及分子生物学的检测可以极大地辅助诊断。

PO-1281

瑞氏染色检测结膜阿米巴包囊

黄小天
电子科技大学附属医院·四川省人民医院医学检验中心

目的 阿米巴角膜炎（Acanthamoeba keratitis， AK）是一种以阿米巴原虫感染导致的感染性角膜炎。阿米巴原虫为单细胞结构的生物，其生活于淡水、咸水、灰尘、泥土、污物、腐败植物及人畜粪便中。另外，又文献报道，再浴盆、空气过滤器、水冷却塔角膜接触镜、镜盒护理液中也分离出阿米巴原虫。致病性自生生活阿米巴不仅可以在自然界自生生活，而且可在温血宿主体内发育增殖，故又称为两栖型生物，属兼性寄生虫。本文收集到 1 例阿米巴角膜炎病例

方法 眼科检查，使用荧光素钠染色后，对患者的眼睑、角膜及晶状体进行观察；使用激光共聚焦显微镜观察患者角膜病变情况。
显微镜检查：刮取患者眼部分泌液，在载玻片上进行涂片，立即使用。
结果 VOD:CF/50cm，VOS:0.8。右眼眼睑无水肿，结膜混合充血，角膜中央区可见直径约 6mm 圆环状全层雾状水肿，上皮褶皱，周边角膜透明，角膜缘 3 点钟位可见一直径约 1mm，深度约 0.7mm 角膜溃疡，前房透明，KP(-)，Tvn(-)，周边虹膜纹理可见，中央区欠清，瞳孔圆，直径约 2mm，对光反射灵敏，晶状体及其后结构欠清。左眼眼睑无水肿，结膜无充血，角膜透明，前房清，虹膜纹理清，瞳孔圆，直径约 2mm，对光反射灵敏，晶状体透明，玻璃体轻混，眼底小瞳下未见明显异常
结论 瑞氏染色检测结膜病灶刮片，查见非常典型的车轮状外壁的阿米巴包囊。

PO-1282

红细胞分布宽度和红细胞分布宽度与血清钙比值是急性胰腺炎严重程度和死亡率的主要预测因子

黎青、陈颖
江苏省人民医院（南京医科大学第一附属医院）

目的 本研究的目的是评估 RDW 与其它预后评分系统相比在 AP 严重程度和死亡率方面的诊断价值。
方法 回顾性病例对照研究 2018-2020 年住院的 160 例 AP 患者。其中重度 AP 患者 80 例，轻度 AP 患者 80 例。
结果 与轻度 AP 患者相比，重度 AP 患者的 RDW 0h 较高（p<0.001），RDW 与血清钙的比值较高（p<0.001）。经过多变量和 ROC 曲线分析后，RDW 0h（AUROC：0.945；p<0.001）和 RDW 与血清钙比值（AUROC：0.969；p <0.001）是 AP 严重程度的主要预测指标，其临界值为 12.9 和 1.39。这些因素优于预后评分，例如 Ranson（AUROC：0.787； p<0.001；临界值：3.0），BISAP（AUROC：0.743；p<0.001；临界值：2.0）和改良 Marshall（AUROC：0.765；p<0.001；临界值：1.0）。死亡率为 9.4％（15/160），所有病例均与重度 AP 相关（18.8％；15/80）。非存活 AP 患者的 RDW 0h 和 RDW 0h 与血清钙比值较高（分别为 15.5±1.5；13.7±1.4；p<0.001 和 2.1±0.4，1.7±0.4；p<0.001）。
结论 RDW 是一个简单的常规参数，可在入院时检测。本 AP 队列显示，RDW 0h>12.9 和 RDW 0h 与血清钙比值>1.39 是较好的 AP 严重程度预测因子，RDW 0h>14.2 和 RDW 0h 与血清钙比值>1.72 是非常好的 AP 死亡率预测因子，优于传统的预后评分系统。

PO-1283

肺泡灌洗液检查对结缔组织病相关间质性肺疾病和特发性间质性肺病的诊断价值

周茂华、李文敏、冼璐桦、蓝名伟
广东省人民医院

目的 探讨支气管肺泡灌洗液(BALF) 细胞分类计数及 T 淋巴细胞亚群检测对结缔组织病相关间质性肺疾病(CTD-ILD)与特发性间质性肺病（IIP)的鉴别诊断价值。
方法 收集 2018 年 6 月～2019 年 12 月来我院行支气管肺泡灌洗液检查的 66 例间质性肺疾病患者的临床资料和实验室检查结果，包括 CTD-ILD 组 28 例和 IIP 组 38 例，比较两组患者 BALF 细胞分类计数和 T 淋巴细胞亚群的差异。

结果 CTD-ILD 组支气管肺泡灌洗液中中性粒细胞、淋巴细胞及嗜酸性粒细胞中位数分别为 31.98×104/ml、13.51×104/ml 及 4.32×104/ml，与 IIP 组相比无显著性差异 (P>0.05）；CTD-ILD 组巨噬细胞计数降低，差异有统计学意义(50.20×104/ml vs 14.04×104/ml，P<0.05）。两组患者 T 淋巴细胞亚群 CD3+、CD3+CD4+、CD3+CD8+和 CD4+/CD8+比值差异均无统计学意义 (P>0.05）。

结论 BALF 细胞分类计数对 CTD-ILD 与 IIP 的鉴别诊断具有一定的价值，巨噬细胞升高可能是 CTD-ILD 区别于 IIP 的特异性表现；BALF T 淋巴细胞亚群检测对 CTD-ILD 与 IIP 的鉴别诊断价值有限。

PO-1284

312 例儿童急性 B 淋巴细胞白血病免疫表型分析

周茂华、罗燕飞、林婷、周远
广东省人民医院

目的 研究儿童急性 B 淋巴细胞白血病(B-ALL)免疫表型特征，初步探讨髓系抗原 CD33、CD13 的表达在儿童 B-ALL 预后中的临床意义。

方法 回顾性分析广东省人民医院 2012 年 1 月至 2020 年 12 月收治的 312 例初治儿童 B-ALL 患者的临床资料，并分析其免疫表型特征。

结果 儿童 B-ALL 表达率最高的淋系抗原为 CD19（99.04%），其后依次为 CyCD79a、CD10、TDT、CD22、CD9、CD20 和 SIgM（分别为 98.08%、96.79%、96.15%、96.15%、92.63%、48.72%、14.74%），85.90%的病例表达 CD34，70.51%的病例表达 CD38。跨系抗原表达率最高的是髓系抗原 CD13 和 CD33，分别占 27.24%和 19.23%，其它抗原 CD15、CD71、CD11b、CD117、CD14 与 CD56 和 CD7 极少表达。临床特征上，CD33+ 儿童 B-ALL 组的临床危险度分级显著高于 CD33-组（P=0.031），但 CD33、CD13 的表达在泼尼松试验、第一阶段化疗后第 15 天和 33 天的完全缓解率（CR）上均无统计学差异。

结论 儿童 B-ALL 存在特征性的免疫表达谱，其临床危险度分级在 CD33+组中显著高于 CD33-组，提示 CD33 可能与长期预后不良有关，但 CD13、CD33 的表达与化疗第一阶段的临床特征及预后没有显著性关系。

PO-1285

Rinsing Sampling of Core Needle Biopsy for Flow Cytometric Analysis: a Favorable Method for Lymphoma Diagnosis

Peidong Chi、Yijun Liu、Yuhua Huang、Minjie Mao、Yu Wang、Zhiming Li、Jian Li
Sun Yat-Sen University Cancer Center, Guangzhou, Guangdong 510060, P.R.China

BACKGROUND Conventional protocols utilize core needle biopsy (CNB) or fine needle aspiration (FNA) to produce cell suspension for flow cytometry (FCM) is a diagnostic challenge for lymphoid malignancies. We aim to develop an alternative CNB rinsing technique (RT) to produce cell suspension for FCM during this mini-invasive procedure of CNB for lymphoma diagnosis.

METHODS FNA and CNB specimens from the same lesion of 93 patients with suspected lymphoma were collected under the guidance of B-ultrasound simultaneously. The fresh CNB samples were prepared to cell suspension by RT for FCM immunophenotyping analysis (Group CNB-RT). Then the CNB tissues after performing the RT process and the fresh FNA tissues were processed by conventional tissue cell suspension (TCS) technique to obtain the cell suspensions

(Groups of CNB-TCS & FNA-TCS) respectively as comparison. The diagnostic efficacies, as well as the concordances of the FCM results with reference to the morphologic diagnoses were compared in these three groups.
RESULTS RT could yield sufficient cells for FCM immunophenotyping analysis, though a lower cell numbers compared to TCS technique. The diagnostic concordance was comparable in group CNB-RT (91.1%) to the group CNB-TCS (88.9%) and group FNA-TCS (88.4%) (p=0.819). The diagnostic sensitivity and specificity of CNB-RT (91.1%; 100%) was not inferior to that of CNB-TCS (88.9%; 100%) and FNA-TCS (88.4%; 98.8%).
CONCLUSIONS This study shows the CNB-RT presented non-inferior diagnostic concordance and efficacy as compared to the TCS technique. CNB-RT has the potential to produce cell suspension for FCM immunophenotyping while preserving tissue for lymphoma diagnosis and research.

PO-1286

Potential diagnostic significance of Hsp90α and Neutrophil to Lymphocyte Ratio in Gestational Hypertension and Preeclampsia

Ning Wang[1]、Jun Zhang[2]、Ke Zhao[2]、Yaru Liu[2]、Hua Li[2]
1. 山东第一医科大学附属山东省肿瘤医院
2. 济南市妇幼保健院

Objective The objective of this study wasto evaluate the differences and the potential diagnosis significance of Hsp90α and Neutrophil to Lymphocyte Ratio（NLR）in normal pregnant women and patients with gestational hypertension (GH) or preeclampsia (PE).
Methods We recruited 131 normal pregnant women, 61 patients with GH and 97 patients with PE. The plasma concentration of Hsp90α was determined by enzyme-linked immunosorbent assay (ELISA)，and complete blood counts were measured by an automated hematology analyzer Sysmex XN-9000. The NLR was calculated as the absolute neutrophil count divided by the absolute lymphocyte count. A receiver operating characteristic (ROC) curve was employed to assess the diagnostic performance of Hsp90α and NLR.
Results Our study indicated that Hsp90α and NLR were increased in the middle and the third trimester of normal pregnancy than the first trimester of normal pregnancy; However, the level of Hsp90α but not NLR in the third trimester was significantly higher than the middle trimester of normal pregnancy. Hsp90α and NLR were increased in GH and PE compared to the normal pregnancy (NP). More importantly, Hsp90α and NLR served as the diagnostic biomarkers for GH and PE, the AUCs for GH were 0.749 and 0.658, for PE were 0.886 and 0.775, respectively. Moreover, their combination significantly elevated the diagnostic efficiency for GH and PE, possessing the AUC of 0.792 and 0.941, respectively.
Conclusions The new inflammatory marker Hsp90α and NLR might be the promising and effective markers for GH and PE. Hence, during prenatal follow-up, NLR and Hsp90α may be useful to predict GH and PE. However, these results must be supported by further prospective large scale.

PO-1287

一种导致复合杂合性遗传性凝血因子XI缺陷症的 F11 基因新突变

王欢欢、王明山、杨丽红、金艳慧
温州医科大学附属第一医院

目的 对一个复合杂合性遗传性凝血因子XI缺陷症家系进行基因突变分析，探讨其分子致病机制。
方法 用 STAGO-STA-R 自动血凝仪检测先证者及其家系成员的血浆凝血酶原时间（PT）、活化部分凝血活酶时间（APTT）、FXI活性（FXI:C）等指标；用 ELISA 法检测 FXI抗原（FXI:Ag）等指标，明确临床表型诊断。采用 DNA 直接测序法分析先证者 F11 基因，发现突变位点后用反向测序予以证实，并检测家系成员相应的突变位点区域。采用 ClustalX-2.1-win 软件分析氨基酸突变位点的保守性；用四个在线生物信息学软件分析突变对蛋白质功能的影响；用 Python-Pymol 软件对突变位点进行蛋白模型分析。
结果 先证者 APTT 为 89.2s，其 FXI:C 和 FXI:Ag 分别为 2%和 3.5%；其父亲、母亲和女儿 APTT 均稍延长，FXI:C 和 FXI:Ag 也均有不同程度下降；其姐姐 APTT 为 91.6s，FXI:C 和 FXI:Ag 分别为 2%和 3.1%。基因分析发现先证者 F11 基因第 7 号外显子存在 c.689G>T 杂合错义突变及第 13 号外显子存在 c.1556G>A 杂合无义突变。保守性分析结果表明，Cys230 在同源物种间高度保守。四个生物信息学软件对 p.Cys230Phe 突变的预测结果一致：均预示此突变很可能是有害突变。突变蛋白模型分析显示，在野生型 FXI蛋白质中，极性亲水性的 Cys230 与 Cys226、His233 和 Ser279 各形成一个氢键；当其突变为非极性疏水的 Phe230 后，原有的氢键没有改变，但增加了一个苯环，从而改变了蛋白质的结构。
结论 该先证者 F11 基因第 7 号外显子存在 p.Cys230Phe 杂合错义突变和第 13 号外显子存在 p.Trp519stop 杂合无义突变，其中 p.Cys230Phe 为一新发现的突变；p.Cys230Phe 遗传自父亲，p.Trp519stop 遗传自母亲，且与该家系 FXI水平减低有关。

PO-1288

Mis-judgement of a patient with Diffuse Large B-cell Lymphoma and the influence of uncapped-statue time on APTT mixing study

Hong Wang
Jiangsu Province Hospital

We reported a woman with the history of Diffuse Large B-cell Lymphoma. At first, she was misdiagnosed with multiple clotting factors deficiency of Factor VIII, Factor IX, Factor XI, and Factor XII. Through further examinations, such as APTT mixing study, diluted clotting factor activity assay, and antiphospholipid antibody test, the laboratory helped in making the correct diagnosis of antiphospholipid syndrome and Factor XII deficiency. New points of this case are: (1) Antiphospholipid antibodies can lead to false combined deficiency of Factor VIII, Factor IX, Factor XI and Factor XII, the true activity levels of which can be detected by dilution method. (2) APTT mixing study of this patient mistakenly indicated the presence of FVIII inhibitor. (3) Autoimmune disorders are frequently mentioned risk factors of APS. However, this patient was a case of APS secondary to hematological malignancy (especially lymphoid neoplasm) and there are less than 10 cases reported till now.

PO-1289

纤维蛋白丝对血细胞计数的影响及处理

赵媛、王妍、林婕、程翔、荆晶、贾晶缓、胡嗯亮
空军军医大学西京医院

目的 探讨外周血涂片中发现纤维蛋白丝对血细胞计数各个参数的影响，分析成因以妥善处理。
方法 1、收集外周血涂片发现纤维蛋白丝的标本 156 例，首先进行性状复检，剔除 9 例不合格标本（可见血凝块），统计剩余 147 例外周血涂片含有纤维蛋白丝的血细胞计数结果数据，简称数据组 1，同时将此 147 例标本当天重新抽血复测，统计复测推片后无纤维蛋白丝的结果数据，简称数据组 2；2、利用统计学软件 SPSS 26.O 对 2 组数据（组 1/组 2）进行配对样本 t 检验统计学分析，以 p〈0.005 为差异有统计学意义；3、调查 147 例患者采血情况，分析比较前后 2 次结果，寻找其他提示。
结果 1、本次试验数据显示纤维蛋白丝会引起 PLT 计数假性减低，RBC/HGB/HCT 计数假性增高，WBC 计数不同程度的变化；2、分析血细胞分析仪散点图直方图，147 例标本中 PLT-F 通道有 145 例散点图报警提示 PLT-Clumps，灵敏度为 98.6%。
结论 1、外周血涂片发现纤维蛋白丝可引起血细胞计数各参数发生变化，应重新采血进行检测；2、XN-9000 血细胞分析仪 PLT-F 通道散点图报警 PLT-Clumps 对于检出纤维蛋白丝有较高的灵敏度。

PO-1290

Clinical application of thrombelastography in patients with different types of coronary heart disease after percutaneous coronary intervention

Peng Zhang
Yijishan Hospital of Wannan Medical College

Objective To study the clinical application of Thrombelastography (TEG) in patients with different types of coronary heart disease after percutaneous coronary intervention (PCI).
Methods One hundred patients diagnosed as coronary heart disease and successfully treated with percutaneous coronary intervention in our hospital from June 2017 to January 2019 were included into the study. According to the type of coronary heart disease, patients were divided into three groups: acute myocardial infarction (AMI) group, unstable angina pectoris (UAP) group and stable angina pectoris (AP) group. We detected coagulation parameters, the degree of platelet inhibition and analyzed difference in the incidence of clopidogrel resistance in three types of coronary heart disease using TEG.
Results The proportion of men in the AMI group is more than in AP group and UAP group($p<0.01$). R and K indices were markedly reduced in the UAP and AMI groups, compared with the AP group, while MA,Angle and CI values significantly increased ($p<0.01$). Clopidogrel was more effective in the AMI group than in the AP group ($P<0.01$) , but the efficacy of clopidogrel in the UAP group was no different from that in the other two groups($p>0.05$).
Conclusions These results show that TEG has high clinical value in monitoring coagulation in patients with coronary heart disease. The coagulation parameters of TEG and clopidogrel effect were significantly different among the three groups at the same dosage of routine antiplatelet drugs, suggesting that clinicians should promote individual antiplatelet therapies based on the results of TEG.

PO-1291

流式荧光技术检测血清细胞因子常见问题与对策

张鹏、徐永新
郑州金域临床检验中心

目的 流式荧光技术检测细胞因子实验由于血清成份复杂，细胞因子含量差距大会对实验结果造成很大影响，且没有商业化质控品,室内质控难以建立。本研究分析流式荧光技术检测细胞因子的常见问题，探讨该项目的室内质控方法，提出处理对策供实验室同行参考。
方法 选取我中心 50 例病人（男 12 例，女 38 例）血清样本，其中高值标本 25 例，低值标本 25 例。每天用质控微球校正仪器，保证仪器光路运行良好。运用流式荧光技术法对血清中 Th1/Th2/Th17 相关十四项细胞因子进行检测，用 FCAP 软件对数据进行分析，发现并分析试验过程中的常见问题，探讨相关对策。
结果 根据不同标本的状态有选择的上调 FSC/SSC 的阈值，可以有效减少细胞碎片的干扰，降低背景噪音；在试验过程中加强对微球斡旋混匀可避免微球聚集现象，有利于微球和样本的结合，在上机前加强对细胞悬浮液的斡旋混匀可保证获取足够的可供分析的细胞数,提高数据有效性；建立标曲时通过增加标准品的稀释点数，扩大了检测范围，保证了对低浓度样本的检测，减少零值的结果；通过对空白微球的荧光强度动态监测，可实现对仪器电压的监测，有利于项目试验条件的标准化；通过用标准品自配高、低浓度的质控品，可实现项目的室内质量控制，保证实验的准确性和重复性。
结论 建立了流式荧光技术检测血清细胞因子常见问题的处理方法和对策,用自配两个浓度标准品的方法进行室内质控可帮助实验室及时发现问题，一定程度上保证实验结果的可靠。

PO-1292

慢加急性肝衰竭患者无临床症状消化道出血的凝血功能改变及预后分析

袁冲、刁艳君、刘家云、周磊、何娟、徐晓丽
空军军医大学西京医院

目的上消化道大出血是慢加急性肝衰的主要死亡原因，但无症状的消化道出血常常被大家忽略。本文探讨无临床症状的慢加急性肝功能衰竭出血患者的凝血功能改变和预后情况，方法收集 2015 年至 2020 年期间在西京消化病医院住院的 42 例慢加急性肝衰竭无出血症状，住院期间不少于 2 次大便潜血阳性病人作为观察组（排除其他原因的出血），另外，选取 42 例同时间段在我院住院的慢加急性肝衰竭大便潜血阴性病人作为阴性对照组。收集患者出凝血检测指标：凝血酶原时间（PT）、活化部分凝血活酶时间 (APTT)、纤维蛋白原（FIG）、凝血酶时间 (TT)、国际标准化比值（INR）、凝血酶原活动度（PT%）、D-二聚体、纤维蛋白/纤维蛋白原降解产物（FDP），并进行患者 4 周内生存时间分析。结果 PT、APTT、INR、D-二聚体、FDP 结果观察组与对照组差异无统计学意义（P>0.05）；PT%、FIG、TT 结果观察组与对照组差异有统计学意义（P<0.05），观察组 FIG 为 1.01±0.20、TT 为 21.84±2.62、PT%为 28.32±6.91;对照组 FIG 为 1.35±0.29、TT 为 19.28±1.74、PT%为 36.79±3.94。生存时间分析发现，观察组病人并发症多，生存时间短，两组差异有统计学意义（P<0.05）。

PO-1293

关于 D-二聚体假阴性与假阳性问题的探讨与分析

颜楠
空军军医大学西京医院

目的 探讨高浓度 D-二聚体（D-Dimer）在“抗原过量”情况下可出现假阴性结果，是否需要进行稀释处理与最适稀释倍数的选择；标本中由于出现异嗜性抗体（heterophilicantibody， HA）等因素干扰导致假阳性结果时，是否需要证明其为假阳性与干扰因素排除方法的选择。
方法 选取我院 2019 年 4 月～2020 年 10 月门诊与住院病例，分为 D-Dimer 假阴性组与 D-Dimer 假阳性组。其中假阴性组分别收集 D-Dimer〈5mg/L, 纤维蛋白/纤维蛋白原降解产物（FDP）<20ug/mL 范围内的结果 50 例，D-Dimer 为（5-10）mg/L, FDP>20ug/mL 范围内的结果 50 例，D-Dimer>10mg/L, FDP>20ug/mL 范围内的结果 50 例，将三种范围的 D-Dimer 结果分别进行各梯度稀释检测并计算回收率；假阳性组收集 D-Dimer 与 FDP 结果倒置的病例 35 例，将 D-Dimer 与 FDP 结果分别进行各梯度稀释检测并计算回收率。

PO-1294

Transient appearance of postchemotherapy pseudothrombocytopenia associated with eosinophilia in a child with acute promyelocytic leukemia

Li Chang 、Fang Liu、Yongmei Jiang
Department of Laboratory Medicine, West China Second University Hospital, Sichuan University

Pseudothrombocytopenia is a well known phenomenon, which is characterized by erroneous low platelet counts due to platelets in vitro clumping. We report a transient appearance of postchemotherapy pseudothrombocytopenia in a child with acute promyelocytic leukemia. Pseudothrombocytopenia and increased eosinophils were two major apparent abnormalities in this patient, and the appearance and disappearance of pseudothrombocytopenia was accorded with abnormal eosinophil counts in time. After excluding EDTA-dependant pseudothrombocytopenia by using alternative anticoagulant or incubating 30min at 37℃, a pseudothrombocytopenia likely induced by IgE-mediated immunologic mechanism associated with eosinophilia was considered. According to the history of disease and medicine, we concluded drug may be an important factor to induce increased eosinophils and IgE in this child. To avoid incorrect diagnoses and inappropriate treatment, pseudothrombocytopenia should always be considered as a possible cause of reported low platelet counts, and once EDTA-induced can be excluded, attention should be paid to drug-use or other causes which may activate platelets.

PO-1295

血小板与淋巴细胞比值对异常凝血酶原阴性肝细胞癌进展的诊断价值

刘京萍
江苏省人民医院

目的 血小板和血小板活化参与肿瘤细胞生长，转移和血管生成的关键步骤。在这项研究中，我们分析了异常凝血酶原阴性的肝细胞癌（HCC）中血小板与淋巴细胞比率（PLR）之间的相关性。
方法 本研究纳入 2017 年 1 月至 2019 年 10 月在江苏省人民医院就诊的 111 名异常凝血酶原阴性的 HCC 初诊患者，并选取 111 名健康体检者作为对照。采用 Mann-Whitney U 检验比较 HCC 和对照组之间实验室参数和临床病理特征的差异。绘制 ROC 曲线确定 PLR 在异常凝血酶原阴性肝癌（PIVKA-II-NHCC）患者中的诊断价值。使用单向方差分析计算 HCC 不同阶段 PLR 的差异。Spearman 相关分析用于分析肝癌患者 PLR 与相关实验参数之间的相关性。
结果 HCC 患者的绝对嗜中性粒细胞计数（N），平均血小板体积（MPV）和嗜中性粒细胞与淋巴细胞之比（NLR）高于对照组。 HCC 患者的血小板计数（PLT），绝对淋巴细胞计数（L），血小板分布宽度（PDW）和 PLR 明显低于对照组。在肝癌的四个阶段之间，PLR 存在显着差异。Spearman 相关分析表明，PLR 与癌症分期，甲胎蛋白（AFP），NLR 和 MPV 呈负相关，与 PLT 和 PDW 呈正相关。 PLR 的 ROC 特性曲线下的面积为 0.631（95％CI：0.591-0.662）。
结论 PLR 与异常凝血酶原阴性的 HCC 相关，可能是其进展的潜在标志。

PO-1296

血栓弹力图分析在妊娠高血压综合征中的应用价值

高丽钦、欧启水
福建医科大学附属第一医院

目的 通过观察妊娠高血压综合征（妊高征）患者血栓弹力图（TEG）与常规凝血项目各项指标之间的关联性,探讨 TEG 在妊高征诊断中的应用价值。
方法 选择 2015 年 11 月至 2018 年 3 月在福建医科大学附属第一医院门诊和住院治疗的妊高征患者 90 例,同时纳入正常妊娠女性（正常妊娠组）60 人和正常非妊娠女性（正常对照组）60 人,采集样本进行 TEG 及常规凝血指标检测,并进行统计学分析。
结果 与正常对照组、正常妊娠组相比,妊高征组凝血因子激活时间（R）、血块形成速率（K）明显减小,而最大血块强度（MA）及弹力图最大切角（α-Angle）明显增高（均 P<0.05）;与正常对照组比较,正常妊娠组和妊高征组凝血酶原时间（PT）、活化部分凝血活酶时间（APTT）、国际标准化比值（INR）、凝血酶时间（TT）明显降低（P<0.05）,而纤维蛋白原（Fib）浓度升高（P<0.05）。与正常对照组和正常妊娠组相比,妊高征组血小板计数（PLT）水平升高（P<0.05）。妊娠高血压组、轻度子痫前期组、重度子痫前期组间 R、K、α-Angle、MA 各指标差异有统计学意义（均 P<0.05）;与妊娠高血压组和轻度子痫前期组相比,重度子痫前期组血小板计数指标差异有统计学意义（P<0.05）;但常规凝血指标结果比较,差异无统计学意义（均 P>0.05）。TEG 各指标与常规凝血指标的相关性分析表明,R 值与 PT、APTT 呈正相关,α-Angle 与 Fib 呈正相关（r=0.701,P<0.01）、K 值与 Fib 呈负相关（r=-0.461,P<0.01）;MA 与 PLT 呈正相关（r=0.635,P<0.01）;但 K 值与 PLT、α-Angle 与 PLT、Fib 与 MA 相关性无统计学意义。
结论 TEG 对于鉴别妊高征患者以及区分妊高征的严重程度有一定的临床价值,其与常规凝血功能指标存在一定的相关性。

PO-1297

微流控芯片单细胞选择性扩增用于循环肿瘤干细胞检测

罗彦彰、刘洋、林冬果、陈晓、刘大渔
华南理工大学附属第二医院（广州市第一人民医院）

目的 利用肿瘤干细胞自我更新特性，发展一种微流控芯片单细胞选择性扩增方法用于循环肿瘤干细胞检测。
方法 设计并制作了一种包含 8000 个捕获池的微流控芯片；分散有结直肠癌 HCT116 细胞的血液样本去除红细胞后重悬于海藻酸钠溶液中，并引入微流控芯片。连续培养 7 天后，通过荧光呈像识别单细胞来源肿瘤球，提示肿瘤干细胞的存在。通过芯片反向灌流回收肿瘤球，利用流式细胞术、免疫荧光、连续传代和类器官培养进行肿瘤干细胞定性分析。
结果 芯片培养获得直径为 36.9 ± 6.8 μm 的单细胞来源肿瘤球，成球率约为 21.6%；肿瘤球的 LGR5、CD44、CD133、CD24、Nanog、OCT4 和 SOX2 等一系列干性标志物呈阳性，而上皮分化标志物 CK20 呈现阴性；芯片回收细胞中肿瘤干细胞标志物 CD133、ALDH、LGR5 阳性细胞比例显著高于悬浮培养所获细胞；在连续传代培养过程中，肿瘤球均呈现 CD133 和 LGR5 均质强阳性，表明细胞干性可稳定维持。
结论 本研究发展了一种微流控芯片单细胞选择性扩增方法，有望实现循环肿瘤干细胞检测，为开发循环肿瘤干细胞作为新型肿瘤标志物做出了有益的尝试。

PO-1298

术前炎症指标 NLR、MLR、SII 在甲状腺髓样癌中应用价值的探索

林琳、吴丽娜
中国医科大学附属盛京医院

目的 探讨外周血中性粒细胞与淋巴细胞比值、单核细胞与淋巴细胞比值、系统免疫炎症指数在甲状腺髓样癌中的应用价值。
方法 以中国医科大学附属盛京医院 2012 年 2 月至 2020 年 7 月收治的甲状腺髓样癌患者 50 例(MTC 组)、甲状腺乳头状癌患者 50 例(PTC 组)、健康体检者 50 例(HC 组)为研究对象，比较三组患者外周血 NLR、MLR、SII 水平的差异，并采用受试者工作特征曲线分析上述三个指标在 MTC 中应用价值，再根据上述三个指标的 ROC 曲线截点值分析其与甲状腺髓样癌临床病理特征的相关性。
结果 MTC 组 NLR 显著高于 PTC 组，差异有统计学意义(P<0.05)；MTC 组 MLR、SII 水平显著高于 PTC 组与 HC 组，差异有统计学意义(P<0.05)。通过 ROC 曲线分析发现，NLR、MLR、SII 的 ROC 曲线下面积分别为 0.620、0.681、0.634， NLR、MLR、SII 的 ROC 曲线截点值分别为: 1.92、523.10× 109 /L、0.26，据此分为将 MTC 组分为低 NLR 组(NLR<=1.92)、高 NLR 组(NLR>1.92)；低 SII 组(SII<=523.10× 109 /L)、高 SII 组(SII>523.10× 109 /L)；低 MLR 组(MLR<=0.26)、高 MLR 组(MLR>0.26)。MLR 指标高值组和低值组患者，性别、淋巴结转移的差异有统计意义(P<0.05)，年龄、肿瘤双侧性及多发性之间差异无统计学意义(P > 0.05)。NLR、SII 与年龄、性别、淋巴结结转移，肿瘤双侧性及多发性之间差异均无统计学意义(P > 0.05)。
结论 MTC 患者 NLR、MLR、SII 水平显著升高，可作为 MTC 辅助鉴别诊断指标。MLR 水平与 MTC 患者淋巴结转移显著相关。

PO-1299

联合检测纤维蛋白原、抗凝血酶Ⅲ对静脉血栓栓塞症的诊断价值

陈峻
武汉市第一医院

目的 探讨纤维蛋白原（FIB）联合抗凝血酶 III（AT-III）在静脉血栓栓塞症患者中的诊断效果。
方法 选择 2017 年 6 月-2018 年 5 月武汉市第一医院住院治疗的静脉血栓栓塞症患者 59 例作为对象，设为观察组；选择同期健康体检者 53 例设为对照组。观察组入院后次日早晨取空腹静脉血 3mL，对照组当天早晨取空腹静脉血 3mL，血清分离后采用发光底物法测定两组 AT-III 水平；采用凝固法测定两组 FIB 水平；绘制 ROC 曲线，分析 FIB 与 AT-III 在静脉血栓栓塞症患者中的诊断效能。
结果 观察组中肺血栓栓塞症与深静脉血栓 FIB、AT-III 水平比较差异无统计学意义（P>0.05）；观察组肺血栓栓塞症合并深静脉血栓患者 FIB、AT-III 水平，均低于单一肺血栓栓塞症与深静脉血栓（P<0.05）；观察组 FIB、AT-III 水平，均低于对照组（P<0.05）；单一 FIB、AT-III 在静脉血栓栓塞症患者中诊断敏感性、特异性差异无统计学意义（P>0.05）；FIB 联合 AT-III 在静脉血栓栓塞症患者中诊断敏感性、特异性，高于单一 FIB、AT-III（P<0.05）。
结论 FIB、AT-III 在静脉血栓栓塞症患者中呈低表达，二者联合检测能获得较高的诊断效能，值得推广应用。

PO-1300

血液检查指标在老年患者脊柱骨质疏松性压缩骨折的辅助诊断价值

霍青
徐州矿务集团总医院（徐州医学院第二附属医院）

目的 探讨血液检查指标能否对老年患者脊柱骨质疏松性压缩骨折提供辅助诊断价值。
方法 纳入 2019 年 10 月至 2020 年 10 月期间 326 例脊柱骨质疏松性压缩骨折老年患者为研究组，205 例腰腿疼患者为对照组，统计两组的性别、年龄、血沉、C 反应蛋白、PT (凝血酶原时间)、PTINR（国际标准化值），PT%（PT 活动度），APTT（活化部分凝血活酶时间），TT（凝血酶时间），FIB（纤维蛋白原），AT（抗凝血酶），D-二聚体的数据并进行比较，并分析两组数据之间的差异性。
结果 两组之间的性别没有差异，研究组的平均年龄 76.89 岁略高于对照组 74.94 岁。PT、PTINR、PT%、APTT、TT，这四个反映血凝的指标，虽然在研究组和对照组之间存在统计学的差异，但是都在正常参考值范围内。研究组血沉为 26.86 mm/h ，C 反应蛋白 9.66 mg/l ，FIB 为 4.27g/l ，D-二聚体 813.94 ng/ml，明显高于正常值，并且与对照组血沉为 18.94 mm/h ，C 反应蛋白<3.45 mg/l ，FIB 为 3.80g/l， D-二聚体 225.21 ng/ml，有统计学差异（P<0.001）。
结论 血沉、C 反应蛋白、FIB 及 D-二聚体的数值在老年患者脊柱骨质疏松性压缩骨折中均有不同程度的升高，对于患者的诊断有一定的辅助价值，其中 D-二聚体升高较明显，提示意义也最大，并且与患者骨折的病史长短有很大相关性。

PO-1301

血常规检测在 HFRS 和 SFTSV 诊断中的作用

张丽霞
江苏省人民医院（南京医科大学第一附属医院）

肾综合征出血热（hemorrhagic fever with renal syndrome，HFRS）我国主要以 HTNV 和 AMRV 感染为主，以鼠类为主要的传染源自然疫源性疾病。该病以全身小血管以及毛细血管损伤为主要病理变化，在临床上以发热、出血倾向、肾脏损伤为主要的三大症状，并可将病程大致上分为五期：发热期、低血压休克期、恢复期、少尿期、多尿期， 重症者可有多个时期重合出现，出血热不仅会造成肝肾功能的损害，严重者还可危及生命，死亡率可达到 10%。

发热伴血小板减少综合症（ fever with thrombocytopenia syndrome virus, SFTSV）我院检出率也非常高。SFTSV 俗称“蜱虫病”，是由新型布尼亚病毒引起的急性自然疫源性传染病，蜱虫为其传播媒介。好发人群主要为蜱虫疫源区的居民、旅游者，急性期患者的血液和血性分泌物具有传染性，感染者在临床上主要表现为发热、乏力、精神不振、恶心、腹泻等症状。

病毒感染确诊主要依靠病原学的检查，同时病毒感染时，外周血会发生非特异性的变化。对于某类病毒感染来说，血液学指标会具有一定的共性及特性，结合其病史，临床体征等信息，往往可以给疾病的诊断提供重要方向。我们根据本院临床多例 HFRS 和 SFTSV 感染的外周血基本特征，进行了分析和总结，发现两种病毒感染存在共同点为：红细胞正常或者升高，血小板进行性下降，外周血可见：核左移；各型反应淋巴细胞，浆样反应淋巴细胞增多；涂抹细胞增多。不同点为通常 HFRS 白细胞增高而 SFTSV 白细胞下降。

在血常规检测指标中，找到蛛丝马迹，及时给临床提供诊断思路，从而更好的为临床病毒感染的诊断、鉴别诊断及治疗提供依据。

PO-1302

新冠疫苗接种对 CPD 参数的影响

孙婷婷
陆军特色医学中心（大坪医院）

目的 白细胞群落参数（cell population data, CPD）是 UniCel DxH800 血细胞分析仪通过 VCS 技术对外周血进行检测,许多研究表明 CPD 参数可能具有临床诊断价值或者作为某些疾病的筛选指标。本研究通过检测接种了新冠疫苗志愿者外周血对 CPD 参数值的影响，为临床提供 CPD 参数潜在的有用信息。

方法 选取 2020 年 3 月-2020 年 4 月进行新冠病毒灭火疫苗接种的志愿者 20 名，年龄在 22-36 岁之间，男女比列为 12/8，分别在接种前 24 小时，第一次接种后 24 小时，第二次接种前 24 小时，第二次接种后 24 小时 四个时间段抽血志愿者的 EDTA-K2 抗凝全血标本，对所有全血样本采用 DxH800 血细胞分析仪检测获得 CPD 参数，观察 CPD 参数的变化趋势。

结果 接种前与第一次接种 24 小时后有显著差异的参数有 18 个，接种前与第二次接种前进行比较，有 12 个参数具有统计学差异，接种前与第二次接种后 24 小时进行比价，有 25 个参数具有统计学的变化，第二次接种前与第二次接种后 24 小时相比较，18 个参数具有统计学差异变化。

结论 新冠疫苗接种后，激活了人体的细胞免疫系统，导致细胞发生了不同程度的变化，第一次疫苗接种后机体的免疫细胞已经启动，也间接反映接种疫苗是成功的，这项研究提供了接种新冠病毒疫苗后 CPD 变化的重要信息，这些变化可能成为临床潜在的应用指标，为某些形态参数的变化做出量化的解释。

PO-1303

儿童继发性血小板增多与呼吸道感染病原体分析

徐丹
华中科技大学协和深圳医院

目的 通过分析患儿呼吸道感染病原体与血小板增多的关系，帮助临床从血小板计数结果对患儿呼吸道感染病原体作初步诊断与鉴别诊断。
方法 收集 2020 年 9 月至 2021 年 2 月住院患儿 163 例（血小板增多 45 例，血小板非增多 118 例）采集血清及 EDTA 抗凝血，应用间接免疫荧光法对九种呼吸道病原体 IgM 进行检测，用 SYSMEX XN-9000 血细胞分析仪对血小板进行计数。
结果 呼吸道感染患儿血小板水平显著高于健康儿童（P＜0.05），45 例呼吸道感染患儿发生血小板增多，其中，肺炎支原体 IgM 检出率最高，其次是副流感病毒；与血小板正常的患儿相比，肺炎支原体检出率显著高于正常组患儿（P＜0.05），而副流感病毒检出与正常组患儿无显著差异（P＞0.05）；乙型流感病毒则不易引发血小板增多；其他病原体检出率较低，差异均不显著（P＞0.05）。
结论 在九种呼吸道道病原体中，儿童对肺炎支原体普遍易感，并易发血小板增多，而乙型流感病毒感染不易引起血小板增多。

PO-1304

新型血栓标志物对恶性肿瘤患者围手术期并发 VTE 的预警效能

张金彪、曹蕾、马飞、代荣琴
河北省沧州中西医结合医院

目的 探讨新型血栓标志物对恶性肿瘤患者围手术期并发 VTE 的预警效能。
方法 回顾性分析自 2020 年 7 月 1 日至 2021 年 2 月 1 日我院收治恶性肿瘤手术患者 150 例，为观察组，围手术期内并发 VTE 者 30 例，为血栓组；未并发 VTE 者 120 例，为无栓组。另选同期健康体检者 60 例，为对照组。各组均检测血栓标志物，对照组检测一次，观察组术前 1d 和术后 1d 各检测一次。采用 SPSS23.0 作统计学处理，评价血栓标志物预警效能。
结果 ①肺癌（P=0.014＜0.05）、老龄（P=0.036＜0.05）、肥胖（P=0.000＜0.05）、转移（P=0.031＜0.05）、晚期（P=0.023＜0.05）是恶性肿瘤患者术后并发 VTE 的高危因素；②术前 1d，血栓组的 TAT 和 TM 高于无栓组，差异有统计学意义（P＜0.05），TM 预警效能最好（截断值 10.70，AUC=0.786，灵敏度 73.30%，特异度 81.70%，P=0.000），TAT 和 TM 联合可提升预警效能（AUC=0.796，灵敏度 80.00%，特异度 77.50%，P=0.000）；术后 1d，血栓四项均高于无栓组，差异具有统计学意义（P＜0.05），TAT 预警效能最好（截断值 16.50，AUC=0.887，灵敏度 82.36%，特异度 71.65%，P=0.000），四项联合可提升预警效能（AUC=0.913，灵敏度 90.00%，特异度 88.60%，P=0.000）；③PIC 作为纤溶激活标志物，与 TAT 均呈现良好的正相关（术前：r=0.665,P=0.000＜0.05；术后：r=0.638,P=0.000＜0.05）。
结论 新型血栓标志物在恶性肿瘤患者围手术期预测 VTE 中具有重要的预警价值；TM 相对 TAT 能更早提示 VTE 风险，截断值为 10.70TU/ml；可选用 PIC 把控 VTE 发生前的纤溶状态，评估出血风险。

PO-1305

Neutrophil Extracellular Traps (NETs) in Peripheral Blood Smear of a Patient with Septic Shock

Lixia Zhang
The First Affiliated Hospital of Nanjing Medical University

We present a patient with septic shock after mitral valve replacement. Examination of blood film revealed neutrophils with toxic granules and vacuole, immature granular cells and numerous smudge granulocytes. These smudge granulocytes might be identified as neutrophil extracellular traps(NETs). The peripheral blood smear analysis may be a simple method for identification of NETs.

A 73-year-old woman got septic shock after mitral valve replacement. CBC showed: white blood cell 8.62×109/L (neutrophil 89.2%), hemoglobin 102 g/L and platelet 26 ×109/L. The peripheral blood smear identified by CellaVision® Hematology Autoanalyzer showed neutrophils with toxic granules and vacuoles (Figure 1A, B [Digital microscopy; Cellavision, ×100 objective]), immature granular cells (Figure 1B, C) and numerous smudgegranulocytes (Figure 1D-I). The free granules near the nucleus, the secreted expulsion nuclear chromatin and network structure showed that these smudge cells might be identified as neutrophil extracellular traps(NETs).

NETs are extracellular, network structures composed of cytosolic and granule proteins that are assembled on a scaffold of chromatin. NETs trap, neutralize and kill pathogens. However, NETs can contribute to immune-related diseases when dysregulated. NET formation in the circulation promotes coagulation, vascular occlusion and thrombosis. NETs are also found in tumors and can promote tumor metastasis1-3. NETs can be analyzed by immunofluorescence. Recently, NETs are proved can be identified by peripheral smear autoanalyzers4-5. The peripheral blood smear analysis may be a simple method for identification of NETs.

PO-1306

The higher risk of severe thrombocytopenia in Escherichia coli comparing with Klebsiella pneumoniae and Pseudomonas aeruginosa

Yingying Diao
China medical university

Thrombocytopenia increases the mortality rate during sepsis. But there is no clear conclusion about which bacteria caused higher levels of thrombocytopenia. The goal of this study is to determine whether there is a difference in the incidence of thrombocytopenia pneumoniae caused by the three common bacteria, namely Escherichia coli (E. coli), Klebsiella (K. pneumoniae) and Pseudomonas aeruginosa (P. aeruginosa). Our data indicate that severe thrombocytopenia (P = 0.04) was a risk factor for bad clinical outcomes, OR were 3.20 (95% CI 1.06–9.68). Then we compared the difference of the risk of severe thrombocytopenia in E. coli as compared with bacteria with K. pneumoniae and P. aeruginosa. After adjusting for potential confounders, the risk of severe thrombocytopenia in E. coli was higher than that in K. pneumoniae and P. aeruginosa in a multivariable logistic regression model (P = 0.04) and OR was 3.30 (95% CI 1.04–10.53). But there was no statistically significant among the age subgroup, gender subgroup, organ dysfunction subgroup. In conclusion, the risk of severe thrombocytopenia in E. coli is significantly higher than K. pneumoniae and P. aeruginosa. For those infected with E. coli, the platelet count should be increased as soon as possible to reduce mortality.

PO-1307

尿液 κ 和 λ 轻链检测在糖尿病早期肾损伤中的价值分析

卢佩
空军军医大学西京医院

目的 探讨尿 κ 轻链、尿 λ 轻链、尿免疫球蛋白 G（IgGU）和尿转铁蛋白（TRFU）在糖尿病早期肾损伤评估中的临床价值。
方法 选择 56 例糖尿病早期肾损伤患者和 50 例同时期健康体检者作为观察组和对照组，分别检测两组的尿 κ 轻链、尿 λ 轻链、尿免疫球蛋白 G 和尿转铁蛋白，并对各组指标进行统计学分析。
结果 观察组尿 κ 轻链、尿 λ 轻链、尿免疫球蛋白 G 和尿转铁蛋白检测水平高于对照组，差异有统计学意义（P<0.05）；观察组尿 κ 轻链、尿 λ 轻链、尿免疫球蛋白 G 和尿转铁蛋白阳性率分别为 92.9%、82.1%、62.5%、64.3%，均高于对照组各指标阳性率，差异有统计学意义（P<0.05）。
结论 尿 κ 轻链、尿 λ 轻链、尿免疫球蛋白 G 和尿转铁蛋白检测，对糖尿病早期肾损伤监测及预测其发生发展有重要的临床价值。

PO-1308

IFN-γ Down-regulated CXCR2 Expression on Circulating Monocytes Results in Re-education of Tumor-Associated Macrophages in Colorectal Cancer

Huayang Wang
Qilu Hospital of Shandong Universtiy

Circulating monocytes are the main source of tumor-associated macrophages (TAMs), but their recruitment to tumor tissue and further differentiation remains unclear. Chemokine receptors play an essential role in cancer development and anti-tumor immunity. In the present study, we observed a significant decrease of CXCR2 expression on circulating monocytes of colorectal cancer (CRC) patients, which was associated with tumor stages, and systemic and local inflammatory status. Pro-inflammatory cytokine IFN-γ, which was over-expressed in CRC patients, was involved in CXCR2 downregulation by promoting GRK-2 expression in monocytes. Decreased CXCR2 expression hindered monocyte recruitment to the tumor site, and modified inflammatory polarization of CRC-educated TAMs. Comparing with humans, mice monocytic cells exhibited a different CXCR2 expression profile. The inhibition of CXCR2 signaling in CRC-bearing mice altered sub-population constitutions of circulating monocytes and TAMs. Interestingly, inhibiting CXCR2 decreased pro-inflammatory cytokine levels in peripheral blood, but increased their expression in xenograft tumor of mouse model. In summary, our findings suggest that CXCR2 expression on circulating monocytes reflects CRC stages, and has the potential to be an effective target of monocytic cell-dependent therapy. However, its effect on anti-tumor immunity should be carefully examined, as it exhibits different expression profiles between species, and seems to exert diverse influence on different myeloid cell types.

PO-1309

应用 CpG-OND 细胞培养添加剂提高 CLL 患者染色体核型分析阳性检出率的临床研究

谭鸿文[1]、毛翠[2]
1. 四川金域医学检验中心有限公司
2. 广州金域医学检验集团股份有限公司

目的 探讨应用含 CpG-ODN（CpG oligonucleotide, CpG 寡脱氧核苷酸）细胞培养添加剂提高慢性淋巴细胞白血病（chronic lymphocytic leukemia，CLL）患者染色体核型分析阳性检出率的临床价值。
方法 收集 2020 年 1 月至 2021 年 3 月送检至我实验室行染色体核型分析且明确诊断为慢性淋巴细胞白血病的初诊患者 143 例，同步进行双线培养，进行常规骨髓细胞培养为常规组；同时应用 CpG-ODN 刺激培养为 CpG 组。收获制备染色体，进行 G 显带染色体核型分析。
结果 143 例 CLL 患者中，染色体培养成功率（镜下可分析中期分裂相≥20 个）CpG 为 99.30%，常规组为 98.60%，培养成功率无明显差异；CpG 组检出异常核型 83 例（58.04%），其中检出 1 种染色体异常 33 例（39.76%），2 种异常 30 例（36.14%），≥3 种异常 20 例（24.10%），常规组仅检出异常核型 1 例（0.70%），其中检出≥3 种异常 1 例（0.70%），差异有显著性；CpG 组 83 例患者中，共检出 14 种 93 个异常，其中数目异常 14 例（16.67%），结构异常 8 例（9.52%），数目及结构异常 61 例（73.50%）。常规组 1 例患者中，数目及结构异常 1 例（0.70%），差异有显著性。
结论 染色体培养成功率无明显差异，但是应用 CpG-ODN 细胞培养添加剂刺激培养细胞，能显著提高在慢性淋巴细胞白血病中异常核型的阳性检出率，值得推广。

PO-1310

一例初诊为 BCR/ABL1 阳性 CML 治疗后转变为 BCR/ABL1 阴性伴复杂核型 AML 的病例分析及文献复习

杨涯梅
四川金域医学检验中心有限公司

目的 探讨一例初诊为 BCR/ABL1 阳性 CML 治疗后转变为 BCR/ABL1 阴性伴复杂核型 AML 的病例分析并文献复习。
方法 对一例为 BCR/ABL1 阳性 CML 治疗后转变为 BCR/ABL1 阴性伴复杂核型 AML 的病例的临床资料、骨髓细胞形态学、骨髓活检、流式细胞学及分子生物学检查的结果及临床诊疗经过分析。
结果 患者 2016 年 4 月初诊时表现为白细胞高、脾大；骨髓形态学提示：骨髓增生极度活跃，粒系占 91.5%，主要以中性中晚幼粒细胞为主；染色体检查提示：46,XY,t(9;22)(q34;q31)；BCR/ABL1(p210 型)融合基因阳性；流式细胞学检查符合 CML-CP 特征；临床诊断为 CML。给予伊马替尼维持治疗，并动态监测 BCR/ABL1(p210 型)融合基因，于 2018 年 7 月达完全细胞遗传学反应。2020 年 11 月，染色体检查提示：45,XY,-7；白血病融合基因检测提示 BCR/ABL1(p210 型)、EV11 基因阳性；流式细胞学查见 15.5%异常髓系原始细胞。2021 年 4 月染色体检查提示：49,XY,-7,+13,+20,+21,+21[3]/50,idem,+8[12]/50,idem,+10[3]/46,XY[2]；骨髓细胞形态学提示原始粒细胞占 53.0%；流式细胞学查见 24.52%异常髓系原始细胞；分子生物学 BCR/ABL1(p210 型)融合基因筛查为阴性；FISH 的 BCR/ABL1 融合探针为阴性；诊断为 AML 伴复杂核型。
结论 CML 疾病发生发展中可能存在 t(9;22)以外的获得性细胞遗传学变异，并可导致第二种髓系肿瘤，当 CML 疾病进展时，应对其进行遗传学与分子生物学评估，并注意与 CML 急变期相鉴别。

PO-1311

狼疮抗凝物在习惯性流产和系统性红斑狼疮中的应用

晋臻[1]、骆贵平[2]
1. 昆明医科大学第一附属医院
2. 昆明医科大学

目的 探索狼疮抗凝物（lupus anticoagulant，LA）在习惯性流产和系统性红斑狼疮（systemic lupus erythematosus，SLE）中的应用价值。
方法 选择 2020 年 12 月至 3 月昆明医科大学第一附属医院及 2020 年 1 月至 2021 年 3 月昆明医科大学第二附属医院临床诊断为习惯性流产或系统性红斑狼疮的患者 214 例，应用磁珠法检测患者血清中狼疮抗凝物，D-二聚体（D2）的数值，其中习惯性流产 98 例，系统性红斑狼疮 116 例。收集同期就诊未发生不良妊娠的患者 88 例,其他就诊的患者 91 例。将所得的四组数据分为系统性红斑狼疮组即 A 组和习惯性流产组即 B 组。
结果 根据 Spearman 相关性分析，在 A 组中 LA（r=0.166）、抗心磷脂抗体（r=0.341）、抗 β2 糖蛋白总抗体（r=0.374）与系统性红斑狼疮呈正相关（P<0.05）。在 B 组中 LA（r=-0.208）、D-二聚体（r=-0.293）与习惯性流产呈负相关（P<0.01）；抗心磷脂抗体（r=0.152），抗 β2 糖蛋白总抗体（r=0.329）与习惯性流产呈正相关（P<0.05）。根据 Logistic 回归分析，在 A 组中，抗心磷脂抗体（ACA）和抗 β2 糖蛋白总抗体（抗-β2）是系统性红斑狼疮的独立危险因素（P<0.05）；在 B 组中，抗 β2 糖蛋白抗体是习惯性流产的独立危险因子（P<0.05）。
结论 ACA 和抗 β2 糖蛋白总抗体可能是系统性红斑狼疮的独立危险因素；抗 β2 糖蛋白总抗体可能是习惯性流产的独立危险因素。

PO-1312

Red blood cell distribution width: a potential laboratory parameter for monitoring inflammation in rheumatoid arthritis

Yujue He、Qishui Ou
the First Affiliated Hospital of Fujian Medical University

Correlation analysis of red blood cell distribution width (RDW) and C-reactive protein (CRP), erythrocyte sedimentation rate (ESR), tumor necrosis factor α (TNF-α), interleukin (IL)-6, and IL-10 in rheumatoid arthritis (RA) to investigate whether RDW can serve as a potential parameter for indicating inflammation in RA patients. A total of 670 RA patients from October 2014 to April 2016 were enrolled in our study. The white blood cell (WBC), red blood cell (RBC), platelet (PLT), hemoglobin (HGB), RDW, CRP, and ESR in peripheral blood of patients with RA were retrospectively analyzed. The relative expression of TNF-α, IL-6, and IL-10 was detected by RT-qPCR. Correlation analysis between RDW and CRP, ESR, TNF-α, IL-6, and IL-10 in RA was conducted by Microsoft Excel. RDW level was significantly increased in RA patients compared to osteoarthritis (OA) patients (P < 0.001) and healthy donors (HDs) (P < 0.001), and RDW was positively associated with inflammatory markers, such as CRP and ESR. In ROC curve analysis, the area under the curve (AUC) of RDW for the identification of RA was 0.881, with a 95% confidence interval (CI) from 0.864 to 0.898. Moreover, correlation analysis showed that RDW level was positively associated with TNF-α and IL-6, however negatively associated with IL-10. RDW was increased in patients with RA which was associated with inflammation in RA, suggesting that RDW may be a potential auxiliary marker for indicating inflammation process in RA conveniently.

PO-1313

基于全基因组表达谱数据的弥漫大 B 细胞淋巴瘤 R-CHOP 方案预后标记物筛选及潜在分子机制研究

彭佳敏
浙江省立同德医院

目的 弥漫大 B 细胞淋巴瘤是最常见的 NHL 类型。R-CHOP 作为 DLBCL 的一线治疗方案，仍存在着相当比例的原发性耐药及缓解后复发。筛选治疗疗效预测标记物及新治疗靶点是临床医生面临的重大挑战。本文通过分析 884 例 DLBCL 表达谱数据结合临床标本验证，筛选疗效预测标记物，为早期预测 DLBCL 患者 R-CHOP 方案敏感性、制定精准化诊疗策略提供依据，并为开发具有临床应用潜力的药物奠定理论基础和研究依据。
方法 根据生存时间计算预后相关差异基因，并利用多基因列表韦恩图分析来筛选。对差异基因进行 heat map、聚类分析和功能网络分析，并对差异基因的预后价值进一步验证，筛选出预后价值最佳的目的基因，验证目的基因的表达水平与患者临床病理因素及预后的相关性，用免疫组化方法检测目的基因在 DLBCL 组织及正常淋巴结对照中的表达水平并进行统计学分析。对目的基因进行功能富集分析，构建相互作用蛋白网络，同时构建药物-目的基因调节网络。
结果 我们筛选出 HK2 等 25 个预后差异表达基因。发现 HK2 表达与患者 OS 及 PFS 显著负相关，并且 HK2 在 PD 组和 ABC 亚型患者中的表达均显著升高。免疫组化结果显示，HK2 在 DLBCL 组织中的表达显著升高。GSEA 分析发现，HK2 表达与肿瘤组织缺氧、侵袭转移、DNA 修复、化疗耐药、肿瘤干细胞通路等显著相关。蛋白相互作用网络分析发现 HK2 与 EGFR、BUB3 等蛋白的直接相互作用可能促进了 DLBCL 的耐药等恶性生物学表型。HK2-药物网络分析发现，JQ1、GKA50 等药物可抑制 HK2 表达。
结论 本研究通过对大样本者全基因组表达谱数据的分析及临床标本免疫组化验证，初步证实 HK2 是一个有效的 R-CHOP 方案疗效预测标记物和潜在治疗靶点，为制定精准化诊疗策略及开发具有临床应用潜力的 DLBCL 药物奠定理论基础和研究依据。

PO-1314

血栓弹力图-血小板图对蛛网膜下腔出血患者行预防性血小板输注的疗效评估

王妍、邹荣基、孟荣、马瑜婷、李卓
西安医学院第一附属医院

目的 运用血栓弹力图-血小板图 (TEG-Platelet Mapping) 评估预防性血小板输注对于服用抗板药物的蛛网膜下腔出血患者的出血倾向的纠正情况。
方法 2019 年 12 月至 2020 年 12 月间纳入的蛛网膜下腔出血患者 80 例，以是否服用抗血小板药物（氯吡格雷）将患者分成实验组（n=40）及对照组（n=40），实验组患者术前预防性输注个 1 治疗量血小板。使用常规血凝六项、TEG-血小板图对两组术前及预防输注后的出血风险进行评估，同时结合相关的临床数据进行分析，探讨预防性输注血小板的疗效。
结果 1、实验组患者的入院出血量、ADP 抑制率、ADPMA 均提示该组患者出血风险高于对照组（t=3.235/4.633/-7.63, P 值均<0.05）；2、血小板输注后，实验组患者的 ADP 抑制率及 ADPMA 较前有显著改善（t=0.068/0.072, P 值均<0.05）;且两组患者的术中出血率、术后发热率及血液相关检测数据均无显著差异（P 值均>0.05）。
结论 TEG-血小板图评估服用抗血小板药物的蛛网膜下腔出血患者的出血倾向有较好的预测力，预防性血小板的输注对于纠正出血风险及改善患者病程可能有一定作用。

PO-1315

Evaluation of inflammatory parameters in patients with hepatic hydatid disease

Zhijia Fan[1]、Hui Zhao[2]、Zhicheng Wang[1]
1. Department of Laboratory Medicine, Huashan Hospital, Fudan University, Shanghai
2. 新疆医科大学附属第一医院检验科

Background Hydatid disease (HD) is a zoonotic parasitic disease caused by the adult or larval stages of Echinococcus cestodes. Early diagnosis and treatment of hepatic HD are difficult owing to the lack of clinical symptoms in early-stage and awareness of the disease. The growth and proliferation of the hydatid were directly related to hosting immune-inflammatory reactions by the infiltration of inflammatory cells. And thus, some hematologic inflammatory factors which are simple and accessible in routine laboratory tests for use as auxiliary markers may be considered. However, the association of these inflammatory parameters with hepatic hydatid disease has not been investigated. We aimed to evaluate the potential value of inflammatory indices in this disorder.

Methods In this retrospective study, a total of 114 patients with hepatic HD and 114 healthy individuals were enrolled from January 2016 to November 2019. Clinical characteristics and laboratory data for all participants were collected and analyzed. The levels of inflammatory parameters were compared in the patient and control group. Univariate and multivariate logistic regression analyses, after correction for potential confounding factors such as age, gender, and ethnic minorities, were applied to evaluate the risk factors of hepatic hydatid disease. Odds ratios (ORs) with 95% confidence intervals (CI) were calculated for the estimated association. To observe the discriminative accuracy of inflammatory indices, receiver operating characteristic (ROC) analyses and the area under the curve (AUC) were analyzed, and differences between pre- and post-operation were compared by pair tests.

Results A total of 114 patients with hepatic HD including 57 males and 57 females were included in this study. Significantly higher levels of platelet distribution width (PDW) and eosinophil percentage (EOS %) were observed in patients than in healthy individuals, and we found significant inflammatory response in patients, as evidenced by the altered levels of inflammatory indices, the patient group had higher levels of neutrophil to lymphocyte ratio (NLR) ($P=0.047$), higher gamma-glutamyl transpeptidase to platelet ratio (GPR) ($P<0.0001$), and higher alkaline phosphatase to platelet ratio (APPR) ($P<0.0001$) and lower levels of the prognostic nutritional index (PNI) ($p<0.0001$) with statistical significance as compared to those in the control group. Multivariate analyses showed each parameter above was the potential risk factor of hydatid. To further evaluate the predictive accuracy of inflammatory indices as markers for HD, the ROC analyses with each parameter were performed. We found that APPR and PNI had better discriminative accuracy as compared to other parameters. After surgical treatment, the levels of PDW and APPR significantly decreased and no significant differences in PLT and EOS % were observed, while PNI still kept lower after surgery.

Conclusions In summary, our results presented the remarkable correlation between hepatic hydatid disease and inflammatory parameters. A significant increase in PDW, EOS, NLR, GPR, and APPR and a decrease in PLT and PNI were found in patients, particularly elevated PDW and APPR, which gradually returned to normal levels after surgical treatment. The alterations of levels in these parameters may be conducive to alerting physicians to the possibility of hepatic hydatid disease and useful to early detect the parasites. And further researches are needed to confirm if each factor combined with the other factors could have more diagnostic value.

PO-1316

MicroRNA-92a for colorectal cancer diagnosis: A systematic review with meta-analysis

Yiling Li[1]、Wei Cui[2]

1. Department of Clinical Laboratory, National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, China
2. Department of Clinical Laboratory, National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, China

Introduction Colorectal cancer (CRC) is the third most frequently diagnosed cancer. Aside from being the second leading cause of cancer death. MicroRNA-92a (miR-92a) functions as an oncogene and promotes tumorigenesis in several types of cancer, and miR-92a is also thought to be a viable biomarker for diagnosing colorectal cancer (CRC). However, there are two or three different sampling methods which are associated with varying degrees of diagnostic accuracy. This meta-analysis aimed to summarize the diagnostic value of miR-92a derived from blood (plasma and serum) and stool samples and for the first time, qualitative comparison of the two sample types' diagnostic accuracy.

Methods The relevant diagnostic studies were retrieved from PubMed, Embase, the Cochrane Library, and Web of Science, up until February 2021. Pooled sensitivity, specificity, and diagnostic odds ratio (DOR) were pooled to assess and compare diagnostic accuracies under random-effects. Data abstracted included first author, publication year, region, demographic information of patients, number of patients and controls, specimen type, TNM stage, screening methods, statistical analysis measure (AUC), and the number of true positive (TP), false positive (FP), false negative (FN) and true negative (TN). Overall test performance, both in plasma/serum and stool sample groups were estimated using summary receiver operating characteristic (SROC) curve analysis and area under the curve (AUC) using Meta-Disc (version 1.4). Besides, the risk of bias and applicability concerns of the inclusions was accessed according to QUDAS-2 (Quality Assessment of Diagnostic Accuracy Studies-2). Meta-regression analysis was also conducted using Deek's funnel plots and Fagan plots using Stata (version 15.1).

Results Initially, 174 were retrieved from the selected databases and through hand searching. 14 studies were included after reviewing the articles in detail and one piece of research data were finally included. There were ten plasma/serum studies and six which utilized stool sampling. In total there were 2,658 participants, consisting of 1,499 CRC patients and 1,159 controls. Comparative analysis found that, miR-92a identified in plasma/serum is superior with a pooled sensitivity of 73% as opposed to 63% although there was no difference in terms of specificity, both having 85% accuracy. Comparative AUC yielded 0.884 for plasma/serum samples versus 0.847 for stool samples. However, in terms of discriminative capacity, analysis of plasma/serum samples appears superior with a DOR of 16.35 compared to stool samples which had a DOR of.9.81.

Conclusions MiR-92a has good diagnostic accuracy for colorectal cancer although there appears to be fewer false positives/negatives when analyzing plasma/serum compared to stool samples.

PO-1317

A multicenter reference interval study of thromboelastography in the Chinese adult population

Xian-fei Zeng[1]、Xing-bin Hu[2]
1. 西安区域医学检验中心
2. 空军军医大学西京医院

Background Thromboelastography (TEG), a method of near-patient monitoring of coagulation, plays an essential role in the assessment of coagulation status, guiding component blood transfusion, and evaluating the effects of anticoagulants. Imprecise reference intervals (RIs) adversely impact the determination of the need for blood transfusion and clinical diagnosis and treatment of coagulopathy. However, there are few RI studies of thromboelastography (TEG) based on the protocols of the Clinical and Laboratory Standards Institute (CLSI) and International Federation of Clinical Chemistry and Laboratory Medicine, Committee on Reference Intervals and Decision Limits (IFCC/C-RIDL). The present multicenter study aimed to establish RIs for the adult Chinese population.
Methods Apparently healthy individuals who fulfilled the inclusion criteria were recruited by non-probability sampling (judgment sampling) at 6 medical centers in Xi'an City and Baoji City of Shaanxi.Based on the health questionnaire, physical examination, laboratory tests, and imaging examinations, inclusion criteria were determined according to the IFCC/C-RIDL and WS/T 402-2012 in China. Blood samples were subjected to laboratory TEG analysis for R, clot formation time (K), α angle (angle), maximum amplitude (MA), and coagulation index (CI). Based on the data distribution outliers were determined using the Dixon method or Tukey's fence, as appropriate. The Ichihara method, 2-level nested analysis of variance (ANOVA) (2N-ANOVA), and the latent abnormal values exclusion (LAVE) were used to define the RIs following recommendations of the Clinical and Laboratory Standards Institute and International Federation of Clinical Chemistry and Laboratory Medicine, Committee on Reference Intervals and Decision Limits. Multiple regression analysis was performed to explore sources of variation.
Results A total of 507 healthy participants were enrolled into the study cohort. Twenty-five individuals with potential coagulopathy were secondarily excluded by LAVE. Smoking was related to reaction time, α angle, and coagulation index in the TEG test ($P < 0.05$). Three test items (R, K, and angle) that did not follow a Gaussian distribution were subjected to Box-Cox transformation for 2N-ANOVA. 2N-ANOVA revealed that the RIs of all 5 test items of TEG needed to be partitioned by age and sex. Finally, TEG RIs were derived both parametrically and nonparametrically for males or females and different age Groups, respectively. Finally, given the clinical application of TEG RIs, RIs with differences < 5% between lower limits and simultaneously between upper limits were recommended to be merged.
Conclusions Few studies have reported RIs determined using TEG. The findings of previous studies with relatively small sample sizes did not significantly conform to the manufacturer's normal references' suggested and differed distinctly from each other. The oversensitivity in determining hypercoagulability where there is no risk for thrombosis and clinical presentation mainly arises from the imprecise TEG RIs, most of which originated from the manufacturer's data, which were not peer-reviewed. In our study, TEG RIs were established for the adult Chinese population using up-to-date methodology. The results will provide a useful and essential comparator for patients in the assessment of coagulation state, goaldirected blood transfusion therapy, and monitoring of the pharmacodynamic effects of anticoagulant drugs.

PO-1318

Prognostic value of pre-treatment LMR and NLR in patients with CD20 positive B cell non- Hodgkin lymphoma after immunochemotherapy

Xiaopeng Zhao、Li Ren
Tianjin Medical University Cancer Institute & Hospital

Objective To investigate the significance of peripheral blood lymphocyte/monocyte ratio (LMR) and neutrophil/lymphocyte ratio (NLR) in predicting the prognosis of CD20 positive B cell non-Hodgkin lymphoma patients after immunochemotherapy with rituximab.
Methods The clinical data of 220 patients with CD20-positive B-cell non-Hodgkin's lymphoma who were first diagnosed and treated in Tianjin Medical University Cancer Hospital from 2009 to 2013 were retrospectively analyzed. First, Pearson Chi-square test was used to study the relationship between pre-treatment LMR and NLR and the clinical disease characteristics of the patients. The cut-off values of LMR and NLR were determined according to the RECEIVER Operating Characteristic (ROC) curve, and the patients were divided into the high-value group and the low-value group according to the cutoff values of LMR and NLR respectively. Kaplan-meier survival curve analysis was performed to determine whether the difference between the high-value group and the low-value group was statistically significant. Then univariate and multivariate analyses were performed on the patients' total survival (OS) and progression-free survival (PFS) using Cox proportional hazard model to obtain the independent risk factors affecting the patients' OS and PFS.
Results The median age of 220 patients was 59 years old and ranged from 18 to 92 years old. At the last follow-up, 94 patients died, 126 survived, with a mortality rate of 42.7%. Pearson chi-square test results showed that NLR level was closely related to the number of extranodal involvement (P=0.002), LDH level (P=0.000) and IPI score (P=0.020). LMR level was closely related to B symptoms (P=0.020), clinical stage (P =0.003), the number of extranodal involvement (P = 0.009), the level of LDH (P = 0.000), β2 microglobulin level (P = 0.001) and the IPI score (P = 0.000). Survival analysis showed that patients with high NLR (≥3.0) had poorer OS and PFS than those with NLR<3.0. Compared with patients with LMR>2.4, patients with LMR≤2.4 had significantly lower OS and PFS. Multivariate analysis showed that NLR（HR 1.865,95%CI 1.196-2.910,P=0.006）and rituximab treatment（HR 0.587,95% CI 0.386-0.893, P=0.013）were independent risk factors affecting the overall survival of the patients. At the same time, statistical analysis showed that IPI score (HR 2.119,95%CI 1.188-3.780, P=0.011), NLR(HR 1.683,95%CI 1.095-2.587, P=0.018)and number of extranodal involvement（HR 2.340,95%CI 1.093-5.009,P=0.029） were independent risk factors affecting patients' progress-free survival.
Conclusions LMR and NLR at initial diagnosis can be used to predict the prognosis of patients with CD20-positive B-cell non-Hodgkin lymphoma, regardless of rituximab treatment.

PO-1319

调节性 B 细胞（Regulatory B cells,Breg）在 IGA 肾病发病机制中的功能作用

李涛
山东大学齐鲁医院

目的 研究调节性 B 细胞（Regulatory B cells,Breg）在 IGA 肾病发病起到的作用及意义。

方法 选取在 IGA 肾病确诊患者 37 名，排除继发性肾病，肿瘤等干扰因素，另取 17 名健康体检患者作为对照组(HCs)。收集所有参与者外周血抗凝标本进行流式细胞术（FCM）和酶联免疫吸附实验（ELISA）分析，检测外周血单个核细胞(PBMCs)中 Breg 细胞及相关亚群和血浆中 IL10 细胞因子水平的表达情况。同时收集所有参与者临床肾功能损伤指标进行统计学相关性分析。
结果 与正常健康对照组相比，IGA 肾病患者外周血单个核细胞(PBMCs)分析中：CD24hiCD38hiCD19+B 细胞，CD5+CD24hiCD38hiCD19+B 细胞,IL10+CD24hiCD38hiCD19+B 细胞水平低表达(P 值>0.05)，然而 CD138+CD9+B 细胞水平高表达(P 值>0.05)，其他 CD24intCD38intCD19+B 细胞，CD24hiCD38-CD19+B 细胞亚群未见显著性差异。ELISA 细胞因子分析中：IGA 肾病患者细胞因子 IL10 水平显著低于健康对照组。临床肾功能损伤指标中：IGA 肾病患者 24h 尿蛋白水平显著高于正常对照组(P 值>0.05)。Spearman 统计学相关性分析发现：CD24hiCD38hiCD19+B 细胞与细胞因子 IL10 水平，CD138+CD9+B 细胞与 24h 尿蛋白水平具有显著性正相关(P 值>0.05)，而 IL10+CD24hiCD38hiCD19+B 细胞与 CD138+CD9+B 细胞具有显著性负相关(P 值>0.05)。
结论 IGA 肾病发病过程中存在 Breg 细胞表达水平的降低，而 Breg 细胞的降低可能是功能性细胞因子 IL10 降低的原因，进而导致了 CD138+浆细胞的活化高表达。两者间的平衡失调可能参与了 IGA 肾病的免疫学发病机制

PO-1320

LPCAT3 regulates erastin-induced ferroptosis in AML cells via UPR pathway

Qiaoqian Chen、Zhiyuan Zheng、Shuhan Liu、Xindi Lin、Donghong Lin
Fujian Medical University

Objective To analyze the induction effect of erastin on the ferroptosis of AML cells; to study the effect of LPCAT3 and LPCAT3-UPR axis in the induction of ferroptosis of AML cells by erastin.
Methods 1. MTS method was used to detect the proliferation of AML cells, such as Kasumi-1, HL-60, K562/G01, K562 under different concentrations of erastin and different intervention times, and used apoptosis, autophagy, ferroptosis, and other cell deaths inhibitors to validate the mode of cell death. 2. The ferroptosis index was used to observe the morphology of mitochondria by transmission electron microscope, the content of ROS was detected by inverted fluorescence microscope and flow cytometry, and the content of MDA was detected by TBA method. 3. Detect PUFAs by GC-MS and analyze the content of oxidized fatty acids. 4. Lentiviral transfection of K562 cells mediates LPCAT3 overexpression. 5. qPCR, Western blot detection of molecular expression of LPCAT3 and UPR pathway.
Results 1. At an erastin concentration of 10μM/L for 24 hours, the proliferation of Kasumi-1 and HL-60 cells was inhibited and could be reversed by ferroptosis inhibitors, the contents of ROS and MDA increased significantly, mitochondria appeared vacuolization and the double membrane was dense, Lipid droplets and other changes; K562/G01, K562 did not appear the above changes. It is suggested that Kasumi-1 and HL-60 are susceptible strains to ferroptosis at an erastin concentration of 10μM/L for 24h, while K562/G01 and K562 are relatively insensitive strains. 2. The basic expression of LPCAT3 in Kasumi-1 and HL-60 cells was higher than that in K562/G01 and K562 cells. After erastin induction, the expression of LPCAT3 in Kasumi-1 and HL-60 cells increased, and the expression of K562/G01 and K562 cells did not change significantly. It is suggested that LPCAT3 is related to the ferroptosis of AML cells induced by erastin. 3. Up-regulation of LPCAT3 in K562 cells induced by erastin can inhibit their proliferation and increase the content of PUFAs, ROS and MDA, showing that K562 cells are relatively insensitive to erastin have ferroptosis. 4. Up-regulation of LPCAT3 in erastin-induced K562 cells can up-regulate the expression of UPR branch PERK-eIF2α-ATF4 protein and cause ferroptosis, and further intervention with UPR branch inhibitors, and inhibition of cell proliferation, reduction of ROS and MDA content, etc. The result of ferroptosis.

Conclusion 1. AML cells can be induced to ferroptosis by erastin, and different AML cell lines have different sensitivity to erastin-induced ferroptosis. 2. LPCAT3 may induce AML cell ferroptosis through UPR branch PERK-eIF2α-ATF4 regulation, cell oxidation sensitive fatty acid and lipid peroxidation regulation of erastin.

PO-1321

The coagulation analysis of reveals novel biomarkers for neonatal hyperbilirubinemia in full term newborn

Fangye Zhou、Li Liu、Rong Fu
Fujian Medical University Teaching Hospital, First Hospital of Putian,

Background The coagulation test is used to diagnose the hematological diseases. Little is known about correlation between the coagulation test and neonatal hyperbilirubinemia. The aim of the study was to determine the neonatal coagulation analysis value in infants with neonatal hyperbilirubinemia as reliable markers. .
Methods All newborns were born and inpatients in the newborn wards of the Chengdu Second People's Hospital. Measurement of serum bilirubin was done to diagnose hyperbilirubinemia. All neonates involved were full term of either gender without any significant illness or major congenital malformations. Data were collected from newborns who had neonatal hyperbilirubinemia and healthy in Chengdu Second People's Hospital. Prothrombin time(PT), Thrombin time(TT), Fibrinogen(Fbg), activated partial thromboplastin time(APTT), and calculated international normalized ration(INR) values were recorded. Linear relationship between INR and level of total bilirubin and indirect bilirubin were analyzed by linear regression. Comparisons of two groups were made by GraphPad Prism 8.
Results In this case-control study, the mean PT, APTT level were significant higher in the infants with hyperbilirubinemia group compared to the healthy infants. We found the correlation between INR and total bilirubin(R=0.3327; P<0.0001). There was also correlation between INR and indirect bilirubin(R=0.3402; P<0.0001).
Conclusions PT, APTT were significant high in neonatal hyperbilirubinemia group. Correlation were observed between the coagulation test and neonatal hyperbilirubinemia. Importantly, the study revealed coagulation test as novel biomarkers for diagnosis of neonatal hyperbilirubinemia in full term newborn.

血栓分子标志物在弥漫大 B 细胞淋巴瘤中的检测及临床意义

江秀娟、张正华、黄金晶、苏海翔
甘肃省肿瘤医院

目的 探讨血栓分子标志物在弥漫大 B 细胞淋巴瘤(Diffuse large B-cell lymphomaDLBCL)中的检测及临床意义。
方法 选择 2019 年 8 月至 2020 年 10 月间在我院住院的弥漫大 B 细胞淋巴瘤患者 60 例为淋巴瘤组，其中初治组 23 例，缓解组 24 例，未缓解组 13 例；选择同期健康体检者 46 例作为对照组。采用化学免疫分析法检测各组血浆中血栓调节蛋白(TM)、纤溶酶-α2 纤溶酶抑制剂复合物(PIC)、组织型纤溶酶原激活剂-抑制剂 1 复合物(t-PAIC)和凝血酶-抗凝血酶Ⅲ复合物(TAT)水平，全自动生化分析仪检测淋巴瘤组血清中乳酸脱氢酶（LDH）水平。比较各组血栓分子标志物之间差异和淋巴瘤患者并发血栓的可能及预后以及与 LDH 相关性。
结果 淋巴瘤患者血浆 TM、PIC 水平明显高于健康对照组（ P ＜0.05）；初治和治疗后未缓解组 TM、PIC 水平均明显高于缓解组（ P ＜0.05）；初治组与未缓解组间 TM、PIC、t-PAIC、TAT 各

指标均无显著差异（ P＞ 0.05）；淋巴瘤并发血栓组 TM、PIC、TAT 水平均明显高于未并发血栓组（ P ＜0.05）。血浆 TM、PIC 水平与淋巴瘤患者 LDH 预后指标有相关性（ P ＜0.01）。
结论 淋巴瘤患者血浆 TM、PIC 水平明显升高，有望作为弥漫大 B 细胞淋巴瘤疗效及预后判断指标。

PO-1323

血栓弹力图检测在评估肝癌患者凝血状态中的临床价值

闫彬、胡天喜、杜伟鹏
南阳市中心医院

目的 探讨血栓弹力图（TEG）在评估肝癌患者凝血状态中的应用价值。
方法 回顾性分析 2017 年 8 月至 2020 年 9 月在河南省南阳市中心医院肝胆外科就诊的 102 例肝癌患者和 48 例肝血管瘤患者。收集患者的 TEG 检测指标（R 值、K 值、Angle 值、MA 值、CI 值和 G 值）、常规凝血指标（PLT、PT、INR、APTT、FIB、TT）以及肝癌患者的基本临床资料。分析肝癌组和肝血管瘤组不同检测参数之间的差异性；分析 TEG 参数在不同肝癌患者亚组中的差异性，并采用 Spearman 秩相关分析肝癌患者 TEG 与常规凝血检测之间的相关性，并比较两种检测方法在判断肝癌患者凝血状态时敏感性的优劣。
结果（1）与肝血管瘤患者相比，肝癌患者 PLT 显著降低，而 PT 值、INR 值和 APTT 值则显著升高（*P*<0.001）；肝癌患者的 MA 值和 G 值则低于肝血管瘤患者（*P*<0.05）；（2）与初诊肝癌患者相比，复诊肝癌患者的 PLT 显著降低，R 值和 K 值显著升高，而 Angle 值、MA 值、CI 值和 G 值则显著降低（*P*<0.05）；（3）除 R 值外，TEG 其它参数在肝切除、经肝动脉栓塞化疗术和保守治疗之间的差异具有显著性（*P*<0.05）；（4）肝癌患者的 TEG 参数与其常规凝血指标之间具有一定的相关性（*P*<0.05）；（5）血栓弹力图检测对低凝状态的检出率为 18.63%（19/102），常规凝血指标对低凝状态的检出率为 7.84%（8/102），检出率之间的差异有统计学意义（*P*=0.001）。
结论 与初诊相比，复诊肝癌患者处于相对低凝状态。利用 TEG 能够更灵敏地诊断出肝癌患者凝血状态的变化，及时采取措施有利于降低出血风险。

PO-1324

LINC01255 combined with BMI1 to regulate human mesenchymal stromal senescence and acute myeloid leukemia cell proliferation through repressing transcription of MCP-1

qinghua Liu、Jing Dong、Jie Li、yanchao Duan、keqiang Wang、qiuhong Kong、hong Zhang
The Second Affiliated Hospital of Shandong First Medical University

Background Long non-coding RNAs (lncRNAs) govern fundamental biochemical and cellular biology processes, for exam_x0002_ple, participate in chromatin remodeling, imprinting, splicing, transcriptional regulation and translation. Dysregulation of lncRNA expression is act as a feature of various diseases and cancers, including hematopoietic malignancies. However, the clinical relevance of myelodysplastic syndrome (MDS) and acute myeloid leukemia preceded by MDS (MDS-AML) requires further research. Recently, lncRNAs have been demonstrated, which play an important role in hematopoiesis, thus, to further fnding more functional lncRNA seemed particularly important.

Methods Western blotting, real-time PCR, RNA-pulldown, RIP (RNA immunoprecipitation), Chromatin immunoprecipi_x0002_tation (ChIP), cellular compartments extraction assays, SA-β-gal staining, lentivirus transfection, cell viability assay and cell proliferation assays were used to examine the relationship between lncRNA LINC01255 and its regulation of p53–p21 pathway in human mesenchymal stromal and acute myeloid leukemia cells.
Results LncRNA LINC01255 is highly expressed in bone marrow cells of AML patients, CD34+ cells of MDS-AML patients and AML cell lines and the higher expression of LINC01255 is associated with poor survival rate of AML patients. LINC01255 can interact with BMI1 and repress the transcription of MCP-1 to active p53–p21 pathway, thus inhibiting the senescence of human mesenchymal stromal and proliferation of acute myeloid leukemia cell.
Conclusions We discovered a novel functional lncRNA LINC01255, which can regulate the senescence of human mesen_x0002_chymal stromal and the proliferation of acute myeloid leukemia cell through inhibiting the transcription of MCP-1.

PO-1325

Dysregulation of LINC00324 associated with methylation facilitates leukemogenesis in de novo acute myeloid leukemia

Guokang Sun[1]、dongming yao[2]、qiurong he[1]、jing zhang[1]
1. West China School of Public Health and China Fourth Hospital
2. 镇江市第一人民医院

Background LINC00324, long intergenic non-coding RNA 324, was found to be overexpressed and facilitated carcinogenesis in various solid malignant tumors such as gastric cancer, ovarian cancer, and lung cancer. However, the role of LINC00324 in leukemogenesis remains to be elucidated.
Methods In this study, bone marrow samples and corresponding clinical data were collected from 106 adult patients with de novo AML. The relative expression levels of LINC00324 was detected by real-time quantitative PCR (RT-qPCR) technology. The real-time quantitative methylation-specific PCR (RQ-MSP) technology was used to detect the promoter unmethylation levels of LINC00324 in bone marrow samples from healthy donors and AML patients. Cell proliferation was used to detect the proliferation of leukemia cell lines after overexpression of LINC00324. Flow Cytometer (FCM) was used to detect the change of apoptosis in leukemia cell lines after overexpression of LINC00324.
Results In de novo AML patients, lower LINC00324 expression was associated with significantly increased hemoglobin (Hb) and lower platelets (PLT). Moreover, Kaplan-Meier analysis suggested that patients with lower LINC00324 expression showed more prolonged overall survival (OS). Importantly, our experimental data showed that LINC00324 was significantly hypomethylated in whole-AML and non-APL patients. Furthermore, the paired sample experiment also showed that the low expression group's promoter region had lower unmethylation levels. Notably, overexpression of LINC00324 in leukemia cell lines promoted the proliferation of target cells and inhibited their apoptosis.
Conclusion Our findings firstly identified that the hypomethylation of LINC00324 was a common molecular event in de novo AML patients. Moreover, higher LINC00324 expression was associated with its promoter methylation and suggested an unfavorable prognosis in AML. Finally, the abnormally up-regulated LINC00324 promotes proliferation and inhibits apoptosis in leukemia cells.

PO-1326

妊娠期 D-二聚体、凝血系列、白细胞及血小板动态变化及临床意义

路静
山东省千佛山医院

目的 探讨妊娠期 D-二聚体、凝血系列、白细胞及血小板的动态变化及临床意义。
方法 选取 2014 年 10 月至 2015 年 5 月期间，在我院妇产科门诊就诊的 288 例健康妊娠期女性患者（按妊娠周期分为：早期妊娠组 116 例，中期妊娠组 85 例，晚期妊娠组 87 例；按妊娠年龄分为：≤30 岁组 166 例，>30 岁组 122 例），选取同期年龄相匹配、健康查体非妊娠女性 50 例作为对照组，观察不同妊娠期 D-二聚体水平（D-dimer，D-D）、凝血酶原时间（prothrombin time，PT）、活化部分凝血酶时间（activated partial thromboplastin time ，APTT）、纤维蛋白原含量（fibrinogen FIB）、白细胞（white blood cell ，WBC）及血小板（platelet，PLT）的变化。
结果 妊娠组与正常对照组比较，PT、APTT 时间缩短，PLT 降低，FIB、D-D 和 WBC 增高，差异有统计学意义（P<0.05），中期妊娠和早期妊娠比较，FIB、D-D 和 PLT 明显增加，差异有统计学意义（P<0.05），PT、APTT、WBC 无明显差异（P>0.05）。晚期妊娠和中期妊娠比较，PT 时间进一步降低，FIB、D-D 增加，差异有统计学意义（P<0.05），APTT 、WBC、 PLT 无明显差异（P<0.05）。晚期妊娠和早期妊娠比较，PT、APTT、PLT 明显减少，FIB、D-D 明显增加，差异有统计学意义，WBC 无明显差异。妊娠年龄≤30 岁和>30 岁女性的 D-D、PT、APTT、FIB 水平比较，差异无统计学意义（P>0.05）。
结论 妊娠期女性的 D-D、PT、APTT、FIB 与正常女性比较有显著性差异，且随着妊娠期的进展，FIB、D- D 在体内含量逐渐增加，而 PT、APTT 逐渐降低；但升高或降低程度均与年龄无关。

PO-1327

一个复合杂合变异导致的遗传性凝血因子Ⅹ缺陷症家系分析

蒋淑婷、王明山
温州医科大学附属第一医院

目的 对一个遗传性凝血因子Ⅹ（FⅩ）缺陷症家系进行表型和基因型检测，寻找致病基因并探讨其可能的分子致病机制。
方法 检测先证者及其家系成员血浆凝血酶原时间(PT)、活化部分凝血活酶时间（APTT）、纤维蛋白原（FIB）、FⅩ活性（FⅩ:C）和 FⅩ抗原（FⅩ:Ag）等指标来明确表型诊断。用 PCR 法对先证者 F10 基因所有外显子及侧翼序列进行扩增，PCR 产物经纯化后进行直接测序；对发现的疑似变异用反向测序予以验证，并对家系其他成员相同变异位点进行检测。通过凝血酶生成试验来评估先证者及其家系成员 FⅩ的促凝活性。运用 ClustalX-2.1-win 软件分析变异的保守性；用 PolyPhen-2、SIFT 和 Mutation Taster 三个在线生物信息学软件预测变异对蛋白质功能的影响；用 Swiss-PDB Viewer 软件对变异前后的蛋白进行模型分析。
结果 先证者 PT 和 APTT 明显延长，分别为 21.8s 和 57.1s；FⅩ:C 和 FⅩ:Ag 分别降低至 7%和 14%；其母亲、二姐、儿子和女儿 FⅩ:C 和 FⅩ:Ag 均下降为正常对照的 50%左右；先证者及家系成员其他相关凝血指标均在正常范围内。基因分析发现先证者 F10 基因第 4 外显子存在 c.361T>C 杂合错义变异及第 8 外显子存在 c.979C>T 杂合错义变异。先证者凝血酶生成潜力比值和峰高比值明显下降，而其延迟时间和达峰时间明显延长。保守性分析显示，p.Cys121 和 p.Arg327 位点在同源物种间均高度保守。生物信息学软件预示两种变异均为有害变异。变异蛋白模型分析显示，

p.Arg327Trp 变异后，Trp327 与 Glu306 之间产生分子碰撞力，原 Arg327 与 Tyr271 之间的氢键消失，导致蛋白质空间结构发生改变。
结论 该家系 F10 基因第 4 外显子 p.Cys121Arg 杂合错义变异和第 8 外显子 p.Arg327Trp 杂合错义变异与该家系 F X 水平减低有关。

PO-1328

云南省 4720 例新生儿溶血病检测情况分析研究

杨雯、陆艳红、李雪然、李玉芳、魏彩霞
昆明金域医学检验所有限公司

目的 探讨 2018 年 1 月至 2020 年 11 月云南省十四个地州市医院送昆明金域医学检验所有限公司共计 4720 例新生儿溶血病（Neonatal hemolytic disease，HDN）标本的发病情况。
方法 送检的 4720 例新生儿溶血标本进行 ABO 和 Rh 血型鉴定（采用玻片凝集法）及新生儿溶血病三项检测（含直抗抗人球蛋白试验、游离抗体试验和释放抗体试验，均采用微柱凝胶法检测），检测结果从性别结构、血型类型、发病率、出生天数阳性率和地区分布等因素进行统计分析。
结果 4720 例中男婴占比 52.4%，女婴占比 47.6%，出生性别比为 110.15:100，A 型血占比 39.3%，B 型血占比 31.4%，AB 型血占比 25.8%，O 型血占比 26.7%，Rh（D）阳性 99.7%，Rh（D）阴性 0.3%。ABO 系统引起的溶血发病率 22.38%远大于 RhD 溶血的发病率 0.43%，母婴血型为 O-A 型阳性率 67.96%大于 O-B 性阳性 31.91%，出生三天内检查阳性率最高达 26.46%，出生 7 天后检出阳性率明显降低仅 2.31%。滇中（辖昆明、玉溪、楚雄和曲靖）阳性率 12.36%，滇西（辖大理、保山和德宏）阳性率 23.00%，滇东南（辖红河和文山）阳性率 17.59%，滇东北（辖昭通）阳性率 32.70%，滇西南（辖普洱、版纳和临沧）阳性率 20.39%，滇西北（辖丽江、迪庆和怒江）没有阳性（送检标本例数仅 2 例）。
结论 使用微柱凝胶法可以微量准确的检出直接抗人球蛋抗体、游离抗体和释放抗体，HDN 检出阳性率三天内最高，母婴血型为 O-A 型阳性率占比高，HDN 尽早送检，做到早发现、早预防、早确诊、早治疗，避免核黄疸的发生危及患儿的生命健康。

PO-1329

全光谱流式细胞术检测 B 淋巴细胞白血病微小残留病单管 16 色组合方案的建立与验证

陈南[1,2]、兰山卉[1]、张静文[1,2]、潘建华[1,2]
1. 广州金域医学检验中心
2. 广州医科大学金域检验学院

目的 建立全光谱流式细胞术检测 B 淋巴细胞白血病微小残留病的单管检测方案。
方法 利用全光谱流式细胞仪，设计单管 16 色 17CD 组合方案检测 B 淋巴细胞白血病微小残留病，并对组合方案荧光染料组合可行性、抗体滴定等验证；同时收集传统流式 8 色组合方案检测的 B 淋巴细胞白血病微小残留病样本，应用单管 16 色组合方案进行全光谱流式细胞术检测，比对两种检测方案的结果，分析其可行性与优劣势。
结果（1）建立了一套基于本实验室的用于全光谱流式细胞仪检测 B 淋巴细胞白血病微小残留病的单管 16 色 17CD 组合方案的设计，其 16 色荧光染料组合的复杂性指数为 6.6。（2）对该组合方案的 17 个 CD 分子分别进行抗体滴定试验，根据染色指数分析，优化了基于该组合方案的最适合的抗体终浓度。（3）与传统流式 8 色组合方案检测结果相比，全光谱流式单管 16 色组合方案检测结果基本一致，表达异常的 CD 分子的比例无显著差异（4）同等条件下，全光谱流式收集的可分

析细胞数量多于传统流式，使用的标本量更少，而且一次性可对 17 个 CD 分子标记进行检测，覆盖较全面，对于微小残留病的检测敏感性更好。与传统流式细胞仪相比，光谱分析不用调整荧光补偿，对多色的分析更便捷。
结论 全光谱流式不用调整荧光补偿、检测灵敏性更好，本项目建立的单管 16 色组合方案可用于 B 淋巴细胞白血病微小残留病的检测。

PO-1330

3134 例早孕女性生殖道微生态检测结果分析

韦小妮
柳州市妇幼保健院

目的 了解本地区早孕女性生殖道微生态的状况，为本地区早孕女性生殖道感染性疾病的早期保健治疗提供科学依据。
方法 选取 2018 年 6 月至 2019 年 9 月在柳州市妇幼保健院就诊的 3134 例早孕女性为研究对象，对其生殖道分泌物进行生殖道微生态检测，检测项目包括盐水湿片显微镜检查、干片革兰染色检查菌群和病原微生物，评估其 Nugent 和 AV 评分，并依据相关标准进行全面微生态评价。
结果 生殖道微生态平衡者 1526 例，占比 48.7%；生殖道微生态失衡者 1608 例，占比 51.3%，其中 CCV 和 BV 感染率较高，分别为 403 例（25.1%）和 395 例（ 24.6%），混合感染者 85 例（5.3%），TV 感染者为 18 例（1.1%），不同年龄阶段早孕女性生殖道微生态失衡总体上无差异。
结论 早孕女性生殖道微生态失衡发生率较高，生殖道感染以 CCV 和 BV 最常见，应提高孕早期妇女的生殖道健康意识及加强其生殖道感染性疾病的早期保健治疗。

PO-1331

高效液相色谱串联质谱测定总睾酮及游离睾酮指数在多囊卵巢综合征诊断中价值

徐苏娟、曾玉、陈亚军
南京市妇幼保健院

目的 通过比较高效液相色谱串联质谱（LC-MS/MS）与化学发光法（CLIA）对多囊卵巢综合征（PCOS）患者及健康对照女性血清总睾酮的定量检测，探究高效液相色谱串联质谱与化学发光法诊断 PCOS 临床意义以期寻找更好的 PCOS 诊断指标。
方法 收集 PCOS 患者 114 例、正常对照 100 例，比较 PCOS 患者和正常对照 LC-MS/MS 和 CLIA 测定的血清总睾酮以及游离睾酮指数诊断效价。
结果 CLIA 方法显示 PCOS 组和对照组在年龄（$p<0.001$）、黄体激素（$p<0.001$）、胰岛素（$p=0.002$）、雌二醇（$p<0.001$）、总睾酮（$p<0.001$）、游离睾酮指数（$p=0.021$）、硫酸脱氢表雄酮（$p=0.021$）、胰岛素抵抗指数（$p=0.034$）以及空腹葡萄糖之间（$p=0.017$）均有差异，其中总睾酮诊断效价较好，曲线下面积为 0.766。我们进一步通过 LC-MS/MS 检测两组甾体类激素，结果显示雄烯二酮（$p<0.001$）、睾酮（$p<0.001$）以及 17-羟孕酮（$p<0.001$）具有显著差异。进一步通过 ROC 曲线显示三者诊断效能分别是 0.830、0.851 以及 0.714。Bland-Altman 法结果显示 LC-MS/MS 和 CLIA 检测的总睾酮一致性较差，因此，LC-MS/MS 检测更准确，且检测的总睾酮有最高的诊断效能。我们进一步分析了 LC-MS/MS 检测结果对于胰岛素抵抗诊断价值，结果显示游离睾酮指数具有最高的诊断价值，ROC 曲线显示三者诊断效能分别是 0.798。
结论 LC-MS/MS 法测定血清总睾酮以及游离睾酮指数较 CLIA 灵敏性高、准确度好。总睾酮对女性 PCOS 的诊断效能高，而游离睾酮对胰岛素抵抗诊断价值更高。

PO-1332

Effect of MT2A on apoptosis and proliferation in HL60 cells

Yuqing Pan、Yan Du
The First Affiliated Hospital of Kunming Medical University

Although accumulating evidence has revealed that metallothioneins (MTs) and its family member MT2A are strongly linked to the risk of various solid tumors, researches on the occurrence and development of acute myeloid leukemia (AML) have rarely been investigated. Here, we constructed a lentiviral vector with MT2A over-expression and the interfering plasmids with MT2A expression inhibition to study the influence of MT2A on the bioactivities of HL60 cells. After cells were infected with a lentiviral vector containing the MT2A gene, both transcription and translation levels of MT2A were significantly increased in the over-expressed group in comparison with control groups. In vitro experiments, all results demonstrated that cell reproductive capacity was inhibited, but cell apoptosis rate was significantly increased. Together, the expression of apoptosis-related protein Bcl2 was remarkably reduced, while a high expression level of Bax protein was detected. Further experiments revealed that up-regulation of MT2A induced cell apoptosis and promoted G2/M phase arrest. The mechanism may be associated with down-regulated p-IκB-α and cyclinD1 expression and up-regulated IκB-α expression in the nuclear factor-kappaB (NF-κB) pathway. On the contrary, MT2A expression was down-regulated by interfering plasmids. We found that cell proliferative potential was notably increased in the interfering group compared with the negative and untreated group. What's more, MT2A may be closely related to AML cell proliferation and function via the NF-κB signal pathway.

PO-1333

脑脊液实验室检测在原发性中枢神经系统淋巴瘤诊断中的价值探讨

赵晖、李虓、宋蓓、赵运转、刘扬、关春燕、张国军
首都医科大学附属北京天坛医院

目的 探讨原发性中枢神经系统淋巴瘤（PCNSL）患者脑脊液的实验室检测指标在 PCNSL 诊断及鉴别诊断中的价值。

方法 回顾性研究。2017 年 12 月至 2020 年 1 月在北京天坛医院诊断 PCNSL 的 46 例患者作为研究对象，选取同期就诊的中枢神经系统脱髓鞘疾病 44 例、中枢神经系统感染性疾病 37 例作为对照组。回顾性分析和比较 3 组患者的脑脊液细胞学、脑脊液有核细胞数、脑脊液糖、蛋白、氯及脑脊液细胞因子 TNF-α、IL-6、IL-8、IL-10、IL-10/IL-6 各指标表达水平，采用 F 检验或秩和检验分析组间水平差异，对有统计学意义的指标运用受试者工作曲线（ROC）评价指标的诊断价值。

结果 46 例 PCNSL 患者中有 15 例在脑脊液中发现淋巴瘤细胞（32.6%）；淋巴瘤组脑脊液蛋白［53.11(37.20,82.8) g/L］及脑脊液 TNF-α［9.1（6.20，12.55）pg/ml］明显高于脱髓鞘组［脑脊液蛋白：35.09(25.71,56.33) g/L；脑脊液 TNF-α：4.91（4.00，7.64）pg/ml］，诊断 PCNSL 的 ROC 曲线下面积分别为 0.630 和 0.631（P<0.05）；PCNSL 组脑脊液 IL-10 和 IL-10/IL-6 高于脱髓鞘组和脑膜炎组，诊断 PCNSL 的 ROC 曲线下面积分别为 0.729 和 0.735（P<0.05）；当 IL-10 的 cut-off 值选择 8.47 时，敏感度为 48.9%，特异度为 95.6%，但 IL-10/IL-6 的 cut-off 值选择 1.38 时，敏感度为 73.3%，特异度为 64.8%。

结论 脑脊液中发现淋巴瘤细胞是 PCNSL 的诊断的直接依据，脑脊液细胞因子 IL-10 及 IL-10/IL-6 对 PCNSL 有较高的诊断价值。

PO-1334

网织红细胞血红蛋白含量对缺铁性贫血诊断的临床价值

闫欣、周伟、孙沐新、安培莹
吉林大学第一医院

缺铁性贫血 (Iron-deficiency anemia, IDA) 为临床最常见的贫血疾病之一, 主要是指机体内贮存铁无法满足正常红细胞生成需要而引发的贫血。诊断步骤较为复杂，骨髓涂片检查是该病的金标准，但骨髓检查是有创性的、费时、操作技术要求较高且花费高，而其他用于诊断缺铁性贫血的生物学指标，例如：血清铁、血清铁蛋白、总铁结合力、可溶性转铁蛋白受体等，通常受炎症、慢性疾病和年龄影响。网织红细胞血红蛋白含量(CHr) 与上述这些指标相比，实用性较好，CHr 更能反映体内实时的 Hb 合成情况，且受炎症的影响较小，是治疗反应的早期预测因子。CHr 在诊断铁缺乏方面具有中等敏感性和特异性，CHr 是铁可用性的良好监测指标，也是缺铁红细胞的早期标记，还可用于铁治疗的监测。通过文献查阅，本文主要探讨 CHr 在缺铁性贫血临床研究中的应用价值。

PO-1335

Circulating Monosaccharide Composite-based Glycan Biomarker Diagnoses of early Hepatocellular carcinoma in patients with hepatitis B virus

Minghui Hu
Affiliated Hospital of Qingdao University

Background Hepatocellular carcinoma (HCC) is one of the most common malignancies in the world. As chronic hepatitis B (CHB) can progress to cirrhosis and HCC, predicting HCC development in high-risk patients with high viral replicative activity or advanced fibrosis is important. Detection of early HCC is critically important for treatment of these patients. Since developing glycan structure-based biomarkers is still ongoing worldwide after continuous effort for several decades, we decided to take the simpler circulatingglycan monosaccharide composite-based biomarker approach for HCC early detection.
Methods The blood samples of age- and gender-matched patients with CHB (n=82), cirrhosis (n=80), HCC in patients with hepatitis B virus (80) and healthy controls (n=82) were collected. The monosaccharide compositions of both free and hydrolyzed glycans were quantified by using an established HPLC method.Receiver operating characteristic (ROC) and logistic regression were used to assess the reliability of the biomarker. The K fold cross validation was applied to test the coefficients of the biomarker for HCC.
Results The circulating monosaccharides especially the mannose from hydrolyzed glycans and the free glucose to free mannose (G/M) ratio not only distinguished the HCC patients from healthy controls, but also distinguished the patients of patients with CHB, cirrhosis and HCC. Logistic regression analysis revealed that monosaccharide composite had better AUC (0.87) and accuracy (87.88%) for detecting HCC patients than the mannose or the G/M ratio alone. Moreover, the monosaccharide composite, the G/M ratio, or even mannose alone was better for HCC early detection than AFP.
Conclusions The monosaccharide composite was a novel circulating biomarker for HCC early detection and systems malfunction-information compounded in monosaccharide composite explained its molecular basis. Thus, systems malfunction-based biomarkers should be pursued for early diagnosis of HCC or other cancers in future.

PO-1336

炎症相关细胞因子与 Ph 阴性骨髓增殖性肿瘤的相关性研究

陈朴、马艳婷、程韵枫、潘柏申、郭玮、王蓓丽
复旦大学附属中山医院

目的 探讨经典型骨髓增殖性肿瘤（myeloproliferative neoplasms，MPN）患者血清中炎症相关细胞因子及部分急性时相反应蛋白水平及其临床意义。
方法 105 例 Ph（-）MPN 患者为 MPN 组，20 例体检健康者为对照组，2 组采用化学发光法及免疫透射比浊法检测造血及炎症相关细胞因子：促红细胞生成素（erythropoietin，EPO）、肿瘤坏死因子-α（tumor necrosis factor-α，TNF-α）、白介素（Interleukin，IL）-1β、IL-2 受体（IL-2R）、IL-6、IL-8、IL-10 及两种急性时相反应蛋白：高敏 C 反应蛋白（hypersensitive C-reactive protein，hs-CRP）和铁蛋白，分析 Ph（-）MPN 发病及疾病转化过程中细胞因子及 hs-CRP、铁蛋白的变化规律。
结果 MPN 患者血清 TNF-α、IL-2R、IL-6、IL-8、hs-CRP 和铁蛋白水平均显著高于对照组（P<0.001），IL-10 水平则显著低于对照组（P<0.001）。PMF 组 IL-2R 水平显著高于 PV 组和 ET 组（P<0.01），PV 组 EPO 水平低于其余各组（P<0.05）；网状纤维增生程度为Ⅲ级的 MPN 患者 IL-2R 水平高于Ⅱ级组（P<0.05），TNF-α 水平高于未增生组（P<0.05）。
结论 炎症相关细胞因子及 hs-CRP、铁蛋白在 MPN 患者中表达异常，且在三种疾病亚型中的表达水平也存在差异。相比既往的骨髓细胞学及病理活检等随访手段，细胞因子检测具有无创、便捷及经济的优点，有望成为 MPN 诊断分型及疾病进展随访的有效辅助指标，甚至在可能成为潜在的治疗及疗效监测的靶点。

初发骨髓瘤患者骨髓涂片与活检浆细胞数量的相关性研究

朱建锋、王蓓丽、潘柏申、郭玮
复旦大学附属中山医院

目的 本研究用于评估初发骨髓瘤患者骨髓涂片和活检对计数浆细胞数量的相关性研究。
方法 我们回顾分析了 205 例骨髓瘤患者的骨髓涂片与骨髓活检中浆细胞数量，采用 fit curve 方法得到拟合曲线方程，并比较两者的相关性，探讨使用任意一种方法来预测浆细胞数量，以降低或避免临床漏诊。
结果 骨髓涂片与骨髓活检检查骨髓瘤患者的浆细胞数量的非线性曲线方程为 y=11.75x0.38（R2=0.163）。骨髓涂片浆细胞数量≦10%时，骨髓活检浆细胞数量≦10%的仅占 27.8%（5/18），而活检浆细胞>10%的占 72.2%（13/18）；骨髓涂片浆细胞数量>60%时，活检浆细胞数量≦10%占比为 0（0/20），而活检浆细胞>10%的占 100%（20/20），即涂片与活检浆细胞数量均大于 60%。对于浆细胞数量不高的患者，骨髓涂片与活检的结果一致性欠佳；浆细胞数量较高的患者，骨髓涂片与活检具有很高的一致性。
结论 实验结果显示对于初发骨髓瘤患者，需重视同时行骨髓涂片与活检检查的必要性，以避免将骨髓涂片作为评判浆细胞数量的标准判断，而忽视活检的重要性。反之亦然，武断地采用任何一种方法的浆细胞数量（10%）进行诊断是不可取的，引起不必要的漏诊。同时对未行骨髓涂片或活检的患者，可采用我们实验模拟的非线性曲线方程对任一方法浆细胞数进行合理估判，来评估预后疗效，如复查时的骨髓涂片与初诊时活检浆细胞量，两者可采用拟合曲线进行结果比对，从而判断患者骨髓浆细胞变化情况，对疾病进展进行判断。

PO-1338

一种基于流式细胞术原理的低值血小板检测方法建立与验证

朱捷、方佩琪、王蓓丽、郭玮
复旦大学附属中山医院

目的 利用流式平台建立一种检测低值血小板的方法并进行验证。
方法 在流式平台上使用绝对计数管检测不同浓度的低值血小板，并分析其在各个不同浓度下的检测精密度和准确度。同时用所得结果与人工镜检法进行比较。另外在实际实验操作中进行验证，通过检测巨核细胞培养体系内的血小板浓度，分析其与体系内巨核细胞数量的相关性。
结果 流式检测法检测低值血小板的的准确度和精密度均优于人工镜检法，其精密度的 CV 和准确度的偏倚值在检测同浓度血小板时均小于人工镜检法。在检测实际巨核细胞体外培养体系中的血小板浓度结果后发现，巨核细胞产生的血小板数量与巨核细胞数量呈显著正相关。
结论 基于流式细胞术原理检测低值血小板的方法，其精密度和准确度可满足实际实验需求，方法可行。

PO-1339

Rosner 指数在血浆纠正试验中的应用

罗磊、陈朴、朱建锋、王蓓丽、郭玮
复旦大学附属中山医院

目的 评估 Rosner 指数（Rosner index）在血浆纠正试验中的应用。
方法 收集 103 例血浆纠正试验标本，比较使用回归正常参考区间或 Rosner 指数结果<11%或 Rosner 指数结果<15%作为判断依据的结果。
结果 103 例血浆纠正试验结果，使用回归正常参考区间作为判断标准时，得出凝血因子缺乏 74 例、肝素或抗磷脂抗体存在 26 例、凝血因子抑制物存在 3 例。使用 Rosner 指数结果<11%作为判断标准时，得出凝血因子缺乏 75 例、肝素或抗磷脂抗体存在 25 例、凝血因子抑制物存在 3 例。使用 Rosner 指数结果<15%作为判断标准时，得出凝血因子缺乏 83 例、肝素或抗磷脂抗体存在 19 例、凝血因子抑制物存在 1 例。
结论 当 APTT 结果轻度延长或显著延长时，分别使用 Rosner 指数<11%或回归参考范围，作为血浆纠正试验的判断依据参考价值更大，能更好的为临床提供诊断思路。

PO-1340

18 例骨髓坏死临床特征及实验室结果分析

陈楠、朱建锋、陈朴、朱娜、王蓓丽、郭玮
复旦大学附属中山医院

目的 分析骨髓坏死的临床特征及实验室结果，加强对该类疾病的认识。
方法 本研究回顾了 2007 年 1 月至 2021 年 1 月于我院行骨髓涂片检查患者 29065 例，其中骨髓坏死患者 18 例，对 18 例骨髓坏死患者临床特征及相关实验室结果进行收集分析。
结果 18 例患者中男性占 61%，女性占 39%。年龄分布为 25~74 岁，中位年龄 54 岁。原发病为恶性肿瘤的患者占 83%，非恶性肿瘤患者占 17%。恶性肿瘤患者中实体肿瘤患者占 53%，其中胃肠道肿瘤患者 4 例，肝恶性肿瘤患者 1 例，肺部肿瘤患者 1 例，腹部结缔组织肿瘤患者 1 例，乳腺肿瘤患者 1 例；血液系统疾病患者占 40%，其中急性早幼粒细胞白血病患者 1 例，急性淋巴细胞白血病患者 1 例，B 细胞淋巴母细胞淋巴瘤/白血病患者 1 例，弥漫大 B 细胞淋巴瘤患者 1 例，慢性

淋巴细胞白血病/小淋巴细胞淋巴瘤患者 1 例，多发性骨髓瘤患者 1 例；另 1 例患者未确认肿瘤来源。非恶性肿瘤患者中消化道出血患者 1 例，心功能不全患者 1 例，不明原因的全血细胞减少患者 1 例。临床症状多种多样，其中最常见的为发热、骨痛、腰背酸痛。实验室结果中外周血涂片均能见到幼粒或者幼红细胞，贫血、血小板减低、白细胞减低及 LDH、ALP、纤维蛋白原、DD-二聚体、C 反应蛋白、血沉、ALT、AST、铁蛋白升高较常见。除外 3 例患者未行骨髓活检检查，其余患者中骨髓坏死程度分级 III 级 40%，II 级 13%，I 级无，无坏死 47%。骨髓纤维化程度 3 级 0%，2 级 20%，1 级 33%，0 级 27%。

结论 骨髓坏死较为少见，多继发于恶性肿瘤，死亡率高、预后较差，骨髓涂片细胞学检查是骨髓坏死诊断的重要方法之一，联合多种实验室检查加强对该类疾病的认识，减少漏诊、误诊的发生，做到早发现、早诊断、早治疗，以望改善预后，提高生存率。

PO-1341

高嗜酸粒细胞综合征的临床及实验室特征研究

张岚、朱建锋、陈朴、郭玮、王蓓丽
复旦大学附属中山医院

目的 高嗜酸粒细胞综合征（HES）是一组少见的异质性疾病。通过对我院 2014 至 2020 年间收治的 63 例 HES 患者的临床资料进行总结分析，了解各亚型的临床及实验室特点，尤其是骨髓及外周血中嗜酸粒细胞的形态学异常。

方法 回顾分析 63 例 HES 患者的临床和实验室资料，复阅外周血和骨髓涂片中嗜酸粒细胞的形态学特征。

结果 以男性多见（男：女=50：13），中位年龄 49（18-85）岁，按照病因分为反应性组 54 例，特发性组 9 例。反应性组的病因众多，主要继发于肿瘤（嗜酸粒细胞为非克隆性）、血管炎、感染性疾病及药物等。两组患者的临床表现均以皮肤受累最为常见，脾肿大及骨髓纤维化发生率接近。特发性组患者的外周血基线嗜酸粒细胞比例高于反应性组（P<0.05）。33%特发性组患者（3/9）外周血可出现幼稚阶段嗜酸粒细胞，而反应性组全部未见（P=0.000）。骨髓涂片中特发性组的嗜酸粒细胞更易出现形态学异常，其中以颗粒稀疏、胞浆嗜碱性颗粒及核分叶过多这三种异常特征的发生率高于反应性组（P<0.05）。

结论 特发性和反应性 HES 的临床及实验室特征相互重叠，但通过骨髓涂片中嗜酸粒细胞的异常形态学特征，能够为两组 HES 的鉴别诊断提供一定帮助。

PO-1342

Prognostic value of circulating tumor cells in patients with bladder cancer: A meta-analysis

Hui Jiang、Xiujuan Gu、Zhihua Zuo、Gang Tian、Jinbo Liu
The Affiliated Hospital of Southwest Medical University

Objective Circulating tumor cells (CTCs) have been considered as a diagnostic and prognostic biomarker for urothelial cancer. However, the prognostic role of CTCs in bladder cancer (BC) remains controversial. Here, we conducted a meta-analysis to evaluate the prognostic significance of CTCs for patients with BC.

Methods All studies relevant to this topic were searched in PubMed, Embase, and Web of Science databases. Hazard ratio (HR) and 95% confidence interval (95% CI) were set as effect measures. The outcomes were overall survival (OS), cancer-free survival (CSS), progression-free survival (PFS)/time to progression (TTP), and disease-free survival (DFS)/recurrence-free survival (RFS)/time to first recurrence (TFR). All analyses were conducted in STATA 15.1.

Results Eleven eligible studies comprising 1,062 patients with BC were included in this meta-analysis. Overall analyses showed that CTC-positive patients had poorer survival (OS: HR 3.88, 95% CI 2.52–5.96, p < 0.001; CSS: HR 3.89, 95% CI 2.15–7.04, p < 0.001) and more aggressive progression (PFS/TTP: HR 5.92, 95% CI 3.75–9.35, p < 0.001; DFS/RFS/TFR: HR 4.57, 95% CI 3.34–6.25, p < 0.001) than CTC-negative patients. Subgroup analyses according to number of patients, detection method, positive rate, and follow-up time revealed that the presence of CTCs predicted high risk of mortality and disease progression in most subgroups.
Conclusion The meta-analysis confirmed that CTCs are a promising prognostic biomarker of poor survival and aggressive tumor progression for patients with BC.
Prospero registration number: CRD42021224865.

PO-1343

APOBEC3B and SPAG5, the Target Genes of miR-539, Involved into Imatinib-Resistant of Gastrointestinal Stromal Tumors

Hongxing Wang
Qilu Hospital, Shandong University

Background Although imatinib can effectively treat gastrointestinal stromal tumor (GIST), some patients are still resistant to it or cannot tolerate the adverse reactions of the drug. This study aimed to investigate potential miRNAs, mRNA and tumor-infiltrating lymphocytes (TILs) associated with the prognosis of imatinib-resistant GIST.
Methods mRNA, miRNA sequencing data and patient clinic traits of primary (imatinib-naive) and imatinib-resistant GIST were obtained from GEO (Gene Expression Omnibus) database. A systems biology approach combining Weighted co-expression network analysis (WGCNA) and differential expression analysis were utilized to detect the imatinib-resistant-related miRNA and gene modules and construct a miRNA-gene network. Tumor-infiltrating immune cells were analyzed by Estimating the Proportion of Immune and Cancer cells (EPIC) and Tumor-Immune System Interactions (TISIDB). miR-539 was measured by qRT-PCR. SPAG5 and APOBEC3B was measured by qRT-PCR and WB. Transforming growth factor (TGF)-β and interleukin (IL)-10 were assessed with enzyme-linked immunosorbent assay (ELISA). The proportions of CD4+ T cells, CD8+ T cells , NK cells and B cells in tumor-infiltrating lymphocyteswere analyzed via flow cytometry (FCM).
Results Two gene modules (brown and yellow) and one miRNA module were associated with the imatinib-resistant. Two hub genes (APOBEC3B and SPAG5) were associated with the imatinib-resistant. Three hub miRNAs were identified to be related to imatinib-resistant (miR-539, miR-376b and miR-18b). G1/S transition of mitotic cell cycle, G2/M transition of mitotic cell cycle, and cell proliferation were common pathways of the gene modules and miRNA module. apolipoprotein B mRNA editing catalytic polypeptide-like 3B (APOBEC3B) and Sperm-associated antigen 5 (SPAG5), which were both target genes of miR-539 was located at the core of miRNA–gene network. APOBEC3B (rho=0.509, p < 2.2e-16) and SPAG5 (rho=0.468, p < 2.2e-16) was positive correlated with the infiltration levels of activated CD4+ T cells. he proportions of CD4+ T cells, and the mRNA and protein relative expression of APOBEC3B and SPAG5 in imatinib-resistant tumor samples significantly increased as compared with tumor samples in imatinib-naive group. Imatinib-resistant tumor samples exhibited significantly downregulation of miR-539 and TGF-β1. Over-expression of miR-539 sensitized imatinib resistant GIST48 cells and increased the secretion of TGF-β1 by inhibiting APOBEC3B and SPAG5.
Conclusion APOBEC3B and SPAG5, the target genes of miR-539 may play as key factor for imatinib-resistant GIST by increasing the proportion of tumor-infiltrated activated CD4+ T cells via TGF-β1. These findings help to advance the understanding of imatinib-resistant GIST and provide potential therapeutic targets.

PO-1344

新型自动粪便分析仪 FA280 检测性能评价

龙婷婷、邓山鹰、江虹
四川大学华西医院

目的 评价自动粪便处理分析系统 FA280 的性能指标，以保障其检测结果的准确性。
方法 对 FA280 进行本底测试，并对重复性、携带污染等性能以及便隐血试剂检测限等进行评价。同时对比 FA280 与 FA160 检测结果或与手工检测隐血结果的一致性。
结果 测试 FA280 的本底白细胞（WBC）、红细胞（RBC）、真菌孢子、脓细胞、虫卵和隐血结果均为阴性。重复 WBC、RBC、真菌孢子和隐血检测在第 2-11 次结果与第 1 次的结果完全一致。携带污染试验中，已知的 10 份阳性标本检测结果 WBC、RBC 及真菌孢子均为阳性，交叉其中的空白样本检测结果均为阴性。隐血试剂卡检测血红蛋白（Hb）浓度低于 0.05ug/ml 时结果为阴性，浓度为 0.1ug/ml 时结果为弱阳性，当 Hb 在 0.2-2000ug/ml 时隐血为阳性。FA280 与 FA160 仪器结果比对，所测 10 份标本 WBC、RBC、真菌孢子、脂肪滴和隐血试验结果全部一致，卡式便隐血试剂与艾博隐血试剂手工检测结果符合率达 96.2%。
结论 FA280 空白测试合格，重复性良好，携带污染试验符合要求。卡式便隐血试剂的检测限为 0.1ug/ml-2000ug/ml。且 FA280 检测结果与 FA160 结果及手工隐血试验比对均合格。仪器性能良好，用于临床检测结果准确。

PO-1345

富氧空位 WO3-x QDs 增强电化学发光的乳腺癌循环肿瘤细胞检测新方法研究

潘登
青岛大学附属医院

目的 近年来，乳腺癌成为威胁女性健康安全的一大重要因素，远处转移是乳腺癌的主要致死原因，循环肿瘤细胞检测在乳腺癌转移及预后判断方面发挥着重要作用，因此探索循环肿瘤细胞的高灵敏检测方法在癌症转移筛查中非常重要，本研究以期通过构建超灵敏检测 CTCs 电化学发光传感方法实现提高乳腺癌转移筛查水平。
方法 本研究提出以二硫化钨粉末为前驱物，通过超声剥离和温和的化学转化过程成功合成了富氧空位氧化钨量子点，利用 WO3-x QDs 高效地增强三联吡啶钌电化学发光的性质来提高乳腺癌循环肿瘤细胞的检测灵敏度，随后合成负载 WO3-x QDs 的磁性 ECL 探针用于高效富集循环肿瘤细胞以便进一步实现检测信号放大作用，本研究以 MUC1 蛋白作为选择性识别肿瘤血清中 CTCs 的标志物，修饰其适体在磁性 ECL 探针上对 CTCs 进行分离和富集，利用 EpCAM 抗体将循环肿瘤细胞固定在电极表面，通过调控电化学发光探针的功能化设计、界面组装及其与特异性 MUC1 适体间相互作用等实现电化学发光探针性能和结构的优化，筛选综合性能最佳组合方案构建用于超灵敏检测乳腺癌循环肿瘤细胞的电化学发光传感器。
结果 1、富氧空位 WO3-x QDs 被用于 ECL 共反应剂可提高 Ru(bpy)32+的 ECL 强度近 400 倍；2、基于富氧空位 WO3-x QDs/Ru(bpy)32+新发光体系的 ECL 效率可与传统 TPrA 标杆体系相媲美，但动物毒性比 TPrA 低约 300 倍；3、结合富氧空位 WO3-x QDs 增强电化学发光以及磁性探针高效富集双重信号放大机制的循环肿瘤细胞检测新方法，其检测限可达到 3 cell/mL。
结论 本研究所构建的电化学发光传感器可实现循环肿瘤细胞的高灵敏分析，为乳腺癌转移提供一种有效的筛查工具，以及其他癌症转移筛查和预后判断提供新方法和新思路。

PO-1346

Plasma SNORD42B and SNORD111 as potential biomarkers for early diagnosis of non-small cell lung cancer

Kangyu Wang、Xingguo Song、Li Xie、Xianrang Song
Shandong Cancer Hospital and Institute, Shandong First Medical University and Shandong Academy of Medical Sciences

Background Despite decades of efforts, non-small-cell lung cancer (NSCLC) remains the leading cause of cancer mortality globally primarily due to the challenge in early detection of the cancer. The aim of this study is to access the efficacy and reliability of plasma snoRNAs in early diagnosis of NSCLC.
Materials and Methods Differential snoRNAs of LUAD and LUSC were analyzed using the SNORic and TCGA databases, then SNORD42B and SNORD111 were selected and further verified in 48 FFPE NSCLC and adjacent normal tissues, as well as in plasma from 165 NSCLC patients and 118 health donors. Then, the diagnostic efficiency of plasma SNORD42B and SNORD111, as well as combined with CEA was determined by receiver operating characteristic (ROC) analysis.
Results SNORD42B and SNORD111 were significantly increased not only in tissues but also in plasma from NSCLC as well as from early-stage NSCLC compared to those from healthy donors. In addition, we validated plasma SNORD42B and SNORD111 were capable to act as promising diagnostic biomarkers for NSCLC and early-stage NSCLC. Moreover, the diagnostic efficiency of CEA was significantly evaluated for early-stage NSCLC when combined with the two plasma snoRNAs.
Conclusion SNORD42B and SNORD111 are significantly upregulated in NSCLC patients, and can serve as the promising and non-invasive diagnostic biomarkers for NSCLC and early-stage NSCLC.

PO-1347

tRNA 衍生片段 tRFs: tRF-Gly-CCC-046,tRF-Tyr-GTA-010 和 tRF-Pro-TGG-001 作为乳腺癌新型诊断生物标志物

张悦[1]、毕钊[1]、董晓菡[1]、于淼[2]、王康羽[1]、宋兴国[1]、谢丽[1]、宋现让[1]
1. 山东省肿瘤医院
2. 山东省立第三医院

目的 近年来，乳腺癌的发病率越来越高，一些晚期发生转移的乳腺癌患者预后仍然很差，因此，需要找到更有效的生物标志物，以达到乳腺癌的早期诊断,早期治疗和改善预后的目的。tRNA 衍生片段(tRFs)已被发现在多种肿瘤的发生和发展中发挥调节作用。本研究的目的是鉴定 tRFs 在乳腺癌中的表达情况及其作为乳腺癌诊断标志物的能力。
方法 本研究纳入了在 2017 年 9 月至 2019 年 9 月，于山东省肿瘤医院接受手术的 83 例患者的癌与癌旁组织，以及另外的 214 例乳腺癌患者与 113 例健康人的血清进行 tRFs 表达水平分析。组织与血清样本的总 RNA 分别用 Trizol 或 Trizol LS 试剂提取，然后采用 q-PCR 的方法检测 tRFs 在癌症组与对照组的相对表达量。通过 ROC 曲线分析，阐明三个 tRFs 作为乳腺癌诊断标志物的能力。
结果 与健康人相比，乳腺癌患者的组织和血清中 tRFs: tRF-Gly-CCC-046, tRF-Tyr-GTA-010 and tRF-Pro-TGG-001 均下调。更重要的是，这三个 tRFs 可以作为乳腺癌诊断和早期诊断的循环生物标志物，曲线下面积(AUC)分别为 0.7871 和 0.7987。
结论 tRFs: tRF-Gly-CCC-046, tRF-Tyr-GTA-010 and tRF-Pro-TGG-001 在乳腺癌中显著下调，可作为乳腺癌诊断和早期诊断的新型生物标志物。

PO-1348

Basophils in the cerebrospinal fluid from a case of central nervous system leukemia

Hongmei Ding
The First Affiliated Hospital of Nanjing Medical University

A 34-year-old man presented with headache, decreased vision, tinnitus, and weakness in both lower extremities. He was diagnosed with chronic myeloid leukemia in 2013 and progressed to acute basophilic leukemia in 2015. Since February 2016 to August 2019, he was diagnosed in the complete remission period (CR) with 0.0% BCR-ABL1 gene detected after a series of treatments including dasatinib.

In this case, an uncommon acute basophilic leukemia in the central nervous system was presented. A large number of basophils were seen in CSF but no obvious abnormalities in the peripheral blood and bone marrow.

This is a very rare case in which CML transforms into acute basophilic leukemia, which then further invades the central nervous system. The patient's first symptoms were blurred vision and ocular congestion for two months. They are essential clinical information that require vigilance for patient with CML in remission. Lumbar MRI and CSF laboratory examinations are very important for the diagnosis of this case of central system leukemia.

PO-1349

Usefulness of Mean Platelet Volume for Differential Diagnosis of Biliary and non-Biliary Acute pancreatitis

Fengfeng Zhao
Department of Clinical Laboratory of Zhongda Hospital, Southeast University

Objective To explore whether the mean platelet volume (MPV) can be used as a reference index for the differential diagnosis of bile-derived acute pancreatitis from non-bile-derived acute pancreatitis.

Method From August 2016 to May 2017, 132 inpatients with acute pancreatitis were diagnosed as acute pancreatitis in the Hospital affiliated to Southeast University, including 62 cases of biliogenic pancreatitis and 70 cases of non-biliogenic pancreatitis. The MPV values of blood routine were analyzed and compared.

Results There was significant difference in MPV between the two groups ($P < 0.05$). The working characteristic curve (ROC) of the subjects showed that the area under the MPV curve was 0.773 (95% CI:0.793-0.895) for distinguishing bile pancreatitis from non-bile pancreatitis. When the cut-off value of MPV was 8.41, the sensitivity and specificity of differential diagnosis of bile pancreatitis were 80.4% and 71.6%, respectively.

Conclusion MPV can be used as a simple and practical reference index to distinguish bile from non-bile acute pancreatitis.

PO-1350

嵌合抗原受体修饰的 T 细胞疗法（CAR-T）后血凝系统的活化

沈文红[1,2,3,5]、沙萍萍[1,2,3,5]、周志英[1,4]、崔庆亚[1,2,3,5]、张威[1,2,3,5]、白霞[1,2,3,5]
1. 苏州大学附属第一医院
2. 江苏省血液研究所
3. 国家血液系统疾病临床医学研究中心
4. 江苏省苏州市高新区（虎丘区）疾病预防控制中心
5. 卫生部血栓与止血重点实验室

目的 嵌合抗原受体修饰的 T 细胞疗法（chimeric antigen receptor T cell therapy， CAR-T 疗法）在血液系统恶性疾病治疗取得令人鼓舞的疗效，CAR-T 活化伴随着细胞因子释放综合征(CRS)，会引起血凝异常，并可能出现威胁生命的弥漫性血管内凝血（DIC）。目前常规开展的凝血系统检测仅能发现已存在血凝异常，对凝血异常前，血栓前状态、Pre-DIC 等的状态不敏感，不易发现凝血系统，纤溶系统，血管内皮功能早期发生的改变。
方法 我们分析 39 例血液系统恶性疾病 CAR-T 后发生 0-1 级 CRS，2-3 级 CRS，11 例急性白血病和 21 例血液系统恶性疾病合并 DIC 患者血栓分子标志物（TAT、PIC、TM、tPAI-C）和血凝指标发生的变化。
结果 39 例血液系统恶性疾病分别为 ALL20 例，AML15 例，MM4 例。CAR-T 的靶标有 CD19，CD19-CD22 双靶，CD38 和 BCMA。我们发现 0-1 级 CRS，2-3 级 CRS 的凝血指标（APTT，PT，TT）较治疗前没有差异。我们也发现发生 2-3 级 CRS 患者 FDP 和 D-dimer 明显升高，除此之外还发现 0-1 级 CRS，2-3 级 CRS 的患者 PIC 明显升高。CAR-T 治疗后合并 CRS 的 TAT 也有一定程度升高，但较治疗前升高并不明显。TM 和 tPAI-C 作为内皮细胞损伤的标志物，我们发生 2-3 级 CRS 的患者内皮损伤更加明显。
结论 我们发现 CAR-T 治疗后机体内凝血、纤溶、内皮系统明显活化，而内皮系统损害更加明显，常规的凝血指标并不能很好的反应 CAR-T 治疗后机体内出血和止血的状态，血栓分子标志物结合血凝指标判断 CAR-T 治疗后凝血和止血状态，可能为临床 CAR-T 后凝血异常的治疗提供更为真实可靠的依据，仍需较大样本的临床实验进一步证实以上结论。

PO-1351

Prediction of lymph node metastasis in oral tongue squamous-cell carcinoma using the neutrophil-to-lymphocyte ratio and platelet-to-neutrophil ratio

Bo Wang[3]、JunWen Liu[2]、Zhengrong Zhong[1]
1. Department of Clinical Laboratory, Shanghai Ninth People's Hospital, Shanghai JiaoTong University School of Medicine
2. Department of Clinical Laboratorial, The Children's Hospital of Fudan University
3. Department of Clinical Laboratory, Shanghai Ninth People's Hospital, Shanghai JiaoTong University School of Medicine

Background Lymph node metastasis in a variety of tumors is associated with systemic inflammatory markers. However, this association has not been reported in oral tongue squamous-cell carcinoma (OTSCC). This study aimed to investigate how the preoperative neutrophil-to-lymphocyte ratio (NLR) and platelet-to-neutrophil ratio (PNR) in OTSCC patients correlated with the occurrence of OTSCC and lymph node metastasis.
Methods The data of 73 patients with primary OTSCC who underwent surgical resection were retrospectively analyzed. Patients with other malignant tumors, patients who had received radiotherapy or chemotherapy before surgery, and patients with active inflammation were excluded. The enrolled patients were divided into groups N0 (no early-stage lymph node

metastasis) and N1 (early-stage lymph node metastasis). Venous blood samples were collected before surgery and at the third week after surgery and subjected to complete blood counting in a blood analyzer. Eighty-seven healthy people were included as a control group. In addition, the NLR and PNR in OTSCC patients were compared with those in the controls, and the postoperative NLR and PNR of group N0 were compared with those of group N1.
Results The NLR was significantly higher in the OTSCC patients than the controls ($P < 0.05$). The area under the receiver operating characteristic curve was 0.595. Further comparison of the NLR and PLR between group N0 and group N1 showed that when NLR was ≤ 1.622, the probability of early-stage lymph node metastasis in OTSCC patients was 73.3%, and when PNR was > 60.889, the probability was 86.7%. In re-examination 3 weeks postoperatively, the NLR and PNR were not significantly different between groups.
Conclusion The NLR has certain reference value for the diagnosis of OTSCC. The preoperative NLR and PNR can be used to predict early-stage lymph node metastasis in patients with histopathologically confirmed OTSCC.

PO-1352

去甲基化药物治疗骨髓增生异常综合征的最新进展

张婧玲
福建医科大学附属协和医院

近年来随着表观遗传学的深入研究，发现 DNA 甲基化在恶性血液肿瘤的发生、发展中起着重要的作用，并为治疗提供了新的靶点。表观遗传学异常尤其是 DNA 甲基化改变是骨髓增生异常综合征发病机制的研究重点，去甲基化药物作为一线治疗方案之一，已在临床取得了一定疗效。目前被批准用于 MDS 临床治疗的去甲基化药物主要有阿扎胞苷和地西他滨。通过对 MDS 患者中克隆细胞内 DNA 甲基化和去甲基化的研究，从而对去甲基化药物的机制有更深入的了解，为临床治疗提供更多的治疗策略。

PO-1353

Efficacy and Safety of Iron Chelator for Transfusion-Dependent Patients with Myelodysplastic Syndrome: A Meta-Analysis

张婧玲、曹颖平
福建医科大学附属协和医院

To systematically evaluate the efficacy and safety of iron chelators for transfusion-dependent patients with MDS. Thirteen cohort studies with 12,990 patients diagnosed with MDS were included in this study. Meta-analysis results showed that in transfusion-dependent MDS patients with secondary iron overload, OS was longer and LFS was longer in MDS patients receiving iron chelators than in MDS patients not receiving iron chelators and in patients with lower-risk MDS in a further subgroup analysis. Subgroup analysis of DFX showed that compared with patients not treated with iron chelator, the group receiving DFX monotherapy had significantly improved OS. In terms of tolerance, meta-analysis of the binary variables in CAEs showed that the occurrence of CAEs was significantly reduced by ICT.

PO-1354

对流式白血病免疫分型样本处理中最适离心力的探讨

董敏
四川省医学科学院·四川省人民医院

目的 找寻流式细胞前处理过程中最适合的离心力和洗涤次数，以保证在流式细胞分析过程中人为造成的异常细胞的选择性丢失最少。
方法 选取诊断正常标本和异常的标本各 10 例，加入 100ul 至流式管中；在流式管中加入 5ml 红细胞溶解剂（一般为 NH4CL），溶血 5min 并计时；溶血时间到后以 250g 的转速离心 5min，后弃去上清液；后加入与之前溶血剂等体积的 PBS（磷酸盐缓冲液）重悬沉淀，混合均匀，以 250g 的转速再次离心 5min 后弃去上清液，收集两次离心后的上清液。配制混合抗体：CD16-FITC，CD3-PE，CD14-ECD，CD19-PC5.5，CD45-PC7，CD33-APC，每种抗体 3ul，共 18ul。加入配好的混合抗体于重悬沉淀管和两次混合上清管中，避光孵育 15min，后上机检测。重新拿一支干净试管，重复上述步骤，只离心一次，收集上清，加入混合抗体孵育 15min，后上机检测。以上为一种离心力一次完整的检测方案。设置不同的离心力梯度：400g、550g、700g、850g，依次重复上述检测步骤，分别记录流式细胞仪收集细胞的速度和图形。
结果 离心次数为一次或者两次，离心力分别为 250g、400g、550g、700g、850g，上清液和重悬沉淀液的细胞的数目和类别是有差异的，且这种差异具有统计学意义（$p<0.05$）。
结论 不同的离心力和不同的离心次数对不同标本影响的差异是有统计学意义的。经统计学和流式细胞学分析，我们认为离心力为 550g，时间为 5min 且离心两次时，异常细胞的丢失（从数目和类别角度）是最少的，对于最终疾病结果判断的影响基本可以忽略不计。

PO-1355

Single and combined used of preoperative inflammatory biomarkers and CA199 in diagnosing pancreatic cancer

Yu Lu[1,2]、Hongli Yu[2]、Shanzi Qin[1]、Mingxing Chen[1]、Huaping Chen[1]、Zuojian Hu[1]、Shan Li[1]、Xue Qin[1]
1. Department of Clinical Laboratory, First Affiliated Hospital of Guangxi Medical University, Nanning 530021, Guangxi, China
2. Department of Clinical Laboratory, Liuzhou People's Hospital, Liuzhou 545006, Guangxi, China

Objective Pancreatic cancer (PCC) poses a significant diagnostic challenge due to the non-specific symptoms of the disease and the close proximity of major blood vessels, which can be easily invaded by the tumor. To improve its accuracy, combinations of CA199 with other indicators have been widely studied. However, the potential diagnostic value of inflammation-related biomarkers combined with CA199 in the diagnosis of PCC remains unclear. The present study was therefore carried out to determine the diagnostic value of preoperative inflammatory biomarkers and CA199, alone or in combination, in diagnosing pancreatic cancer (PCC).
Methods This retrospective study was comprised of 75 PCC patients and 83 healthy controls (HC). The participant's medical data was mined from the electronic records of the First Affiliated Hospital of Guangxi Medical University. The data included the preoperative circulating albumin/fibrinogen ratio (AFR), the platelet/lymphocyte ratio (PLR), the lymphocyte/monocyte ratio (LMR), the neutrophil/lymphocyte ratio (NLR), and the derived NLR (dNLR). The receiver operating characteristic (ROC) curve and the area under the ROC curve (AUROC) were used to evaluate the diagnostic efficacy of these candidate biomarkers for PCC.
Results A single AFR significantly distinguished PCC from the healthy controls (AUROC: 0.903, 95% CI: 0.846–0.945) and had a significantly higher sensitivity and larger AUROC than CA199 (AUROC: 0.814, 95% CI: 0.774–0.871). The combinations of AFR with CA199 (AUROC: 0.932, 95% CI: 0.881–0.966), RDW with CA199 (AUROC: 0.905, 95% CI: 0.849–0.946), Alb with

CA199 (AUROC: 0.869, 95% CI: 0.806–0.917), and Fib with CA199 (AUROC: 0.921, 95% CI: 0.868–0.958) also yielded higher sensitivities and larger AUROCs than CA199 alone.
Conclusions The present study is the first to comprehensively evaluate the diagnostic value of circulating inflammatory biomarkers alone and combined with CA199. Our results suggest that circulating AFR was an effective biomarker in distinguishing PCC patients from HCs, and combining AFR, RDW, Alb, and Fib with CA199 could significantly improve the diagnostic efficacy for PCC. However, as a retrospective single-center cohort with relatively small sample sizes, larger-scale and multi-center studies are warranted to confirm our findings.

PO-1356

48 例传染性单核细胞增多症患儿高荧光强度淋巴细胞比分比检测的临床意义

刘娟
吉林大学第一医院

目的 传染性单核细胞增多症患儿高荧光强度淋巴细胞百分比实验检查与临床特征的相关性
传染性单核细胞增多症(infectionmononucleosis,IM)是儿童常见病毒感染性疾病。诊断主要依据典型临床表现和外周血异型淋巴细胞比例增高和 EBV 或 CMV-lgM 抗体检测。尽管传染性单核细胞增多症外周血异型淋巴细胞增高很常见，但也常见于其他病毒感染性疾病，不具有特异性。本研究全自动血液细胞分析仪检测传染性单核细胞增多症患儿高荧光强度淋巴细胞百分比，探讨高荧光强度淋巴细胞百分比对 IMEB 病的诊断价值，同时分析高荧光强度淋巴细胞百分比与 EB 病毒感染程度的相关性，为传染性单核细胞增多症诊断提供快速有用价值。
材料与方法 研究对象：收集 48 例于本院儿科确诊的 IM 患者，其中男 23 例，女 25 例，男女比为 0.92：1。研究方法 ：对 IM 患儿进行血常规检测，检测血液中高荧光强度淋巴细胞百分比，同时进行外周血血细胞形态检查检查异型淋巴百分比，同时检测患儿 EB 和 CMV 病毒感染的核酸载量检测。统汁学处理：通过 SPSS18.0 统计软件，分析高荧光强度淋巴细胞百分比对 IM 的诊断效能，灵敏度和特异度，临界值；分析高荧光强度淋巴细胞百分比与 EB 和 CMV 病毒感染的相关性。
结果 48 位 IM 患儿，47 位患者高荧光高度淋巴细胞百分比明显升高；外周血细胞形态学检查，其中 36 位患者异型淋巴细胞比例大于 10%。相关性分析 IM 患儿高荧光强度淋巴百分比与 EB 病毒感染程度具有一致性。

PO-1357

糖尿病合并高血压患者血小板参数的变化及临床意义

孙婷、李艳
武汉大学人民医院

目的 研究血小板参数在糖尿病（DM）及 DM 合并高血压（HBP）患者中的变化及临床意义。
方法 收集 2018 年 10 月至 2019 年 8 月在武汉大学人民医院确诊为 2 型糖尿病（T2DM）的患者 113 例，将其作为 DM 组；T2DM 合并 HBP 患者 157 例，作为 DM 合并 HBP 组，并按照血压水平将其分为 HBPⅠ、Ⅱ、Ⅲ级三个亚组；检测并分析两组的空腹血糖（FPG）、糖化血红蛋白（HbAlc）、血小板计数（PLT）、血小板压积（PCT）、平均血小板容积（MPV）、血小板分布宽度（PDW）及大血小板比率（P-LCR），以及通过受试者工作特征（ROC）曲线比较 PLT、MPV、PDW、P-LCR、HbAlc 对 DM 合并 HBP 的诊断价值；并探究 DM 合并不同严重程度 HBP 患者以上指标的变化趋势。

结果 DM 合并 HBP 组的 HbAlc、PLT、MPV、PDW、P-LCR 的水平明显高于 DM 组，且差异有统计学意义（P < 0.05）。随着 HBP 严重程度的升高，FPG、MPV、PDW、P-LCR 的水平升高，呈明显的上升趋势。P-LCR 的 ROC 曲线下面积（AUC）为 0.812,大于 PLT(AUC 为 0.618)，MPV(AUC 为 0.805)、PDW(AUC 为 0.799)和 HbAlc（AUC 为 0.578），对 DM 合并 HBP 的诊断价值最大。
结论 血小板参数与 DM 合并 HBP 的发生关系密切，对于诊断评估 DM 合并 HBP 有一定的价值。

PO-1358

多发性骨髓瘤患者血清 TAT、TM、PIC 的变化及临床分析

王贝
东南大学附属中大医院

目的 探讨多发性骨髓瘤患者凝血酶-抗凝血酶复合物(TAT)、血栓调节蛋白(TM)、纤溶酶-α2 纤溶酶抑制剂复合物(PIC)水平变化在临床诊治中的价值。
方法 选择 2019 年 1 月至 2020 年 12 月我院收治的多发性骨髓瘤患者 82 例作为研究对象,设为 A 组;非多发性骨髓瘤患者 120 例,设为 B 组;选取同期体检健康者 86 例设为 C 组。多发性骨髓瘤患者按照诱导治疗危险度再分为低危组(n=31)、中危组(n=30)和高危组(n=21),检测各组受试者的血清 TAT、TM、PIC 水平变化情况,并应用受试者工作特征曲线(ROC 曲线)分析 TAT、TM、PIC 水平预测多发性骨髓瘤 患者早期死亡的诊断效能结果 A 组血清 TAT、TM、PIC 水平均明显高于 B 组组和 C 组(P 均<0.05),高危组患者的血清 TAT、TM、PIC 水平均高于中危组和低危组,差异均有统计学意义(,P 均 <0.05)。化疗后,早期死亡 8 例(9.76%),存活组患者的 TAT、TM、PIC 水平均低于死亡组,差异有统计学意义(P 均<0.05)。ROC 曲线分析显示,三者联合检测的曲线下面积均大于 TAT、TM、PIC 单独预测,可提高预测灵敏度和特异度,差异均有统计学意义(P 均<0.05)。
结论 多发性骨髓瘤患者血清 TAT、TM、PIC 水平异常升高提示患者预后不良,其在临床诊断及预后评估中均有较高价值

PO-1359

我国四川地区儿童患者蓝氏贾第鞭毛虫检出情况分析

胡正强、李节
四川大学华西第二医院

目的 了解我国四川地区儿童患者蓝氏贾第鞭毛虫（贾第虫）检出情况，分析易感人群及感染原因，提出防疫意见及建议。
方法 回顾四川大学华西第二医院 2019 年 9 月 1 日至 2020 年 8 月 31 日儿童患者大便常规检查数据及资料共 11575 例，检查方法均采用生理盐水直接涂片镜检法，可疑病例加做碘液染色。
结果 在 11575 例儿童患者粪便中查见贾第虫包囊或滋养体 4 例，其中 3 例为少数民族患者，1 例为汉族患者，电话追踪汉族患者有少数民族地区生活史。一年内汉族患者标本量为 10645 例，检出率为 0.009%，少数民族患者标本量为 930，检出率占 0.320%。少数民族患者检出率高于汉族患者，两者差异有统计学意义（P<0.05）。
结论 应重视四川地区低感染虫种和低致病性虫种如贾第虫的检出。贾第虫病易反复感染，建议基层医疗卫生单位定期对人群进行普查，发现确诊病例立即采取驱虫措施。相关部门加强人和动物宿主的粪便管理，搞好环境卫生，防止水源污染。建议加强对相关检验人员进行寄生虫专业培训和考核，以提高寄生虫检出率和寄生虫病诊断率。贾第虫病在少数民族患者检出率较高，主要与其个人卫生、生活习惯、饮食习惯等有关，建议加强少数民族地区防疫管理，培养儿童良好的卫生习惯，以减少贾第虫病的传播与流行。

PO-1360

不同尿液标记物检测对评价肾小管功能的临床意义

李帅[1]、马文静[2]、刘红[1]、王昌敏[1]
1. 新疆维吾尔自治区人民医院（新疆维吾尔自治区高血压诊疗研究中心、新疆维吾尔自治区临床皮肤性病研究所、新疆维吾尔自治区普外科微创研究所、新疆维吾尔自治区内分泌糖尿病研究所）
2. 新疆乌鲁木齐市中医医院检验科

目的 通过检测尿胱蛋白酶抑制剂 C（Cystatin C）、尿 α1-微量球蛋白（α1-MG）、尿 N-乙酰-β-D-氨基葡萄糖苷酶（NAG）和尿 β2-微球蛋白（β2-MG）的浓度水平，从而评价患者的肾小管功能。
方法 选择 2019 年 1 月～2020 年 10 月在我院肾病科住院的患者 90 例为观察组，另选健康体检者 50 例为对照组。尿 Cystatin C、α1-MG 和 β2-MG 测定采用酶联免疫法（ELISA）检测，尿 NAG 测定采用对硝基苯酚（PNP）比色法检测。并对检测结果进行比较及统计学分析，以受试者工作特征（ROC）曲线及曲线下面积（AUC）评价各项尿液标记物的敏感性。
结果 观察组尿 Cystatin C、α1-MG、NAG、β2-MG 的测定含量明显高于正常对照组，差异具有统计学意义（P＜0.001），通过 ROC 曲线、诊断试验结果显示：尿 NAG、Cystatin C 的曲线下面积分别为 0.862、0.902，95%可信区间分别为 0.805～0.921、0.895～0.963，较尿 α1-MG 和 β2-MG 更具有敏感性（P＜0.001）。
结论 联合各项尿液标记物检测对评价患者的肾小管功能具有重要的临床意义，可以作为肾小管损伤性疾病的早期诊断、疗效观察和预后判断的有效指标。

PO-1361

宿主免疫反应对华支睾吸虫感染诱发肝胆系统癌变机制的研究进展

张慧、许建成
吉林大学第一医院

目的 肝吸虫病早期一般无临床症状，容易产生误诊和漏诊。而在发现时往往已经有大量成虫寄生或阻塞胆总管出现黄疸，增加了发生胆管癌的可能性。深入了解其导致肝纤维化甚至肝癌的分子机制，有助于提出更有效的防治措施。
方法 综述 2000 年至今关于宿主免疫反应对华支睾吸虫感染诱发肝胆系统癌变机制的研究文献，针对两方面进行归纳总结：1.华支睾吸虫与肝胆病变的关系；2.宿主免疫反应在华支睾吸虫感染过程中诱发癌变的机制。提出宿主免疫反应在华支睾吸虫感染诱发肝胆系统癌变过程中发挥重要作用及具体作用机制。
结果 1.华支睾吸虫与肝胆病变的关系包括：（1）华支睾吸虫生活史及致病机制；（2）华支睾吸虫感染与肝胆系统癌的相关性。2.宿主免疫反应在华支睾吸虫感染过程中诱发癌变的机制包括：（1）细胞：巨噬细胞、树突状细胞、T 细胞；（2）细胞因子：TGF-β、TNF-α、IL；（3）其它：NO、Toll 样受体。
结论 长期的华支睾吸虫感染可诱发宿主发生一系列的病理生理及免疫反应，一方面通过促炎作用发展为慢性炎症，另一方面通过免疫抑制削弱机体抗肿瘤免疫。因此华支睾吸虫长期感染，因破坏宿主的免疫平衡导致肝胆管病变，甚至诱发胆管癌的发生。

PO-1362

地中海贫血继发血色病分析

项伶俐[1]、王 焱[2]、刘军权[1,2]、姬会春[2]
1. 杭州金域医学检验所有限公司
2. 宿迁市第一人民医院

血色病（hemochromatosis，HC）是一种铁代谢障碍性疾病，是指铁过量沉积在肝脏、心脏、胰腺及其他实质器官，对这些器官的功能和结构造成损害的疾病状态，多见于 40 岁以上男性，临床特征表现为：肝硬化，糖尿病，皮肤色素沉着等，可分为原发性和继发性血色病，本文报道的是一例不明原因长期贫血的女性患者查总铁结合力下降，铁饱和度明显增高，铁蛋白大于 1000μg/L，影像学、肝穿刺均提示肝血色病合并肝硬化，进一步查地中海贫血基因及血色病基因，排除原发性血色病，最终诊断为地中海贫血所致的继发性血色病。

PO-1363

D-dimer daily continuous tendency predicts the short-term prognosis for COVID-19 independently: a retrospective study from Northeast China

Yinting Xing、Wei Yang、Yingyu Jin、Chao Wang、Xiuru Guan
The First Affiliated Hospital of Harbin Medical University

BACKGROUND and OBJECTIVE To study whether D-dimer daily continuous tendency could predict the short-term prognosis of COVID-19.
PATIENTS and METHODES According to the short-term prognosis, 81 COVID-19 patients were divided into two groups, one of worse prognosis (Group W) and the other of better prognosis (Group B). The slope of D-dimer linear regression during hospitalization (SLOPE) was calculated as an indicator of D-dimer daily continuous tendency. The SLOPE difference between Group W and Group B was compared. The difference between the discharge results and the 3-month follow-up results was also compared. COX regression analysis was used to analyze the relationship between SLOPE and short-term prognosis of COVID-19.
RESULTS There were 16 patients in Group W and 65 patients in Group B. Group W had more critical proportion ($p<0.0001$), indicating that the symptoms of its patients were more severe during hospitalization. ARDS, the most visible cause of worse prognosis, accounted for up to 68.75%, and many symptoms merged and resulted in worse prognosis. The D-dimer levels of Group W not only were significantly higher ($p<0.0001$), but also showed an increasing trend. In addition, the D-dimer levels at discharge were significantly higher than those at follow-up ($p=0.0261$), and the mean difference was as high as 0.7474. SLOPE significantly correlated with the short-term prognosis of COVID-19 independently (RR: 1.687, 95%CI: 1.345-2.116, $P<0.0001$). The worst prognosis occurred most likely during the first month after COVID-19 diagnosis.
CONCLUSION Our study found that D-dimer daily continuous tendency independently correlates with worse prognosis and can be used as an independent predictor of the short-term prognosis for COVID-19.

PO-1364

471 例慢性淋巴细胞白血病的临床和实验室特征分析

杨莹、凌秋艳、金咏梅、曾婷婷、蒋能刚、廖红艳
四川大学华西医院

目的 本研究旨在探讨慢性淋巴白血病（CLL）的临床表现及主要实验室特征，深入了解不同分期 CLL 患者的实验室指标差异及其对 CLL 预后的指示作用，为临床诊断与治疗提供有效的参考信息。
方法 采用统计学方法对 2010 年 1 月-2015 年 1 月四川大学华西医院共 471 例慢性淋巴细胞白血病病人的临床信息及实验室检查资料包括血细胞计数、骨髓形态及免疫表型等结果进行回顾性分析。
结果 本组患者多发于老年，男性多见，中位年龄 64 岁，男女比例 1.89:1。大部分患者初诊时已有典型临床表现，就诊原因以发现白细胞增高或淋巴比例增高为主，占 47.34%。339 例（71.97%）初诊时 WBC>10×109/L 且淋巴细胞绝对值≥5×109/L。肝脾肿大 8 例（4.26%），发热 16 例（8.51%），乏力心累 8 例（4.26%）。56.21%的患者处于 BinetA-B 期，43.79%的患者处于 BinetC 期。49.42%的患者骨髓增生明显活跃至极度活跃。54.1%患者 β2-MG 升高。33.3%的患者出现 IgM 下降，不同 Binet 分期的 IgM 表达无差异(p>0.05)。外周血单核细胞绝对计数（AMC）与 IgG 存在显著相关性（p<0.05）。LDH 在 BinetA 期与 BinetC 期之间分布存在差异（X2=4.041，p=0.044），BinetC 期 LDH 水平较 BinetA 期高。
结论 本组 CLL 人群临床症状与免疫表型表达情况基本与典型 CLL 表型相符，一定程度上反应了我国 CLL 人群的发病情况。

PO-1365

Variable Ratio of Neutrophil-to-lymphocyte Ratio and C-reactive Protein Predict Prognosis of Acute Ischemic Stroke Treated with t-PA Thrombolysis

Bin Wang
Affiliated Hospital of Xuzhou Medical University
徐州医科大学

Background and purpose The mechanism linking systemic inflammatory changes and prognosis after tissue plasminogen activator (t-PA) thrombolysis for acute ischemic stroke(AIS) is not fully understood. We investigated whether peripheral inflammation after t-PA thrombolytic reperfusion therapy for AIS leads to disruption of the blood-brain barrier（BBB） and cerebral edema（CED） that hinders clinical recovery.
Methods We performed a study to investigate the correlation between systemic inflammatory changes and multiple factors of brain injury after t-PA thrombolysis for AIS in the Affiliated Hospital of Xuzhou Medical University between 2018 and 2020. The main inclusion criteria in brief: adults, with AIS, receiving t-PA thrombolytic reperfusion therapy. Neutrophil to lymphocyte ratio was collected from the patient's most recent health check-up prior to the stroke. In patients with AIS, 24h after t-PA thrombolytic therapy, neutrophil-to-lymphocyte ratio and C-reactive protein (CRP) concentrations were measured in peripheral blood, and the presence and grading of CED were assessed simultaneously by computed tomography. Calculate the variable ratio of neutrophil-to-lymphocyte ratio (variable ratio = (post-stroke ratio - healthy physical examination ratio)/healthy physical examination ratio). Clinical outcomes included early neurological function NIHSS (NIH Stroke Scale) and neurological function status at three months. Ordinal regression models and logistic regression models were obtained with adjusted odds ratios and 95% CI(confidence intervals). Receiver operating characteristics analysis in the training cohort was used to define the optimal cutoff values and validated on an independent dataset.

Results We included a grand total of 613 patients in this research. At 24 h after thrombolysis, CRP concentration were associated with brain injury (CED, adjusted odds ratio 1.53 [1.22–1.81], P<0.05), early neurological deterioration (NIHSS , adjusted odds ratio 1.65 [1.38 –1.84], P<0.05) and 90-d functional status (adjusted odds ratio 2.04 [1.51–2.72], P< 0.01).The variable ratio of neutrophil-to-lymphocyte ratio increased with higher degrees of brain injury(CED, adjusted odds ratio 1.34[1.10–1.69]，P<0.05), early neurological deterioration (NIHSS , adjusted odds ratio 1.35[1.08–1.67]，P<0.05) and 90-d functional status (adjusted odds ratio 1.82[1.31–2.52]，P<0.01). Systemic inflammatory response syndrome was related to CED due to altered white blood cell counts. The variable ratio of neutrophil-to-lymphocyte ratio and CRP concentration are ideal predictors of t-PA thrombolysis for AIS, with an area under the CRP curve of approximately 0.9 and an area under the variable ratio of neutrophil-to-lymphocyte ratio curve of approximately 0.8. The accuracy, sensitivity, and specificity of the variable ratio of neutrophil-to-lymphocyte ratio and CRP concentration ≥7 assay were around 60%.
Conclusions Increased early systemic inflammatory response after t-PA thrombolytic reperfusion therapy in patients with AIS is associated with the severity of brain injury. The variable ratio of neutrophil-to-lymphocyte ratio and CRP concentration in peripheral blood compared with patients before stroke can be used as valid markers of prognosis in AIS treated with t-PA thrombolysis-reperfusion.

PO-1366

UF-5000 全自动尿沉渣分析仪在快速筛查尿路感染中的应用

邓山鹰
四川大学华西医院

目的 利用 UF5000 全自动尿沉渣分析仪中细菌分型提示、细菌计数（BACT）及白细胞计数（WBC）检测结果，与尿细菌培养结果进行比较分析，探讨其在尿路感染快速筛查中的应用价值。
方法 收集 2019 年 7 至 2020 年 2 月怀疑尿路感染的门诊及住院病人的清洁中段尿共 2332 份，将标本分为两份，一份用于尿细菌培养，另一份用 UF-5000 进行定量分析，并对两种方法结果进行比较。同时应用受试者工作特征曲线（ROC 曲线）评价 UF-5000 的 BACT、WBC 计数的诊断效能并确定 Cut off 值。
结果 2332 例样本中病原学培养阳性标本 1092 例（46.8%），其中细菌培养阳性 916 例，真菌培养阳性 176 例。 在 2156 例非真菌感染样本中，尿细菌培养阳性率为 42.5%。UF-5000 细菌筛查分型提示阳性率为 39.7%，假阳性率为 5.2%，假阴性率为 13.5%，阳性预测值为 86.9%，阴性预测值为 90.5%；总符合率为 91.3%，其中革兰氏阴性菌符合率为 83.8 %，革兰氏阳性菌符合率为 72.5%。与尿培养阴性样本相比较，各尿培养阳性组 BACT 计数、WBC 计数均明显升高（P<0.001）。且在各类尿培养阳性病例中，不同水平菌落数分组其 BACT 计数均有明显差异（P<0.001），菌落数较多者 BACT 计数较高。UF-5000 的 WBC 与 BACT 计数相关性较弱（相关系数=0.134，P<0.01），且在不同水平尿培养阳性病例中，WBC 计数未见明显差异。ROC 曲线分析结果表明，UF-5000 的 WBC 计数、BACT 计数与各类尿细菌培养结果均具有相关性（P<0.001），其中 BACT 计数与革兰氏阴性菌培养结果的相关性最高（AUC 为 0.970），且 BACT 计数的诊断效能高于 WBC 计数。
结论 UF-5000 的 WBC、BACT 计数及分型提示可用于 UTI 快速筛查，且 BACT 计数诊断效能高于 WBC 计数。

血清 S100 蛋白在肺炎支原体感染合并脑炎患儿治疗中的意义

刘雅奇[1]、杨冰[2]
1. 郑州安图生物工程股份有限公司
2. 郑州大学附属儿童医院

目的 通过动态监测中枢神经系统特异性蛋白（S100 蛋白）在血清中含量的变化情况，为儿童肺炎支原体（MP）感染合并脑炎患儿的诊治和疗效监测提供辅助判断依据。
方法 选择 2019 年 10 月至 2020 年 4 月在郑州大学附属儿童医院收治的 229 例年龄在 5-8 岁之间的 MP 感染合并脑炎患儿进行血清 S100 蛋白动态监测，分析临床诊治效果与 S100 蛋白水平变化的关系。
结果 1、血清 S100 蛋白阴阳性与患儿中枢神经系统损伤的总符合率 87%，阴性符合率 85%，阳性符合率 95%；2、有 44 例患儿血清 S100 蛋白含量在 3-4 d 出现不同程度升高，多数患儿在 5d 后首发中枢神经系统损伤症状；介入脑炎方案治疗后 S100 蛋白含量的变化与患儿的治愈时间相关，治愈时间越短，血清 S100 蛋白含量降低至正常水平也越快，反之，治愈时间越长，血清 S100 蛋白含量下降速度越慢，最终下降至正常水平所需时间也就越长。
结论 血清 S100 蛋白的检测可以对 MP 感染合并脑炎患儿的提前判断提供依据，从而提前介入治疗以降低风险、提高预后质量，同时可以通过动态监测 S100 蛋白的含量变化对治疗方案的疗效提供辅助判断。

PO-1368

PLT-F 在低值血小板计数中的意义

毛志刚
四川大学华西医院

目的 探讨血小板荧光法（PLT-F）通道在低值血小板计数中的准确性与可行性。
方法 利用 Sysmex-XN 全自动血细胞分析仪分别经阻抗法、光学法、荧光法测定 100 例低值血小板标本，并将流式细胞仪方法作为参考方法，利用直线相关回归分析数据。
结果 低值血小板检测重复性 PLT-I 通道 CV 值为 5.5%—14.9%，PLT-O 通道 CV 值为 7.4—13.3，PLT-F 通道 CV 值为 1.9—11.1。以流式细胞仪计数为参考方法，PLT-I、PLT-O、PLT-F 通道相关系数（r）分别为 0.913、0.946、0.947，相关性均良好。其中低值血小板组（≤20×109/L）中，PLT-I、PLT-O、PLT-F 测定结果与参考标准 PLT-FCM 的相关系数（r）依次为 0.879、0.893、0.928。
结论 PLT-F 通道在低值血小板计数中准确性好，临床应用价值高。

PO-1369

早产儿凝血试验参考范围的研究与分析

赵树龙
徐州医科大学附属医院

目的 对于本院妊娠期小于 37 周早产儿 24 小时内凝血功能参考范围进行比较分析，同时对于已知参考范围适应性进行评价。

方法 回顾性分析 2017 年 9 月到 2017 年 12 月份之间的一个本院新生儿病 ICU 房内 108 例妊娠期＜37 周出生的早产儿 24h 内凝血功能的结果。分别计算均值与中位数，并与已知实验室凝血功能参考范围进行比较分析。
结果 108 例早产儿中有 2 例因 TT.APTT 结果过高无法测出而不进行分析。106 例早产儿中 PT、APTT、TT、FIB 的均值分别为 15.93、93.17、22.15、1.23。中位数分别为 15.25（15.30,15.20）、92.45（92.40,92.50）、21.3（21.3,21.3）、1.085（1.080,1.090）。
结论 早产儿凝血功能 PT、APTT、TT、FIB 与现已知的实验室参考标准相比较存在一定的差异性，PT、APTT、TT 存在明显的延长，FIB 明显降低。因此建立针对早产儿的凝血功能指标，对于知道临床早儿的治疗具有指导意义。

PO-1370

Prediction of morbidity in patients with acute pancreatitis: a retrospective study

Si Chen、Chaonan Liu、Jing Zhou
West China Hospital, Sichuan University

Background Acute pancreatitis (AP) is a common acute abdominal disease complicated by high incidence of severe complications. Mathematical models to predict them may help improve outcomes of AP.
Methods We retrospectively reviewed medical records of 1,297 patients with AP between January 2011 and March 2015. Records of 1,062 patients were used to derive models to predict morbidity as acute kidney injury (AKI), respiratory failure (RF) and infection, which were verified using records of the remaining 235 patients .
Results In the entire cohort, 66 patients suffered AKI, 131 suffered RF, and 152 experienced infection. After multivariable registration, higher level of glucose was an independent risk factor for all of the observed complications; endotracheal intubation and higher level of creatine were risks for AKI, calcium antagonists, higher urea and leukocyte levels, lower platelet number, as well as altered mental status were risks RF, and elder, higher urea and leukocyte levels, altered mental status, endotracheal intubation, noninvasive ventilation and surgery were factors for infection. Models for predicting morbidity were created using 2-7 simple indices. Risk model of AKI gave a high AUC of 0.94 based on data at admission. Risk models of RF and infection showed good predictive power using data at admission and better power after including in-hospital data. The performance was confirmed in the validation subset.
Conclusions We have developed simple risk models of morbidity to predict prognosis of AP patients. At admission, AKI can be predicted by risk model precisely. The other two complications predictive power are increased when in-hospital data were included in the models suggests that AP progression contributes substantially to morbidity and should be considered for accurate prediction of prognosis.

PO-1371

Evaluation of the Diagnostic Value of Peripheral Blood Parameters for Neonatal Pneumonia

Dan Liao
Daping Hospital, Army Medical University

Background To evaluate the diagnostic value of peripheral blood parameters including white blood cell (WBC), neutrophil, lymphocyte, monocyte, platelet, mean platelet volume (MPV), platelet distribution width (PDW), mean corpuscular volume (MCV), red cell distribution width

(RDW), neutrophil-to-lymphocyte ratio (NLR), monocyte-to-lymphocyte (MLR), platelet-to-lymphocyte ratio (PLR) and platelet-to-neutrophil ratio (PNR) for neonatal pneumonia.
Methods Two hundred and six full-term neonates in our hospital from January 2018 to December 2019 were en_x0002_rolled, including 73 pneumonic neonates and 133 health controls. Peripheral blood parameters were measured by an automatic blood cell analyzer. While C-reactive protein (CRP) and PCT concentrations were detected by electrochemical luminescence assay. Clinical signs, characteristic population, temperature, and chest radiograph findings were recorded. The receiver operating characteristic (ROC) curve was used to determine the cutoff values and analyze the diagnosis significances for neonatal pneumonia.
Results This study showed that WBC, neutrophil, RDW, NLR, and MLR levels in the pneumonic group were higher than that of the control group, whereas lymphocyte, monocyte, platelet, and PNR levels were lower ($p < 0.05$). The ROC curve result showed that NLR and PNR owned higher AUC values than the rest of peripheral blood variables. At a cutoff value 2.581, NLR exhibited 63.01% sensitivity, 90.98% specificity, and 0.847 area under ROC curve (AUC). In addition, at a cutoff value 52.77, PNR showed 84.93% sensitivity, 78.95% specificity, and 0.856 AUC.
Conclusions This study clarifies that peripheral blood parameter of NLR and PNR have good applied value in diagnosis neonatal pneumonia with high sensitivity and specificity.

PO-1372

探讨 7847 例液基细胞学联合普通涂片对甲状腺针吸细胞学的诊断价值

李琳
吉林大学第一医院

目的 探讨液基细胞学制片技术联合普通涂片在甲状腺针吸细胞学诊断的应用价值。
方法 对 7847 例门诊及住院甲状腺肿块患者进行回顾性分析，超声引导下细针抽吸穿刺，同时采用液基细胞学制片和普通制片两种制片和染色方法。由 2 名有经验的诊断医师同时对涂片进行诊断。分别评价液基制片和普通制片的制片效果和诊断结果。阳性病例进行病理追踪。
结果 液基细胞学制片和普通制片的效果分别从细胞数量、背景、密度、体积、核清楚程度及排列方式等方面评价，前者背景干净，细胞核结构清晰，可见核沟，核内包涵体。细胞排列和层次由于离心后受到破坏，单层平铺，成小团分布，少见乳头状排列。普通涂片背景血细胞干扰严重，胶质较多，细胞核结构欠清晰，可见核内包涵体，偶见核沟。细胞排列和层次保持完好，可见乳头团及平铺排列形式。液基细胞学涂片（例）检出率：34.8%；普通涂片（例）检出率：26.9%；两者联合（例）检出率：38.0%。两者联合与普通涂片比较（$P<0.05$）有统计学意义。两者联合与液基细胞学比较($P>0.05$)无统计学意义。阳性符合率两者联合与普通涂片之间有显著性差异（$P<0.05$）。两者联合与液基细胞学涂片之间无显著性差异。（$P>0.05$）。
结论 两种制片方法各有优缺点，两者联合应用可以互补优缺点，明显提高检出率及病理符合率，但由于针吸细胞学取材时受结节大小、位置因素等影响较大，故在临床诊断中，还应结合彩超及血清学结果综合考虑，避免出现假阳性及假阴性病例，做出最有利于患者诊治方案。

PO-1373

高荧光细胞和血清腹水白蛋白梯度在恶性腹水诊断中的价值

孙静芳、刘云、蒋清清、宋爽、李世宝、马萍、丁爽
徐州医科大学附属医院

目的 探讨高荧光细胞（HFC）和血清腹水白蛋白梯度（SAAG）在恶性腹水诊断中的应用价值。

方法 回顾性研究 2018 年 1 月至 2020 年 4 月收治的 202 例腹水患者，依据脱落细胞学检查结果分为恶性腹水（36 例）和良性腹水（166 例），分析 HF 和 SAAG 在良、恶性腹水中的分布差异，并计算单项及联合检测的敏感性、特异性和准确性。
结果 恶性腹水组 HF#和 HF%水平均显著高于良性组，SAAG 水平显著低于良性组。HF#、HF%和 SAAG 的曲线下面积分别为 0.797、0.704、0.770，单项指标分析时，HF#和 SAAG 的敏感性、特异性、准确度分别为 83.33、66.87、69.8 vs. 88.89、62.05、66.8，HF#和 SAAG 串联时敏感性、特异性、准确度分别为 77.78、80.12、79.7，HF#和 SAAG 并联时敏感性、特异性、准确度分别为 94.44、48.80、56.9。
结论 HF and SAAG 联合应用后虽灵敏度有所下降，但特异度和准确度均明显升高，更有利于恶性腹水的诊断。

PO-1374

活化部分凝血酶活时间纠正实验结果判读方法评价

刘超男、周静
四川大学华西医院

背景 活化部分凝血酶活时间(APTT)延长是凝血常规检测中最常见的异常结果之一，可能是由于因子缺乏，存在因子抑制剂或抗磷脂抗体(APL)导致。APTT 纠正实验可帮助快速筛选延长原因，明确诊疗方向。但是目前纠正实验结果判读的标准众多，如何解释纠正实验的结果是急需解决的问题。
目的 比较目前常用的判读纠正实验结果方法的实验室诊断效能，并探索一个最佳的标准更快、更准确的区分 APTT 延长的原因。
方法 纳入 2018 年 1 月 1 日至 2019 年 12 月 31 日在我院就诊的单独 APTT 延长的患者。所有样品均进行 1：1 混合比例的纠正实验，134 个样品加做了患者血浆和正常血浆 4：1 混合的纠正实验。评估现有 APTT 纠正实验判读标准的诊断效能和最佳分界值，并探讨何时以及如何将 1:1 和 4:1 混合实验有机结合。
结果 研究共纳入 251 例样本，其中因子缺乏 116 例，FVIII 抑制剂 75 例，APL60 例。Rosner 指数小于 11%，或孵育后延长时间小于 3s 是现有标准中区分因子缺陷和抑制剂、时间依赖性和非时间依赖性抑制剂的最佳方法，但是各个实验室设定自己的评价标准可获得更好的诊断效能。当 Rosner 指数在 5.0% ~ 9.1%之间时加做 4：1 混合的纠正实验，其余样本仅进行 1：1 纠正实验，结合 Rosner 指数和孵育后延长时间百分比可获得最佳的诊断效能。
结论 APTT 纠正实验对因子缺乏和抑制剂，甚至是时间和非时间依赖性抑制物都具有良好的诊断效能。与仅进行 1:1 混合相比，将 1:1 和 4:1 混合相结合，可以提高诊断效率。

PO-1375

Comprehensive application of nanopore direct RNA sequencing and short reads sequencing to evaluate nonsense-mediated RNA decay activity in prostate cancer patients

Ying Li
Beijing Hospital

Objective Nonsense-mediated mRNA decay (NMD) is a critical post-translational mechanism to guard cells against potential poisonous proteins. NMD plays an essential role in pathology and physiology. Inhibit NMD by small molecules can produce an abundance of truncated proteins that

can be prospective neoantigens. Therefore, therapies target NMD has the potential to be an adjuvant treatment of some cancers. However, methods to measure NMD activity in patients are rare. This study detects NMD activity and analyzes transcripts feature both at short reads sequencing and nanopore direct RNA sequencing. We chose several transcripts as potential candidates to reflect NMD activity by qPCR, further applied them to three cell lines and newly diagnosed prostate cancer patients.
Methods Native RNA sequencing was performed using Direct RNA Sequencing Kit (SQK-RNA002). The GridON Flow Cell (R9.4 chemistry) was run for 48hours on MinKNOW software. Guppy was used to base-calling and FLAIR software for further analysis. For short reads sequencing, the libraries were sequenced on an Illumina platform and 150 bp paired-end reads were generated. Data were analyzed use STAR, HTseq, StingTie, and DAVID. We chose several high-expression transcripts based on the relative transcriptional level as NMD indicators. qPCR validation was conducted use SYBR-green in BioRad5 system. Patients were enrolled at Beijing Hospital, prostate cancer and paracancerous tissues of patients were collected and stored in RNA-Later. Total RNA of tissue was isolated by TRIzol(Invitrogen) for further experiment.
Results We conducted parallel sequencing of DMSO and NMD inhibitor SMG1i both in short reads sequencing and Nanopore direct RNA sequencing. We found that NMD inhibition can significantly increase transcriptional isoforms and alternative splicing events. Approximately 40% of transcripts detected by Nanopore were unannotated. These NMD indicators we chose showed excellent performance in HEK293T, U2OS, and 22Rv1 cell lines under NMD inhibition. In clinical patients, NMD activity fluctuates widely among individuals.
Conclusions Combined with nanopore sequencing and short reads sequencing can reflect NMD activity and its' features. We have shown the ability and reliability of NMD indicators both in cell lines and clinical patients. These results provided a good foundation for future studies on the NMD activity measurement and NMD inhibition treatment for cancers.

PO-1376

A PCR-based detection and analysis system for personalized medicine in cardiovascular diseases

Zhaohui Liu[1]、Kai Cui[2]、Juan Zhao[2]、Kun Zhao[2]、Zhou Zhou[2]
1. Fuwai Yunnan Cardiovascular Hospital
2. 中国医学科学院阜外医院

Background Cardiovascular Diseases (CVDs) are the leading cause of death globally. According to the WHO reports, about 18 million people die from CVDs each year, accounting for about 1/3 of the total deaths in the world, and the prevalence and mortality of CVDs is continuously rising. Many factors contribute to this high prevalence of CVDs, such as hypertension, atherosclerosis, coronary heart disease, and stroke. Some commercialized drugs including β1-adrenergic receptors, statins, ACE Ⅰ, clopidogrel, warfarin, diuretics, and antiarrhythmics have been used commonly. However, the single nucleotide polymorphisms (SNPs) of key genes indrug metabolism is associated with the therapeutic responses and adverse reactions which shown the variation between different individuls. Commercially available genetic tests are mainly based on sequencing or real-time PCR platforms which only target a certain drug or a certain class of drugs. Guiding the selection and combination of drugs usually needs to test multiply, spending more time and increasing the financial burden for the patients.
OBJECTIVE In order to simultaneously test the related genes of multiple drugs, we established a geneticdetection method for 11 kinds of common cardiovascular drugs (clopidogrel, warfarin, statins, beta-receptor blockers, calcium antagonists, diuretics, ACE inhibitors, angiotensin II receptor antagonists, nitroglycerin, antiarrhythmic drugs and folic acid) in only one reaction. This method enables the direct amplification with blood sample and testing the SNPs,

eliminating the step of DNA extraction and simplifying the operation process. And we also developed an analysis software to assist in the interpretation of data.
Methods According to the Guidelines for Gene Detection of Drug Metabolizing Enzymes and Drug Targets by NHFPC as well as documents and guidelines by FDA and CPIC, DPWG and other authoritative organizations, we selected 25 SNPs related to the above 11 drugs. Based on allele-specific PCR (AS-PCR) and multiplex quantitative fluorescent PCR, the 25 SNPs can be amplified and detected in one tube with a capillary electrophoresis system.
RESULTS With this system, we tested 1500 clinical samples, detected the genotype of each gene we interested and analyzed the statistical data. Verified by Sanger sequencing, all the genes were accurately detected and the detection rate reached 99%, with the coincidence rate reached 100%. Except for the CYP2D6*10 100C>T site, the distribution of each genotype fit well with Hardy Weinberg Equilibrium and consistent with the frequency reported previously.
Conclusion In this research, we established a multiple SNPs detection system based on ThermoFisher genetic analysis CE platform. We detected 25 gene loci related to 11 common cardiovascular drugs with only one tube reaction, and the results shown high accuracy and reliability. With direct amplification of blood and automatic interpretation by software, this system can simplify the operation process, lower the risk of introducing experimental errors, reduce the cost of multiple gene testing. We expect that this system can be used to effectively guide the usage of drugs for morecardiovascular diseases and other kinds of diseases.

PO-1377

A predictive proteomic signature for he response to 5-FU based neoadjuvant chemoradiotherapy in Locally Advanced rectal cancer patients

Jianan Wang[1,2]、Chengbin Wang[1]
1. Department of Clinical Laboratory Medicine, The General Hospital of People's Liberation Army
2. 解放军医学院

Background Colorectal cancer is the third most common and the fourth most lethal cancer in the world. In the majority of cases, patients are diagnosed at an advanced stage or even metastatic, thus explaining the high mortality. The standard treatment for patients with locally advanced rectal cancer (LARC) is neoadjuvant chemoradiotherapy (nCRT) with 5-fuorouracil (5-FU) followed by surgery. Most patients with LARC present incomplete pathological response to nCRT, the resistance rate remains high with approximately 30% of non-responders. Despite the efforts to predict treatment response using tumor-molecular features, as differentially expressed genes, no molecule has proved to be a strong biomarker. The tumor proteomic analysis is a promising strategy for biomarkers identification, which can be used to identify a predictive model to forecast treatment response outcomes and figured out response relevant proteins in nCRT.
Methods We performed LC-MS/MS-based proteomic analysis to select potentially proteins and then used in silico approach to further validate the differential proteins screened out from our training cohort . 42 patients diagnosed with LARC and treated with 5-FU based nCRT between 2010-2018 at Chinese PLA General Hospital were enrolled in the study. All of these cases had available paired pre-treatment formalin-fixed paraffin-embedded (FFPE) biopsies and post-CRT FFPE surgical specimens from the same patients and histologically confirmed adenocarcinoma. According to Tumor Regression Grade (TRG), patients were divided into three treatment response groups: poor-responders (PR, AJCC TRG2+3), moderate responders (MR, AJCC TRG1) and total responders (TR, AJCC TRG0), and to compare the proteomes of these diferent groups. From 42 paired FFPE biopsies and surgical specimens, we extracted and analysed the tumor proteome of these patients.
Results Comparing TR and PR group, we have identified 91 differentially abundant proteins between biopsies, 165 between surgical specimens of two groups. Next, comparing biopsies and

surgical specimens of each group through paired t-test, we screened out 1467 and 771 proteins changed after nCRT in TR and PR group, respectively. 848 proteins with different change directions(from biopsies to surgical specimens) in TR and PR group were defined as response relevant proteins which might provide some indications to explain different response in TR and PR group. Then, 129 proteins were figured out in intersections between differentially expressed proteins and response relevant proteins, which might play a role in tumor resistant to nCRT and predict the patient response to the therapy. Among these proteins, we have identifed 43 genes expressed significantly different in rectal cancer tissue and normal tissue using GEPIA2 database(mainly involved in TFIID-class transcription factor complex binding, snoRNA binding, ATPase binding, RNA polymerase II transcription factor binding, etc), and there were 11 genes related to the overall survival of rectal cancer patients(favorable:SF3B6, NUP153, ARGLU1, GNL3, MTHFD1L, PTCD3, SLC27A2; unfavorable:SPTB, TMOD1, CD63, S100A13). , A set of 16 proteins(over-expressed in PR group: PLEKHA6, CHMP4B, VWA1, LMNA; over-expressed in TR group: PTPN6, SF3B3, HDAC2, NDUFA5, PHGDH, TIMM44, AHSA1, GNL3, POLR2A, MTHFD1L, PTP4A1, NUP35) was independently validated in a gene expression dataset for chemoradiosensitivity of colorectal cancer cells from GSE20298 to be related to nCRT resistance, enrichment analysis found that these 16 proteins were related to nuclear envelope reassembly, nucleus organization, processing of capped intron-containing pre-mRNA and generation of precursor metabolites and energy.

Conclusions From this retrospective study, protein differences between different response groups to nCRT in LARC patients were highlighted using FFPE proteomic analysis, they might be the novel biomarkers for diagnosis and guiding therapeutic strategies of rectal cancer. These results will pave the way for a larger cohort for better sensitivity and specificity of the signature to guide decisions in the choice of treatment.Furthermore, the findings will provide an insight about the proteins and molecular pathways involved in the response to treatment of LARC patients.

PO-1378

Epstein Barr virus encoded microRNA BART22 drives malignant transformation and predicts poor prognosis in patients with nasopharyngeal carcinoma

Ting Zhang[1]、Zui Chen[1]、Kaixiong Xu[1]、Xiaoqiong Gu[2]、Banglao Xu[1]
1. Guangzhou First People's Hospital
2. 广州市妇女儿童医疗中心

Purpose This study aims to clarify whether Epstein Barr virus encoded microRNA BART22（EBV-miR-BART22） was involved in the formation and metastasis of epithelial-mesenchymal transition (EMT) in nasopharyngeal carcinoma (NPC) cells，and explicate the signaling pathways and target gene by which EBV-miR-BART22 promotes EMT and metastasis in NPC cells, which provide clues for finding new effective intervention target as well as prognostic marker for nasopharyngeal carcinoma metastasis.

Methods The sequencing data of nasopharyngeal carcinoma tissues versus normal control tissues in the GEO database were analyzed to determine the target microRNAs. The expression of EBV-miR-BART22 in NPC tissues microarray and the relationship with patients prognosis were detected by the in situ hybridization(ISH) staining. After overexpression of EBV-miR-BART22 in EBV negative CNE-1, CNE-2, and SUNE-1 cell lines, or knockdown of EBV-miR-BART22 expression in EBV positive C666-1 cell line respectively, the detection of cell migration, invasion, and EMT related protein expression changes were performed. The effects of overexpression / knockdown of EBV-miR-BART22 on NPC cell metastasis were observed by in vivo animal experiments. Potential signaling pathways and target genes were selected by RNA sequencing and bioinformatic analysis. Plasmids or siRNAs were respectively used to overexpress or

interfere the β-Catenin or MOSPD2 expression in cell lines with lentiviral infection, and the changes in cell migration / invasion function and EMT indicators were observed.
Results Multiple GEO datasets showed that EBV-miR-BART22 expression was significantly higher and most variable in NPC tissues compared with normal tissues. The ISH results indicated that high expression of EBV-miR-BART22 was positively correlated with nasopharyngeal carcinoma distant metastasis, TNM stage as well as poor prognosis of patients, and EBV-miR-BART22 was an independent risk factor for poor prognosis of nasopharyngeal carcinoma patients. Overexpression of EBV-miR-BART22 could promote NPC cells migration and invasion, and downregulate EMT epithelial marker E-cadherin, upregulate mesenchymal markers N-cadherin and vimentin. EBV-miR-BART22 could promote nasopharyngeal carcinoma cells metastasis in nude mice in vivo. RNA sequencing, bioinformatic analysis, as well as in vitro cellular assays confirmed that EBV-miR-BART22 could directly target MOSPD2 and activate Wnt/β-Catenin pathway, thereby promoting EMT and metastasis of nasopharyngeal carcinoma cells.
Conclusions EBV-miR-BART22 activates Wnt/β-catenin pathway by targeting MOSPD2 to promote EMT and metastasis of NPC cells. EBV-miR-BART22 could serve as a potential biomarker for diagnosis and prognosis evaluation in nasopharyngeal carcinoma.

PO-1379

Potent RBD-specific neutralizing rabbit monoclonal antibodies recognize emerging SARS-CoV-2 variants elicited by DNA prime-protein boost vaccination

Yuxin Chen
Nanjing Drum Tower Hospital

Global concerns arose as the emerged and rapidly spreading SARS-CoV-2 variants might escape host immunity induced by vaccination. In this study, a heterologous prime-boost immunization strategy for COVID-19 was designed to prime with a DNA vaccine encoding wild type (WT) spike protein receptor-binding domain (RBD) followed by S1 protein-based vaccine in rabbits. Four vaccine-elicited rabbit monoclonal antibodies (RmAbs), including 1H1, 9H1, 7G5, and 5E1, were isolated for biophysical property, neutralization potency and sequence analysis. All RmAbs recognize RBD or S1 protein with KD in the low nM or sub nM range. 1H1 and 9H1, but neither 7G5 nor 5E1, can bind to all RBD protein variants derived from B.1.351. All four RmAbs were able to neutralize wild type (WT) SARS-CoV-2 strain in pseudovirus assay, and 1H1 and 9H1 could neutralize the SARS-CoV-2 WT authentic virus with IC50 values of 0.136 μg/mL and 0.026 μg/mL, respectively. Notably, 1H1 was able to neutralize all 6 emerging SARS-CoV-2 variants tested including D614G, B.1.1.7, B.1.429, P.1, B.1.526, and B.1.351 variants, and 5E1 could neutralize against the above 5 variants except P.1. Epitope binning analysis revealed that 9H1, 5E1 and 1H1 recognized distinct epitopes, while 9H1 and 7G5 may have overlapping but not identical epitope. In conclusion, DNA priming protein boost vaccination was an effective strategy to induce RmAbs with potent neutralization capability against not only SARS-CoV-2 WT strain but also emergent variants, which may provide a new avenue for effective therapeutics and point-of-care diagnostic measures.

PO-1380

3044 cases reveal important prognosis signatures of COVID-19 patients

Yang Yang、Xinyi Xia
Institute of Laboratory Medicine, Jinling Hospital, Nanjing University School of Medicine

Objective Critical patients and intensive care unit (ICU) patients are the main population of COVID-19 deaths. Therefore, establishing a reliable method is necessary for COVID-19 patients to determine the primary prognostic factors and distinguish patients who may have critical symptoms from other patients.

Methods Clinical characteristics, treatment efficacy,clinical outcome, demographics, basic diseases and laboratory test results of 3044 patients with COVID-19 in Wuhan Huoshenshan Hospitalwere analyzed. Then, logistic regression was used to explore the influence of various laboratory indicators on clinical critical illness and death, and random forest machine learning algorithm was used to find and verify the most importantlaboratory indicators leading to critical illness and death outcomes.

Results The study shows thatthe susceptible population was mainly between 61-70 years old (n=932, 30.62%). The elderly patients had poor clinical status and high mortality rate (P<0.0001).Logistic regression results after age and sex adjustment showed that hypertension (OR=1.4825, P =0.0141), diabetes (OR=1.5573, P =0.016) and tumor (OR=2.3150, P =0.0223) were the main risk factors. Next, 54 laboratory indicators were evaluated of the influence on critical illness and death, and the eight most important prognostic indicators (neutrophil percentage, procalcitonin, neutrophil absolute value, C-reactive protein, albumin, interleukin-6, lymphocyte absolute value and myoglobin) were identified by using the random forest algorithm, which present significantly distinct within differently clinical severities.Together with age and sex, these eightindicators can be used to construct a prognostic model that can accurately predictdisease severity and clinical outcome of the patients. The clinical reliability of the model was verified by 491 sample training sets, and the receiver operating characteristic curve (ROC) showed that the model had a good AUC of 0.875(95% CI：0.821-0.93), and also verified in a separate cohort of 170 patients with an AUC of 0.897 (95% CI: 0.78-1.00). Finally, by combining public lung single cells and bulk transcriptome data to analyze 15 cell populations from 8 normal lungs,we find that TMPRSS2 and FURIN genes promoting the binding of SARS-CoV-2 and ACE2 are mainly expressed in AT2 cells.The expression level and proportion of ACE2, TMPRSS2 and FERIN in males and the elderly were higher than those in females and the young, this may partly explain why older and male patients are more likely to develop critical illness and death.

Conclusion The eight most important prognostic indicators were neutrophil percentage, procalcitonin, neutrophil absolute value, C-reactive protein, albumin, interleukin-6, lymphocyte absolute value and myoglobin.Theprognosticmodel including these eight indicators, as well as sex and age was built to predict the outcome of disease progression and death of COVID-19patients, which has important clinical practical significance for the management and prediction of COVID-19patients.

(This paper has been published in Comput Struct Biotechnol J, IF=6.018）

PO-1381

Bronchoalveolar Lavage Fluid Glycopatterns as Novel Potential Biomarkers for Early Diagnosis of Lung Cancer

Lina Liu[1,2]、Dan Li[2]、Jian Shu[3]、Li Wang[2]、Fan Zhang[3]、Chen Zhang[3]、Hanjie Yu[3]、Mingwei Chen[2]、Zheng Li[3]、Xuan Guo[2]
1. Xi'an No. 4 Hospital
2. 西安交通大学第一附属医院
3. 西北大学

Objectives Lung cancer (LC) is a prevalent and life-threatening neoplasia worldwide. Although aberrant glycosylation has been observed in human serum and tissue, little is known about the alterations in bronchoalveolar lavage fluid (BALF) that are associated with LC. Our aim was to systematically investigate and assess the alterations of protein glycopatterns in BALF and possibility as biomarkers for diagnosis of LC.
Methods In this study, lectin microarrays were utilized to detect and compare the differential expression of BALF glycoproteins from patients with 80 adenocarcinomas (ADC), 77 squamous cell carcinomas (SCC), 51 small cell lung cancer (SCLC), and 73 benign pulmonary diseases (BPD). Then, lectin blotting analysis was performed to verify the results of lectin microarrays. These 281 BALF specimens were then randomly divided into test group and validation group. First, five diagnostic models (Model LC, ModelADC, Model SCC, Model SCLC, and Model LC-ES (early stage of lung cancer)) were constructed to identify benign and malignant lung diseases, ADC, SCC, SCLC and LC-ES by binary stepwise logistic regression based on the lectin microarrays data from 163 BALF samples in the test group. Subsequently, the diagnostic models constructed in the test group were then applied to a validation group to assess the discriminatory efficiencies through ROC analysis. Moreover, an independent test was performed with 120 newly collected BALF samples enrolled in the double-blind cohort to further assess the clinical application potential of the diagnostic models.
Results According to the results, there were 15 (e.g., PHA-E, EEL, and BPL) and 14 lectins (e.g., PTL-II, LCA, and SJA) that individually showed significant variations in different types and stages of lung cancer compared to BPD. Notably, the diagnostic models achieved better discriminate power (Model LC (AUC: 0.61, sensitivity: 0.918 and specificity: 0.939), Model LC-ES (AUC: 0.856, sensitivity: 0.829 and specificity: 0.810), Model ADC (AUC: 0.619, sensitivity: 0.706 and specificity: 0.586), Model SCC (AUC: 0.693, sensitivity: 0.800 and specificity: 0.667), Model SCLC (AUC: 0.718, sensitivity: 0.721 and specificity: 0.684)) in the validation cohort and exhibited high accuracies of 0.917, 0.864, 0.712, 0.671 and 0.781 in the double-blind cohort for the diagnosis of LC, LC-ES, ADC, SCC, and SCLC, respectively.
Conclusions Taken together, the present study revealed that the abnormally altered protein glycopatterns in BALF are expected to be novel potential biomarkers for the identification and early diagnosis of lung cancer, which will contribute to explain the mechanism of the development of lung cancer from the perspective of glycobiology.

PO-1382

Ability of a machine learning algorithm to predict the need for perioperative red blood cells transfusion in pelvic fracture patients: A multicenter cohort study in China

Xueyuan Huang、Xinming Nie、Rong Gui
The Third Xiangya Hospital, Central South University

Background Predicting the perioperative requirement for perioperative red blood cells (RBCs) transfusion in patients with the pelvic fracture may be challenging. In this study, we constructed a

perioperative RBCs transfusion predictive model (ternary classifications) based on a machine learning algorithm.

Materials and Methods This study included perioperative adult patients with pelvic trauma hospitalized across six Chinese centers between September 2012 and June 2019. An extreme gradient boosting (XGBoost) algorithm was used to predict the need for perioperative RBCs transfusion, with data being split into training test (80%), which was subjected to 5-fold cross-validation, and test set (20%). The ability of the predictive transfusion model was compared with blood preparation based on surgeons' experience and other predictive models, including random forest, gradient boosting decision tree, K-nearest neighbor, logistic regression, and Gaussian naïve Bayes classifier models. Data of 33 patients from one of the hospitals were prospectively collected for model validation.

Results Among 510 patients, 192 (37.65%) have not received any perioperative RBCs transfusion, 127 (24.90%) received less-transfusion (RBCs <4U), and 191 (37.45%) received more-transfusion (RBCs ≥4U). Machine learning-based transfusion predictive model produced the best performance with the accuracy of 83.33%, and Kappa coefficient of 0.7967 compared with other methods (blood preparation based on surgeons' experience with the accuracy of 65.94%, and Kappa coefficient of 0.5704; the random forest method with an accuracy of 82.35%, and Kappa coefficient of 0.7858; the gradient boosting decision tree with an accuracy of 79.41%, and Kappa coefficient of 0.7742; the K-nearest neighbor with an accuracy of 53.92%, and Kappa coefficient of 0.3341). In the prospective dataset, it also had a food performance with accuracy 81.82%.

Conclusion This multicenter retrospective cohort study described the construction of an accurate model that could predict perioperative RBCs transfusion in patients with pelvic fractures.

PO-1383

Long non-coding RNA LINC02474 affects metastasis and apoptosis of colorectal cancer by inhibiting the expression of GZMB

Tiantian Du
The Second Hospital of Shandong University

Background Colorectal cancer (CRC) is one of the most frequently diagnosed malignancies. Metastasis is the main event that impedes the therapeutic effect on CRC, and its underlying mechanisms remain largely unclear. LINC02474 is a novel long noncoding RNA (lncRNA) associated with cancer metastasis, while little is known about how LINC02474 regulates these malignant characteristics.

Methods LINC02474 and GZMB expressions were assessed by quantitative real-time polymerase chain reaction (qRT-PCR) or Western blotting analysis. Cell metastasis was detected by transwell assay and metastatic nude mouse model, and apoptosis was determined by Western blotting analysis and flow cytometry. Besides, the interaction between LINC02474 and GZMB was detected by dual-luciferase reporter assays.

Results The expression of LINC02474 was significantly up-regulated in CRC tissues. Moreover, depletion of LINC02474 damaged the metastatic abilities of CRC cells while boosting apoptosis. Besides, up-regulation of LINC02474 could promote migration and invasion, while apoptosis was inhibited in CRC cells. Besides, down-regulation of LINC02474 promoted the expression of GZMB, and interference of GZMB could increase the metastatic abilities of CRC cells while reducing apoptosis. Furthermore, LINC02474 was related to the transcriptional repression of GZMB in CRC cells determined by the dual-luciferase reporter assay.

Conclusions The findings revealed that a novel lncRNA, LINC02474, as an oncogene, could promote metastasis but limit apoptosis partly by impeding GZMB expression in CRC. Besides, LINC02474 had the potential to be used as a biomarker in the prognosis of CRC.

PO-1384

Clinical prognostic value and contribution of m6A RNA methylation regulators and tumor microenvironment cell-infiltration characterization in Gastroesophageal Adenocarcinomas

duanrui liu
Jinan Central Hospital affiliated to Shandong University

Objective Gastroesophageal adenocarcinomas (GEA) is still a major cause of cancer-related mortality worldwide. Currently, development of effective targeted therapeutics for GEA patients lags behind other cancers. Tumor microenvironment (TME) is the complex cellular milieu consisting of immune cells, mesenchymal cells, endothelial cells, inflammatory mediators and extracellular matrix molecules adaptively or innately, which remarkable influence the immunotherapy. RNA N6-methyladenosine (m6A) modification plays nonnegligible role in shaping individual TME characterizations. However, potential roles of m6A modification in TME cell infiltration remain unknown in gastroesophageal adenocarcinomas (GEA).
Methods We examined the TME of GEA using assessments of the RNA-sequencing data focusing on the distinct m6A modification patterns from the public databases. Intrinsic patterns of m6A modification were evaluated for associations with clinicopathological characteristics, underlying biological pathways, tumor immune cell infiltration, oncological outcomes and treatment responses. We generated a single-cell transcriptome atlas of the GEA sample to validate the role of the m6A modification pattern on TME.
Results Most of 21 m6A RNA methylation regulators are higher expressed in GEA patients. The proportion of immune cells in GEA tumor tissues was significantly different from that in normal tissues. Therefore, changes in tumor-infiltrating immune cells (TIICs) proportions might be intrinsic to individual differences. Then, we identified two distinct m6A modification patterns of GEA (cluster1 and 2 subgroup) by applying consensus clustering to 21 m6A RNA methylation regulators, and correlated two subgroups with TME cell-infiltrating characteristics. Compared with the cluster1 subgroup, the cluster2 subgroup correlates with a poorer prognosis, and most of 21 m6A RNA methylation regulators are higher expressed in cluster2. Meanwhile, apart from Macrophages M0, the relative levels of three immune cell types (T cells CD8, Monocytes, Mast cells resting) in cluster 1 were higher than the cluster 2. Cox regression and Lasso regression were employed to identify three prognostic m6A methylation regulators (KIAA1429, HNRNPA2B1 and FMR1) and establish the risk signature. The risk signature was not only an independent prognostic marker for GEA patients but also a predictor of clinicopathological variables. GSEA analysis showed multiple signaling differences between high and low risk score group. Furthermore, through WGCNA analysis, COL4A1 and COL5A2 in the brown module were significantly correlated to the prognosis, PD-1/L1 and CTLA-4 expression of GEA patients. Interesting, low COL5A2 expression was linked to an enhanced response to anti-PD-1 immunotherapy. Finally, the single-cell transcriptome atlas of GEA samples validated the role of m6A modification pattern on TME and revealed that three m6A regulators are highly expressed in CD4+ T cells, CD8+ T cells, Treg cells and Macrophages.
Conclusions Our work revealed m6A RNA methylation regulators are a type of vital participant in the malignant progression and TME diversity of GEA. m6A modification patterns of COL5A2 may be the potential biomarker contributes to predicting the response to anti-PD-1 immunotherapy.

PO-1385

Dynamic serum biomarkers to predict the efficacy of PD-1 in patients with nasopharyngeal carcinoma

ao zhang、runkun han、luocan wang、rongzeng cai、shulin chen、peng sun、hao chen
Sun Yat-sen University Cancer Center

Background There is a lack of effective treatments for recurrent or metastatic nasopharyngeal carcinoma (RM-NPC) while the response rate of Programmed death 1 (PD-1) in NPC is about 20% to 30%. We aim to explore reliable and minimally invasive prognostic indicators for predicting the efficacy of PD-1 inhibitors combined therapy in RM-NPC.
Methods Serum markers of 160 RM-NPC patients were measured before and 3 weeks after the first anti-PD1 treatment. The least absolute shrinkage and selection operator (LASSO) logistic regression was performed to select dynamic serum indicators and construct prediction model. Univariate, multivariate, nomogram and survival analyses were conducted to identify independent prognostic factors associated with 1-year progression-free survival (PFS).
Results Based on 2 markers screened by Lasso logistic regression, we constructed a risk score prediction model for 8-12 weeks anti-PD1 efficacy prediction with the AUC of 0.737 in training cohort and 0.723 in validation cohort. Risk score and metastasis were included into nomogram, and the Kaplan–Meier survival curves showed that high risk group had a shorter PFS than the low risk group. The concordance index (C-index) of the nomogram for PFS was higher than that of TNM stage in the training cohort and validation cohort.
Conclusion We proposed a strategy for monitoring dynamic changes of biochemistry markers and emphasized their importance as potential prognostic biomarkers for advanced NPC treated with ICBs. Our risk score prediction model based on dynamic change of LDH and AST / ALT has predictive and prognostic value for NPC patients treated with PD-1 inhibitors.

PO-1386

Circulating tumor DNA methylation in hepatocellular carcinoma diagnosis using digital droplet PCR

Juan Wang [1]、liu yang[1]、jiayun liu[1]、yanjun diao[1]、lianghong zheng[2]、kang zhang[3]、yueyun ma[4]、xiaoke hao[1]
1. Department of Clinical Laboratory Medicine, Xijing Hospital, Air Force Medical University
2. 广州优泽生物技术有限公司
3. 澳门科技大学医学院
4. 解放军空军总医院检验科

BACKGROUND In recent years, several protein biomarkers, gene mutations, and epigenetic modifications were analyzed for the molecular diagnosis of hepatocellular carcinoma(HCC). As a non-invasive liquid biopsy analyte, circulating cell-free DNA (cfDNA) gained tremendous attention to diagnosevarious cancers, including HCC. The analysis of aberrant DNA methylation incfDNA is also used to diagnose early carcinogenesis. This study aimed to evaluate the performance of a DNA methylation-based digital droplet PCR (ddPCR) assay and its application to detect HCC patients.
METHODS Blood samples were obtained from 97 HCC patients, 80 healthy subjects, and 46 chronic hepatitis patients. cfDNA was extracted, bisulfite converted, and DNA methylation quantified using a ddPCR platform.
RESULTS Wequantitated cfDNAamount variation in different physical conditions.The level of cfDNA amount in the HCC group was significantly higher than that in the healthy control group. Subsequently, we validated the dynamic changes in the peripheral DNA methylation ratio that corresponds to the HCC progression. The higher level of DNA methylation status and ctDNA amount were also detected in advanced (BCLC C) and late (BCLC D) stages in the current

results. Furthermore, we explored the diagnostic value of methylation patterns for HCC diagnosis. The differential methylation status between HCC, chronic hepatitis, and healthy individuals was investigated using a cutoff value of 15.70% for DNA markers combined with the AFP level and cfDNA amount, the sensitivity was estimated to be 78.57%, and the specificity was 89.38% with the diagnostic accuracy of 89.27%. These results showed high diagnostic accuracy (ACC) of 85.27%, while positive predictive value (PPV) and negative predictive value (NPV) were 81.91% and 87.20%, respectively. However,DNA methylation markers could not be directly used in HCC diagnosis. We confirmed the potential application of tissue-specific methylation markers,combined with AFP and cfDNA analysis in the investigation of susceptible HCC patients differentiated from the asymptomatic population.The current data showed the AUC of AFP for asymptomatic population screening was 0.786 and could be improved to 0.958 if combined with specific DNA methylation patterns and cfDNA amount.We proved that ctDNA methylation analysis is a reliable and robust method for the early diagnosis of HCC.
CONCLUSION A sensitive methylation-based assay that might serve as a liquid biopsy test for diagnosing HCC. By using DNA methylation pattern in ddPCR platform, wedemonstrated that its efficiently detects trace amounts of DNA methylation. This relatively inexpensive approach is generalizable and could be popularized in personalized medicine, which would potentially open the pathway for health management.

PO-1387

A DNA Methylation-Based Epigenetic Signature for the Identification of Lymph Node Metastasis in T1 Colorectal Cancer

Yinghui Zhao、Chuanxin Wang
The Second Hospital of Shandong University

Background The T1 colorectal cancers (T1 CRC) are characterized as an early-stage, invasive cancers, that have infiltrated the sub-mucosal epithelial layer within the colonic lumen. Considering its invasiveness and risk of lymph node metastasis (LNM), the current guidelines recommend endoscopic resection for T1 CRC that are LNM-negative, and radical surgical resection in only those that are at high risk of LNM-positive. With the implementation of population-based CRC screening programs, the diagnostic rates for T1 CRC has increased considerably. However, the clinicopathological criteria for risk-stratification of T1 CRC are imperfect, which leads to erroneous diagnosis of as much as 70-80% of patients as high-risk, resulting in unnecessary and excessive radical surgeries and post-surgical complications. Given the importance of aberrant methylation in CRC, we conducted a genomewide methylation profiling analyses to develop methylated DNA (mDNA) biomarkers for the identification of LNM in patients with T1 CRC.
Methods For the biomarker discovery phase, we performed Infinium Methylation EPIC BeadChip microarrays in a cohort of 39 T1 CRC patients (17 LNM-positive and 22 LNM-negative). Following rigorous bioinformatic analysis and prioritization of aberrantly methylated biomarkers, we performed quantitative pyrosequencing analysis in 235 specimens from independent cohorts of patients, which included 195 resected tissues (training cohort: n = 128, validation cohort: n = 67) and 40 pre-treatment biopsies.
Results Through a systematic analysis based on the methylation profiles in LNM-negative and positive T1 CRC patients, we identified and trained a 9-methylated CpG signature (cg08463024, cg15246085, cg02558364, cg05928186, cg00353923, cg19929126, cg27136241, cg00450784, cg14044640), by performing logistic regression analysis in the training cohort patients. This resulted in a robust area under the curve (AUC) value of 0.88 (95% CI. 0.777 - 0.942) for distinguishing T1 CRC with vs. without LNM, which was subsequently validated in another independent patient cohort (AUC= 0.90; 95% CI. 0.797 - 0.958). However, for an easier

translation in the clinic, these mDNA biomarkers remarkably well even in pre-treatment biopsies (AUC=0.81; 95% CI. 0.723 - 0.906). Furthermore, a combination diagnostic model that combined mDNA and conventional clinicopathological features, further improved its diagnostic potential for the identification of LNM in T1 CRC.
Conclusions We have established a novel epigenetic signature that can robustly identify LNM status, even in pre-operative settings, in patients with T1 CRC; highlighting its potential clinical implication in more prudent selection of high-risk patients that require radical surgeries and spare the others from its complications and expense.

PO-1388

A 3-min UPLC-MS/MS method for the simultaneous determination of plasma catecholamines and their metabolites: Method verification and diagnostic efficiency

Meiling Jian[1]、Honglang Huang[2]、Kecheng Li[2]、Liangmin Chuan[3]、Lin Li[4]、Li Jiang[5]
1. Department of Laboratory Medicine, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China.
2. School of Medicine, University of Electronic Science and Technology of China, Chengdu 610054, Sichuan, China
3. Department of Laboratory Medicine, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China.
4. Department of Laboratory Medicine, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China.
5. Department of Laboratory Medicine, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China.

Objective To verify a rapid and sensitive ultraperformance liquid chromatography-tandem mass spectrometry (UPLC-MS/MS) method for the quantification of catecholamines and their metabolites, and to validate its efficiency for the diagnosis of phaeochromocytomas and paragangliomas (PPGLs).
Methods Plasma samples were pretreated with solid-phase extraction, followed by a 3-min UPLC-MS/MS analysis to quantify epinephrine (E), norepinephrine (NE), dopamine (DA), metanephrine (MN), normetanephrine (NMN) and 3-methoxytyramine (3-MT), simultaneously. The UPLC-MS/MS method was comprehensively verified and its diagnostic efficiency on PPGLs was tested using 7 PPGLs and 408 non-PPGLs patient plasma samples.
Results Using the developed method, the limit of detections (LODs) of the 6 analytes ranged from 0.0002 nmol/L (MN) to 0.0250 nmol/L (NE), while the lower limit of measuring intervals (LLMIs) ranged from 0.05 nmol/L (E, MN and NMN) to 0.10 nmol/L (NE and DA). The reportable ranges were 0.05-30.00 nmol/L for E, MN and NMN, 0.10-30.00 nmol/L for NE and DA, 1.00-300.00 pg/mL for 3-MT. No significant matrix effect was detected after correcting using internal standard. Besides, intra-day and inter-day precision were also within acceptance criteria with coefficient of variations (CVs) ≤15% and recoveries ranged from 95% to 115% for all the 6 analytes. The carryover effect was lower than 10%. Its diagnostic efficiency for PPGLs was significantly increased, the areas under the receiver operating characteristic (ROC) curves were increased from 68.7%-89.1% (using E, NE and DA) to 75.2%-99.9% (using MN, NMN and 3-MT).
Conclusion This study verified a rapid UPLC-MS/MS method for the determination of catecholamines and their metabolites in human plasma. It showed high diagnostic efficiency and will serve as an important tool to avoid the risk for missing patients with PPGLs.

PO-1389

Genetic diagnostic spectrum and exome-multigenic background study of childhood epilepsy

Ruen Yao、Jian Wang
Shanghai Children's Medicanl Center

Childhood epilepsy is a common but extremely heterogeneous neurological condition with a high incidence worldwide. Genetic diagnosis of childhood epilepsy patient provide the most accurate pathogenesis evidence, but still large proportion of highly suspected patients are undiagnosed. Multigenic factors in genetic background contribute to childhood epilepsy should be evaluated. In this study, exome-level sequencing was used to depict the mutation spectrum of childhood epilepsy cohort. Furthermore, variants information from sequencing data were analyzed besides monogenic diagnosis purpose to elucidate the possible multigenic factor related with epilepsy pathogenesis. Exome-sequencing reached a diagnostic rate of 30.6% and identified six genes not currently listed in epilepsy associated gene list. Multigenic study reveal that three-fold possibility of deleterious missense mutation occurrence in ion-channel and synaptic genes in those undiagnosed cohort may contribute to polygenic risk of childhood epilepsy.

PO-1390

The novel cytokine CSBF/C10orf99 plays a protective role in psoriasis

Xiulan Yang[1,2]、xixi Li[2]、wenling Han[2]
1. the affiliated hospital of guizhou medical university
2. 北京大学医学部

Cytokines are small secreted proteins usually produced upon activation of several types of cells. They are important molecules that regulate the function of the immune system. CSBF/C10orf99 is a novel cytokine identified by our group through Immunomics screening platform. It is highly expressed in the lesional skin of psoriasis patients and IMQ-induced psoriasis model. We have verified that CSBF/C10orf99 interacted with SUSD2 to inhibit colon cancer cell growth. Several studies show that CSBF/C10orf99 is upregulated in the lesion skin of psoriasis. Psoriasis, affecting approximately 2% of the global population, is a chronic autoimmune skin disease. It often occurs in the skin tissues of the back, abdomen, joints, etc. Psoriasis is characterized by epidermal hyperplasia, increased angiogenesis, and dermal infiltration of inflammatory cells including neutrophils and T cells. Psoriasis is an autoimmune disease caused by multiple genes, and its etiology and pathogenesis remain unclear. We also found that CSBF/C10orf99 was dramatically upregulated in human and mouse psoriatic tissues and it was mainly expressed in the epidermis of lesional skin. IL-17A and mCSBF/C10orf99 can significantly increased the expression of *Csbf/C10orf99* in primary keratinocytes. Administration of mCSBF/C10orf99 by intraperitoneal injection can significantly ameliorate IMQ-induced psoriasiform skin with milder redness and scaling, reduced cell infiltration especially neutrophils and γδ T cells. To know its physiological function, we prepared *Csbf/C10orf99* knockout mice and found that *Csbf/C10orf99* deficiency had no obvious influence on the development of main organs and immune cells. The redness and scaling induced by IMQ is increased in *Csbf/C10orf99*$^{-/-}$ mice, with more cell infiltration including neutrophils and γδ T cells. Bone marrow transfer assay indicates that CSBF regulates psoriasis largely through targeting non-hematopoietic cells, most likely keratinocytes. Our results suggest that the novel potential cytokine CSBF/C10orf99 is increased in psoriasis, keratinocytes is the major source of CSBF/C10orf99, CSBF/C10orf99 can ameliorate the IMQ-induced psoriasiform skin inflammation.

Multiple cytokines, including IL-17A, IL-23, TNF-α, have been observed to increase in lesional skin in IMQ-induced psoriasis-like mice. To examine which factor induces keratinocytes to express CSBF/C10orf99, we stimulated primary murine keratinocytes with a panel of cytokines that are involved in the pathogenesis of psoriasis. Cytokines such as IL-17A, IL-23, TNF-α significantly increased the expression of *Csbf/C10orf99*. IL-17A also upregulated the expression of *CSBF/C10orf99* in HaCaT cells.

In conclusion, our study found that IL-17A could upregulate the expression of CSBF/C10orf99. *Csbf/C10orf99*$^{-/-}$ mice showed significantly worse psoriasis-like symptoms. Our study reveals the protective role of CSBF/C10orf99 against IMQ induced psoriasis in Balb/c mice. CSBF/C10orf99 from non-hemopoietic cells plays a protective role in this disease. Our study is helpful to understand the pathogenesis of psoriasis and provide new ideas and methods for the development of targeted drugs for the treatment of psoriasis.

ZNF276 promotes malignant phenotype of breast carcinoma through upregulating CYP1B1-mediated Wnt/β-catenin pathway

Ting Lei[1]、Yongyin He[2]、Wenwu Zhang[1]、Yi Zhu[1]、Xiaoyu Song[1]、Zhenzhan Kuang[2]、Quan Zhou[2]、Zhaohui Sun[2]、Bin Xiao[1]、Linhai Li[1]

1. Department of Clinical Laboratory, The Sixth Affiliated Hospital of Guangzhou Medical University, Qingyuan People's Hospital

2. 中国人民解放军南部战区总医院

Background Breast cancer has replaced lung cancer as the most popular malignancy since 2020, largely due to the progression of a significant fraction of primary tumors to the metastatic stage. Zinc finger protein 276 (ZNF276) was first identified in a mouse model of Fanconi anemia, however, the expression and underlying role of ZNF276 in breast cancer is not fully understood.

Methods The mRNA and protein expression levels of ZNF276 in breast cancer tissues were detected by TCGA database analysis combined with tissue microarray, and the expression of ZNF276 in MCF-7, MDA-MB-231, SK-BR-3, BT-474 and UACC-812 breast cancer cell lines were analysed by RT-qPCR and Western blot. The effect of ZNF276 on the proliferation, invasion and migration was conducted by functional experiments both in vivo and in vitro. Transcriptome sequencing combined with CUT Tag to explore the potential downstream target genes of ZNF276, and the dual luciferase assay was used to verify the transcriptional regulatory relationship of ZNF276 to the target gene promoter. TOP/FOP Flash assay, immunofluorescence, RT-qPCR and Western blot were used to clarify the underlying role of ZNF326 on Wnt pathway activation. Screening of potential ZNF276 interacting proteins by immunoprecipitation and mass spectrometry (IP-MS), and identification of ZNF276 binding proteins by co-immunoprecipitation (co-IP).

Results ZNF276 is highly expressed in breast cancer tissues and cell lines. Mechanistically, ZNF276 interacted with MAGEB2 and transcriptionally promoted CYP1B1, leading to the activation of Wnt/β-catenin pathway, which gave rise to the proliferation, migration and invasion of breast cancer cells. Specifically, ZNF276 binds to the -1127 bp to -921 bp region of the CYP1B1 promoter through its C2H2 domain, thereby regulating the transcriptional activity of CYP1B1 promoter.

Conclusions Above all, ZNF276 promotes proliferation, migration and invasion of breast cancer cells by recruiting MAGEB2 to regulate CYP1B1, promoting β-catenin nuclear translocation and activating the Wnt/β-catenin pathway. Our findings shed light on the molecular mechanism of ZNF276 and offered a potential therapeutic strategy for breast cancer patients.

PO-1392

Circulating exosomal small RNAs are promising non-invasive diagnostic biomarkers for gastric cancer

Nan Zhang
Jinling Hoapital

Background Dysregulation of small non-coding RNA (ncRNA) is associated with various human diseases including cancer. Gastric cancer (GC) is the fifth most common cancer worldwide and the third leading cause of death from malignant tumours. The most commonly used GC tumour markers such as CEA, CA199, CA242 and CA724 are not diagnostically sensitive or specific enough to screen GC patients. Thus, there is an urgent need to develop new and simple diagnostic biomarkers for detection of GC.
Objectives This study aimed to evaluate the circulating exosomal small RNAs including microRNAs (miRNAs) and P-element-induced wimpy testis (PIWI)-interacting RNAs (piRNAs) as sensitive and specific non-invasive biomarkers for GC diagnosis.
Methods Serum exosomal small RNA transcriptome was examined using unique molecular identifiers (UMI) small RNA sequencing. Dysregulated miRNAs and piRNAs were verified in 70 GC patients and 60 healthy controls (HC) by reverse transcription quantitative PCR.
Results For the total samples in training cohorts and validation cohorts, both the expressions of miR-1307-3p, piR-018569, piR-004918 and piR-019308 were significantly increased ($P < 0.0001$) in GC patients ($n = 70$) as com-pared to those in HC ($n = 60$). Further, we analysed correlation between expression of miR-1307-3p/piR-018569/piR-004918/piR-019308 with clinical characteristics of GC patients. Our data showed that GC patients with metastasis had significantly higher ($P < .05$) expression levels of piR-004918 and piR-019308 in serum exosomes than GC patients without metastasis. However, no significant differences were detected for miR-1307-3p/piR-018569/piR-004918/piR-019308 in patients with other clinical characteristics such as sex, age or grade. Moreover, GC patients with metastasis had significantly higher expression levels of piR-004918 and piR-019308 than GC patients without metastasis. The area under the curve (AUC) for miR-1307-3p, piR-019308, piR-004918 and piR-018569 in the GC group was 0.845, 0.820, 0.754 and 0.732, and the results showed that the diagnostic values of miR-1307-3p, piR-019308, piR-004918 and piR-018569 were much better than that of CEA, CA199 and AFP, which had the AUCs of 0.689, 0.687 and 0.634, respectively. When miR-1307-3p/piR-019308/piR-004918/piR-018569 combined with CEA and CA199, the AUC of the biomarker panel reached 0.902 , 0.914, 0.859 and 0.868. The optimal cut-off values for miR-1307-3p/piR-019308/piR-004918/piR-018569 combined with CEA and CA199 were 5.5576, 8.5607 , 21.8673 and 7.8026, respectively. These data suggested that in addition to miR-1307-3p, serum exosomal piR-019308 combined with CEA and CA199 could provide excellent diagnostic capabilities for GC patients.
Conclusion Our study showed for the first time that in addition to miR-1307-3p, serum exosomal piR-019308, piR-004918 and piR-018569 are potential robust biomarkers for GC diagnosis. Serum exosomal piR-004918 and piR-019308 might be potential markers for monitoring metastasis of GC. The clinical values of piRNAs as biomarkers in other types of cancer need further investigation.

PO-1393

The effect of inflammatory cytokine neutralizing antibody therapy on TFH and TFR cells in collagen-induced arthritis and its significance

Chen Liu、Xingyue Zeng、Tianci Liu、Songsong Lu、Ying Song
Department of Clinical Laboratory, Peking University People's Hospital

Objective We aimed to illustrate the changes of follicular helper (TFH) and follicular regulatory (TFR) cells in rheumatoid arthritis using the collagen-induced arthritis (CIA) model and further clarity the impact of anti-inflammatory treatment on TFH and TFR cells.
Methods We established CIA model and used flow cytometry to analyze the changes of TFH and TFR cells in peripheral blood and spleen at different time points. The expression of TIGIT, CD226, ICOS and PD-1 that characterize the functions of TFH and TFR were also analyzed. The function of spleen TFH and TFR cells from CIA was further analyzed. The effects of anti-inflammatory antibody treatments on the subpopulation and function changes of TFH and TFR were also analyzed in CIA mice.
Results The levels of TFH and TFR were significantly increased in spleen and peripheral blood of CIA mice. After treatment, TFH and TFR cells decreased significantly. TIGIT+ and TIGIT+CD226-TFH cells in CIA mouse spleen were elevated and PD-1 and ICOS expression on TFH and TFR cells in the spleen were also significantly increased. The ability of TFH to secrete IL-21 and help B cells, and TFR to secrete IL-10 and inhibit TFH were both enhanced in CIA mouse spleen. After antibody treatment, cell subsets and functions were significantly recovered.
Conclusion In the pathogenesis of rheumatoid arthritis, TFH and TFR cells in the germinal center increases and their functions are enhanced. After the treatment by inflammatory factor antibodies, TFH and TFR subsets and their functions can be significantly recovered.

Long non-coding RNA RP11-490M8.1 inhibits lipopolysaccharide-induced pyroptosis of human umbilical vein endothelial cells via the TLR4/NF-κB pathway

Xuehui Liu[1]、Shaoguo Wu[1]、Yanwei Hu[2]
1. Guangzhou Twelfth People's Hospital，Guangzhou，Guangdong
2. 广州市妇女儿童医疗中心

Background and aims Pyroptosis is a relatively newly discovered form of programmed cell death that plays an important role in the development of atherosclerosis. Many evidence have reported that lncRNAs are participate in the regulation of atherosclerosis development. However, the regulatory mechanism of lncRNAs on pyroptosis must be further study.
Methods Here, In vitro assays were performed to study the role of lncRNA RP11-490M8.1 on pyroptosis. Moreover, the relative gene mRNA and lncRNA expression levels were tested by quantitative real-time PCR, and protein levels were evaluated by western blot analysis.
Results lncRNA RP11-490M8.1 was significantly downregulated in atherosclerotic plaques. LPS markedly reduced the expression of lncRNA RP11-490M8.1,while induced pyroptosis through increasing the levels of NLRP3, caspase-1, ASC, IL-1β, and IL-18 at both the mRNA and protein in HUVECs. The promotion effects of LPS on pyroptosis were markedly suppressed by overexpression of lncRNA RP11-490M8.1. In addition, LPS increased mRNA and protein of TLR4 and NF-κB, which was also markedly offset by overexpression of lncRNA RP11-490M8.1.

Conclusions These findings indicate that lncRNA RP11-490M8.1 inhibits LPS-induced pyroptosis via the TLR4/NF-κB pathway. Thus, lncRNA RP11-490M8.1 may provide a therapeutic target to ameliorate atherosclerosis.

Staphylococcus aureus Competition and Symbiosis with Nasal Microbiome through Sequestration of Environmental Iron

Yanfeng Zhao[1]、Simon Heilbronner[2]、Darya Belikova[2]
1. The Second Affiliated Hospital of Nanjing Medical University
2. 德国 Tubingen University

The human microbiome is critically associated with human health and disease. Antibiotic resistant bacterial pathogens such as methicillin resistant Staphylococcus aureus, reside within the microbiota, increasing the risk of infections. Epidemiological studies of the nasal microbiome showed positive and negative correlations of non-pathogenic species with S. aureus, but the underlying molecular mechanisms are poorly understood. The environment of the nasal cavities is iron limited and bacteria produces iron scavenging siderophores to overcome this limitation. Here we show that siderophore acquisition is crucial for S. aureus nasal colonization. We screened 80 nasal bacterial strains of seven genera for their capacity to produce siderophores as well as to consume siderophores produced by S. aureus and found that 80% of strains engaged in siderophore-mediated interactions with S. aureus. Especially non-pathogenic corynebacterial species consumed the staphylococcal siderophores staphyloferrin A, staphyloferrin B or both. In coculture experiments, corynebacteria species reduced S. aureus growth in an iron-dependent fashion while other members of the microbiome, producing siderophores accessible to S. aureus, did not. Our data show that consumption of S. aureus-derived siderophores by non-pathogenic species can reduce pathogen proliferation and gives first molecular explanation for the negative correlation of S. aureus and corynebacteria observed in previous studies.

Evaluation of seven commercial SARS-CoV-2 RNA detection kits based on real-time polymerase chain reaction (PCR) in China

Bingqi Wang
The Second XiangYa Hospital of Central South University

Purpose SARS-CoV-2 is a new, rapidly spreading human beta coronavirus. It was first identified in Wuhan and caused a disease named COVID-19. SARS-CoV-2 real-time PCR assays represent one of the reference standards to make a definitive diagnosis of COVID-19. Various commercial kits were available for emergency use in China during the outbreak of disease. However, they lack validation for diagnostic use in the clinic. Here, we selected seven representative commercial kits to evaluate their performance in SARS-CoV-2 RNA detection.
Methods We collected 42 archived SARS-CoV-2-positive samples and 200 randomly selected SARS-CoV-2-negative samples. Total nucleic acid extractions were performed on the NP968-S Nucleic Acid Extraction System with paramagnetic particle method, using the Virus DNA/RNA Isolation Kit. Seven kits tested samples in parallel and according to the manufacturer's introductions. Sensitivity, specificity, positive predictive value, negative predictive value, andYouden index were calculated. Cohen's Kappa coefficient, chi-square values were carried out using SPSS software.
Results We selected seven domestic diagnosis kits: kit A (BGI BIOTECH CO., LTD), kit B (OUTDO BIOTECH CO., LTD), kit C (SANSURE BIOTECH INC.), kit D (PERKIN ELMER MEDICAL DIAGNOSTIC PRODUCTS, CO., LTD), kit E (DAAN GENE CO., LTD. OF SUN YAT-SEN UNIVERSITY), kit F (JIANGSU BIOPERFECTUS TECHNOLOGIES CO., LTD), and kit G (FOSUN LONG MARCH MEDICAL SCIENCE CO., LTD). The target genes by seven kits were not the same. All the kits were designed to target the virus ORF1ab gene. Still, kit F and kit G could simultaneously detect ORF1ab, N, and E. We discovered that all seven kits have excellent specificity, but there were differences in their clinical sensitivity. The concordance of kit A, kit B, kit D, and kit F and "reference result" was robust. Besides, the detection rate on different target genes of these assays are not the same; the detection ability of the ORF1ab gene for some kits was weak.
Conclusion To sum up, we summarized and compared the detailed information of seven SARS-CoV-2 RNA detection kits in this study. The overall sensitivity and specificity of all seven kits were sufficient for diagnosing COVID-19. However, there is some difference in their detection ability and clinical applications. At present, real-time PCR has become the "gold standard" of COVID-19 diagnosis. It's meaningful to select the most suitable detection kit to improve the detection rate of SARS-CoV-2 in clinical samples.

PU-0002

Exosomal long non-coding RNA 17A may serve as a novel plasma-based biomarker for diagnosis of Alzheimer's disease

Lina Wang
Laboratory Medical Center, The Second Hospital of Shandong University, Jinan, Shandong Province, China

Long non-coding RNA (lncRNA) and exosomes are involved in the pathological process of Alzheimer's disease (AD). Many lncRNAs, such as brain cytoplasmic 200 RNA (BC200), 17A and 51A were upregulated in the brains of patients with AD. The aim of the present study was to determine whether the expression levels of several lncRNAs derived from plasma exosomes

could be used as a biomarker of AD. A total of 59 patients with AD and 61 controls were recruited, and the expression levels of BC200, 17A and 51A were detected. Some other clinical characteristics were collected and analyzed simultaneously. The expression levels of 17A in patients with AD were significantly higher compared with the controls ($p < 0.05$). Receiver operating characteristic curve analysis showed that the area under the curve was 0.633, the sensitivity was 83.05%, the specificity was 45.90%, and the cutoff point was 0.595. Through subgroup analysis, we also found that 17A can distinguish moderate to severe AD from mild AD. In order to identify whether the diagnostic value of 17A was independent of some clinical data, such as age, sex, blood pressure, blood sugar, smoking and drinking status, blood levels of folic acid and et al , we did subgroup analysis and Spearman's rank correlation test. The results showed that there was no significant statistical difference. The present study showed that plasma exosomal 17A may be used as a potential novel biomarker for diagnosis of AD.

流式细胞技术在临床检验中的应用

黄薇、钱源
昆明医科大学第一附属医院

近年来医学研究发展越来越快，随之也加速发展的还有各种各样的医学技术。流式细胞技术（flow cytometry，FCM）是 20 世纪 70 年代初发展起来的一项高新技术，是一种综合应用光学、机械学、流体力学、电子计算机、细胞生物学、分子免疫学等学科技术，使被测溶液流经测量区域，并逐一检测其中每一个细胞的物理和化学特性，从而对高速流动的细胞或亚细胞进行快速定量测定和分析的方法。随着研究的日益深入，流式细胞技术已经不仅仅是在医学研究中有着重要的意义，而是进入临床应用阶段对于临床检验也有极大的影响。本文主要从流式细胞术在临床上的应用入手，分析其在临床检验中的应用。

二甲双胍通过 IGF-1/PI3K/Akt 信号通路对细胞衰老的影响

侯玉丽、付静轩、王培昌
首都医科大学宣武医院

目的 探讨二甲双胍（Met）通过 IGF-1/PI3K/Akt 信号通路对细胞衰老的影响。
方法 选取 2BS 细胞分成四组，即对照（NC）组、胰岛素样生长因子-1（IGF-1）组、Met 组、Met+IGF-1 组。加药处理后进行 SA-β-Gal 染色检测细胞衰老水平、CCK8 试验检测细胞增殖能力、EdU 试验检测 DNA 合成能力以及 Western blot 检测各组 PI3K、p-PI3K、Akt、p-Akt 蛋白表达。
结果 各组 SA-β-Gal 染色阳性率比较，差异有统计学意义（$P < 0.05$）。Met+IGF-1 组 SA-β-Gal 染色阳性率低于 IGF-1 组，差异有高度统计学意义（$P < 0.01$）。在相同时间点，Met+IGF-1 组 OD450 值高于 IGF-1 组，差异有统计学意义（$P < 0.05$）。EdU 染色后在 370 nm 处的染色结果显示，各组 OD370 值比较，差异有统计学意义（$P < 0.05$）；Met+IGF-1 组 OD370 值高于 IGF-1 组，差异有统计学意义（$P < 0.05$）。Met 组 p-PI3K、p-Akt 蛋白表达量低于其他组，差异有统计学意义（$P < 0.05$）。IGF-1 组 p-PI3K、p-Akt 蛋白表达量高于其他组，差异有统计学意义（$P < 0.05$）。Met+IGF-1 组 p-PI3K、p-Akt 蛋白表达量低于 IGF-1 组，差异有统计学意义（$P < 0.05$）。
结论 Met 可通过抑制 IGF-1/PI3K/Akt 信号通路来延缓细胞衰老。

线粒体 DNA（mtDNA）的可变拷贝数预测急性髓细胞白血病患者预后

黄松苓、赵滢
昆明医科大学第一附属医院

目的 线粒体 DNA（mtDNA）拷贝数的变化在包括急性髓细胞白血病在内的各种人类癌症中被广泛报道，并被认为是癌症的一个重要标志。然而，对于可变 mtDNA 含量在该癌症预后评估中的价值还尚未有相关报道。
方法 采用实时定量 PCR 方法，对一组急性髓细胞白血病患者和正常对照组进行 mtDNA 拷贝数检测，探讨不同 mtDNA 含量与急性髓细胞白血病患者临床结局的关系。
结果 与对照组相比，大多数急性髓细胞白血病患者的 mtDNA 含量较低，前者的相对平均 mtDNA 含量高于后者。值得注意的是，可变 mtDNA 含量并不影响急性髓细胞白血病患者的总生存率，但是我们发现，mtDNA 含量增加与晚期肿瘤患者的生存率低相关。
结论 在本研究中，我们发现 mtDNA 含量的增加与晚期肿瘤患者生存率的下降有着密切的联系。

Low expression of immune-related lnRNA HSPC324 is associated with poor prognosis in smoking-related luad

dajie zhou、Jing Wang
Yantai Yuhuangding Hospital

Background Smoking is one of the most dangerous factors associated with the growth of lung adenocarcinoma (LUAD). Through database mining, many survival- and prognosis-related biomarkers were collected. However, the accuracy of immune-related lncRNA predictions is not precise enough. Therefore, we pointed to found a new signature to boost the smoking-related LUAD prognosis estimation.
Methods Pearson correlation analysis were used to performed lncRNA expression and immune-related genes in the samples to distinguish immune-related lncRNAs. RNA high-throughput sequencing and clinicopathologic data of HSPC324 were downloaded from the TCGA. The relationship between the overall survival (OS) and HSPC324 expression was analyzed by the Kaplan-Meier method and the Cox regression analysis.
Results Based on a median expression of 0.343, we divided patients into high- and low-expression categories. Our results indicated that the HSPC324 expression was decreased in smoking-related LUAD (all tumor vs. adjacent tissues) (P= 9.573e−27). Also, Kaplan-Meier curves showed that low HSPC324 expression was associated with a better overall survival among the smoking-related LUAD patients (P=0.032). Univariate Cox regression analysis showed that reduced HSPC324 expression in smoking-related LUAD is associated with stage (HR =1.03, 95%CI [1.372-1.883], P =4.19E-09), T classification (HR = 1.545, 95%CI [1.233-1.936], P=0.000) and N classification (HR = 1.6749, 95%CI [1.378-2.035], P= 2.15E-07). MultiCox Cox regression analysis showed that stage (HR =1.3903, 95%CI [1.106-1.747], P =0.004), HSPC324 (HR =0.5767, 95%CI [0.349 -0.953], P =0.03) were independent prognostic biomarker for smoking-related LUAD.
Conclusions Low expression of HSPC324 may be a potential molecular marker for predicting poor prognosis of smoking-related LUAD. It also suggested that HSPC324 might potentially have biological functions in the development of smoking-related LUAD.

长链非编码 RNA Z38 在结直肠癌中低表达并作为一个肿瘤抑制因子

王晴美
郴州市第一人民医院

LncRNAs serve comprehensive roles in various diseases, including cancer. Z38 was up-regulated in breast cancer, which is a notable biomarker of prognosis;its potential biological roles and involvement in the progression of colorectal cancer (CRC) remains unclear. The present study aimed to investigate the expression of Z38 in patients with CRC and to investigate its effect on cells.Low expression levels of Z38 were associated with the old age of patients, large tumor size, poorly tumor differentiation (p <0.05).Up-regulation of Z38 could inhibit CRC cell proliferation in vitro.The results of the present study suggest that over-expression of Z38 inhibits proliferation and plays important roles in CRC, which may act as a novel candidate biomarker and therapeutic target in carcinomas.

47 例鹦鹉热衣原体阳性检出患者的临床特征分析

邓方芳、冯敏、谭筱醴、张玮佳
四川金域医学检验中心有限公司

目的 探讨宏基因二代测序技术检出鹦鹉热衣原体阳性患者的临床特征。
方法 回顾性分析 2020 年 8 月至 2021 年 5 月通过宏基因二代测序技术检出的 47 例鹦鹉热衣原体阳性患者的临床特征，包括性别、年龄、鸟禽接触史、实验室检查、影像学表现、临床症状等，为鹦鹉热衣原体的研究和临床诊疗提供依据。
结果 47 例阳性检出患者中男性居多，共 33 例，占 70.2%，女性 14 例，占 29.8%；年龄范围为 34 岁-82 岁，其中 60 岁-70 岁占 39.1%。6 例患者（12.8%）有明确鸟禽接触史，41 例患者（87.2%）接触史不详。阳性检出患者中 40%同时存在发热、咳嗽症状，15%仅表现为咳嗽，25%仅以发热为主要症状。阳性检出患者的 C 反应蛋白均高于正常值范围，占 100%。63.2%阳性者降钙素原升高。14.8%表现为白细胞计数升高，77.8%在正常值范围，7.4%低于正常值。中性粒细胞比率升高者占 77.8%，14.8%在正常范围内，7.4%低于正常值。影像学方面，5 例（25%）炎症部位为左肺，7 例（35%）炎症部位在右肺，8 例（40%）双侧同时存在，其中 6 例（30%）明确炎症部位以下叶为主，1 例（5%）上叶为主。
结论 鹦鹉热衣原体阳性检出患者主要表以男性为主，且老年人居多，临床表现为 C 反应蛋白普遍升高，中性粒细胞比率与降钙素原明显升高，白细胞计数基本正常。影像学多表现肺部炎症改变，分布无特异性。大部分存在发热、咳嗽症状。由于患者群体特征无明显特异性，因此宏基因二代测序技术对于及早发现鹦鹉热衣原体感染意义重大。

Serum metabolic profiling analysis of chronic gastritis and gastric cancer by untargeted metabolomics

Lin Yu[1]、Qinhuai Lai[2]、Qian Feng[1]、Yuanmeng Li[1]、Bei Xu[1]、Jiafu Feng[1]
1. Mianyang Central Hospital
2. 四川大学生物治疗国家重点实验室

Purpose Gastric cancer is a common tumor of the digestive system. Identification of potential molecules associated with gastric cancer progression and validation of potential biomarkers for gastric cancer diagnosis are very important. Thus, the aim of our study was to determine the serum metabolic characteristics of the serum of patients with chronic gastritis (CG) or gastric cancer (GC) and validate candidate biomarkers for disease diagnosis.
Experimental design: A total of 123 human serum samples from patients with CG or GC were for untargeted metabolomics analysis via UHPLC-Q-TOF/MS to determine characteristics of the serum. Principal component analysis (PCA), partial least squares discriminant analysis (PLS-DA) and heat map were used for multivariate analysis. In addition, commercial databases were used to identify the pathways of metabolites. Differential metabolites were identified based on a heat map with a t-test threshold ($p < 0.05$), fold-change threshold (FC > 1.5 or FC < 2/3) and variable importance in the projection (VIP >1). Then, differential metabolites were analyzed by receiver operating characteristic (ROC) curve to determined candidate biomarkers. All samples were analyzed for fasting lipid profiles.
Results Analysis of serum metabolomic profiles indicated that most of the altered metabolic pathways in the three groups were associated with lipid metabolism ($p < 0.05$) and lipids and lipid-like molecules were the predominating metabolites within the top 100 differential metabolites ($p < 0.05$, FC > 1.5 or FC < 2/3, and VIP >1). Moreover, differential metabolites, including hexadecasphinganine, linoleamide and N-Hydroxy arachidonoyl amine had high diagnostic performance according to PLS-DA. In addition, fasting lipid profile analysis showed the serum levels of total cholesterol (TC), high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C) and apolipoprotein A1 (Apo-A1) were decreased concomitant to the progression of the progression of the disease compared with those in the control group ($p < 0.05$).
Conclusions Thus, this study demonstrated that lipid metabolism may influence the development of CG to GC. Hexadecasphinganine, linoleamide and N-Hydroxy arachidonoyl amine were selected as candidate diagnostic markers for CG and GC.

PU-0010

Chinese Abnormal Compound Heterozygote Spinocerebellar Ataxia Type 8: A case report

Minjin Wang
West China Hospital

An elderly Chinese male patient was diagnosed with compound heterozygous spinocerebellar ataxia type 8, molecular diagnosis found that this patient with (CTA)n(CTG)n repeats unit of his ATXN8/ATXN8OS gene was 134/93. The patient has a 6-year medical history, mainly manifested by ataxia, dysarthria, abnormal eye movements, and pyramidal signs. Magnetic resonance imaging(MRI) showed no obvious abnormalities in the medulla oblongata and cervical spinal cord except for cerebellar atrophy and sulci enlargement. There are heterozygous SCA8 individuals among his family members, but there are significant differences in their onset-age and clinical manifestations. This case reminds us that (CTA)n(CTG)n repeats are very prone to dynamic mutations in intergenerational inheritance, and the ATXN8/ATXN8OS

gene penetrance is different in different SCA8 individuals, which suggests that genetic detection is of great importance.

PU-0011

Establishment of Real Time Allele Specific Locked Nucleic Acid Quantitative PCR for Detection of HBV YIDD (ATT) Mutation and Evaluation of Its Application

Yongbin Zeng 、Qishui Ou
The First Affiliated Hospital of Fujian Medical University

Background Long-term use of nucleos(t)ide analogues can increase risk of HBV drug-resistance mutations. The rtM204I (ATT coding for isoleucine) is one of the most important resistance mutation sites. Establishing a simple, rapid, reliable and highly sensitive assay to detect the resistant mutants as early as possible is of great clinical significance.
Methods Recombinant plasmids for HBV YMDD (tyrosine-methionine-aspartate-aspartate) and YIDD (tyrosine-isoleucine-aspartate-aspartate) were constructed by TA cloning. Real time allele specific locked nucleic acid quantitative PCR (RT-AS-LNA-qPCR) with SYBR Green I was established by LNA-modified primers and evaluated with standard recombinant plasmids, clinical templates (the clinical wild type and mutant HBV DNA mixture) and 102 serum samples from nucleos(t)ide analogues-experienced patients. The serum samples from a chronic hepatitis B (CHB) patient firstly received LMV mono therapy and then switched to LMV + ADV combined therapy were also dynamically analyzed for 10 times.
Results The linear range of the assay was between 1×10(9) copies/μl and 1 × 10(2) copies/μl. The low detection limit was 1 × 10(1) copies/μl. Sensitivity of the assay were 10(-6), 10(-4) and 10(-2) in the wild-type **Background** of 1 × 10(9) copies/μl, 1 × 10(7) copies/μl and 1 × 10(5) copies/μl, respectively. The sensitivity of the assay in detection of clinical samples was 0.03%. The complete coincidence rate between RT-AS-LNA-qPCR and direct sequencing was 91.2% (93/102), partial coincidence rate was 8.8% (9/102), and no complete discordance was observed. The two assays showed a high concordance (Kappa = 0.676, P = 0.000). Minor variants can be detected 18 weeks earlier than the rebound of HBV DNA load and alanine aminotransferase level.
Conclusions A rapid, cost-effective, high sensitive, specific and reliable method of RT-AS-LNA-qPCR with SYBR Green I for early and absolute quantification of HBV YIDD (ATT coding for isoleucine) variants was established, which can provide valuable information for clinical antiretroviral regimens.

PU-0012

外泌体 ABCA1 蛋白在阿尔茨海默病诊断价值的初步研究

刘辰庚、赵越、路尧、王培昌
首都医科大学宣武医院

目的 初步探索高 ABCA1 外泌体跨血脑屏障的现象及其作为阿尔茨海默病候选标志物的潜在价值。
方法 将 9 月龄 APP/PS1 模型小鼠脑脊液（CSF）高 ABCA1 外泌体注射至野生型（WT）小鼠脑室研究其转运过程，同时检测主 69 例观认知下降（SCD）、43 例轻度认知障碍（mild cognitive impairment，MCI）和 35 例痴呆期（dementia of Alzheimer's type，DAT）患者血清外泌体 ABCA1 水平。
结果 APP/PS1 双转基因小鼠 CSF 和血清中外泌体 ABCA1 水平随龄显著升高（$P < 0.05$）；注射 2 小时后 WT 小鼠血清外泌体 ABCA1 水平显著升高（$P < 0.05$）；MCI 和 DAT 患者血清外泌体 ABCA1 较对照组显著升高（$P < 0.05$），且 DAT 组高于 MCI 组（$P < 0.05$）。

结论 ABCA1 外泌体可经透过血脑屏障到达外周血而被有效检测，其可作为 AD 诊断的候选标志物，但在 SCD 的诊断中还需积累更多的研究数据。

PU-0013

A noval mutation analysis of the MMAA genes in Chinese boy with impaired health-related quality of life in children affected by methylmalonic acidemia

Dongling Tang[1]、Juan Le[1]、bo Wang[2]
1. Renmin Hospital of Wuhan University Wuhan,
2. 湖北省妇幼保健院（湖北省妇女儿童医院）

Background Isolated methylmalonic acidemia refers to a group of inborn errors of metabolism characerized by elevated methylmalonic acid concentrations in the blood and urine due to the failure of converting methylmalonyl-CoA into succinyl-CoA during propionyl-CoA metabolism.Mutations in the MMAA gene cause isolated methylmalonic acidemia. It occurs in approximately one to three out of every 100 thousand Chinese newborns.
METHODS A 13-month-old boy was diagnosed with isolated methylmalonic acidemia. Isolated methylmalonic acidemia was diagnosed by analyzing the organic acids in plasma and/or urine using gas-liquid chromatography and tandem mass spectrometry. The subtype of methylmalonic acidemia was established by cellular biochemical studies including 14¯C propionate incorporation, B12 responsiveness, complementation analysis, cobalamin distribution assays and molecular genetic testing. Identification of biallelic pathogenic variants in MUT, MMAA, MMAB, MCEE, and MMADHC genes and confirmation of carriers in parents can establish the diagnosis (2-4). In our case the MMAA mutations in the proband were detected by targeted sequencing. The mutations in the proband and his family members were validated by Sanger sequencing.
RESULT We identified two mutations in the MMAA gene in this case: c.491G>A and c.650T>A. The c.491G>A is a novel mutation in the MMAA gene. The boy is a heterozygous carrier of both mutations. The boy was treated with intravenous sodium benzoate and fluids. His sensorium gradually improved and he recovered from the acute illness. Other family members are heterozygous carriers of either mutations but with no symptoms.it is clear that a novel c.491G>A mutation was detected in the MMAA gene. Heterozygous carriers of both c.491G>A and c.650T>A mutations are associated with isolated methylmalonic acidemia.
Conclusion Mutations in the MMAA gene can affect either its GTPase activity or the interaction with MUT (10). In our case, the boy with symptoms is a heterozygous carrier of both mutations. On one allele, he has a Novel mutation in the MMAA gene previously reported nonsense p.Leu217* mutation. On the other allele, he has a novel p.Gly164Glu point mutation. His family members, who carry either mutations on one allele, have no symptoms. This novel mutation is likely to be pathogenic. However,the mechanisms of dysfunction of this mutant require further investigation. It is evident that the detection of novel mutations may be instrumental in the development of efficient non invasive genetic diagnosis and in the expansion of its application in other disorders.

血清外泌体 MT1-MMP 在胃癌中的表达及临床意义研究

董召刚
山东大学齐鲁医院

目的 检测血清外泌体 MT1-MMP 及 CEA、CA19-9、CA72-4 在胃癌、不典型增生、慢性萎缩性胃炎、健康对照中的表达，探讨对胃癌的早期诊断价值。
方法 收集 2016.12-2017.12 山东大学齐鲁医院住院的胃癌 119 例、不典型增生 33 例、慢性萎缩性胃炎 31 例，患者术前清晨空腹血清 3ml，收集 31 例健康对照血清。提取血清外泌体，并利用电镜、粒径、western blot 鉴定。试剂盒提取血清外泌体 RNA，实时荧光定量 PCR 检测血清外泌体 MT1-MMP 表达。电化学发光法检测 CEA、CA19-9、CA72-4 水平。MT1-MMP 表达采用 2-ΔΔCT 方法计算。数据用中位数表示，M-W 检验或 K-W 检验分析与胃癌临床参数的关系。绘制 ROC 曲线计算曲线下面积，计算胃癌 cut-off 及相应的敏感度、特异度、阳性预测值、阴性预测值。
结果 成功分离并鉴定血清外泌体，血清外泌体 MT1-MMP 在胃癌中表达高于不典型增生、慢性萎缩性胃炎及健康对照（P 均<0.05），不典型增生高于慢性萎缩性胃炎（P=0.022）及健康对照（P=0.001），慢性萎缩性胃炎高于健康对照（P=0.019）。胃癌 CEA 高于不典型增生、慢性萎缩性胃炎健康对照（P<0.05）。CA19-9 和 CA72-4 在三组表达无显著差异（P >0.05）。胃癌患者血清外泌体 MT1-MMP 表达与肿瘤大小、分化、分型、浸润深度、转移、TNM 分期密切相关（P 均<0.05）。ROC 曲线显示 MT1-MMP 与 CEA 联合可提高诊断效能，其灵敏度、特异度、阳性预测值、阴性预测值、曲线下面积为 75.6%、83.9%、94.7%、47.3%、0.821 (95% CI: 0.750-0.878)。
结论 血清外泌体 MT1-MMP 在胃癌表达升高，与分期转移密切相关，对胃癌早期诊断价值较高，有成为无创诊断标志物的潜能。

PU-0015

血清 lncRNA UCA1 在食管鳞癌的表达及临床意义

闫素真、杜鲁涛、王传新
山东大学第二医院

目的 探讨长链非编码 RNA(lncRNA) 尿路上皮癌胚抗原 1(UCA1) 在食管鳞癌患者血清中的表达及潜在 的临床意义。
方法 收集 96 例食管鳞癌患者血清样本，同时选取 96 例年龄、性别匹配的健康体检者作为健康对照组，其中 12 例食管鳞癌患者行术前、术后比较。采用实时荧光定量 PCR 的方法检测 lncRNA UCA1 在食管鳞癌 血清中的表达，并对食管鳞癌患者术前、术后进行比较。分析食管鳞癌患者血清 lncRNA UCA1 与其临床病理参 数的关系，采用受试者工作曲线(ROC) 对血清 lncRNA UCA1 的诊断效能进行评价。
结果 与健康对照组比较， 食管鳞癌患者血清中 lncRNA UCA1 的表达升高，且患者术后较术前表达下降，差异有统计学意义(P＜0．001) 。血 清 lncRNA UCA1 诊断食管鳞癌的 ROC 曲线下面积(AUC) 为 0．816，灵敏度和特异度分别为 77．1%和 76．0%。此 外，与传统肿瘤标志物鳞状细胞癌相关抗原(AUC = 0．679) 比较，lncRNA UCA1 对食管鳞癌诊断效能更高(P＜ 0．001) 。
结论 血清 lncRNA UCA1 可作为食管鳞癌早期诊断及术后监测潜在的新型肿瘤标志物。

前列腺癌骨转移相关基因学分析

李亚平
成都市第三人民医院

目的 通过对前列腺癌骨转移相关基因芯片数据的生物信息学分析，进一步了解前列腺癌骨转移发病的分子机理。
方法 从 Gene Expression Omnibus(GEO)网站下载前列腺癌骨转移相关芯片数据 GSE32269，选取其中的 51 个样本，包括 22 个原发性局限性前列腺癌样本，29 个前列腺癌骨转移组织样本。利用 BRB ArrayTools v 4.5.1 stable 对两组样本进行差异基因分析（DEGs）。所有差异基因根据其表达值的变化分为上调和下调组，导入 DAVID 进行 GO 富集分析以及 KEGG 信号通路分析。利用 string 在线分析差异基因的蛋白-蛋白相互作用（PPI）网络。
结果 两组基因表达谱比较，共筛选出 340 个差异基因。相对于原发性局限性前列腺癌样本，前列腺癌骨转移组织样本共 164 个基因表达上调，176 个基因表达下调。 GO 富集分析显示，上调基因富集主要与肌肉收缩、负调节生长、细胞对锌离子的反应、丝氨酸内肽酶活性等有关。而下调基因富集与细胞外基质、胶原蛋白分解代谢、胶原纤维组织、胶原结合、血小板衍生生长因子相关。KEGG 通路最重要的术式包括黏着斑、细胞外基质受体相互作用、细胞周期、嘌呤代谢、整合素信号通路等生物通路。 PPI 网络提示表达上调的 SPP1、HBB、AR、MMP9 及下调的 AZGP1 是重要的重要基因，被认为是中枢基因。
结论 SPP1、HBB、AR、MMP9、AZGP1、POSTN、FN1、VCAN 等基因与前列腺癌骨转移的生物学进程密切相关，其中 SPP1 基因上调表达明显，提示前列腺癌骨转移中可能存在 SPP1/MET 信号通路和 AR 失调现象。

Association between mitochondrial DNA copy number and non-small cell lung cancer risk

Songling Huang 、ying zhao
Department of Clinical Laboratory, the First Affiliated Hospital of Kunming Medical University, Kunming, 650032, China

BACKGROUND Alterations of mitochondrial DNA (mtDNA) copy number is widely reported in various human cancers, including lung cancer, and is considered to be an important hallmark of cancers. This study was undertaken to investigate the possibility of variable mtDNA copy number in peripheral blood lymphocytes (PBLs) as a risk predictor for non-small cell lung cancer (NSCLC).
METHODS Using real-time quantitative PCR approach, we examined mtDNA copy number in PBLs from 60 NSCLC patients and 60 matched controls.
RESULTS We found that the mitochondrial DNA copy number in NSCLC patients was significantly higher than that in the control group (median: 1.28 to 0.97; P < 001). We further assessed the association between mitochondrial DNA copy number and NSCLC risk using multivariate logistic regression. With the median of the control value as the cut-off point, it was found that the risk of NSCLC increased significantly in high mtDNA copy number compared with the low mtDNA copy number (the ratio of the adjusted ratio, 2.57; 95% confidence interval, 1.89-3.26).In trend analysis, we found that higher mitochondrial DNA copy number had a dose-response relationship with increased risk of NSCLC (P < 001).
CONCLUSIONS These findings provide the first epidemiological evidence that high mitochondrial DNA copy number in PBLs is associated with increased risk of NSCLC.

Expanding the Rules of Nucleic Acid Hybridization Using Junction Probes

Xuchu Wang、Zhihua Tao
the Second Affiliated Hospital of Zhejiang University School of Medicine

Nucleic acid hybridization is crucial in target recognition with respect to nucleic acid biosensing and gene regulation. Conventional linear probes or molecular beacon encounter challenges in multiplexing and specific recognition of intractable nucleic acids. Advances in nucleic acid nanotechnologies have gave birth to a set of novel structural probes: junction probes (JPs), which make full use of the advantages of specificity, stability, programmability and predictability of Watson–Crick base pairing. Recent years, junction probes have been regularly implemented in constructing systems related to biosensing synthetic biology and gene regulation. herein, we summarize the latest advances in JPs designs as potential nucleic acids biosensing systems and expansive applications, and provided some general guidelines for developing JPs based sensing strategies for implement of such systems.

Loading of "cocktail siRNAs"into extracellular vesicles via TAT-DRBDfor the treatment of castration-resistant prostate cancer

Yanjun Diao 、liu yang、mingquan su、rui li、yue zhang、lei zhou、weixiao fan、xiaoke hao、jiayun liu
Department of Clinical Laboratory Medicine, Xijing Hospital, Fourth Military Medical University, Xi'an, China

Extracellular vesicles (EVs) are cell-derived, membranous nanoparticles that mediate intercellular communication by transferring biomolecules between cells. As natural delivery vehicles, EVs may exhibit higher delivery efficiency, lower immunogenicity, and better compatibility than existing therapeutic RNA carriers. One major limitation for their therapeutic use is the lack of an efficient, robust, and scalable method to load EVs with therapeutic siRNA molecules of interest. Here, we report a novel strategy using polycationic membrane-penetrating peptide TAT to encapsulate siRNAs into EVs. **METHODS** Three TAT peptides were expressed with DRBD as 3TD fusion protein in a in E. coli prokaryotic expression system. DRBD binding with siRNAs in a sequence-independent manner facilitates multiplex genes（FLOH1, NKX3 and DHRS7） targeting, which is particularly important in complex multi-genic CRPC.**RESULTS** EVs were isolated using differential centrifugation from WPMY-1 cell culture medium. The increase of mergered yellow fluorescence in the engineered EVs showed by TIRFM and the decrease of zeta potential absolute valuescertificatedthe co-localization of siRNA with EVs, which indicated that siRNA has been successfully delivered into WPMY-1 EVs. qRT-PCR analysis revealed that the mRNA level of FLOH1, NKX3 and DHRS7 wasdramatically decreased when cells treated with engineered EVs loaded of siRNAs mixtures relative to thelevel of untreated cells. Western and flow cytometryresults indicate that delivery of siRNA mixtures by engineered EVs can effectively downregulate AR expression and induce LNCaP-AI cellapoptosis.**CONCLUSION**The uptake efficiency of the EVs and the significant downregulated expression of three genes suggested the potential of TAT as efficient siRNAs carriers by keeping the function of the cargoes.

PU-0020

SOD 和 8-OHdG 子痫前期患者胎盘组织的表达及临床意义

景丽萍、庄学伟
山东省立第三医院

目的 测定子痫前期患者胎盘组织超氧化物歧化酶（Superoxide dismutase,SOD）及 DNA 氧化损伤产物 8-羟基脱氧鸟苷(8-hydroxy-2-deoxyguanosine,8-OHdG)的表达，探讨其在子痫前期发病机制中的作用。
方法 采用实时定量 PCR 检测 SOD1 和 SOD2 mRNA,免疫组化法检测 SOD1，SOD2 和 8-OHdG 在正常第三期和子痫前期胎盘组织的表达水平。
结果 与正常胎盘组织相比，子痫前期胎盘组织中 SOD1 和 SOD2 mRNA 和蛋白表达降低（P<0.05），而 DNA 氧化损伤产物 8-OHdG 升高。
结论 子痫前期患者抗氧化应激能力下降，氧化损伤产物增加，氧化应激是子痫前期病因之一。

PU-0021

Exosomal LncRNA RP5-977B1 as a novel minimally-invasive biomarker for early diagnosis and prognostic prediction in non-small cell lung cancer

Ling Min
Cancer Center of Guangzhou Medical University

Lung cancer is the leading cause of cancer-related deaths in the world. Non-small cell lung cancer (NSCLC) accounts for 85% of all lung cancer cases. For lack of conveniently sensitive and specific biomarkers, the majority of patients are in the late stage at initial diagnosis. Long non-coding RNAs (LncRNAs), a novel type of non-coding RNA, have recently been recognized as critical factors in tumor initiation and progression, but the role of exosomal LncRNAs has not been thoroughly excavated yet. In the present study, we isolated exosomes from the serum of NSCLC patients and healthy controls. RNA deep sequencing was subsequently performed to detect differentially expressed exosomal LncRNAs. On the basis of analysis, we find that exosomal LncRNA RP5-977B1 exhibited higher levels in NSCLC than that in the healthy controls, this result was also verified by qRT-PCR assay. Furthermore, RP5-977B1 is validated to be mainly encapsulated by exosomes that are protected from RNase digestion. ROC curve, with AUC values of 0.8899 in distinguishing of NSCLC patients and controls, was performed to evaluate the diagnostic values of RP5-977B1, the diagnostic efficiency was superior to conventional biomarker serum CEA and CYFRA21-1, especially in early stage patients. Kaplan-Meier analysis revealed that high expression of exosomal RP5-977B1was closely related with worse prognosis in NSCLC (P=0.036). Together, our results suggest that exosomal RP5-977B1 serve as a novel “liquid biopsy” diagnostic and prognostic biomarker to monitor NSCLC and improve possible therapy.

PU-0022

孕妇年龄风险与胎儿染色体异常发生率的相关性分析

李辉斌
南方医科大学珠江医院

目的 探讨高龄孕妇各年龄段与胎儿染色体异常的相关性。

方法 回顾性分析 925 例高龄孕妇(≥35 岁)，行绒毛膜穿刺、羊膜腔穿刺和脐带穿刺收集绒毛、羊水和脐血进行培养及染色体 G 显带核型分析，分析高龄孕妇与胎儿染色体异常率及类型的分布情况，按年龄分组(35-37 岁组、38-40 岁组、40 岁以上组)，用 χ2 检验各年龄组的异常率的差异。
结果 在 925 例高龄孕妇的羊水染色体核型分析中，共检出异常核型 66 例(7.13%)，其中染色体数目异常 53 例(6.93%)，占异常构成比 80.3%，其中 21 三体比例最高 29 例(3.14%)，占异常构成比 43.93%，18 三体/13 三体/性染色体数目异常比例分别为 11 例（1.19%)/4 例(0.43%)/9 例(0.97%)。结构异常 13 例(1.05%)，占异常构成比 19.7%，其中易位 8 例(0.86%)，倒位 5 例(0.54%)。从 35 到 37 岁、38 到 40 岁、40 岁以上 3 个年龄组的染色体核型异常率依次为 5.49%、6.02%和 10.38%，孕妇年龄递增胎儿染色体异常率逐年上升。各年龄组间总体异常率差异有统计学意义(χ2＝6.436，P＝0.04)。
结论 胎儿染色体异常的风险随孕妇年龄的增长而增加，结构异常的分布与母亲年龄因素相关性，40 岁以上胎儿染色体总体异常率显著上升。对高龄孕妇进行产前诊断染色体核型分析是避免染色体异常儿出生的重要手段。

Overexpression of LINC00673 promotes the proliferation of cervical cancer cells

Shengkai Huang 、Ruo-Xuan Ni、Wen-Jie Wang、Di Wang、Mei Zhao、Cheng-Zhi Lei、Chang-Zhi Huang、Ping Bai、Yi-Qun Che、Jian-Ping Xu
National Cancer Center/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, 100021, China

Objective To study the expression of LINC00673 in cervical cancer and cervical intraepithelial neoplasia (CIN) and to explore the role of LINC00673 in the development of cervical cancer.
Methods The expression of LINC00673 in serum from cervical cancer patients, CIN patients, and healthy participants was detected by RT-qPCR. The function of LINC00673 in cervical cancer cells was analyzed using in vitro and in vivo experiments.
Results Our results revealed that serum LINC00673 levels were highest in cervical cancer patients, followed by patients with CIN and healthy controls. In vitro experiments demonstrated that overexpression of LINC00673 enhanced the proliferation and cell cycle progression of HeLa and SiHa cells. In vivo experiments showed that the tumor weight and volume of nude mice subcutaneously injected with LINC00673-overexpressing HeLa cells were larger than those of nude mice injected with control cells ($P < 0.05$). Western blotting showed that cell cycle-related proteins cyclin A2 and cyclin E and interstitial-associated proteins Snail and N-cadherin were upregulated and p53 signaling pathway-related proteins were downregulated in LINC00673-overexpressing HeLa and SiHa cells.
Conclusion LINC00673 plays an important role in the development of cervical cancer and may serve as a new therapeutic target for cervical cancer.

无创产前筛查对胎儿染色体非整倍体检出的临床价值

周慕平、刘娜、文君、黄艳
邵阳市妇幼保健院

目的 探究无创产前筛查对胎儿染色体非整倍体检出的临床价值。
方法 选取 2017 年 6 月至 2019 年 6 月某院产科收治的产前检查孕妇 102 例作为研究对象，统一应用无创产前 DNA 检测技术采集母体外周血进行无创产前筛查，系统评估胎儿染色体非整倍体疾病

患病风险率。针对高风险筛查结果孕妇采取分析染色体核型方式，研究无创产前筛查对胎儿染色体非整倍体疾病的诊断价值。
结果 对纳入研究 102 例孕妇进行外周血检测，共 102 份标本，NIPT 检测显示性染色体非整倍异常 16 例。经咨询发现，16 例孕妇均自愿接受检测，其中 NIPT 与染色体核型分析结果一致 6 例，包括（45，X）3 例；（46，XXX）1 例；（46，XX）1 例；（47，XXY）1 例。检测显示高风险 8 例，检出阳性率 7.84%。染色体核型分析结果等同于无创产前筛查检测结果。
结论 针对胎儿染色体非整倍体疾病产前筛查应用无创产前 DNA 检测具有重要临床价值，由于该检测技术敏感性较高。
因此，具有较高的准确性，且为无创操作，对孕妇及胎儿的伤害较小，是提高生育质量的重要技术。

PU-0025

Isocitrate dehydrogenase 3A, a rate-limiting enzyme of the TCA cycle, promotes hepatocellular carcinoma and functions as a prognostic marker

Wenzhe Si、Liyan Cui
Peking University Third Hosiptal

Background The precise molecular mechanism of hepatocellular carcinoma (HCC) remains ambiguous. Isocitrate dehydrogenase 3A (IDH3A) is known as a subunit of the IDH3 heterotetramer. To the best of our knowledge, the biological effect of IDH3A in malignant tumors is unclear.
Methods Cell transfection was used to upregulate and downregulate the expression of IDH3A in HCC cells. Wound scratch assays were assessed using the migration activity. While transwell assays were carried out to detect the invasion of HCC cells. RNA-seq, RT-qPCR and western blot were used to validate MTA1 as a potential target gene.
Results Here, we report that IDH3A is significantly upregulated in HCC tissues; moreover, high expression of IDH3A is strongly associated with tumor size and the clinicopathologic stage of HCC. RNA-seq revealed that depletion of IDH3A affects the expression of metastasis associated 1 (MTA1), an oncogene which is related to the progression of numerous cancer types to the metastasis stage. The present study suggested that IDH3A can upregulate MTA1 expression and promote epithelial-mesenchymal transition (EMT) in HCC by inducing MTA1 expression, thereby facilitating cell migration and invasion of HCC cells.
Conclusions In the present study, we demonstrated the importance of IDH3A in HCC progression. The identification of the IDH3A axis provides novel insight into the pathogenesis of HCC, and the IDH3A axis might represent a novel target for the treatment of HCC.

HPV 基因分型联合 TCT 筛查宫颈病变的价值分析

吴颖、彭荣、谢艳、李思、张莉、廖丹
长沙迪安医学检验所有限公司

目的 了解湖南地区人乳头瘤病毒(HPV)的感染情况和各亚型分布特征，探讨 HPV 检测联合液基细胞学（TCT）检查在宫颈癌筛查中的价值。
方法 采用荧光 PCR 熔解曲线法对 2020 年 1 月-2020 年 12 月湖南地区送检的 71212 例女性宫颈脱落细胞进行 HPV23 种基因亚型检测，HPV 阳性感染者进行液基细胞学（TCT）检查，TCT 结果为高度鳞状上皮内病变（HSIL）的病例进行组织病理诊断。

结果 送检的 71212 例女性两癌筛查标本，HPV 感染率为 10.99%，其中单一型别感染率为 9.27%（6600 例），多重型别感染率为 1.72%（1223 例）；高危型感染为 9.51%（6775 例），低危型感染为 1.48%（1048 例），高危型以 52 型、58 型和 16 型为主，低危型以 81 型和 70 型为主。年龄中以 51-60 岁感染率最高，为 45.35%，不同年龄段感染率差异有统计学意义（x2=397.537，p<0.001）。HPV 阳性感染者宫颈脱落细胞进行 TCT 检查，阳性符合率为 40.02%（3131 例）；HPV 联合 TCT 检查与组织病理诊断符合率为 83.33%。
结论 湖南地区 HPV 感染以高危型 HPV52 型、HPV58 型和 HPV16 型为主，具有地域性特征, HPV 联合 TCT 筛查，有助于提高宫颈上皮内瘤变（CIN）、宫颈癌检出率，以尽早发现和治疗宫颈癌。

PU-0027

胰腺癌患者外周血清 microRNA-25 水平的定量评估

许笑、关明
复旦大学附属华山医院

目的 胰腺癌是常见的消化道恶性肿瘤之一，由于其隐匿性强却病势凶险，导致了高死亡率、低治愈率的特点。当前，主流检测胰腺癌的肿瘤标志物是血清癌抗原 19-9（Ca19-9），但是在诸多消化道肿瘤中会升高，甚至有的急性胰腺炎患者也会升高，所以在还没有出现显著的临床症状时，Ca19-9 无法为胰腺癌患者提供及时的鉴别提示。近年，一种新的核酸标志物已经引起了广泛的注意，这就是 microRNA-25。miR-25 唯有微染色体维持蛋白（MCM7），miR-25 的过度成熟，会抑制 PHLPP2 的表达，进而激活 AKT 通路，诱发胰腺癌。本研究旨在通过绝对定量检测血清 miR-25，揭示其在胰腺癌治疗过程中的定量改变及与其他肿瘤，尤其是胃肠道肿瘤中的血清定量差异，为该 microRNA 在胰腺癌鉴别检测和辅助预后中提供进一步依据。
方法 本研究收集来自复旦大学附属华山医院胰腺癌患者 50 例，包含 20 对术前术后配对样本，健康人对照 50 例和胰腺炎患者 50 例的血清样本。此外，还收集了卵巢癌、肺癌、食管癌、胃癌、肝癌和结直肠癌，各 20 例病例血清。使用江苏命码 miR-25 检测试剂盒检测并比较各组间的差异。
结果 性能验证显示本方法线性良好，R2>0.99，批间和批内精密度均小于 10%，检测阈值为 3300copies/μl。50 例胰腺癌患者的 miR-25 检测结果均为阳性，手术治疗后，14（70%）例病例出现了显著下降。此外，健康人对照组、胰腺炎患者组和其他肿瘤患者组，均未测出 miR-25 升高。miR-25 的特异性和灵敏度都达到 100%，同比组内胰腺癌样本的 Ca19-9 结果只有 70%的灵敏度和 80%特异性。
结论 miR-25 比起常规的 Ca19-9 有着显著提升的特异性和灵敏度。同时，在血清中的定量检测 miR-25 不但能有有效鉴别胰腺癌和良性胰腺疾病患者，也能鉴别有关的消化道及其他肿瘤。从手术前后的定量结果，更显示了该项目不但有助于胰腺癌的监测，还对手术疗效的评估有着积极的意义。

PU-0028

2019 新型冠状病毒感染患者血标本病毒核酸的检测与分析

高勇[1,2]、刘赟蕾[1]
1. 阜阳市第二人民医院
2. 安徽医科大学附属阜阳传染病医院

目的 探讨 2019 新型冠状病毒感染患者血标本中病毒核酸阳性情况，以及血标本病毒核酸阳性与临床表现重症化的关系。
方法 采用实时荧光 RT-PCR 方法，对 15 例确诊新型冠状感染患者 67 份血标本进行 2019-nCoV 核酸检测。

结果 67 份血标本中，有 3 份 2019-nCoV 核酸阳性，且均来自 2 例危重型患者。
结论 确诊 COVID-19 患者血液中可能存在病毒颗粒，并与临床表现重症化或危重症化有关，在临床诊疗的过程中，应加强医务人员的生物安全防护及确诊患者标本的管理。

PU-0029

新型冠状病毒肺炎患者痰液与咽拭子标本核酸检测阳性率比较及 时间差分析

高勇[1,2]、韩明锋[1]
1. 阜阳市第二人民医院
2. 安徽医科大学附属阜阳传染病医院

目的 比较新型冠状病毒肺炎（COVID-19）患者痰液与咽拭子标本核酸检测阳性率，并分析不同标本阳性率时间差，为临床诊断提供参考。
方法 本研究收集 2020 年 1 月 22 日至 2020 年 2 月 28 日确诊的 COVID-19 患者 166 例，回顾性分析上述患者 1192 份痰液与咽拭子标本核酸检测数据。
结果 在第 0-7 天采样时间段，痰标本与咽拭子标本对重症患者 SARS-CoV-2 感染的临床灵敏度分别为 94.1%、33.3%（P<0.001），对轻症患者 SARS-CoV-2 感染的临床灵敏度分别为 66.5%、29.8%（P<0.001）；在第 8-14 天及≥15 天采样时间段，由于病人在持续治疗过程中其体内病毒逐渐清除，两类标本的临床灵敏度均有所降低，但对于轻症患者痰液标本诊断 SARS-CoV-2 感染的阳性率仍显著高于咽拭子标本组。在各采集时段，痰标本组病毒基因（ORF1ab/N）核酸检测 Ct 值均有低于咽拭子标本组趋势，提示痰标本中病毒载量高于咽拭子标本。部分 COVID-19 患者痰标本检出 SARS-CoV-2 的持续时间比咽拭子标本长，其咽拭子标本的阳性检出时间晚于痰液标本。
结论 痰液标本诊断 SARS-CoV-2 感染的阳性率在感染早期与轻症患者组显著高于咽拭子标本。为提高核酸检测灵敏度，建议尽可能留存痰液标本，同时对疑似患者多点采样或同一部位反复核酸检测，结合血清抗体、CT 影像学等联合评估，以提高疑似病例的诊断灵敏度。

PU-0030

血清可溶性甘露糖受体在肝癌患者中的表达水平及其临床意义

黄程荣、王琴
安徽医科大学第二附属医院

目的 探讨肝癌（HCC）患者体内可溶性甘露糖受体（sMR）的表达水平及其临床意义。
方法 采用酶联免疫吸附实验分别检测肝癌患者、慢性乙型肝炎（CHB）患者及健康对照（HC）血清 sMR 水平，统计分析一般资料，比较不同分期及病理特征患者血清 sMR 水平，并通过绘制 ROC 曲线评价 sMR 及 AFP 对肝癌的诊断效能。
结果 肝癌患者血清 sMR 水平高于慢性乙型肝炎及健康对照者，根据巴塞罗那临床肝癌分期分类标准将 HCC 患者的疾病严重程度分为巴塞罗那 A、B、C、D 期（早、中、晚、终末期），其中 A 期 27 例，B 期 39 例，C 期 42 例，D 期 21 例。结果提示随着疾病进展，肝癌患者体内 sMR 水平升高，同时发现 HCC 患者血清中 sMR 水平在肝癌组肿瘤直径＞5 cm 及多发结节组中均升高但 AFP 水平与肿瘤数目及肿瘤大小差异无显著性。进一步以不同研究对象作为对照组绘制 ROC 曲线评估 sMR 及 AFP 对 HCC 患者的诊断效能，研究发现以 HC 组或非肝癌患者为对照组 sMR 曲线下面积（0.992 和 0.864）均高于 AFP（0.848 和 0.761），且当 AFP 与 sMR 联合检测时，ROC 曲线下面积（0.996 和 0.909）均高于单个指标。说明 AFP+sMR 是 HCC 患者诊断的良好预测指标。以非肝癌组为对照组，AFP 阴性 HCC 患者（49 例）作为病例组，ROC 曲线下面积为 0.854

（0.783~0.909），当 sMR 截断值为 110pg/ml 时，敏感性和特异性分别为 79.59%、80.0%，表明 sMR 对于 AFP 阴性的 HCC 患者也有一定的补充诊断价值。
结论 血清 sMR 水平在肝癌患者中升高，其表达水平与肿瘤分期、大小及数目有关，同时发现血清 sMR 及 AFP 联合检测对于肝癌的诊断水平高于单个指标对肝癌诊断具有重要临床意义和应用价值。

Decreased serum vitamin D levels and low liver vitamin D receptor expression in patients with chronic hepatitis B are related to liver fibrosis

张浩、王琴、汪玲妹、周强
安徽医科大学第二附属医院

Background To investigate whether any association existed between serum 25(OH)D level and liver histology in chronic hepatitis B (CHB) patients.
Methods Serum 25(OH)D levels were examined and associations between serum 25(OH)D concentration and clinical parameters were analysed. The expression levels of hepatic VDR protein were determined using immunohistochemical staining (IHS).
Results The 25(OH)D serum levels decreased significantly compared with healthy controls. The decrease in 25(OH)D was concomitant with an increase in viral load, as well as levels of total bile acid（TBA）in CHB patients. Moreover, serum 25(OH)D levels in patients with fibrosis stage 2 or 3/4 were significantly decreased compared with that of in patients fibrosis stage 1. VDR expression was less strongly present on the cytosol of hepatocytes in CHB patients compared with those of healthy controls, and negatively correlated with fibrosis stage.
Conclusions These results may suggest that declined in 25(OH)D levels and low expression of hepatic VDR are related to the severity of liver damage in CHB patients.

PU-0032

CRISPR/Cas13a 检测肿瘤驱动基因 TP53 R248W 的研究

邝振展、孙朝晖
中国人民解放军南部战区总医院

成簇的规律间隔的短回文重复序列(clustered regularly interspaced short palindromic repeats,CRISPR)及其相关蛋白是近年来火爆的研究热点，它们组成的系统在分子诊断，RNA 干扰和基因编辑上有着巨大的潜力。CRISPR/Cas13a 是一种 RNA 引导的 RNA 酶，它的活性由高等真核生物和原核生物核苷酸结合(higher eukaryotes and prokaryotes nucleotide-binding ，HEPN)结构域决定。Cas13a 可以与 CRISPR RNA (crRNA)结合形成 Cas13a/crRNA 复合物，通过 crRNA 间隔序列的引导下识别靶 RNA。Cas13a/crRNA/靶 RNA 复合物可以激活 HEPN 结构域，使 Cas13a 蛋白获得 RNA 酶活性。因此，CRISPR/Cas13a 在分子诊断中具有广泛的应用价值，例如可对肿瘤病人组织和血浆样本中的突变基因进行检测。
目的 建立一种 TP53 R248W 变异体分子检测技术。
方法 根据 TP53 基因 R248W 变异体设计合成特异性扩增引物，通过优化扩增引物和扩增技术，寻找 TP53R248W 变异体最合适的扩增条件；设计特异性 crRNA，通过使用特异性高的 crRNA 来引导 Cas13a 蛋白检测扩增产物；评价不同浓度 crRNA 对 CRISPR/Cas13 方法检测效能的影响；通过不同突变率 TP53 R248W 变异体及模拟血浆 ctDNA 评价 CRISPR/Cas13a 方法的检测灵敏度。
结果 CRISPR/Cas13a 检测产物大小适宜在 300bp 左右，CRISPR/Cas13a 检测强度受 crRNA 浓

度的影响，crRNA 浓度越高，CRISPR/Cas13a 检测强度越高。CRISPR/Cas13a 检测 TP53 R248W 变异体的灵敏度为 104 copies / μl，最低可以检测出突变率为 0.01%的变异体。
结论 建立的 CRISPR/Cas13a 方法具有快速、简便、灵敏、特异等优点，为组织和血浆中的 TP53 R248W 变异体的检测提供了新的技术手段。

通过生信分析法推测多发性骨髓瘤中潜在的抑癌基因

阎赟梦
郑州大学第一附属医院

Multiple myeloma (MM) is characterized by aberrant accumulation of monoclonal plasma cells within the bone marrow compartment. In this study, we performed an integrated bioinformatic analysis of DNA methylation and gene expression profile from the gene expression omnibus to identify potential molecular mechanisms and functional genes in MM. In this study, Gene expression profiles (GSE16558 and GSE21304) were analyzed utilizing the R software and GEO2R to obtain aberrantly methylated differentially expressed genes (DEGs). Functional and pathway enrichment analysis of candidate genes were conducted utilizing the cluster profiler package. Twenty-seven upregulated hypomethylated genes and fourteen downregulated hypermethylated genes were identified. As for biological pathways, up-hypomethylated genes were significantly enriched in iron ion homeostasis, B cell differentiation, lymphocyte proliferation. The down-hypermethylated genes were significantly enriched in B cell activation.

2018-2020 年上海北部 45296 例流感样病例病原监测分析

刘晴晴、杨振华
上海市宝山区中西医结合医院

目的 对 2018-2020 年冬春季就诊于上海某三甲医院发热门诊的流感样病例进行病原检测分析，追踪上海北部流感流行的特点。
方法 采用免疫胶体金法和逆转录定量 PCR 方法(reverse transcription-polymerase chain reaction, RT-PCR)对 45296 例流感样病例(influenza-like illness, ILI)的鼻咽拭子标本进行甲型流感(简称甲流)和乙型流感(简称乙流)病毒抗原快速检和核酸检测。采用全自动五分类血球仪 XN-1000 分析患者的外周血全血细胞分析，并对结果进行统计学分析。
结果 胶体金法快速检测出流感病例 7518 例，阳性率 16.60%。其中甲型流感阳性 5180 例，占 68.90%，乙型流感阳性 2193 例，占 29.17%，甲、乙型流感混合感染 145 例，占 1.93%。0-20 岁儿童和青少年流感的发病率很高，阳性率为 20.14%。0-10 岁男童的甲、乙流的阳性率均高于女童（差异均有统计学意义，P<0.5）。随机抽取流感样病例 500 例鼻咽拭子标本，通过 RT-PCR 进行核酸检测，共检出流感阳性 122 例，检出率 24.4%，甲流 74 例，占 60.7%，乙流 48 例，占 39.3%，与临床一致率较高。甲流的 WBC、N%、NLR、CRP 均高于乙流，甲流的 LY%、M%均低于乙流，差异均有统计学意义（P<0.5）。比较八项血细胞指标的受试者特征曲线(receiver operator chamcteristic curve，ROC)的曲线下面积(area under the curve，AUC)，发现中性粒细胞/淋巴细胞比值(neutrophil-to-1ymphocyte ratio, NLR)高于其他指标。
结论 上海北部地区冬春季仍以甲流为主，乙流也在冬春季暴发流行，应引起重视。年龄、性别因素是影响冬春季节甲流和乙流感染的主要因子。NLR 对于鉴别甲流与乙流有一定的意义。

Investigation of the association between ten pathogens causing sexually transmitted diseases and high-risk human papilloma virus infection in Shanghai

Li Xie
Shanghai First People's Hospital Baoshan Branch, Shanghai, P.R.China

Cervical cancer, one of the high-incidence female malignant tumors, has predominated in recent years. Persistent infection with high-risk human papillomavirus (HR-HPV) is the main cause of cervical cancer. Studies have shown that infection with certain sexually transmitted disease (STD) pathogens increases the risk of persistent infection with HR-HPV and is a high-risk factor for cervical cancer. In the present study, cervical specimens were collected for Thinprep cytology test detection, while DNA of cervical cells was extracted for HPV genotyping and detection of 10 STD pathogens, including Neisseria gonorrhoeae, Chlamydia trachomatis (CT), Ureaplasma urealyticum, Ureaplasma urealyticum parvum (Uup)1, Uup3, Uup6, Uup14, Mycoplasma hominis (Mh), Mycoplasma genitalium (Mg) and herpes simplex virus II. Significant differences were observed between CT, Mh and Mg infections and HR-HPV infection ($P<0.05$). In addition, CT, Uup3, Uup6 and Mh infections were associated with HR-HPV infection (odds ratio >1; $P<0.05$). In the comparison of Uup3, Uup6 and Mg infections between the cervical intraepithelial neoplasia (CIN) group and the control group, statistically significant differences were observed ($P<0.05$). In conclusion, the incidences of CT, Mh and Mg infections were similar with HR-HPV infection. CT, Uup6, Mh and Mg infections were risk factors for HR-HPV infection. Finally, Uup3, Uup6 and Mg were risk factors of CIN.

血清胎盘来源外泌体和外泌体中 miR-210 与子痫前期的相关性

段玉萍、谢骊、蔡雷鸣、吴晶晶、洪茂、厉倩
复旦大学附属中山医院吴淞医院

目的 探讨孕妇血清中胎盘来源外泌体和外泌体内 miR-210 在子痫前期孕期中的变化规律及临床意义。
方法 收集 2018 年 1 月-2019 年 12 月在我院收治的子痫前期（preeclampsia， PE）孕妇 30 例和正常孕妇 30 例孕早中晚期血清标本。通过 ExoQuick 提取试剂盒分离正常孕妇和 PE 孕妇孕早中晚期血清中外泌体，利用 CD63 ELISA 试剂盒检测 CD63 表达水平计算外泌体总量；通过胎盘碱性磷酸酶（(placental alkaline phosphatase，PLAP）ELISA 试剂盒检测胎盘来源外泌体的水平；通过实时荧光定量 PCR 方法检测正常孕妇和 PE 孕妇不同孕期血清中外泌体内 miR-210 的表达；并对血清外泌体 PLAP 水平和 miR-210 相对表达水平进行相关性分析。
